

- What does DPI stand for? **Deep Packet Inspection**
- Virtual heartbeat connection part of Active/Active or Active/Standby HA requirement? **Yes, if we go with two boxes at some point they will be located at two different physical locations over a L2 10Gb connection.**
- For the requirement of support authentication of chromebooks and personal devices, are these devices connecting (/authenticating) to the School WiFi network? **They Connect to an open SSID with no authentication required however we do have a portal for them to accept a EULA.**
- Can you give an example of "Identify and Control applications sharing the same connections"? **Items like G-mail where you can launch other applications from within that session. This is similar to Granular application control except from within the website vs an "app" on a device.**
- Does the 4-5GB throughput assume that your ISP connection will be 10GB? What will the ISP speed look like for the new solution? **We currently have two internet connections, one is 500Mb and the other is 2.2Gb. We tunnel the internal connection between our router and firewall over a single 10Gb From there we would span into a single 10Gb connection that handles the 2.2Gb link and a 1Gb connection that handles the 500Mb connections. The firewall must be able to handle both Fiber and Copper connections.**
- Are you looking for a standalone firewall where management and the gateway reside on the same appliance or management on one appliance and the gateway on a second appliance? **I am open for whatever you recommend.**
