Answers for RFP #2019-610-5 – Network Access Solution

1. How would the district like to authenticate MacBooks, iPads, Androids, and any other wireless devices that they are doing PSK for today or that only support PSK?
2. Will the district continue to use PSK or convert all supported clients to 802.1x auth on the wireless?
   a. What would the district like to do for the clients that don't support 802.1x?

The District would prefer to move everything over to 802.1x that is capable, however, for clients/devices that do not support 802.1x, the District is open to continuing to use PSK or other authentication methods.
