    b. Each analog alarm shall have an adjustable percent-of-limit-based hysteresis (default: 0% of the alarm threshold, i.e., no hysteresis; alarm exits at the same value as the alarm threshold) the alarmed variable required to exit the alarm. Alarm conditions have ceased when the alarmed variable is below the triggering threshold by the amount of the hysteresis.

4. Latching. A latching alarm requires acknowledgment from the operators before it can return to normal, even if the exit deadband has been met. A nonlatching alarm does not require acknowledgment. Default latching status is as follows:

    a. Level 1 alarms: latching

    b. Level 2 alarms: latching

    c. Level 3 alarms: nonlatching

    d. Level 4 alarms: nonlatching

5. Post-exit Suppression Period. To limit alarms, any alarm may have an adjustable suppression period such that once the alarm is exited, its post-exit suppression timer is triggered and the alarm may not trigger again until the post-exit suppression timer has expired. Default suppression periods are as follows:

    a. Level 1 alarms: 0 minutes

b. Level 2 alarms: 5 minutes

c. Level 3 alarms: 24 hours

d. Level 4 alarms: 7 days

N. VFD Speed Points

To avoid operator confusion, the speed command point (and speed feedback point, if used) for VFDs should be configured so that a speed of 0% corresponds to 0 Hz, and 100% corresponds to maximum speed set in the VFD, not necessarily 60 Hz. The maximum speed may be limited below 60 Hz to protect equipment, or it may be above 60 Hz for direct drive equipment. Drives are often configured such that a 0% speed signal corresponds to the minimum speed programmed into the VFD, but that causes the speed AO value and the actual speed to deviate from one another.

1. The speed AO sent to VFDs shall be configured such that 0% speed corresponds to 0 Hz, and 100% speed corresponds to maximum speed configured in the VFD.

It is desirable that the minimum speed reside in the VFD to avoid problems when the VFD is manually controlled at the drive. But minimums can also be adjusted inadvertently in the VFD to a setpoint that is not equal to the minimum used in software. The following prevents separate, potentially conflicting minimum speed setpoints from existing in the BAS software and the drive firmware.

2. For each piece of equipment, the minimum speed shall be stored in a single software point; in the case of a hard-wired VFD interface, the minimum speed shall be the lowest speed command sent to the drive by the BAS. See Section 1.3 for minimum speed setpoints. The active minimum speed parameter shall be read every 60 minutes via the drive's network interface. When a mismatch between the drive's active minimum speed and the minimum speed stored in the software point is detected, the minimum speed stored in the software point shall be written to the VFD via the network interface to restore the active minimum speed parameter to its default value, and generate a Level 4 alarm.

The minimum speed parameter is read via the network interface to detect any changes in the minimum speed parameter. Upon detecting a change in the minimum speed setting, the correct minimum speed stored in a BAS software point is written back to the drive via the network interface to override any changes that are made locally to the minimum speed parameter at the VFD.

O. Trim & Respond Set-Point Reset Logic

1. T&R set-point reset logic and zone/system reset requests, where referenced in sequences, shall be implemented as described below.

2. A "request" is a call to reset a static pressure or temperature setpoint generated by downstream zones or air-handling systems. These requests are sent

upstream to the plant or system that serves the zone or air handler that generated the request.

a. For each downstream zone or system, and for each type of set-point reset request listed for the zone/system, provide the following software points:

1) Importance-Multiplier (default = 1)

Importance-Multiplier is used to scale the number of requests the zone/system is generating. A value of zero causes the requests from that zone or system to be ignored. A value greater than one can be used to effectively increase the number of requests from the zone/system based on the critical nature of the spaces served.

2) Request-Hours Accumulator. Provided SystemOK (see Section 3.1R) is true for the zone/system, every x minutes (default 5 minutes), add x divided by 60 times the current number of requests to this request-hours accumulator point.

3) System Run-Hours Total. This is the number of hours the zone/system has been operating in any mode other than Unoccupied Mode.

Request-Hours accumulates the integral of requests (prior to adjustment of Importance-Multiplier) to help identify zones/systems that are driving the reset logic. Rogue zone identification is particularly critical in this context, because a single rogue zone can keep the T&R loop at maximum and prevent it from saving any energy.

4) Cumulative%-Request-Hours. This is the zone/system Request-Hours divided by the zone/system run-hours (the hours in any mode other than Unoccupied Mode) since the last reset, expressed as a percentage.

5) The Request-Hours Accumulator and System Run-Hours Total are reset to zero as follows:

a) Reset automatically for an individual zone/system when the System Run-Hours Total exceeds 400 hours.

b) Reset manually by a global operator command. This command will simultaneously reset the Request-Hours point for all zones served by the system.

6) A Level 4 alarm is generated if the zone Importance-Multiplier is greater than zero, the zone/system Cumulative% Request Hours exceeds 70%, and the total number of zone/system run hours exceeds 40.

b. See zone and air-handling system control sequences for logic to generate requests.

c. Multiply the number of requests determined from zone/system logic times the Importance-Multiplier and send to the system/plant that serves the

zone/system. See system/plant logic to see how requests are used in T&R logic.

3. For each upstream system or plant setpoint being controlled by a T&R loop, define the following variables. Initial values are defined in system/plant sequences below. Values for trim, respond, time step, etc. shall be tuned to provide stable control. See Table 5.1.14.3.

Table 5.1.14.3 Trim & Respond Variables

Variable	Definition
Device	Associated device (e.g., fan, pump)
SP0	Initial setpoint
SPmin	Minimum setpoint
SPmax	Maximum setpoint
Td	Delay timer
T	Time step
I	Number of ignored requests
R	Number of requests from zones/systems
SPtrim	Trim amount
SPres	Respond amount (must be opposite in sign to SPtrim)
SPres-max	Maximum response per time interval (must be same sign as SPres)

Informative Note: The number of ignored requests (I) should be set to zero for critical zones or air handlers.

4. Trim & Respond logic shall reset the setpoint within the range SPmin to SPmax. When the associated device is off, the setpoint shall be SP0. The reset logic shall be active while the associated device is proven on, starting Td after initial device start command. When active, every time step T, if R≤I, trim the setpoint by SPtrim. If there are more than I requests, respond by changing the setpoint by SPres*(R – I), (i.e., the number of requests minus the number of ignored requests) but no more than SPres-max. In other words, every time step T.

If R≤I, change Setpoint by SPtrim
If R > I, change setpoint by (R – I)*SPres but no larger than SPres-max

P. Equipment Staging and Rotation

1. Parallel equipment shall be lead/lag or lead/standby rotated to maintain even wear.

2. Two runtime points shall be defined for each equipment:

   a. Lifetime Runtime: The cumulative runtime of the equipment since equipment start-up. This point shall not be readily resettable by operators.

Lifetime Runtime should be stored to a software point on the control system server so the recorded value is not lost due to controller reset, loss of power, programming file update, etc.

   b. Staging Runtime: An operator resettable runtime point that stores cumulative runtime since the last operator reset.

Staging Runtime provides a resettable runtime counter, which allows for reset of the staging runtime hours used for lead/lag or lead/standby rotation between maintenance intervals or equipment replacement while maintaining a separate log of the Lifetime Runtime. If runtime were not resettable, and logic relied only on Lifetime Runtime for determining staging lead/lag position, newly added equipment could run for years as the lead equipment before swapping rotation positions with older equipment per the logic below.

3. Lead/lag equipment: Unless otherwise noted, identical parallel staged equipment (such as CHW pumps and cooling towers) shall be lead/lag alternated when more than one is off or more than one is on so that the equipment with the most operating hours as determined by Staging Runtime is made the last stage equipment and the one with the least number of hours is made the lead stage equipment.

This strategy effectively makes it such that equipment are not "hot swapped", e.g., a pump would not be started and another stopped during operation just for runtime equalization.
For example, assume there are two equipment and only one is on, but the operating equipment has exceeded the run hours of the disabled equipment. The equipment will not rotate positions until either a stage up or down occurs. If the plant stages up, then both equipment will be on and lead/lag position will switch; when the plant next stages down, the former lead equipment with more run hours will then turn off.
Expanding further, for a plant with three equipment, if all three are off or all are on, the staging order will simply be based on run hours from lowest to highest. If two equipment are on, the one with more hours will be set to be stage 2 while the other is set to stage 1; this may be the reverse of the operating order when the equipment were started. If two of the equipment are off, the one with the more hours will be set to be stage 3 while the other is set to stage 2; this may be the reverse of the operating order when the equipment were stopped.
Example with three pumps:

1. *P-1 (1000 hours), 2 (950 hours), and 3 (900 hours) are all off. Staging logic makes lead/lag order: 3, 2, 1.*
2. *P-3 starts. Logic does not change its order since it is on by itself.*
3. *P-3 runs for 51 hours. Since it is on and others off, the lead/lag order does not change. It can run this way indefinitely and the order does not change.*

4. *There is then a stage-up command. P-2 (the next in lead/lag order) is started. So, both P-2 and P-3 are on. P-3 now has more run hours than P-2. So, the Lead/lag order changes to: 2, 3, 1.*
5. *These two pumps run another 51 hours. Run times are P-1 (1000 hours), P-2 (1001), and P-3 (1002). No changes are made to lead/lag order because P-1 is off alone.*
6. *There is a stage down command. P-2 is now lead so it stays on. P-3 is shut off. The order for the two off pumps is now adjusted because P-1 has fewest run hours. Lead/lag order is now: 2, 1, 3.*
7. *P-2 runs for 100 more hours. It now has the longest runtime, but order does not change since it is on alone. Order is still 2, 1, 3.*
8. *There is a stage down or plant-off command. P-2 shuts off. Run times are P-1 (1000 hours), P-2 (1101), and P-3 (1002). Since all are off, order is switched to: 1, 3, 2.*

---

4. Lead/standby equipment:

   a. Unless equipment runs continuously, parallel equipment that are 100% redundant shall be lead/standby alternated when more than one of the equipment is off so that the equipment with the most operating hours as determined by Staging Runtime is made the last stage equipment and the one with the least number of hours is made the earlier stage equipment.

For example, assuming there are three equipment, if all three are off, the staging order will be based on run hours from lowest to highest.

   b. If equipment runs continuously, lead/standby positions shall switch at an adjustable day of the week and time (e.g., every Tuesday at 10:00 am) based on Staging Runtime; standby equipment shall first be started and proven on before former lead equipment is changed to standby and shut off.

      1) Variable speed fans and pumps shall have a deceleration rate of 1 Hz/second or slower set in BAS logic when disabled to prevent nuisance trips of operating equipment (e.g., chillers).

5. Exceptions to Lead/lag and Lead/standby rotation

   a. Operators with appropriate access level shall be able to manually command staging order via software points, but not overriding the In-Alarm or Hand-Operation logic in the following subsections.

      1) Staging order changes initiated via operator override shall be instituted as part of normal staging events.

      2) Staging order shall remain overridden until released by operators.

   b. Faulted Equipment:

1) A faulted equipment is any equipment commanded to run that is either not running or unable to perform its required duty. If an operating equipment has any fault condition described subsequently, a Level 2 alarm shall be generated and a response shall be triggered as defined below.

    a) Fans and Pumps

        1. Status point not matching its on/off point for 3 seconds after a time delay of 15 seconds while the equipment is commanded on.

2) Upon identification of a fault condition:

    a) For fans, pumps:

        1. The next commanded off equipment in the staging order, Equipment “B”, shall be commanded on while alarming Equipment “A” remains commanded on.

        2. If Equipment “B” fails to prove status (i.e., it also goes into alarm), it shall remain commanded on and the preceding step shall be repeated until the quantity of equipment called for by the current stage has proven on, or there are no more available equipment.

        3. Set alarming equipment to the last positions in the lead/lag or lead/standby staging order sequenced reverse chronologically (i.e., the equipment that alarmed most recently is sent to last position).

        4. Staging order of non-alarming equipment shall follow the even wear logic. Equipment in alarm can only automatically move up on the staging order if another equipment goes into alarm.

        5. Equipment in alarm shall run if so called for by the lead/lag or lead/standby staging order and present stage.

3) Fans and Pumps

    a) Status point not matching its on/off point for 15 seconds after a time delay of 60 seconds when the equipment is commanded off.

Logic for hand operation of chillers, boilers, and cooling towers is not provided because sequences cannot stably respond to overrides by operators in all possible scenarios. For example, if a chiller is turned on in hand in a variable primary system with only one other chiller currently running, the control system would need to react by opening the isolation valves of the chiller placed in hand and either (1) immediately shutting down the former lead chiller or (2) changing the minimum chilled water flow setpoint, opening isolation valves, and possibly staging on condenser water pumps and cooling towers. Chillers, boilers, and cooling towers should only be placed in hand by changing the

staging sequence manually via the control system interface; they cannot be safely or stably operated in hand at the chiller/boiler/tower controllers.

Q. Air Economizer High Limits

1. Economizer shall be disabled whenever the outdoor air conditions exceed the economizer high-limit setpoint as specified. Setpoints shall be automatically determined by the control sequences (to ensure they are correct and meet code) based on energy standard, climate zone, and economizer high-limit-control device type selected by the design engineer in Section 1.2E.3 or **Error! Reference source not found.**. Setpoints listed below are for current California Energy Standards.

2. Title 24-2019

Device Type	California Climate Zones	Required High Limit (Economizer off when)
Fixed dry bulb	3	TOA > 24°C (75°F)
Differential dry bulb	3	TOA > TRA

R. Hierarchical Alarm Suppression

1. For each piece of equipment or space controlled by the BAS, define its relationship (if any) to other equipment in terms of “source,” “load,” or “system.”

   a. A component is a “source” if it provides resources to a downstream component, such as a chiller providing chilled water (CHW) to an AHU.

   b. A component is a “load” if it receives resources from an upstream component, such as an AHU that receives CHW from a chiller.

   c. The same component may be both a load (receiving resources from an upstream source) and a source (providing resources to a downstream load).

   d. A set of components is a “system” if they share a load in common (i.e., collectively act as a source to downstream equipment, such as a set of chillers in a lead/lag relationship serving air handlers).

      1) If a single component acts as a source for downstream loads (e.g., an AHU as a source for its VAV boxes), then that single-source component shall be defined as a “system” of one element.

      2) For equipment with associated pumps (chillers, boilers, cooling towers):

         a) If the pumps are in a one-to-one relationship with equipment they serve, the pumps shall be treated as part of the system to which they

are associated (i.e., they are not considered loads), as a pump failure will necessarily disable its associated equipment.

b) If the pumps are headered to the equipment they serve, then the pumps may be treated as a system, which is a load relative to the upstream equipment (e.g., chillers) and a source relative to downstream equipment (e.g., air handlers).

2. For each system as defined in Section 3.1R.1.d, there shall be a SystemOK flag, which is either true or false.

3. SystemOK shall be true when all of the following are true:

   a. The system is proven on.

   b. The system is achieving its temperature and/or pressure setpoint(s) for at least 5 minutes

   c. The system is ready and able to serve its load

4. SystemOK shall be false while the system is starting up (i.e., before reaching setpoint) or when enough of the system's components are unavailable (in alarm, disabled, or turned off) to disrupt the ability of the system to serve its load. This threshold shall be defined by the design engineer for each system.

   a. By default, Level 1 through Level 3 component alarms (indicating equipment failure) shall inhibit SystemOK. Level 4 component alarms (maintenance and energy efficiency alarms) shall not affect SystemOK.

   b. The operator shall have the ability to individually determine which component alarms may or may not inhibit SystemOK.

5. The BAS shall selectively suppress (i.e., fail to announce; alarms may still be logged to a database) alarms for load components if SystemOK is false for the source system that serves that load.

   a. If SystemOK is false for a cooling water system (i.e., chiller, cooling tower, or associated pump), then only high-temperature alarms from the loads shall be suppressed.

   b. If SystemOK is false for a heating water system (i.e., boiler or associated pump), then only low temperature alarms from the loads shall be suppressed.

   c. If SystemOK is false for an air-side system (air handler, fan coil, VAV box, etc.), then all alarms from the loads shall be suppressed.

6. This hierarchical suppression shall cascade through multiple levels of load-source relationship such that alarms at downstream loads shall also be suppressed.

7. The following types of alarms will never be suppressed by this logic:

    a. Life/safety and Level 1 alarms

    b. Failure-to-start alarms (i.e., equipment is commanded on, but status point shows equipment to be off)

    c. Failure-to-stop/hand alarms (i.e., equipment is commanded off, but status point shows equipment to be on)

S. Time-Based Suppression

1. Calculate a time-delay period after any change in setpoint based on the difference between the controlled variable (e.g., zone temperature) at the time of the change and the new setpoint. The default time delay period shall be as follows:

    a. For thermal zone temperature alarms: 18 minutes per °C (10 minutes per °F) of difference but no longer than 120 minutes

    b. For thermal zone temperature cooling requests: 9 minutes per °C (5 minutes per °F) of difference but no longer than 30 minutes

    c. For thermal zone temperature heating requests: 9 minutes per °C (5 minutes per °F) of difference but no longer than 30 minutes

T. Occupancy Sensor Status

1. Occupancy status of all spaces shall be via the Lighting Control BACnet interface.

2. Where a zone serves more than one room, “unoccupied” (or “unpopulated” per Guideline 36 terminology) means all rooms are unoccupied and “occupied” (populated) means any room is occupied.

3. In case of the network connection with the Lighting Controls is lost:

U. Pandemic Mode

1. Provide a software switch on the Home Page graphic for Pandemic Mode on/off. The switch shall include a timer that can be manually set by the operator for a period of up to 60 weeks, after which the Mode shall be shut off and control logic and setpoints returned to normal.

2. When the Pandemic Mode timer is on:

    a. All CO2 DCV setpoints shall be set to 800 ppm.

b. Occupancy sensors used for Occupied Standby logic shall be not reset zone ventilation rates; with respect to ventilation, the zone shall be considered "populated".

c. All Zone Group time schedules shall indicate Occupied Mode one hour prior to the scheduled time. This earlier time shall be reflected in optimum start logic.

V. Wildfire Mode

1. Provide a 2-position software switch on the Home Page graphic for Wildfire Mode:

a. Off. Locks Wildfire Mode off.

b. On. Turns Wildfire Mode on for a preset period of time, after which the Mode shall be shut off. The preset time shall be operator adjustable for up to 1 week.

2. When the Wildfire Mode timer is on:

a. Disable all economizers (lock High Limit to off).

3.2 ELECTRICITY DEMAND LIMITING

*Automatic Demand Response is required by Title 24 for all non-healthcare systems with DDC to the zone.*Demand Response

1. On home page, provide three software switches: Demand Limit Level 1 to 3.

a. These switches shall have AUTO, ON, and OFF positions. AUTO position shall set the Demand Limit Level's status to enabled or disabled based on an OpenADR 2.0 signal from the utility (see Section 250000 Building Automation Systems) ON shall manually enable the Demand Limit Level; and OFF shall disable and lockout the Demand Limit Level.

b. The Highest Demand Limit Level signal currently enabled, either via an ON or AUTO command, shall be given priority.

c. These signals are used at the zone level (see Zone Control sequences) to adjust setpoints to reduce demand.

*Include this if we have a BACnet interface to lighting controls and want to initiate demand shed via BAS. Otherwise, the lighting control system will require a separate OpenADR 2.0 VEN for this purpose to comply with Title 24.*Include Demand Shed commands to the lighting control system via BACnet interface for each Demand Level. The response to each Demand Shed command shall be programmed into the lighting control system under Division 26.

3. When any Demand Limit Level is on, generate a Level 4 alarm.

3.3 GENERIC VENTILATION ZONES

A. Zone Minimum Outdoor Air and Minimum Airflow Setpoints

1. For every zone that requires mechanical ventilation, the zone minimum outdoor airflows and setpoints shall be calculated depending on the governing standard or code for outdoor air requirements.

2. See Section 1.2C for zone minimum airflow setpoint Vmin.

3. For compliance with California Title 24, outdoor air setpoints shall be calculated as follows:

   a. See Section 1.2B.2 for zone ventilation setpoints.

   b. Determine the zone minimum outdoor air setpoints Zone-Abs-OA-min and Zone-Des-OA-min.

Zone-Abs-OA-min is used in terminal-unit sequences and air-handler sequences. Zone-Des-OA-min is used in air-handler sequences only.

      1) Zone-Abs-OA-min shall be reset based on the following conditions in order from highest to lowest priority:

         a) Zero if the zone has an occupancy sensor and is unpopulated and is permitted to be in occupied-standby mode per Section 1.2B.2.a.3).

         b) Varea-min if the zone has a CO2 sensor.

         c) Zone-Des-OA-min otherwise.

      2) Zone-Des-OA-min is equal to the following, in order from highest to lowest priority:

         a) Zero if the zone has an occupancy sensor, is unpopulated, and is permitted to be in occupied-standby mode per Section 1.2B.2.a.3).

         b) The larger of Varea-min and Vocc-min otherwise.

   c. Vmin

      1) Shall be equal to Zone-Abs-OA-min if Vmin in Section 1.2C is “AUTO”;

      2) Else shall be equal to Vmin as entered in Section 1.2C.

   d. The occupied minimum airflow Vmin* shall be equal to Vmin except as noted below, in order from highest to lowest priority:

1) If the zone has an occupancy sensor and is permitted to be in occupied-standby mode per Section 1.2B.2.a.3), Vmin* shall be equal to zero when the room is unpopulated.

2) If the zone has a CO2 sensor:

   a) See Section 1.2B.2.a.3) for CO2 setpoints.

   b) During Occupied Mode, a P-only loop shall maintain CO2 concentration at setpoint; reset from 0% at setpoint minus 200 PPM and to 100% at setpoint.

   c) Loop is disabled and output set to zero when the zone is not in Occupied Mode.

   d) For cooling-only VAV terminal units, dual-duct VAV terminal units with mixing control and inlet airflow sensors, or dual-duct VAV terminal units with cold-duct minimum control:

      1. The CO2 control loop output shall reset the occupied minimum airflow setpoint Vmin* from the zone minimum airflow setpoint Vmin at 0% up to maximum cooling airflow setpoint Vcool-max at 50%, as shown in Figure 5.2.1.4-1. The loop output from 50% to 100% will be used at the system level to reset outdoor air minimum; see AHU controls.

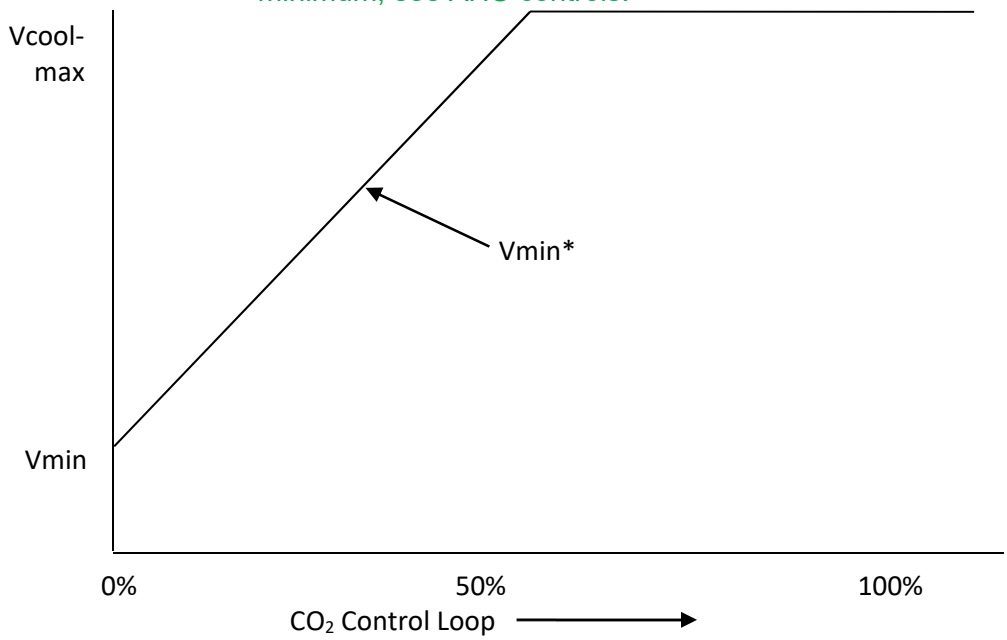

Figure 5.2.1.4-1 Vmin* reset with CO2 loop.

B. Time-Averaged Ventilation

ASHRAE Standard 62.1 and California Title 24 allow for ventilation to be provided based on average conditions over a specific period of time. This time-averaging

method allows for zone airflows to effectively be controlled to values below the VAV box controllable minimum value, which may reduce energy use and the risk of overcooling when the zone ventilation requirement is less than the VAV box controllable minimum.

1. When the active airflow setpoint Vspt is nonzero and is less than the lowest possible airflow setpoint allowed by the controls (Vm), the airflow setpoint shall be pulse width modulated as follows:

    a. The time-averaged ventilation (TAV) ratio shall be determined as TAVratio = Vspt/Vm

    b. The total cycle time (TCT) shall be 15 minutes (adjustable)

    c. Open period. During the open period, the TAV airflow setpoint Vspt* shall be equal to Vm for a period of time OP, which is the larger of the following:

    d. 1.5 minutes or

    e. TCT multiplied by TAVratio

    f. Closed period. During the closed period, Vspt* shall be set to 0 for a period of time CP, where CP = TCT – OP. The VAV damper control loop shall be disabled with output set equal to 0 during the closed period. At the end of each closed period, the VAV damper shall be commanded to the last position from the previous open period prior to reenabling the control loop.

    g. During TAV mode, each cycle shall consist of an open and closed period that alternate until Vspt is greater than Vm.

The following logic ensures that multiple zones do not enter TAV mode at the same time, avoiding the synchronized opening and closing of VAV dampers. Where there are a small number of zones and the majority may potentially be in TAV mode synchronously, avoiding this issue may be more reliably achieved by sequencing the VAV terminal units deterministically so that each VAV terminal unit always opens at a specific minute into the total cycle time. The aim of this sequencing is to ensure that the total airflow is as constant as possible over the total cycling time even if all of the VAV terminal units enter TAV mode at the same time (e.g., when a building-wide temperature setback occurs).
For example, the total open cycle for VAV terminal-unit A opens at minute 1 of the total cycle time, VAV terminal-unit B opens at minute x of the total cycle time, etc.
The random number for each terminal unit, RNDM, can be determined using a random number generator each time the unit enters TAV mode or set manually to a fixed value. If configured manually, set RNDM for each terminal unit to a unique value within the range of 0.0 to 1.0 such that the values are evenly distributed across the terminal units within a system.

    h. When first entering TAV mode, start with an initial open period of duration RNDM*OP, where RNDM is a random number between 0.0 and 1.0.

2. When in TAV mode, the active airflow setpoint, Vspt, shall be overridden to Vspt*.

C. Zone Alarms

1. For zones with CO2 sensors:

a. If the CO2 concentration is less than 300 ppm, or the zone is in Unoccupied Mode for more than 2 hours and zone CO2 concentration exceeds 600 ppm, generate a Level 3 alarm. The alarm text shall identify the sensor and indicate that it may be out of calibration.

b. If the CO2 concentration exceeds setpoint plus 10% for more than 10 minutes, generate a Level 3 alarm.

3.4 GENERIC THERMAL ZONES

A. This section applies to all single-zone systems and subzones of air-handling systems, such as VAV boxes, fan-powered boxes, etc.

B. Setpoints

1. See Section 1.2B.1 for zone temperature setpoints.

2. Each zone shall have separate occupied and unoccupied heating and cooling setpoints.

3. The active setpoints shall be determined by the operating mode of the Zone Group (see Section 3.5F).

The following is from addendum e to G36-2021:

a. During occupied mode:

1) The cooling set point shall be the occupied cooling set point.

2) The heating set point shall be the occupied heating set point.

b. During warm-up mode:

1) The cooling set point shall be the unoccupied cooling set point.

2) The heating set point shall be the unoccupied heating set point until the time remaining until the zone group's occupied start time is less than the zone's required warm-up time, tz-warmup, at which point the heating set point shall be the occupied heating set point.

c. During cool-down mode:

1) The cooling set point shall be the unoccupied cooling set point until the time remaining until the zone group's occupied start time is less than the zone's required cool-down time, tz-cooldown, at which point the cooling set point shall be the occupied cooling set point.

2) The heating set point shall be the unoccupied heating set point.

d. During setback mode:

1) The cooling set point shall be the unoccupied cooling set point.

2) The heating set point shall be 2°C (3°F) above the unoccupied heating set point.

e. During setup mode:

1) The cooling set point shall be 2°C (3°F) below the unoccupied cooling set point.

2) The heating set point shall be the unoccupied heating set point.

f. During unoccupied mode:

1) The cooling set point shall be the unoccupied cooling set point.

2) The heating set point shall be the unoccupied heating set point.

4. The software shall prevent the following:

a. The heating setpoint from exceeding the cooling setpoint minus 0.5°C (1°F) (i.e., the minimum difference between heating and cooling setpoints shall be 0.5°C [1°F]).

b. The unoccupied heating setpoint from exceeding the occupied heating setpoint.

c. The unoccupied cooling setpoint from being less than the occupied cooling setpoint.

5. Where the zone has a local setpoint adjustment knob/button:

a. The setpoint adjustment offsets established by the occupant shall be software points that are persistent (e.g., not reset daily), but the actual offset used in control logic shall be adjusted based on limits and modes as describe below.

b. The adjustment shall be capable of being limited in software.

These are absolute limits imposed by programming, which are in addition to the range limits (e.g., ±4°F) of the thermostat adjustment device.

1) As a default, the active occupied cooling setpoint shall be limited between 22°C (72°F) and 27°C (80°F).

2) As a default, the active occupied heating setpoint shall be limited between 18°C (65°F) and 22°C (72°F).

c. The active heating and cooling setpoints shall be independently adjustable, respecting the limits and anti-overlap logic described in Sections 3.4B.3.a and 3.4B.5.b. If zone thermostat provides only a single set-point adjustment, then the adjustment shall move both the active heating and cooling setpoints upward or downward by the same amount, within the limits described in Section 3.4B.5.b.

d. The adjustment shall only affect occupied setpoints in Occupied Mode, Warmup Mode, and Cooldown Mode and shall have no impact on setpoints in all other modes.

e. At the onset of demand limiting, the local set-point adjustment value shall be frozen. Further adjustment of the setpoint by local controls shall be suspended for the duration of the demand-limit event.

6. Cooling Demand Limit Set-Point Adjustment. The active cooling setpoints for all zones shall be increased when a demand limit is imposed on the associated Zone Group. The operator shall have the ability to exempt individual zones from this adjustment through the normal BAS user interface. Changes due to demand limits are not cumulative.

   a. At demand-limit Level 1, increase setpoint by 0.5°C (1°F).

   b. At demand-limit Level 2, increase setpoint by 1°C (2°F).

   c. At demand-limit Level 3, increase setpoint by 2°C (4°F).

7. Heating Demand-Limit Set-Point Adjustment. The active heating setpoints for all zones shall be decreased when a demand limit is imposed on the associated Zone Group. The operator shall have the ability to exempt individual zones from this adjustment through the normal BAS user interface. Changes due to demand limits are not cumulative.

   a. At demand-limit Level 1, decrease setpoint by 0.5°C (1°F).

   b. At demand-limit Level 2, decrease setpoint by 1°C (2°F).

   c. At demand-limit Level 3, decrease setpoint by 2°C (4°F).

Heating demand limits may be desirable in buildings with electric heat or heat pumps or in regions with limited gas distribution infrastructure.

8. Occupancy Sensors. For zones that have an occupancy switch:

a. When the switch indicates that the space has been unpopulated for 5 minutes continuously during the Occupied Mode, the active heating setpoint shall be decreased by 0.5°C (1°F) and the cooling setpoint shall be increased by 0.5°C (1°F).

b. When the switch indicates that the space has been populated for 1 minute continuously, the active heating and cooling setpoints shall be restored to their previous values.

C. Local Override. When thermostat override buttons are depressed, the call for Occupied Mode operation shall be sent to the Zone Group control for 60 minutes. Local Override shall be capable of being enabled and disabled separately for each thermostat via the graphical user interface; default to disabled.

Local overrides will cause all zones in the Zone Group to operate in Occupied Mode to ensure that the system has adequate load to operate stably.

D. Control Loops

1. Two separate control loops, the Cooling Loop and the Heating Loop, shall operate to maintain space temperature at setpoint.

   a. The Heating Loop shall be enabled whenever the space temperature is below the current zone heating set-point temperature and disabled when space temperature is above the current zone heating setpoint temperature and the loop output is zero for 30 seconds. The loop may remain active at all times if provisions are made to minimize integral windup.

   b. The Cooling Loop shall be enabled whenever the space temperature is above the current zone cooling set-point temperature and disabled when space temperature is below the current zone cooling set-point temperature and the loop output is zero for 30 seconds. The loop may remain active at all times if provisions are made to minimize integral windup.

2. The Cooling Loop shall maintain the space temperature at the active cooling setpoint. The output of the loop shall be a software point ranging from 0% (no cooling) to 100% (full cooling).

3. The Heating Loop shall maintain the space temperature at the active heating setpoint. The output of the loop shall be a software point ranging from 0% (no heating) to 100% (full heating).

4. Loops shall use proportional + integral logic or other technology with similar performance. Proportional-only control is not acceptable, although the integral gain shall be small relative to the proportional gain. P and I gains shall be adjustable by the operator.

5. See other sections for how the outputs from these loops are used.

E. Zone State

1. Heating. When the output of the space Heating Loop is nonzero and the output of the Cooling Loop is equal to zero.

2. Cooling. When the output of the space Cooling Loop is nonzero and the output of the Heating Loop is equal to zero.

3. Deadband. When not in either heating or cooling.

F. Zone Alarms

1. Zone Temperature Alarms

a. High-temperature alarm

1) If the zone is 2°C (3°F) above cooling setpoint for 10 minutes, generate a Level 4 alarm.

2) If the zone is 3°C (5°F) above cooling setpoint for 10 minutes, generate a Level 3 alarm.

b. Low-temperature alarm

1) If the zone is 2°C (3°F) below heating setpoint for 10 minutes, generate a Level 4 alarm.

2) If the zone is 3°C (5°F) below heating setpoint for 10 minutes, generate a Level 3 alarm.

Default time delay for zone temperature alarm (10 minutes) is intentionally long to minimize nuisance alarms. For critical zones, such as IT closets, consider reducing time delay or setting delay to zero.

c. Suppress zone temperature alarms as follows:

1) After zone setpoint is changed per Section 3.1S.

2) While Zone Group is in Warmup Mode or Cooldown Mode.

The following is from addendum e to G36-2021:

G. Zone Group Mode Requests

1. Zone Group Mode Requests shall be generated by the conditions in each zone and sent to the Zone Group of which the zone is a member.

2. Warm-up Mode Requests

a. An algorithm provided with the BAS shall calculate the required zone warm-up time, tz-warmup, which shall be less than 3 hours, based on the zone's occupied heating set point, the current zone temperature, the outdoor air temperature, and a heating mass/capacity factor for each zone.

b. The heating mass/capacity factor may be either manually adjusted or automatically self-tuned by the BAS. If automatic, the tuning process shall be turned ON or OFF by a software switch to allow tuning to be stopped after the system has been trained.

c. If the zone group is in any mode other than occupied mode and the time remaining until the zone group's occupied start time is less than the zone's required warm-up time, tz-warmup, send 1 Warm-up Mode Request; else, send 0 Warm-up Mode Requests.

3. Cooldown Mode Requests

a. An algorithm provided with the BAS shall calculate the required zone cool-down time, tz-cooldown, which shall be less than 3 hours, based on the zone's occupied heating set point, the current zone temperature, the outdoor air temperature, and a cooling mass/capacity factor for each zone.

b. The cooling mass/capacity factor may be either manually adjusted or automatically self-tuned by the BAS. If automatic, the tuning process shall be turned ON or OFF by a software switch to allow tuning to be stopped after the system has been trained.

c. If the zone group is in any mode other than occupied mode and the time remaining until the zone group's occupied start time is less than the zone's required cool-down time, t-cooldown, send 1 Cooldown Mode Request; else, send 0 Cooldown Mode Requests.

Warm-up and cooldown modes are used to bring the zone groups up to temperature based on their scheduled occupancy period. The algorithms used in these modes (often referred to as "optimal start") predict the shortest time to achieve occupied set point to reduce the central system energy use based on past performance.
It is recommended to use a global outdoor air temperature not associated with any AHU to determine warm-up start time. This is because unit-mounted OA sensors, which are usually placed in the outdoor air intake stream, are often inaccurate (reading high) when the unit is off due to air leakage from the space through the OA damper.

4. Setback Mode Requests

a. If the zone group is in unoccupied or setback mode and zone temperature is less than the unoccupied heating setpoint for 5 minutes, send 1 Setback Mode Request; else, send 0 Setback Mode Requests.

5. Setup Mode Requests

a. If the zone group is in unoccupied or setup mode and zone temperature is greater than the unoccupied cooling setpoint for 5 minutes, send 1 Setup Mode Requests; else, send 0 Setup Mode Requests.

3.5 ZONE GROUPS

Zone scheduling groups, or Zone Groups, are sets of zones served by a single air handler that operate together for ease of scheduling and/or in order to ensure sufficient load to maintain stable operation in the upstream equipment. A Zone Group is equivalent to an isolation area as defined in ASHRAE/IES Standard 90.1 and Title 24.

A. Each system shall be broken into separate Zone Groups composed of a collection of one or more zones served by a single air handler. See Section 1.2D for Zone Group assignments.

B. Each Zone Group shall be capable of having separate occupancy schedules and operating modes from other Zone Groups.

Note that, from the user's point of view, schedules can be set for individual zones, or they can be set for an entire Zone Group, depending on how the user interface is implemented. From the point of view of the BAS, individual zone schedules are superimposed to create a zone-group schedule, which then drives system behavior. The schedule may govern operation of other integrated systems such as lights, daylighting, or other, in addition to the HVAC system.

C. All zones in each Zone Group shall be in the same zone-group operating mode as defined in Section 3.5F. If one zone in a Zone Group is placed in any zone-group operating mode other than Unoccupied Mode (due to override, sequence logic, or scheduled occupancy), all zones in that Zone Group shall enter that mode.

Occupied-standby mode applies to individual zones, is considered a zonal subset of Occupied Mode, and shall not be considered a zone-group operating mode.

D. A Zone Group may be in only one mode at a given time.

E. For each Zone Group, provide a set of testing/commissioning software switches that override all zones served by the Zone Group. Provide a separate software switch for each of the zone-level override switches listed under "Testing and Commissioning Overrides" in terminal unit sequences. When the value of a Zone Group's override switch is changed, the corresponding override switch for every zone in the Zone Group shall change to the same value. Subsequently, the zone-level override switch may be changed to a different value. The value of the zone-level switch has no effect on the value of the zone-group switch, and the value of the zone-group switch only affects the zone-level switches when the zone-group switch is changed.

The testing and commissioning overrides will be specified for each type of terminal unit and system in subsequent sequences. These overrides allow a commissioning agent to, for example, force a zone into cooling or drive a valve all the way open or closed.

Zone-group override switches allow a commissioning agent to apply a zone-level override to all zones in a Zone Group simultaneously. This greatly accelerates the testing and commissioning process.

F. Zone-Group Operating Modes. Each Zone Group shall have the modes shown in the following subsections.

The modes presented in this section are to enable different setpoints and ventilation requirements to be applied to Zone Groups based on their operating schedule, occupancy status, and deviation from current setpoint.
See ASHRAE Guideline 13 for best practices in locating zone-group operating mode programming logic based on network architecture.

1. Occupied Mode. A Zone Group is in the Occupied Mode when any of the following is true:

   a. The time of day is between the Zone Group's scheduled occupied start and stop times.

   b. Any zone local override timer (initiated by local override button) is nonzero.

The following is from addendum e to G36-2021:

2. Warm-Up Mode. Warm-up mode shall start when the number of Warm-Up Mode Requests > I (I = ignores, default = 5), and shall end at the zone group's scheduled occupied start time or Warm-Up Mode Requests <MT (MT=minimum threshold, default = 1) after a minimum of 10 minutes in this mode.

3. Cool-down Mode. Cool-down mode shall start when the number of Cool-down Mode Requests > I (I = ignores, default to 5), and shall end at the zone group's scheduled occupied start time or Cool-down Mode Requests <MT (MT=minimum threshold, default = 1) after a minimum of 10 minutes in this mode.

4. Setback Mode. Setback mode shall start when the number of Setback Mode Requests > I (I = ignores, default to 4), and shall end when Setback Mode Requests <MT (MT=minimum threshold, default = 1) after a minimum of 10 minutes in this mode.

5. Setup Mode. Setup mode shall start when the number of Setup Mode Requests > I (I = ignores, default to 4), and shall end when Setup Mode Requests <MT (MT=minimum threshold, default = 1) after a minimum of 10 minutes in this mode.

Setback and setup modes are used to keep zone temperatures (and mass) from straying excessively far from occupied set points so that the cooldown and warm-up modes can achieve set point when initiated. The number of ignored zones (set at 4 here) are to ensure that the central systems (fans, pumps, heating sources, or cooling sources) can operate stably. Obviously, the size of the zones and the characteristics of the central systems are a factor in choosing the correct number of zones in each group.

3.6 DUAL-DUCT VAV TERMINAL UNIT − SNAP-ACTING CONTROL

A. See “Generic Thermal Zones” (Section 3.3C) for setpoints, loops, control modes, alarms, etc.

B. See “Generic Ventilation Zones” (Section 3.3) for calculation of zone minimum outdoor airflow.

C. See Section C.2.c for zone minimum airflow setpoint Vmin, maximum cooling airflow setpoint Vcool-max, and the zone maximum heating airflow setpoint Vheat-max.

D. Active endpoints used in the control logic depicted in Figures 5.11.5-1 and 5.11.5-2 shall vary depending on the mode of the Zone Group the zone is a part of (see Table 5.11.4).

Table 5.11.4 Endpoints as a Function of Zone Group Mode

Endpoint	Occupied	Cooldown	Setup	Warmup	Setback	Unoccupied
Cooling maximum	Vcool-max	Vcool-max	Vcool-max	0	0	0
Minimum	Vmin*	0	0	0	0	0
Heating maximum	Vheat-max	0	0	Vheat-max	Vheat-max	0

E. Control logic is depicted schematically in Figures 5.11.5-1 and 5.11.5-2 and described in the following subsections.

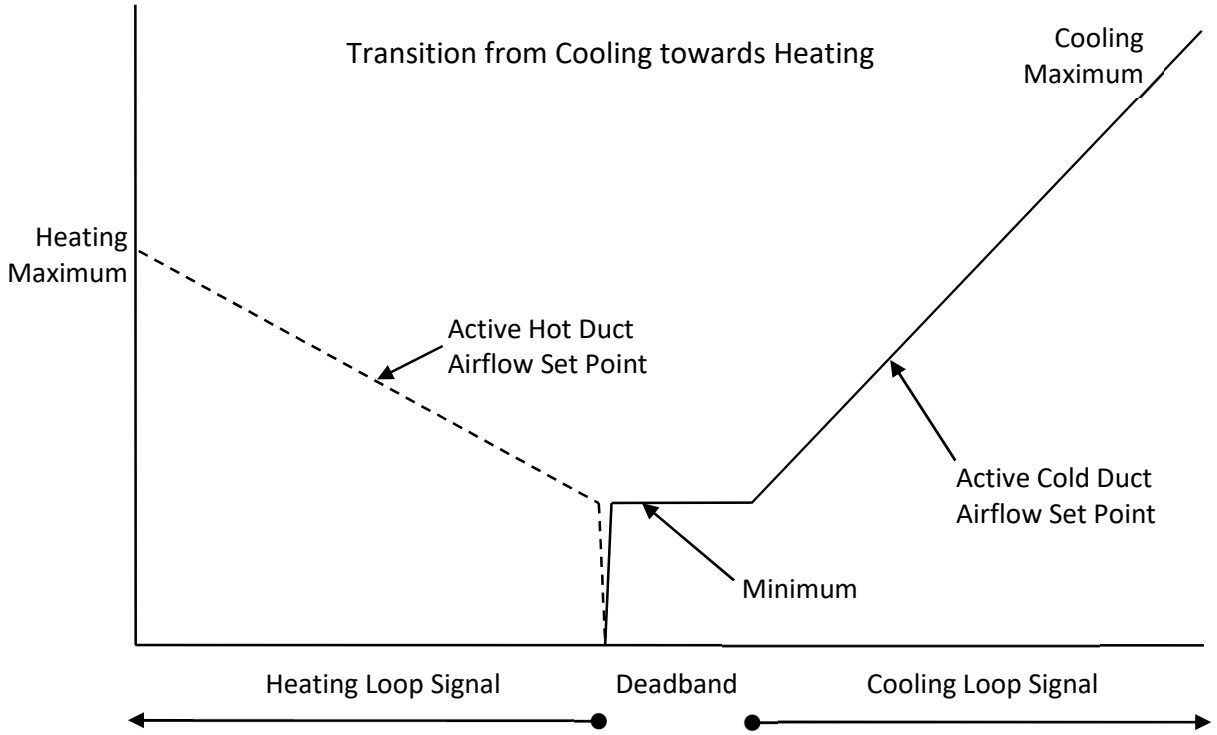

Figure 5.11.5-1 Control logic for snap-acting dual-duct VAV zone (transition from cooling towards heating).

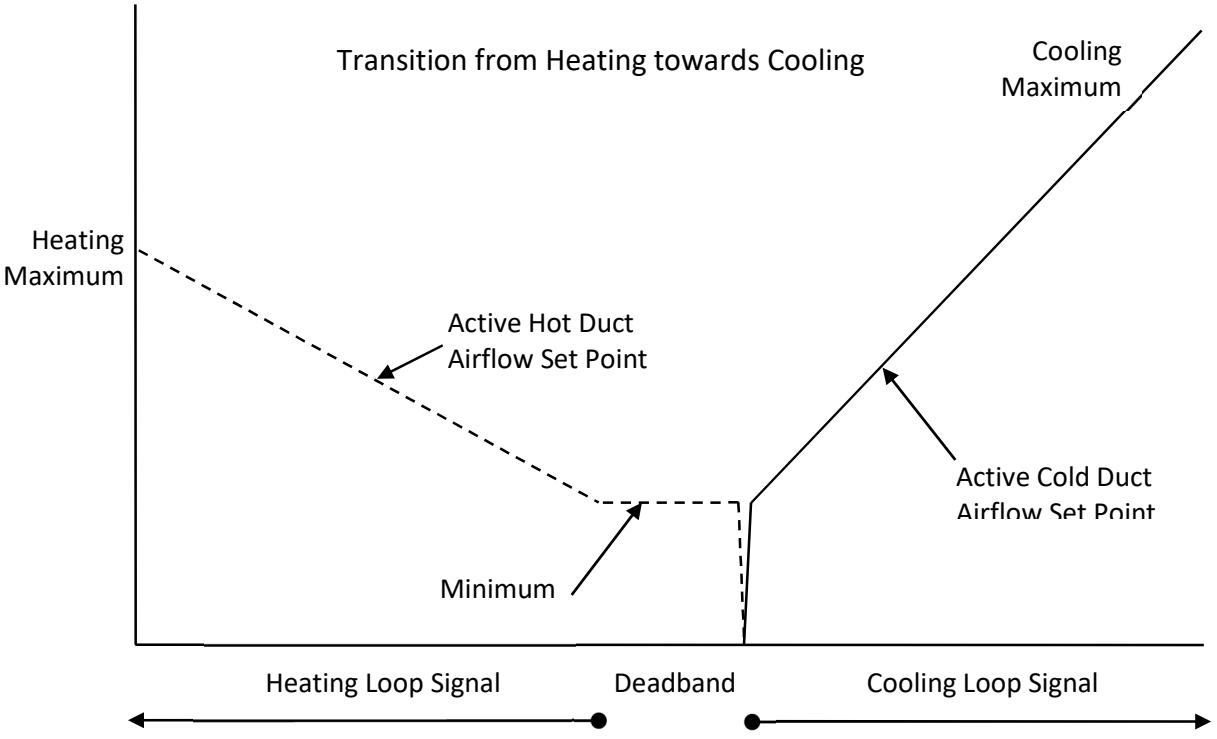

Figure 5.11.5-2 Control logic for snap-acting dual-duct VAV zone (transition from heating towards cooling).

1. Temperature and Damper Control with Dual Inlet Airflow Sensors

    a. When the Zone State is cooling, the cooling-loop output shall reset the active cold duct airflow setpoint from the minimum endpoint to cooling maximum endpoint. The cold duct damper shall be modulated by a control loop to maintain the measured cooling airflow at the active cold duct airflow setpoint. The hot duct damper shall be closed.

        1) If cold-deck supply air temperature from the air handler is greater than room temperature, the active cold duct airflow setpoint shall be no higher than the minimum endpoint.

    b. When the Zone State is deadband, the active cold duct and hot duct airflow setpoints shall be their last setpoints just before entering deadband. In other words, when going from cooling to deadband, the active cold duct airflow setpoint is equal to the minimum endpoint, and the active hot duct airflow setpoint is zero. When going from heating to deadband, the active hot duct airflow setpoint is equal to the minimum endpoint, and the active cold duct airflow setpoint is zero. This results in a snap-action switch in the damper setpoint as indicated in Figures 5.11.5-1 and 5.11.5-2.

    c. When the Zone State is heating, the heating-loop output shall reset the active hot duct airflow setpoint from the minimum endpoint to heating maximum endpoint. The hot duct damper shall be modulated by a control loop to maintain the measured heating airflow at the active hot duct airflow setpoint. The cold duct damper shall be closed.

        1) If hot-deck supply air temperature from the air handler is less than room temperature, the active hot duct airflow setpoint shall be no higher than the minimum endpoint.

2. Overriding Section 3.6E.1 Logic (to Avoid Backflow from One Duct to the Other)

    a. If heating air handler is not proven on, the heating damper shall be closed.

    b. If cooling air handler is not proven on, the cooling damper shall be closed.

F. Alarms

1. Low Airflow

    a. If the measured airflow is less than 70% of setpoint for 10 minutes while setpoint is greater than zero, generate a Level 4 alarm.

    b. If the measured airflow is less than 50% of setpoint for 10 minutes while setpoint is greater than zero, generate a Level 3 alarm.

c. If a zone has an Importance-Multiplier of 0 (see Section 3.1O.2.a.1)) for its static pressure reset T&R control loop, low airflow alarms shall be suppressed for that zone.

2. Airflow Sensor Calibration. If the fan serving the zone is off and airflow sensor reading is above the larger of 10% of the maximum airflow setpoint or 50 cfm for 30 minutes, generate a Level 3 alarm.

3. Leaking Damper. If the damper position is 0%, and airflow sensor reading is above the larger of 10% of the cooling maximum airflow setpoint or 50 cfm for 10 minutes while the fan serving the damper is proven on, generate a Level 4 alarm.

G. Testing/Commissioning Overrides. Provide software switches that interlock to a system level point to

a. force zone airflow setpoint to zero,

b. force zone airflow setpoint to Vcool-max,

c. force zone airflow setpoint to Vmin,

d. force zone airflow setpoint to Vheat-max,

e. force cooling damper full closed/open,

f. force heating damper full closed/open, and

g. reset request-hours accumulator point to zero (provide one point for each reset type listed in the next section).

H. System Requests

1. Cooling SAT Reset Requests

a. If the zone temperature exceeds the zone's cooling setpoint by 3°C (5°F) for 2 minutes and after suppression period due to setpoint change per Section 3.1S, send 3 requests.

b. Else if the zone temperature exceeds the zone's cooling setpoint by 2°C (3°F) for 2 minutes and after suppression period due to setpoint change per Section 3.1S, send 2 requests.

c. Else if the Cooling Loop is greater than 95%, send 1 request until the Cooling Loop is less than 85%.

d. Else if the Cooling Loop is less than 95%, send 0 requests.

2. Cold-Duct Static Pressure Reset Requests

a. If the measured airflow is less than 50% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 3 requests.

b. Else if the measured airflow is less than 70% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 2 requests.

c. Else if the damper position is greater than 95%, send 1 request until the damper position is less than 85%.

d. Else if the damper position is less than 95%, send 0 requests.

3. Heating SAT Reset Requests

a. If the zone temperature is below the zone's heating setpoint by 3°C (5°F) for 2 minutes and after suppression period due to setpoint change per Section 3.1S, send 3 requests.

b. Else if the zone temperature is below the zone's heating setpoint by 2°C (3°F) for 2 minutes and after suppression period due to setpoint change per Section 3.1S, send 2 requests.

c. Else if the Heating Loop is greater than 95%, send 1 request until the Heating Loop is less than 85%.

d. Else if the Heating Loop is less than 95%, send 0 requests

4. Hot-Duct Static Pressure Reset Requests

a. If the measured airflow is less than 50% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 3 requests.

b. Else if the measured airflow is less than 70% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 2 requests.

c. Else if the damper position is greater than 95%, send 1 request until the damper position is less than 85%.

d. Else if the damper position is less than 95%, send 0 requests.

5. Heating-Fan Requests. Send the heating fan that serves the zone a heating-fan request as follows:

a. If the Heating Loop is greater than 15%, send 1 request until the Heating Loop is less than 1%.

b. Else if the Heating Loop is less than 15%, send 0 requests.

3.7 DUAL-DUCT VAV TERMINAL UNIT − MIXING CONTROL

A. See “Generic Thermal Zones” (Section 3.3C) for setpoints, loops, control modes, alarms, etc.

B. See “Generic Ventilation Zones” (Section 3.3) for calculation of zone minimum outdoor airflow.

C. See Section C.2.c for zone minimum airflow setpoint Vmin, zone maximum cooling airflow setpoint Vcool-max, and the zone maximum heating airflow setpoint Vheat-max.

D. Active endpoints used in the control logic depicted in Figure 5.12.5 shall vary depending on the mode of the Zone Group the zone is a part of (see Table 5.12.4).

Table 5.12.4 Endpoints as a Function of Zone Group Mode

Endpoint	Occupied	Cooldown	Setup	Warmup	Setback	Unoccupied
Cooling maximum	Vcool-max	Vcool-max	Vcool-max	0	0	0
Minimum	Vmin*	0	0	0	0	0
Heating maximum	Vheat-max	0	0	Vheat-max	Vheat-max	0

E. Control logic is depicted schematically in Figure 5.12.5 and described in the following sections.

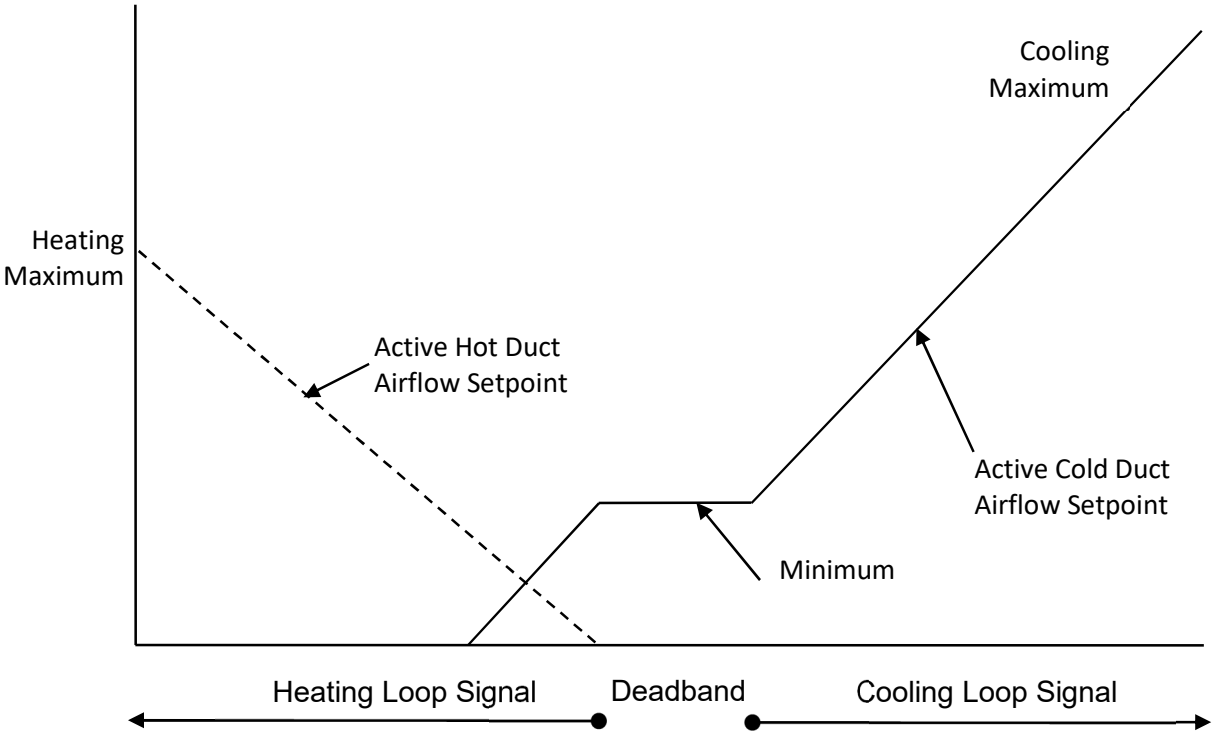

Figure 5.12.5 Control logic for mixing dual-duct VAV zone with inlet sensors.

1. Temperature Control

   a. When the Zone State is cooling, the Cooling Loop output shall reset the active cold duct airflow setpoint from minimum endpoint to the cooling maximum endpoint. The cold duct damper shall be modulated by a control loop to maintain the measured cold duct airflow at the active cold duct airflow setpoint.

      1) If cold duct supply air temperature from the air handler is greater than room temperature, the active cold duct supply airflow setpoint shall be no higher than the minimum endpoint.

   b. When the Zone State is deadband, the active cold duct airflow setpoint shall be the minimum endpoint. The cold duct damper shall be modulated by a control loop to maintain the measured cold duct airflow at the active cold duct airflow setpoint. The hot duct damper shall be closed.

   c. When the Zone State is heating, the heating-loop output shall reset the active hot duct airflow setpoint from zero to the heating maximum endpoint. The hot duct damper shall be modulated by a control loop to maintain the measured hot duct airflow at the active hot duct airflow setpoint. The cooling damper shall be controlled to maintain the sum of the measured inlet airflows at the minimum endpoint.

1) If hot-deck supply air temperature from air handler is less than room temperature, the active hot duct airflow setpoint shall be no higher than the minimum endpoint.

2. Overriding Section 1 Logic (to Avoid Backflow from One Duct to the Other)

a. If heating air handler is not proven on, the heating damper shall be closed.

b. If cooling air handler is not proven on, the cooling damper shall be closed.

F. Alarms

1. Low Airflow

a. If the measured airflow is less than 70% of setpoint for 10 minutes while setpoint is greater than zero, generate a Level 4 alarm.

b. If the measured airflow is less than 50% of setpoint for 10 minutes while setpoint is greater than zero, generate a Level 4 alarm.

c. If a zone has an Importance-Multiplier of 0 (see Section 3.1O.2.a.1)) for its static pressure reset T&R control loop, low airflow alarms shall be suppressed for that zone.

2. Airflow Sensor Calibration. If the fan serving the zone is off and airflow sensor reading is above the larger of 10% of the maximum airflow setpoint or 50 cfm for 30 minutes, generate a Level 3 alarm.

3. Leaking Damper. If the damper position is 0%, and airflow sensor reading is above the larger of 10% of the cooling maximum airflow setpoint or 50 cfm for 10 minutes while the fan serving the damper is proven on, generate a Level 4 alarm.

G. Testing/Commissioning Overrides. Provide software switches that interlock to a system level point to

a. force zone airflow setpoint to zero,

b. force zone airflow setpoint to Vcool-max,

c. force zone airflow setpoint to Vmin,

d. force zone airflow setpoint to Vheat-max,

e. force cooling damper full closed/open,

f. force heating damper full closed/open, and

g. reset request-hours accumulator point to zero (provide one point for each reset type listed in the next section).

H. System Requests

1. Cooling SAT Reset Requests

   a. If the zone temperature exceeds the zone's cooling setpoint by 3°C (5°F) for 2 minutes and after suppression period due to setpoint change per Section 3.1S, send 3 requests.

   b. Else if the zone temperature exceeds the zone's cooling setpoint by 2°C (3°F) for 2 minutes and after suppression period due to setpoint change per Section 3.1S, send 2 requests.

   c. Else if the Cooling Loop is greater than 95%, send 1 request until the Cooling Loop is less than 85%.

   d. Else if the Cooling Loop is less than 95%, send 0 requests.

2. Cold-Duct Static Pressure Reset Requests

   a. If the measured airflow is less than 50% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 3 requests.

   b. Else if the measured airflow is less than 70% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 2 requests.

   c. Else if the damper position is greater than 95%, send 1 request until the damper position is less than 85%.

   d. Else if the damper position is less than 95%, send 0 requests.

3. Heating SAT Reset Requests

   a. If the zone temperature is below the zone's heating setpoint by 3°C (5°F) for 2 minutes and after suppression period due to setpoint change per Section 3.1S, send 3 requests.

   b. Else if the zone temperature is below the zone's heating setpoint by 2°C (3°F) for 2 minutes and after suppression period due to setpoint change per Section 3.1S, send 2 requests.

   c. Else if the Heating Loop is greater than 95%, send 1 request until the Heating Loop is less than 85%.

   d. Else if the Heating Loop is less than 95%, send 0 requests.

4. Hot-Duct Static Pressure Reset Requests

a. If the measured airflow is less than 50% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 3 requests.

b. Else if the measured airflow is less than 70% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 2 requests.

c. Else if the damper position is greater than 95%, send 1 request until the damper position is less than 85%.

d. Else if the damper position is less than 95%, send 0 requests.

5. Heating-Fan Requests. Send the heating fan that serves the zone a heating-fan request as follows:

a. If the Heating Loop is greater than 15%, send 1 request until the Heating Loop is less than 1%.

b. Else if the Heating Loop is less than 15%, send 0 requests.

3.8 AIR-HANDLING UNIT SYSTEM MODES

A. AHU system modes are the same as the mode of the Zone Group served by the system. When Zone Group served by an air-handling system are in different modes, the following hierarchy applies (highest one sets AHU mode):

a. Occupied Mode

b. Cooldown Mode

c. Setup Mode

d. Warmup Mode

e. Setback Mode

f. Unoccupied Mode

3.9 DUAL-FAN DUAL-DUCT COOLING AIR HANDLER

A. Supply Fan Control

1. Supply Fan Start/Stop

a. Supply fan shall run when system is in the Cooldown Mode, Setup Mode, or Occupied Mode.

b. Totalize current airflow rate from VAV boxes to a software point Vps.

VAV box airflow rates are summed to obtain overall supply air rate without the need for an airflow measuring station (AFMS) at the air-handler discharge. This is used for ventilation rate calculations and may also be used for display and diagnostics.

2. Static Pressure Set-Point Reset

   a. Static pressure setpoint. Setpoint shall be reset using T&R logic (see Section 3.1O) using the parameters shown in Table 5.16.1.2.

Table 5.16.1.2 Trim & Respond Variables

Variable	Value
Device	Supply fan
SP0	120 Pa (0.5 in. of water)
SPmin	25 Pa (0.1 in. of water)
SPmax	Max_DSP (see Section 1.3B.1)
Td	10 minutes
T	2 minutes
I	2
R	Zone static pressure reset requests
SPtrim	–12 Pa (–0.05 in. of water)
SPres	15 Pa (+0.06 in. of water)
SPres-max	32 Pa (+0.13 in. of water)

The T&R reset parameters in Table 5.16.1.2 are suggested as a starting point; they will most likely require adjustment during the commissioning/tuning phase.

3. Static Pressure Control

   a. Supply fan speed is controlled to maintain DSP at setpoint when the fan is proven on. Where the Zone Groups served by the system are small, provide multiple sets of gains that are used in the control loop as a function of a load indicator (such as supply-fan airflow rate, the area of the Zone Groups that are occupied, etc.).

High-pressure trips may occur if all VAV boxes are closed (as in Unoccupied Mode) or if fire/smoke dampers are closed (in some fire/smoke damper (FSD) designs, the dampers are interlocked to the fan status rather than being controlled by smoke detectors). Multiple sets of gains are used to provide control loop stability as system characteristics change.

B. Supply Air Temperature Control

1. Control loop is enabled when the supply air fan is proven on, and disabled and output set to deadband (no heating, minimum economizer) otherwise.

2. Supply Air Temperature Setpoint

The default range of outdoor air temperatures [21°C (70°F) –16°C (60°F)] used to reset the Occupied Mode SAT setpoint was chosen to maximize economizer hours. It may be preferable to use a lower range of OATs (e.g., 18°C [65°F] – 13°C [55°F]) to minimize fan energy if there is a 24/7 chiller plant that is running anyway; reheat is minimized, as in a VAV dual-fan dual-duct system, or the climate severely limits the number of available economizer hours.
If using this logic, the engineer should oversize interior zones and rooms with high cooling loads (design them to be satisfied by the warmest SAT) so these zones do not drive the T&R block to the minimum SAT setpoint.

   a. See Section 1.2E.1 for Min_ClgSAT, Max_ClgSAT, OAT_Min, and OAT_Max setpoints.

   b. During Occupied Mode and Setup Mode, setpoint shall be reset from Min_ClgSAT when the outdoor air temperature is OAT_Max and above, proportionally up to T-max when the outdoor air temperature is OAT_Min and below.

      1) T-max shall be reset using T&R logic (see Section 3.1O) between Min_ClgSAT and Max_ClgSAT. The parameters shown in Table 5.16.2.2 are suggested as a starting place, but they will require adjustment during the commissioning/tuning phase.

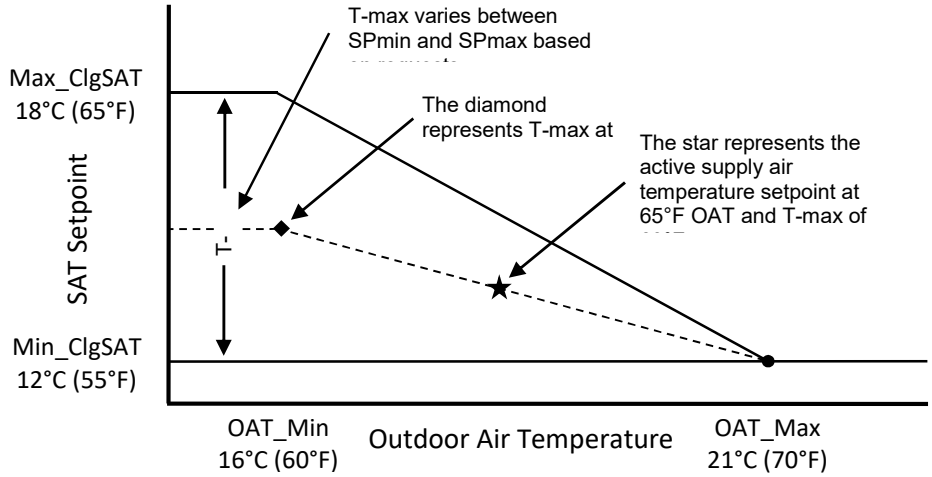
The T&R reset parameters in Table 5.16.2.2 are suggested as a starting place; they will most likely require adjustment during the commissioning/tuning phase.

Table 5.16.2.2 Trim & Respond Variables

Variable	Value
Device	Supply fan
SP0	SPmax
SPmin	Min_ClgSAT
SPmax	Max_ClgSAT
Td	10 minutes
T	2 minutes
I	2
R	Zone cooling SAT requests

SPtrim	+0.1°C (+0.2°F)
SPres	–0.2°C (–0.3°F)
SPres-max	–0.6°C (–1.0°F)

The net result of this SAT reset strategy is depicted in the Figure 5.16.2.2 for Min_ClgSAT = 12°C (55°F), Max_ClgSAT = 18°C (65°F), OAT_Max = 21°C (70°F), and OAT_Min = 16°C (60°F).



Informative Figure 5.16.2.2 Example supply air temperature reset diagram.

c. During Cooldown Mode, setpoint shall be Min_ClgSAT.

3. Supply air temperature shall be controlled to setpoint using a control loop whose output is mapped to sequence the hot water supply temperature, outdoor air damper, return air damper, and chilled water supply temperature as shown in Figure 5.16.2.3.

   a. When switching from Heating Mode to Cooling Mode and vice versa, wait the longer of the nominal timing of the changeover valve and 5 minutes (adj.) since the 2-way control valve was last shut prior to releasing the control valve to open (the intent of this logic is twofold: to avoid sending chilled water into the hot water system before the changeover valve is fully indexed, and to give the fluid trapped in the coil time to reach neutral temperature before being passed to the other loop).

   b. Control valve output action shall be direct-acting when in Cooling Mode and reverse acting when in heating mode.

   c. For units with relief dampers or relief fans

1) Economizer damper minimum position MinOA-P and/or return air damper maximum position MaxRA-P are modulated to control minimum outdoor air volume (see Sections 3.9D.3, 3.9E.3 and 3.9F.2).

For units with a separate minimum outdoor air damper, economizer damper minimum position MinOA-P is 0%, and return air damper maximum position MaxRA-P is modulated to control minimum outdoor air volume (see Sections 3.9D and 3.9E).

3) For units with a single common minimum outdoor air and economizer damper, return air damper maximum position MaxRA-P and economizer damper minimum position MinOA-P are modulated to control minimum outdoor air volume (see Section 3.9F). Economizer damper maximum position MaxOA-P is limited during minimum outdoor air control (e.g., economizer lockout due to high OAT).

d. The points of transition along the x-axis shown and described in Figure 5.16.2.3 are representative. Separate gains shall be provided for each section of the control map (heating coil, economizer, cooling coil) that is determined by the contractor to provide stable control. Alternatively, the contractor shall adjust the precise value of the x-axis thresholds shown in Figure 5.16.2.3 to provide stable control. Damper control depends on the type of building pressure control system.

For AHUs with relief fans, outdoor air and return air dampers are sequenced rather than complementary (as per traditional sequences) to reduce fan power at part loads.

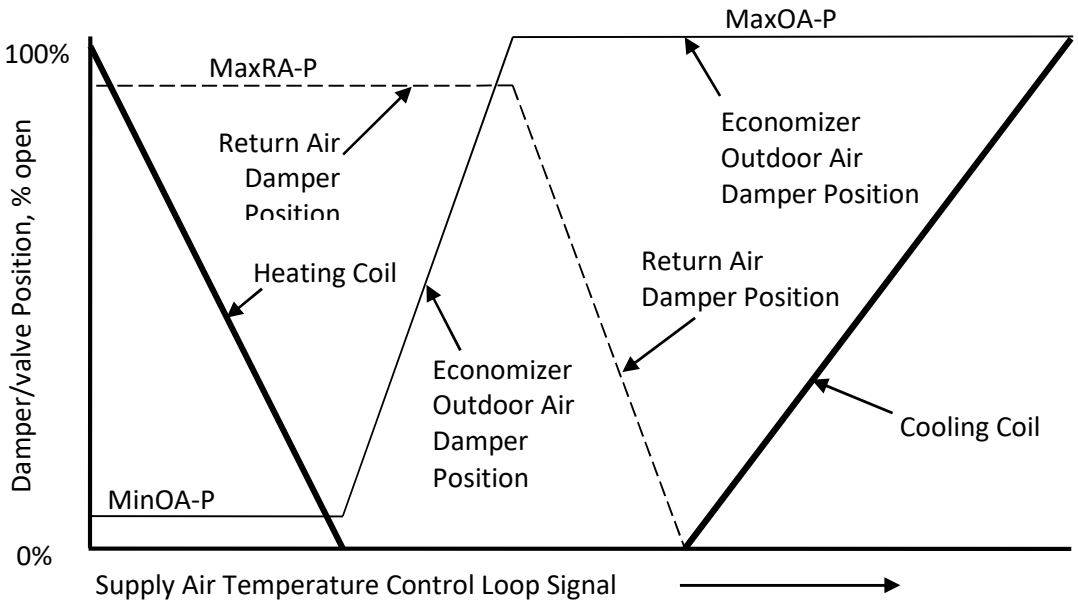


Figure 5.16.2.3 SAT loop mapping with relief damper or relief fan.

C. Minimum Outdoor Airflow Setpoints

1. Outdoor Airflow Setpoint for California Title 24 Ventilation

   a. See Section 3.3A.3 for zone outdoor air rates Zone-Abs-OA-min and Zone-Des-OA-min.

   b. See Section 1.2E.2.a for setpoints AbsMinOA and DesMinOA.

   c. Effective outdoor air absolute minimum and design minimum setpoints are recalculated continuously based on the mode of the zones being served.

      1) AbsMinOA* is the sum of Zone-Abs-OA-min for all zones in all Zone Groups that are in Occupied Mode but shall be no larger than the absolute minimum outdoor airflow AbsMinOA.

      2) DesMinOA* is the sum of Zone-Des-OA-min for all zones in all Zone Groups that are in Occupied Mode but shall be no larger than the design minimum outdoor airflow DesMinOA.

D. Minimum Outdoor Air Control with a Separate Minimum Outdoor Air Damper and Differential Pressure Control

1. DP setpoint for California Title 24 Ventilation

   a. See Section 1.1.1.1.a for design OA DP setpoints.

   b. See Section 3.9C.1 for calculation of current setpoints AbsMinOA* and DesMinOA*.

   c. See zone CO2 control logic under terminal unit sequences.

   d. The active minimum DP setpoints AbsDPsp* and DesDPsp* shall be determined by the following equations:

$$\text{AbsDPsp}^* = \text{AbsMinDP}\left[\frac{\text{AbsMinOA}^*}{\text{AbsMinOA}}\right]^2$$

$$\text{DesDPsp}^* = \text{DesMinDP}\left[\frac{\text{DesMinOA}^*}{\text{DesMinOA}}\right]^2$$

This equation prevents excess outdoor air from being supplied during periods of partial occupancy.

   e. The minimum outdoor air DP setpoint MinDPsp shall be reset based on the highest zone CO2 control-loop signal from AbsDPsp* at 50% signal to DesDPsp* at 100% signal.

   f. The minimum outdoor air setpoint MinOAsp shall be reset based on the highest zone CO2 control-loop signal from AbsMinOA* at 50% signal to DesMinOA* at 100% signal.

2. Open minimum outdoor air damper when the supply air fan is proven on and the system is in Occupied Mode and MinDPsp is greater than zero. Damper shall be closed otherwise.

3. Outdoor Air and Return Air Dampers

   a. For units with relief dampers or relief fans

Minimum outdoor air control is enabled when economizer damper position is less than MOA-P because it cannot be assumed that the combination of the minimum and the economizer outdoor air dampers are providing sufficient outdoor air under these conditions.
Minimum outdoor air control is disabled when return damper position is less than MRA-P, because the economizer damper has been closed to enable an accurate airflow measurement through the minimum outdoor air damper.
The 20% and 80% thresholds can be increased/decreased to ensure minimum outdoor airflow will be maintained but at the expense of fan energy. This threshold could be determined empirically during TAB work as well.

1) When the supply air fan is proven on and the system is in Occupied Mode and MinDPsp is greater than zero, the system shall calculate MOA-P. The value of MOA-P shall scale from 5% when supply-fan speed is at 100% design speed proportionally up to 80% when the fan is at minimum speed. When MOA-P is not being calculated for any reason, it shall be set to 0%.

2) When the supply air fan is proven on and the system is in Occupied Mode and MinDPsp is greater than zero, the system shall calculate MRA-P. The value of MRA-P shall scale from 95% when supply fan speed is at 100% design speed proportionally down to 20% when the fan is at minimum speed. When MRA-P is not being calculated for any reason, it shall be set to 100%.

3) Minimum outdoor air control shall be enabled when the unit is in Occupied Mode and either of the following conditions are true for 10 minutes:

   a) The economizer high limit conditions in Section 3.1Q are exceeded.

   b) When the minimum outdoor air damper is open and the economizer outdoor air damper position is less than MOA-P.

4) When minimum outdoor air control is enabled, the normal sequencing of economizer outdoor air and return air dampers per Section 3.9B shall be suspended per the following sequence:

   a) Fully open return air damper; and

Economizer outdoor air damper is closed when minimum outdoor air control is enabled to ensure a good signal across the minimum outdoor air damper.

b) Wait 15 seconds, then close the economizer outdoor air damper; and

c) Wait 3 minutes, then release return air damper position for control by the SAT control loop in Section 3.9B. Economizer outdoor air damper remains closed.

d) The maximum return air damper position endpoint MaxRA-P shall be modulated from 100% to 0% to maintain DP across the minimum outdoor air damper at setpoint MinDPsp.

5) Minimum outdoor air control shall be disabled when the unit is no longer in Occupied Mode, or both of the following conditions are true for 10 minutes:

a) The economizer high limit conditions in Section 3.1Q are not exceeded.

b) The minimum outdoor air damper is closed or the return air damper position is 10% below MRA-P.

6) When minimum outdoor air control is disabled:

a) MaxRA-P shall be set to 100%.

b) Economizer and return air damper positions shall be controlled by the SAT control loop per Section 3.9B.

E. Minimum Outdoor Air Control with a Separate Minimum Outdoor Air Damper and Airflow Measurement

1. Outdoor Airflow Setpoint for California Title 24 Ventilation

a. See Section 3.9C.1 for calculation of current setpoints AbsMinOA* and DesMinOA*.

b. See zone CO2 control logic under terminal unit sequences.

c. The minimum outdoor air setpoint MinOAsp shall be reset based on the highest zone CO2 control-loop signal from AbsMinOA* at 50% signal to DesMinOA* at 100% signal.

2. Open the minimum outdoor air damper when the supply fan is proven ON, the AHU is in Occupied Mode and MinOAsp is greater than zero. Minimum outdoor air damper shall be closed otherwise.

3. Outdoor Air and Return Air Dampers

a. For units with return fans

Minimum outdoor air control is enabled when return damper position exceeds MRA-P because it cannot be assumed that the combination of the minimum and the economizer outdoor air dampers are providing sufficient outdoor air under these conditions.
The 20% threshold can be increased to ensure minimum outdoor airflow will be maintained but at the expense of fan energy. This threshold could be determined empirically during TAB work as well.

1) When the supply air fan is proven on and the system is in Occupied Mode and MinOAsp is greater than zero, the system shall calculate MRA-P. The value of MRA-P shall scale from 95% when supply fan speed is at 100% design speed proportionally down to 20% when the fan is at minimum speed. When MRA-P is not being calculated for any reason, it shall be set to 100%.

2) Minimum outdoor air control shall be enabled when the unit is in Occupied Mode and either of the following conditions are true for 10 minutes:

   a) The economizer high limit conditions in Section 3.1Q are exceeded.

   b) When the minimum outdoor air damper is open and the return air damper position is greater than MRA-P.

3) When minimum outdoor air control is enabled, the normal sequencing of economizer outdoor air and return air dampers per Section B shall be suspended per the following sequence:

   a) Fully open return air damper; and

Economizer outdoor air damper is closed when minimum outdoor air control is enabled to ensure a good signal across the minimum outdoor air damper.

   b) Wait 15 seconds, then close the economizer outdoor air damper; and

   c) Wait 3 minutes, then release return air damper position for control by the SAT control loop in Section B. Economizer outdoor air damper remains closed.

   d) The maximum return air damper position endpoint MaxRA-P shall be modulated from 100% to 0% to maintain airflow across the minimum outdoor air damper at setpoint MinOAsp.

4) Minimum outdoor air control shall be disabled when the unit is no longer in Occupied Mode, or both of the following conditions are true for 10 minutes:

   a) The economizer high limit conditions in Section 3.1Q are exceeded.

b) The minimum outdoor air damper is closed or the return air damper position is 10% below MRA-P.

5) When minimum outdoor air control is disabled:

a) Economizer outdoor air damper shall be fully opened.

b) MaxRA-P shall be set to 100%.

c) Economizer and return air damper positions shall be controlled by the SAT control loop per Section B.

b. For units with relief dampers or relief fans

Minimum outdoor air control is enabled when economizer damper position is less than MOA-P because it cannot be assumed that the combination of the minimum and the economizer outdoor air dampers are providing sufficient outdoor air under these conditions.
Minimum outdoor air control is disabled when return damper position is less than MRA-P, because the economizer damper has been closed to enable an accurate airflow measurement through the minimum outdoor air damper.
The 20% and 80% thresholds can be increased/decreased to ensure minimum outdoor airflow will be maintained but at the expense of fan energy. This threshold could be determined empirically during TAB work as well.

1) When the supply air fan is proven on and the system is in occupied mode and MinOAsp is greater than zero, the system shall calculate MOA-P. The value of MOA-P shall scale from 5% when supply-fan speed is at 100% design speed proportionally up to 80% when the fan is at minimum speed. When MOA-P is not being calculated for any reason, it shall be set to 0%.

2) When the supply air fan is proven on and the system is in occupied mode and MinOAsp is greater than zero, the system shall calculate MRA-P. The value of MRA-P shall scale from 95% when supply fan speed is at 100% design speed proportionally down to 20% when the fan is at minimum speed. When MRA-P is not being calculated for any reason, it shall be set to 100%.

3) Minimum outdoor air control shall be enabled when the unit is in Occupied Mode and either of the following conditions are true for 10 minutes:

a) The economizer high limit conditions in Section 3.1Q are exceeded.

b) When the minimum outdoor air damper is open and the economizer outdoor air damper position is less than MOA-P.

4) When minimum outdoor air control is enabled, the normal sequencing of economizer outdoor air and return air dampers per Section B shall be superseded per the following:

a) Fully open return air damper; and

Economizer outdoor air damper is closed when minimum outdoor air control is enabled to ensure a good signal across the minimum outdoor air damper.

b) Wait 15 seconds, then close the economizer outdoor air damper; and

c) Wait 3 minutes, then release return air damper position for control by the SAT control loop in Section B. Economizer outdoor air damper remains closed.

d) The maximum return air damper position endpoint MaxRA-P shall be modulated from 100% to 0% to maintain airflow across the minimum outdoor air damper at setpoint MinOAsp.

5) Minimum outdoor air control shall be disabled when the unit is no longer in Occupied Mode, or both of the following conditions are true for 10 minutes:

a) The economizer high limit conditions in Section 3.1Q are not exceeded.

b) The minimum outdoor air damper is closed or the return air damper position is 10% below MRA-P.

6) When minimum outdoor air control is disabled:

a) MaxRA-P shall be set to 100%.

b) Economizer and return air damper positions shall be controlled by the SAT control loop per Section B.

F. Minimum Outdoor Air Control with a Single Common Damper for Minimum Outdoor Air and Economizer Functions and Airflow Measurement

1. Outdoor Airflow Setpoint for California Title 24 Ventilation

a. See Section 3.9C.1 for calculation of current setpoints AbsMinOA* and DesMinOA*.

b. See zone CO2 control logic under terminal unit sequences.

c. The minimum outdoor air setpoint MinOAsp shall be reset based on the highest zone CO2 control-loop signal from AbsMinOA* at 50% signal to DesMinOA* at 100% signal.

2. Minimum Outdoor Air Control Loop

   a. Minimum outdoor air control loop is enabled when the supply fan is proven on and the AHU is in Occupied Mode, and disabled and output set to zero otherwise.

   b. For units with return fans:

The following logic limits the return damper position to ensure that minimum outdoor air is maintained at all times, while the actual return damper position is modulated by the SAT control loop.

      1) The outdoor airflow rate shall be maintained at the minimum outdoor damper outdoor airflow setpoint MinOAsp by a direct-acting control loop whose output is mapped to the return air damper maximum position endpoint MaxRA-P.

The following logic directly controls the return damper position to ensure that exactly the minimum outdoor air – and no more – is provided when economizer lockout conditions are exceeded. When economizer lockout no longer applies, return damper control reverts to the SAT control loop.

      2) While the unit is in Occupied Mode, if the economizer high limit conditions in Section 3.1Q are exceeded for 10 minutes, outdoor air shall be controlled to the minimum outdoor airflow. When this occurs, the normal sequencing of the return air damper by the SAT control loop is suspended, and the return air damper position shall be modulated directly to maintain measured airflow at MinOAsp (i.e. return damper position shall equal MaxRA-P). The economizer damper shall remain open.

      3) If the economizer high limit conditions in Section 3.1Q are not exceeded for 10 minutes, or the unit is no longer in Occupied Mode, release return damper to control by the SAT control loop (i.e. return damper position is limited by MaxRA-P endpoint, but is not directly controlled to equal MaxRA-P).

   c. For units with relief dampers or relief fans:

The following logic limits the return and economizer damper positions to ensure that minimum outdoor air is maintained at all times, while the actual damper positions are modulated by the SAT control loop.

      1) The outdoor airflow rate shall be maintained at the minimum outdoor air setpoint MinOAsp by a reverse-acting control loop whose output is mapped to economizer damper minimum position MinOA-P and return air damper maximum position MaxRA-P as indicated in Figure 5.16.6.3.

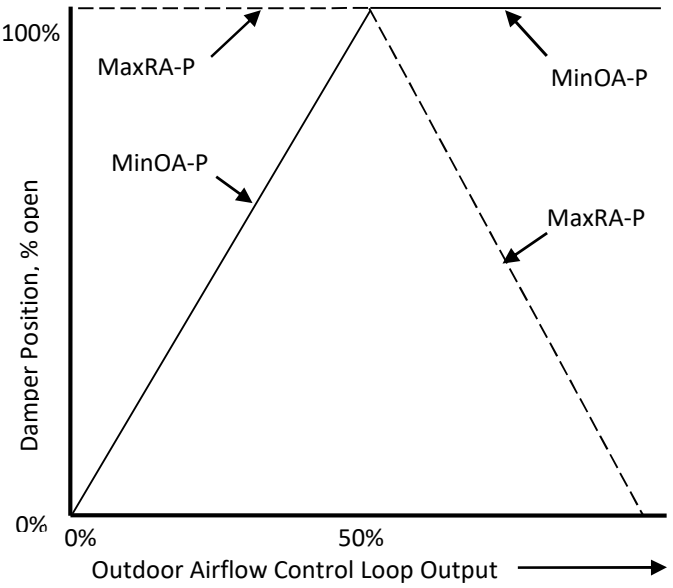

Figure 5.16.6.3 Minimum outdoor airflow control mapping with single damper.

The following logic directly controls the return and economizer damper positions to ensure that exactly the minimum outdoor air – and no more – is provided when economizer lockout conditions are exceeded. When economizer lockout no longer applies, return damper control reverts to the SAT control loop.

2) While the unit is in Occupied Mode, if the economizer high limit conditions in Section 3.1Q are exceeded for 10 minutes, outdoor airflow shall be controlled to the minimum outdoor airflow setpoint, MinOAsp. When this occurs, the normal sequencing of the return air damper by the SAT control loop is suspended as follows:

   a) Fully open the return air damper

   b) Wait 15 seconds, then set MaxOA-P equal to MinOA-P

   c) Wait 3 minutes, then modulate the return air damper to maintain the measured airflow at MinOAsp (i.e. return air damper position shall equal MaxRA-P).

3) If the economizer high limit conditions in Section 3.1Q are not exceeded for 10 minutes, or the unit is no longer in Occupied Mode, set MaxOA-P = 100% and release the return air damper to control by the SAT control loop (i.e. return air damper position is limited by the MaxRA-P endpoint, but is not directly controlled to equal MaxRA-P).

G. Relief-Fan Control

A pressure zone is defined as an enclosed area with interconnected return paths. The appropriate boundaries for pressure zones, establishing which relief fans run together and which building pressure sensors are used, will need to be determined by the engineer based on building geometry.
Relief fans are enabled and disabled with their associated supply fans, but all relief fans that are running and serve a pressure zone run at the same speed. All operating relief fans that serve a pressure zone shall be controlled as if they were one system, running at the same speed and using the same control loop, even if they are associated with different AHUs. For example, if two AHUs share a pressure zone, their relief fans should be controlled together as one system, while both AHUs are operating.
This prevents relief fans from fighting each other, which can lead to flow reversal or unstable fan speed control and space pressurization problems.
The appropriate boundaries between relief systems, establishing which relief fans run together, will need to be determined by the engineer based on building geometry.

1. See Section **Error! Reference source not found.** for pressure Zone Group assignments.

2. Relief fans or relief fan VFD Fan groups shall be lead/lag controlled per Paragraph 3.1P.

3. All operating relief fans that serve a pressure zone shall be grouped and controlled as if they were one system, running at the same speed when enabled and using the same control loop, even if they are associated with different AHUs.

4. A relief fan shall be enabled when its associated supply fan is proven on, and shall be disabled otherwise.

5. Building static pressure shall be time averaged with a sliding 5-minute window and 15 second sampling rate (to dampen fluctuations). The averaged value shall be that displayed and used for control.

    a. Where multiple building pressure sensors are used, each shall be time-averaged and the highest of the averaged values for sensors within a pressure zone shall be used for control.

6. A single P-only control loop for each pressure zone shall maintains the building pressure at a setpoint of 12 Pa (0.05 in. of water) with an output ranging from 0% to 100%. The loop shall be enabled when any supply fan within the pressure zone is proven ON. The loop is disabled with output set to zero otherwise.

The following is intended to use barometric relief as the first stage and then maintain many fans on at low speed to minimize noise and reduce losses through discharge dampers and louvers. Fans are staged off only when running at minimum speed. For best results, fan speed minimums should be set as low as possible.

7. Fan speed signal to all operating fans in the relief system group shall be the same and shall be equal to the PID signal but no less than the minimum speed.

Except for Stage 0, discharge dampers of all relief fans shall be open only when fan is commanded on.

In some installations, the relief fan inlet plenum may also be the return plenum to the AHU mixed air plenum, in which case the pressure in this plenum may be drawn negative relative to the outdoors by the supply air fan drawing return air from this plenum. This can occur when the return path has a fairly high pressure drop. If the engineer is concerned that this may occur, Stage 0 and references to it should be deleted.

a. Stage 0 (barometric relief). When relief system is enabled, and the control loop output is above 5%, open the motorized dampers to all relief fans serving the relief system group that are enabled; close the dampers when the loop output drops to 0% for 5 minutes.

b. Stage Up. When control loop is above minimum speed plus 15%, start stage-up timer. Each time the timer reaches 7 minutes, start the next relief fan (and open the associated damper) in the relief system group, per staging order, and reset the timer to 0. The timer is reset to 0 and frozen if control loop is below minimum speed plus 15%.

1) For systems where relief fans share a common relief fan inlet plenum: When staging from Stage 0 (no relief fans) to Stage 1 (one relief fan), the relief dampers of all nonoperating relief fans must be closed.

2) For systems where relief fans do not share a common relief fan inlet plenum: When staging from Stage 0 (no relief fans) to Stage 1 (one relief fan), the discharge dampers of all nonoperating relief fans shall remain open when the associated supply fan is proven ON.

c. Stage Down. When PID loop is below minimum speed, start stage-down timer. Each time the timer reaches 5 minutes, shut off lag fan per staging order and reset the timer to 0. The timer is reset to 0 and frozen if PID loop rises above minimum speed or all fans are off. If all fans are off, go to Stage 0 (all dampers open and all fans off).

8. For fans in a Level 2 alarm and status is off, discharge damper shall be closed when stage is above Stage 0.

Freeze protection logic was deleted since it is buggy and not needed in Bay Area.

H. Alarms

1. Maintenance interval alarm when fan has operated for more than 1500 hours: Level 4. Reset interval count when alarm is acknowledged.

2. Fan alarm is indicated by the status being different from the command for a period of 15 seconds.

a. Commanded on, status off: Level 2

b. Commanded off, status on: Level 4

3. Filter pressure drop exceeds the larger of the alarm limit or 12.5 Pa (0.05") for 10 minutes when airflow (expressed as a percentage of design airflow or design speed if total airflow is not known) exceeds 20%: Level 4. The alarm limit shall vary with total airflow (if available; use fan speed if total airflow is not known) as follows:

$$DP_x = DP_{100}(x)^{1.4}$$

where DP100 is the high-limit pressure drop at design airflow (determine limit from filter manufacturer) and DPx is the high limit at the current airflow rate x (expressed as a fraction). For instance, the setpoint at 50% of design airflow would be (0.5)1.4, or 38% of the design high-limit pressure drop. See Section 1.2E.4 for DP100.

The constant value threshold for the filter pressure drop alarm is a function of the transducer and A/D converter used to measure filter differential pressure. The value used shall be determined as the minimum accuracy of the transducer and A/D converter combination.

4. High building pressure (more than 25 Pa [0.10 in. of water]) for 5 minutes: Level 3.

5. Low building pressure (less than 0 Pa [0.0 in. of water], i.e., negative) for 5 minutes: Level 4.

Automatic fault detection and diagnostics (AFDD) is a sophisticated system for detecting and diagnosing air-handler faults.
To function correctly, AFDD requires specific sensors and data be available, as detailed in the sequences below. If this information is not available, AFDD tests that do not apply should be deleted.

I. Automatic Fault Detection and Diagnostics

The AFDD routines for AHUs continually assess AHU performance by comparing the values of BAS inputs and outputs to a subset of potential fault conditions. The subset of potential fault conditions that is assessed at any point depends on the operating state (OS) of the AHU, as determined by the position of the cooling and heating valves and the economizer damper. Time delays are applied to the evaluation and reporting of fault conditions to suppress false alarms. Fault conditions that pass these filters are reported to the building operator along with a series of possible causes.
These equations assume that the air handler is equipped with hydronic heating and cooling coils, as well as a fully integrated economizer. If any of these components are not present, the associated tests and variables should be omitted from the programming.
Note that these alarms rely on reasonably accurate measurement of mixed air temperature. An MAT sensor is required for many of these alarms to work, and an averaging sensor is strongly recommended for best accuracy.

1. AFDD conditions are evaluated continuously and separately for each operating AHU.

2. For units with return fans:

   a. The OS of each Ahu shall be defined by the commanded positions of the heating coil control valve, cooling coil control valve and the return air damper in accordance with Table 2.

Table 2 VAV AHU Operating States

Operating State	Heating Valve Position	Cooling Valve Position	Return Air Damper Position
#1: Heating	> 0	= 0	= MaxRA-P
#2: Free cooling, modulating OA	= 0	= 0	MaxRA-P > x > 0%
#3: Mechanical + economizer cooling	= 0	> 0	= 0%
#4: Mechanical cooling, minimum OA	= 0	> 0	= MaxRA-P
#5: Unknown or dehumidification	No other OS applies		

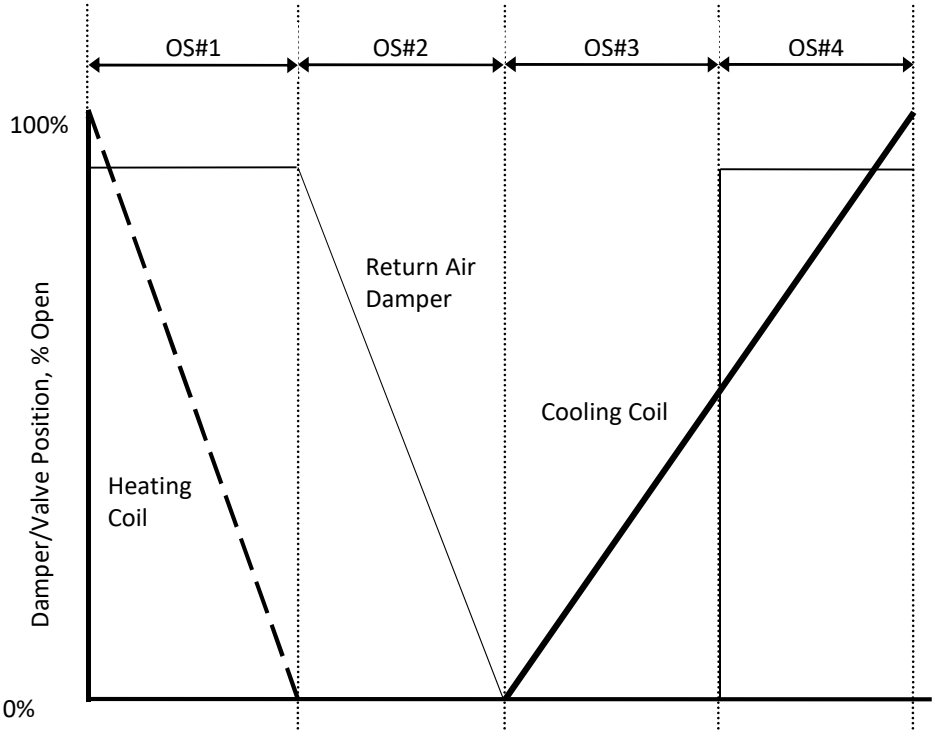

Figure 2 VAV AHU operating states.

3. For units with relief dampers or relief fans and a separate minimum outdoor air damper:

   a. The OS of each AHU shall be defined by the commanded positions of the heating-coil control valve, cooling-coil control valve, and economizer damper in accordance with Table 3 and Figure 3.

Table 3 VAV AHU Operating States

Operating State	Heating Valve Position	Cooling Valve Position	Economizer Outdoor Air Damper Position
#1: Heating	> 0	= 0	= 0%
#2: Free cooling, modulating OA	= 0	= 0	0% < x < 100%
#3: Mechanical + economizer cooling	= 0	> 0	= 100%
#4: Mechanical cooling, minimum OA	= 0	> 0	= 0%
#5: Unknown or dehumidification	No other OS applies		

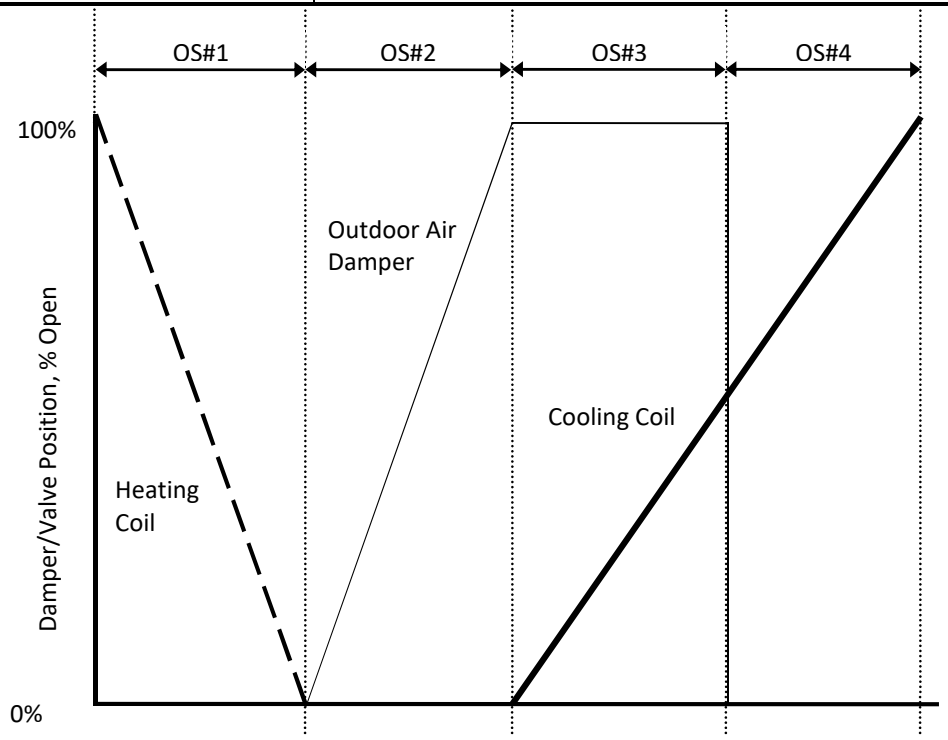

Figure 3 VAV AHU operating states.

4. For units with relief dampers or relief fans and a single common damper of minimum outdoor air and economizer functions.

   a. The OS of each AHU shall be defined by the commanded positions of the heating-coil control valve, cooling-coil control valve, and economizer damper in accordance with Table 4 and Figure 4.

Table 4 VAV AHU Operating States

Operating State	Heating Valve Position	Cooling Valve Position	Outdoor Air Damper Position
#1: Heating	> 0	= 0	= MinOA-P
#2: Free cooling, modulating OA	= 0	= 0	MinOA-P < x < 100%
#3: Mechanical + economizer cooling	= 0	> 0	= 100%
#4: Mechanical cooling, minimum OA	= 0	> 0	= MinOA-P
#5: Unknown or dehumidification	No other OS applies		

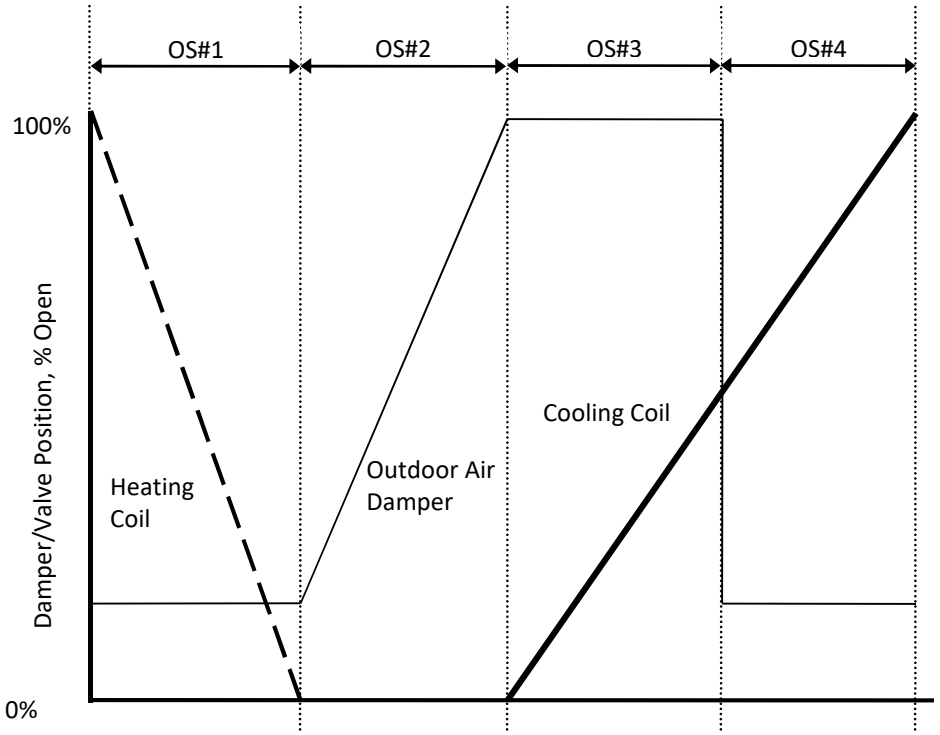

Figure 4 VAV AHU operating states.

The OS is distinct from, and should not be confused with, the zone status (cooling, heating, deadband) or Zone Group mode (occupied, warmup, etc.).
OS#1 through OS#4 (see Tables 2 through 4) represent normal operation during which a fault may nevertheless occur if so determined by the fault condition tests in Section 8. By contrast, OS#5 may represent an abnormal or incorrect condition (such as simultaneous heating and cooling) arising from a controller failure or programming

error, but it may also occur normally, e.g., when dehumidification is active or during warmup.

5. The following points must be available to the AFDD routines for each AHU:

For the AFDD routines to be effective, an averaging sensor is recommended for SAT. An averaging sensor is essential for MAT, as the environment of the mixing box will be subject to nonuniform and fluctuating air temperatures. It is recommended that the OAT sensor be located at the AHU so that it accurately represents the temperature of the incoming air.

   a. SAT = supply air temperature

   b. MAT = mixed air temperature

   c. RAT = return air temperature

   d. OAT = outdoor air temperature

   e. DSP = duct static pressure

   f. SATSP = supply air temperature setpoint

   g. DSPSP = duct static pressure setpoint

   h. HC = heating-coil valve position command; 0% □ HC □ 100%

   i. CC = cooling-coil valve position command; 0% □ CC □ 100%

   j. FS = fan speed command; 0% □ FS □ 100%

   k. CCET = cooling-coil entering temperature (Depending on the AHU configuration, this could be the MAT or a separate sensor for this specific purpose.)

   l. CCLT = cooling-coil leaving temperature (Depending on the AHU configuration, this could be the SAT or a separate sensor for this specific purpose.)

   m. HCET = heating-coil entering temperature (Depending on the AHU configuration, this could be the MAT or a separate sensor for this specific purpose.)

   n. HCLT = heating-coil leaving temperature (Depending on the AHU configuration, this could be the SAT or a separate sensor for this specific purpose.)

6. The following values must be continuously calculated by the AFDD routines for each AHU:

a. Five-minute rolling averages with 1-minute sampling time of the following point values; operator shall have the ability to adjust the averaging window and sampling period for each point independently.

1) SATavg = rolling average of supply air temperature

2) MATavg = rolling average of mixed air temperature

3) RATavg = rolling average of return air temperature

4) OATavg = rolling average of outdoor air temperature

5) DSPavg = rolling average of duct static pressure

6) CCETavg = rolling average of cooling-coil entering temperature

7) CCLTavg = rolling average of cooling-coil leaving temperature

8) HCETavg = rolling average of heating-coil entering temperature

9) HCLTavg = rolling average of heating-coil leaving temperature

b. %OA = actual outdoor air fraction as a percentage = (MAT – RAT)/(OAT – RAT), or per airflow measurement station if available.

c. %OAmin = active minimum OA setpoint (MinOAsp) divided by actual total airflow (from sum of VAV box flows or by airflow measurement station) as a percentage.

d. OS = number of changes in operating state during the previous 60 minutes (moving window)

7. The internal variables shown in Table 5.16.14.5 shall be defined for each AHU. All parameters are adjustable by the operator, with initial values as shown.

Default values are derived from NISTIR 7365 and have been validated in field trials. They are expected to be appropriate for most circumstances, but individual installations may benefit from tuning to improve sensitivity and reduce false alarms.
The default values have been intentionally biased toward minimizing false alarms—if necessary, at the expense of missing real alarms. This avoids excessive false alarms that will erode user confidence and responsiveness. However, if the goal is to achieve the best possible energy performance and system operation, these values should be adjusted based on field measurement and operational experience.
Values for physical factors, such as fan heat, duct heat gain, and sensor error, can be measured in the field or derived from trend logs. Likewise, the occupancy delay and switch delays can be refined by observing in trend data the time required to achieve quasi steady-state operation.
Other factors can be tuned by observing false positives and false negatives (i.e., unreported faults). If transient conditions or noise cause false errors, increase the

alarm delay. Likewise, failure to report real faults can be addressed by adjusting the heating coil, cooling coil, temperature, or flow thresholds.

Table 7 VAV AHU AFDD Internal Variables

Variable Name	Description	Default Value
ΔTSF	Temperature rise across supply fan	1°C (2°F)
ΔTMIN	Minimum difference between OAT and RAT to evaluate economizer error conditions (FC#6)	6°C (10° F)
ℰSAT	Temperature error threshold for SAT sensor	1°C (2°F)
ℰRAT	Temperature error threshold for RAT sensor	1°C (2°F)
ℰMAT	Temperature error threshold for MAT sensor	3°C (5°F)
ℰOAT	Temperature error threshold for OAT sensor	1°C (2°F) if local sensor @ unit. 3°C (5°F) if global sensor.
ℰF	Airflow error threshold	30%
ℰVFDSPD	VFD speed error threshold	5%
ℰDSP	Duct static pressure error threshold	25 Pa (0.1")
ℰCCET	Cooling coil entering temperature sensor error. Equal to ℰMAT or dedicated sensor error	Varies, see Description
ℰCCLT	Cooling coil leaving temperature sensor error. Equal to ℰSAT or dedicated sensor error	
ℰHCET	Heating coil entering temperature sensor error; equal to ℰMAT or dedicated sensor error	
ℰHCLT	Heating coil leaving temperature sensor error. Equal to ℰSAT or dedicated sensor error	
ΔOSMAX	Maximum number of changes in Operating State during the previous 60 minutes (moving window)	7
ModeDelay	Time in minutes to suspend Fault Condition evaluation after a change in Mode	30
AlarmDelay	Time in minutes to that a Fault Condition must persist before triggering an alarm	30
TestModeDelay	Time in minutes that Test Mode is enabled	120

The purpose of ΔTmin is to ensure that the mixing box/economizer damper tests are meaningful. These tests are based on the relationship between supply, return, and outdoor air. If RAT ~ MAT, these tests will not be accurate and will produce false alarms.
The purpose of TestModeDelay is to ensure that normal fault reporting occurs after the testing and commissioning process is completed as prescribed in Section 14.

8. Table 8 shows potential fault conditions that can be evaluated by the AFDD routines. If the equation statement is true, then the specified fault condition exists. The fault conditions to be evaluated at any given time will depend on the OS of the AHU.

The equations in Table 8 assume that the SAT sensor is located downstream of the supply fan and the RAT sensor is located downstream of the return fan. If actual sensor locations differ from these assumptions, it may be necessary to add or delete fan heat correction factors.
To detect the required economizer faults in California Title 24 section 120.2(i)7, use FC#2, #3, and #5 through #13 at a minimum. Other Title 24 AFDD requirements, including acceptance tests, are not met through these fault conditions.

Table 8 VAV AHU Fault Conditions

FC#1	Equation	DSPAVG < DSPSP - ƐDSP and VFDSPD ≥ 99% - ƐVFDSPD	Applies to OS #1 – #5
	Description	Duct static pressure is too low with fan at full speed	
	Possible Diagnosis	Problem with VFD Mechanical problem with fan Fan undersized SAT Setpoint too high (too much zone demand)	
FC#2 (omit if no MAT sensor)	Equation	MATAVG + ƐMAT < min[(RATAVG - ƐRAT), (OATAVG - ƐOAT)]	Applies to OS #1 – #5
	Description	MAT too low; should be between OAT and RAT	
	Possible Diagnosis	RAT sensor error MAT sensor error OAT sensor error	
FC#3 (omit if no MAT sensor)	Equation	MATAVG - ƐMAT > max[(RATAVG + ƐRAT), (OATAVG + ƐOAT)]	Applies to OS #1 – #5
	Description	MAT too high; should be between OAT and RAT	
	Possible Diagnosis	RAT sensor error MAT sensor error OAT sensor error	

FC#4	Equation	ΔOS > ΔOSMAX	Applies to OS #1 – #5
	Description	Too many changes in Operating State	
	Possible Diagnosis	Unstable control due to poorly tuned loop or mechanical problem	
FC#5 (omit if no MAT sensor)	Equation	SATAVG + ƐSAT ≤ MATAVG - ƐMAT + ΔTSF	Applies to OS #1
	Description	SAT too low; should be higher than MAT	
	Possible Diagnosis	SAT sensor error MAT sensor error Cooling coil valve leaking or stuck open Heating coil valve stuck closed or actuator failure Fouled or undersized heating coil HW temperature too low or HW unavailable Gas or electric heat unavailable DX cooling stuck on	
FC#6	Equation	| RATAVG - OATAVG | ≥ ΔTMIN and | %OA - %OAMIN | > ƐF	Applies to OS #1, #4
	Description	OA fraction is too low or too high; should equal %OAMIN	
	Possible Diagnosis	RAT sensor error MAT sensor error OAT sensor error Leaking or stuck economizer damper or actuator	
FC#7 (omit if no heating coil)	Equation	SATAVG < SATSP - ƐSAT and HC ≥ 99%	Applies to OS #1
	Description	SAT too low in full heating	
	Possible Diagnosis	SAT sensor error Cooling coil valve leaking or stuck open Heating coil valve stuck closed or actuator failure Fouled or undersized heating coil HW temperature too low or HW unavailable Gas or electric heat unavailable DX cooling stuck on Leaking or stuck economizer damper or actuator	

SECTION 26 05 00

COMMON WORK RESULTS FOR ELECTRICAL

PART 1 - GENERAL

1.1 REQUIREMENTS OF REGULATORY AGENCIES

A. Provide design and installation in accordance with appropriate standards, codes and recommendations, applicable codes and ordinances including interpretations of such codes if known to the trade at the time of construction.

B. Reference Standards: All materials and equipment shall comply with applicable standards and requirements of the following:

1. California Electrical Code (CEC) 2019 Edition; (2017 NEC with 2019 California Amendments).
2. California Building Code - Title 24.
3. Uniform Fire Code (UFC).
4. Uniform Mechanical Code (UMC).
5. Uniform Building Code (UBC).
6. National Electrical Code (NEC).
7. National Fire Protection Association (NFPA).
8. National Electrical Manufacturers Association (NEMA).
9. National Electrical Contractors Association (NECA).
10. American National Standards Institute (ANSI).
11. Institute of Electrical and Electronic Engineers (IEEE).
12. Underwriters Laboratories (UL).

A. SUMMARY

1. Section Includes:

A. Electrical equipment coordination and installation.

B. Sleeves for raceways and cables.

C. Sleeve seals.

D. Grout.

E. Common electrical installation requirements.

B. SUBMITTALS

1. Submit in accordance with Division 1 sections.

C. COORDINATION

1. Coordinate arrangement, mounting, and support of electrical equipment:

   A. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.

   B. To provide for ease of disconnecting the equipment with minimum interference to other installations.

   C. To allow right of way for piping and conduit installed at required slope.

   D. So, connecting raceways, cables, wireways, cable trays, and busways will be clear of obstructions and of the working and access space of other equipment.

2. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.

3. Coordinate location of access panels and doors for electrical items that are behind finished surfaces or otherwise concealed. Access doors and panels (Furnished & Installed by Ceiling Subcontractor) are specified in Section 08 31 13 Access Doors and Frames.

4. Coordinate sleeve selection and application with selection and application of firestopping specified in Section 07 84 00 Firestopping.

PART 2 - PRODUCTS

1. See individual Division 26 Electrical Sections.

PART 3 - EXECUTION

A. COMMON REQUIREMENTS FOR ELECTRICAL INSTALLATION

1. Comply with NECA 1-2000 and facility standards.

2. Measure indicated mounting heights to bottom of unit for suspended items and to center of unit for wall-mounting items.

3. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange, and install components and equipment to provide maximum possible headroom consistent with these requirements.

4. Equipment: Install to facilitate service, maintenance, and repair or replacement of components of both electrical equipment and other nearby installations. Connect in such a way as to facilitate future disconnecting with minimum interference with other items in the vicinity.

5. Right of Way: Give to piping systems installed at a required slope.

END OF SECTION

SECTION 26 05 19
LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 – GENERAL

1.1 SUMMARY

A. .General building wire.

B. Metal-clad cable (Type MC)

C. Flexible cord/cable (Type 'S').

D. Pull cord.

E. Wire splices, joints, and terminations.

1.2 REFERENCES

A. ANSI/NFPA 70 - National Electrical Code (NEC)

B. Part 3, Title 24, California Electrical Code (CEC)

C. Underwriters Laboratories, Inc. (UL):

1. .UL-83, UL-44 - Thermoplastic-Insulated Wire and Cables.

2. .UL-4 - Armored Cable.

3. .UL-486A - Copper Connectors and Lugs.

1.3 SUBMITTALS

A. Submit in accordance with Division 1.

B. Provide manufacturer's literature describing products.

1. Wire, cable, and flexible cord.

2. Wire splicing and termination materials.

1.4 QUALITY ASSURANCE

A. Provide materials that are new or recycled.

B. Manufacturer: Company specializing in manufacturing products specified in this Section with 3 years’ experience.

1.5 PROJECT CONDITIONS

A. Verify that field measurements are as shown on the Drawings.

B. Conductor sizes are based on copper & aluminum.

C. Wire and cable routing shown on the Drawings is approximate unless dimensioned. Route wire and cable as required to meet Project Conditions.

D. When wire and cable routing is not shown, and destination only is indicated, determine exact routing and lengths required.

1.6 COORDINATION

A. Coordinate work under provisions of Division 1.

B. Determine required separation between cable and other work.

C. Determine cable routing to avoid interference with other work.

PART 2 – PRODUCTS

2.1 GENERAL

A. Provide wire, cable and connectors that bear the UL label or listing.

B. Provide wire and cable with 600-volt insulation rating unless otherwise noted.

C. Color coding for all conductors (including MC Cable).

1. Identify System conductors as to voltage and phase connections by means of color-impregnated insulation or colored marking tape; see Section 26 05 53 Identification for Electrical Systems.

2. 480Y/277-volt, 3 phase, 4 wire system:

   a. Phase A – Brown

   b. Phase B – Orange

   c. Phase C – Yellow

   d. Neutral – White or Gray

   e. Ground – Green

3. 208Y/120-volt, 3 phase, 4 wire system:

   a. Phase A – Black

   b. Phase B – Red

   c. Phase C – Blue

   d. Neutral – White

   e. Ground – Green

   f. IG Ground - Green with yellow tracer

4. Switch legs: Use same branch circuit phase color coding, which they are connected to, unless otherwise noted.

2.2 MANUFACTURERS

A. Wire and cable: Copper or Aluminum Conductors: Southwire, or equal

B. Connectors for wire and cable conductors: 3M, T&B, Ideal Industries, or equal.

2.3 BUILDING WIRE AND CABLE

A. Description: Single conductor insulated wire.

B. Conductor: Copper or Aluminum

C. Insulation Voltage Rating: 600-volts.

2.4 METAL-CLAD CABLE (TYPE MC)

A. Description: ANSI/NFPA 70, Type MC. Manufactured in accordance with NEC Article 334. AFC Type MC-Lite or equal.

B. Conductor: Copper or Aluminum

C. Insulation Voltage Rating: 600-volts.

D. Insulation Temperature Rating: 90 degrees C.

E. Insulation Material: Thermoplastic

F. Armor Material: Aluminum

G. Armor Design: Interlocked metal tape, corrugated tube, or smooth tube.

H. Ground: Internal insulated green copper conductor.

2.5 FLEXIBLE CORDS AND CABLE (TYPE 'S')

A. Provide Type 'S' flexible cords and cables manufactured in accordance with CEC Article 400.

B. Composed of two or more conductors and a full size green insulated ground wire with an outer jacket of rubber or neoprene.

C. Equip flexible cords and cables with wire mesh strain relief grips either as a integral component of the connector or as an independently supported unit.

D. Suspended flexible cords and cables using safety spring(s) unless otherwise noted on the Drawings.

2.6 PULL CORD

A. Empty branch circuit or system conduits: Provide mildew resistant polypropylene line, minimum 210-pound tensile strength. Greenlee Polyline, or equal.

B. Empty feeder conduits or ducts: Provide mildew resistant polypropylene rope, minimum 1/4-inch diameter. Durlaine, or equal.

2.7 WIRE SPLICES, JOINTS AND TERMINATIONS

A. Insulated Spring Connectors:

1. Wire connections for 8 AWG and smaller.

2. Electrical spring connector insulated with a color-coded, pliable, vinyl skirt. 3M/Scotchlok, or equal.

3. Self-striping pigtail and tap connectors are not permitted.

4. Insulation displacement connectors are not permitted.

B. Bolted Pressure Connectors:

1. Copper or Aluminum wire and cable connections. Provide split bolt for 6 AWG through 4/0 AWG and two-piece connector for 250 AWG and larger. Burndy Type KS/KVS, or equal.

C. Compression Type Terminating Lugs:

1. Copper or Aluminum wire and cable connections as required. Use long barrel type, tin plated copper compression lugs having color-keyed tool die index marking. Provide 1-hole lugs for 8 AWG through 4/0 AWG. Provide 2-hole lugs for 250 AWG and larger. Use minimum of three crimps per lug or as recommended by the manufacturer. T & B Series 54800/54900, or equal.

2. Notch or single point type crimping is not permitted.

D. Splicing and Insulating Tape (600 Volts and Below):

1. Provide black, ultraviolet proof, self-extinguishing, 7 mils thick vinyl general purpose electrical tape. Suitable for temperatures from minus 18 degrees C to 105 degrees C. Scotch 33+, or equal.

E. Insulating Compound (600 Volts and Below):

1. Vinyl Mastic: Self-fusing, rubber-based insulating compound, laminated to an all-weather grade vinyl (PVC) backing. 3M/Scotch 2200 Series or equal.

2. Insulation Putty: Electrical grade, rubber-based, elastic-type putty in tape form. 3M Scotchfil, or equal.

F. Insulating Resin:

1. Use two-part liquid epoxy resin with resin and catalyst in premeasured, sealed mixing pouch. Scotchcast 4, or equal.

2. Use with thermal and dielectric properties equal to the insulating properties of the cables immersed in the resin.

G. Terminal Strips:

1. Provide box type rail mounted terminal block system. Furnish required quantity plus 25 percent spare. Install using continuous rows method in terminal cabinets. Provide ampere ratings as required. T & S Series HR, GR, or equal.

2. Identify all terminals with same numbering sequence being used for a particular system. Use marking strips to identify terminals.

H. Crimp Type Connectors:

1. Provide insulated fork or ring crimp terminals with tinned electrolytic copper-brazed barrel, funnel wire entry and insulation support. T & B RA Series, or equal.

2. Fasten crimp type connectors or terminals using a crimping tool recommended by the connector manufacturer.

3. Provide insulated overlap splices with tinned seamless electrolytic copper barrel with funnel wire entry and insulation support. T & B Series R or equal.

4. Provide insulated butt splices with tinned seamless electrolytic copper barrel with center stop, funnel wire entry and insulation support. T & B Series R, or equal.

I. Cable Ties:

1. Provide harnessing and point-to-point wire bundling using nylon cable ties, T & B Series TY or equal. Install ties using tool supplied or recommended by the manufacturer of ties.

J. Wire Lubricating Compound:

1. UL listed for the wire insulation and conduit type. Ideal, CRC or equal.

2. Use on wire for isolated type electrical power systems is not permitted.

K. Bolt Termination Hardware:

1. Bolts: Plated, medium carbon steel heat treated, quenched, and tempered conforming to ASTM A-325 or SAE grade 5; or silicon bronze alloy ASTM B-9954 Type B.

2. Nuts: Heavy semi-finished hexagon, conforming to ANSI B18.2.2, threads to be unified coarse series (UNC), class 2B steel or silicon bronze alloy.

3. Flat washers: Steel or silicon bronze, Type A plain standard wide series, confirming to ANSI B27.2. SAE or narrow series are not permitted.
4. Lock Washers: Hardened steel, cadmium plated or silicon bronze.
5. Maximum current capacity for bolt sizes:
    a. 1/4-inch bolt - 125 amps
    b. 5/16-inch bolt - 175 amps
    c. 3/8-inch bolt - 225 amps
    d. 1/2-inch bolt - 300 amps
    e. 5/8-inch bolt - 375 amps
    f. 3/4-inch bolt - 450 amps

L. Mechanical

1. Stud Kearney
2. Mechanical Lugs

PART 3 – EXECUTION

3.1 GENERAL WIRING METHODS

A. Install products in accordance with manufacturer's instructions.

B. Concealed dry interior locations; normal power systems: Use Type THHN insulation or MC Cable for branch circuit wiring. Use Type XHHW or dual rated THHN/THWN insulation for feeders.

C. MC Cable acceptable for concealed branch circuit wiring and final connections to fixtures.

D. Exposed dry interior locations: Use Type THHN insulation for branch circuit wiring. Use Type XHHW or dual rated THHN/THWN insulation for feeders.

E. Wet or damp locations: Use Type XHHW insulation for feeder and branch circuit wiring.

F. Use Type RHH or THHN insulation for wire installed in fixture channels.

G. Use stranded conductors only.

H. Use conductor not smaller than 12 AWG for power and lighting circuits.

I. Use conductor not smaller than 16 AWG for control circuits.

J. Use suitable wire pulling lubricant for building wire 4 AWG and larger.

K. Parallel feeders: Install phase conductors and neutral conductors so that they are equal in length and identical in all ways.

L. Provide adequate length of conductors within electrical enclosures and train the conductors to terminal points with no excess. Bundle multiple conductors; conductors larger than 10 AWG, bundle in individual circuits. Make terminations so there is no bare conductor visible at the terminal.

M. Minimum conductor size for 20 ampere power and lighting branch circuits having 4 or fewer current carrying conductors in a single conduit:

1. Use 10 AWG conductors for 120-volt branch circuits longer than 75 feet.

N. Minimum conductor size for 20 ampere power and lighting branch circuits having 12 or fewer current carrying conductors in a single conduit:

1. Use 10 AWG conductors for 120-volt branch circuits longer than 65 feet.

O. Provide 10 AWG pig tails on all 20A and 30A wiring devices served by 8 AWG conductors and larger.

P. Splice cables and wires only in outlet boxes, junction boxes, pull boxes, manholes, or handholes. When more then one neutral is present, group and bundle each neutral with its associated phase conductors.

Q. Install cable supports for all vertical feeders in accordance with the CEC. Provide split wedge type fittings which firmly clamps each individual cable and tightens due to cable weight.

R. Panelboards, cabinets, wireways, switches, and equipment assembles. Neatly form, train, and tie the cables in individual circuits. Use nylon ties for securing cable/wire bundles.

S. Seal cable or wire, entering a building horizontally from underground or exiting walk-in cold box or freezer, using non-hardening approved compound, duct seal or equal. Seal at nearest box or panelboard raceway termination.

T. Use connectors with ampacity and temperature ratings equal to or greater than the wires that are being terminated.

U. Terminate stranded wire using fittings, lugs or devices listed for the application. Do not terminate stranded wire by wrapping it around a screw or bolt.

V. Flexible cords and cables supplied as part of a pre-manufactured fixture or unit assembly: Install according to manufacturer's published installation instructions.

3.2 WIRING INSTALLATION IN RACEWAYS

A. Install wire in raceway after interior of building has been physically protected from the weather and all mechanical work likely to injure conductors has been completed.

B. Pull all conductors into a raceway at the same time. Exercise care in pulling conductors so that insulation is not damaged.

C. Use UL listed, non-petroleum base and insulating type pulling compound as needed.

D. Completely mandrel all underground conduits prior to installing conductors.

E. Completely and thoroughly swab raceway system before installing conductors.

F. Do not use block and tackle, power driven winch or other mechanical means for pulling conductors smaller than 2 AWG.

G. Wire Pulling:

1. Provide installation equipment that will prevent the cutting or abrasion of insulation during pulling of cables.

2. Use rope made of nonmetallic material for pulling feeders.

3. Attach pulling lines for feeders by means of either woven basket grips or pulling eyes attached directly to the conductors.

4. Pull in together multiple conductors or cables in a single conduit.

5. Use wire-pulling compound as lubricant for installing wires and cables in raceways. Use of oil, grease, graphite, or similar substances is not permitted.

H. Install and test all cables in accordance with manufacturer's instructions and warranty.

3.3 CABLE INSTALLATION

A. Install MC Cable in accordance with manufacturer’s instructions and in accordance with NEC. Follow manufacturer's instructions when connecting the cable to fittings and boxes. Secure connectors to the cable, but not over tightened. Firmly attach connector to the metal boxes.

B. Support cables every 4.5 feet and within 12 inches of box or fitting using separate metal strap or spring metal clip for each cable. Do not bundle cables together.

C. Do not support cables from raceways or mechanical piping.

D. Do not rest cables on ceiling tiles or allow contact with mechanical piping systems.

E. Cable connection to light fixtures: Acceptable to attach cable to fixture support wire using spring metal clip.

F. Use steel with insulated throat cable connectors. OZ/Gedney AMC Series or equal.

G. Use cable having color coded conductors as noted. Color coded conductor sleeves are not permitted.

H. Provide separate sleeves or fire barriers for cable firewall penetration, unless cable is UL listed for the application.

3.4. WIRE SPLICES, JOINTS, AND TERMINATION

A. Join and terminate wire, conductors, and cables in accordance with UL 486A, B, & C, CEC, and manufacturers' instructions.

B. Thoroughly clean wires before installing lugs and connectors

C. Make splices, taps and terminations to carry full ampacity of conductors, without noticeable temperature rise.

D. Make splices and termination mechanically and electrically secure.

E. Where determined that unsatisfactory splices or terminations have been installed, remove the devices, and install approved devices.

F. Terminate wires in terminal cabinets, relay and contactor panels using terminal strip connectors.

G. Bundle spare conductors using nylon ties. Leave sufficient length to terminate anywhere in the panel or cabinet.

H. Use nylon cable ties for bundling and securing wire and cable as required to maintain harnessing.

I. Encapsulate below grade splices at outlet, pull and junction boxes using specified insulating resin kits. Make all splices watertight for exterior equipment and equipment in pump rooms.

J. Make up all splices and taps in accessible junction or outlet boxes with specified connectors. Use same color pigtails and wire tap as the feed conductor. Form conductor prior to cutting. Provide at least 6 inches of tail and neatly packed in box after splice is made up.

K. 8 AWG and smaller conductor connections:

1. Connectors: Solderless, screw-on, reusable spring pressure cable type, 600-volt, 105-degree C. with integral insulation, approved for copper conductors.

2. The integral insulator to completely cover the stripped wires.

3. The number, size, and combination of conductors, as listed on the manufacturers packaging shall be strictly complied with.

L. 6 AWG and larger conductor connections:

1. Join or tap conductors using bolted pressure connectors or compression (hi- press) taps specified. Cover using moldable insulating compound and overwrapped with two half-lapped layers of vinyl insulating tape.

2. Terminate conductors from size 6 AWG to 750 MCM copper using bolted pressure or mechanical compression lugs in accordance with manufacturer's instructions.

3. Insulate splices and joints with materials approved for the particular use, location, voltage, and temperature. Insulate with not less and that of the conductor level that is being joined.

4. Use hydraulic crimping tool for making compression indents. Burndy Series Y35 Hypress, or equal.

5. Apply oxide inhibiting compound to conductors before joining, installing compression lugs, or making terminations.

M. Termination Hardware Assemblies:

1. AL/CU lugs connected to copper bus. Secured using a steel bolt, flat washer (two per bolt), lock washer, and nut.

2. Copper lugs connected to copper bus. Secured using silicon bronze alloy bolt, flat washer (two per bolt), lock washer, and nut.

3. Install lock washers under the nut.

4. Torque bolted assemblies using the manufacturer's recommendations. In the absence of such recommendations, use torque values listed in UL 486 Standards.

5. Apply silicon spray or other suitable lubricant before torqueing bolts. Clean bolt surface after torqueing. Mark torqued bolt heads using red or pink lacquer paint. Torque Seal or equal.

3.5 IDENTIFICATION

A. Refer to Section 26 05 53 Identification for Electrical Systems for additional information.

B. Securely tag all branch circuits. Mark conductors with specified vinyl wrap-around markers. At each accessible location, mark each conductor with the corresponding circuit number.

C. Color code conductors' size 6 AWG and larger using specified phase color markers and identification tags.

D. Provide terminal strips with write on marking strips.

E. In manholes, Christy boxes and handholes, Provide embossed brass tags. Show the cable type and voltage rating. Attach the tags to the cables with slip-free plastic cable lacing units.

3.6 HOMERUNS

A. Permissible to combine up to 6 branch circuits (12 current carrying conductors) per conduit.

B. Individual homerun conduits containing more than 6 branch circuits are not permitted.

C. Adjust branch circuit conductor ampacity in accordance with CEC Article 310. Provide higher ampacity conductor sizes as needed.

3.7 SLEEVE-SEAL INSTALLATION

A. Install to seal underground exterior-wall penetrations.

B. Use type and number of sealing elements recommended by manufacturer for cable material and size. Position cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.8 FIRESTOPPING

A. Refer to Section 07 84 00 Firestopping for additional information.

B. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly according to Section 07 84 00 Firestopping.

3.9 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

B. Tests and Inspections:

1. After installing conductors and cables and before electrical circuitry has been energized, test conductors' size 4/0 and larger for compliance with requirements.

2. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

C. Test Reports: Prepare a written report to record the following:

1. Test procedures used.

2. Test results that comply with requirements.

3. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

D. Remove and replace malfunctioning units and retest as specified above.

END OF SECTION

SECTION 26 05 26

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes methods and materials for grounding systems and equipment.

1.2 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Field quality-control test reports.

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled by a Nationally Recognized Testing Laboratory (NRTL) and marked for intended use.

B. Comply with UL 467 for grounding and bonding materials and equipment.

PART 2 - PRODUCTS

2.1 CONDUCTORS

A. Insulated Conductors: Copper wire or cable insulated for 600V unless otherwise required by applicable Code or the University.

B. Bare Copper Conductors:

1. Solid Conductors: ASTM B 3.

2. Stranded Conductors: ASTM B 8.

3. Tinned Conductors: ASTM B 33.

4. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG conductor, 1/4 inch (6 mm) in diameter.

5. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.

6. Bonding Jumper: Copper tape, braided conductors, terminated with copper ferrules; 1 5/8 inches (41 mm) wide and 1/16 inch (1.6 mm) thick.

2.2 CONNECTORS

A. Listed and labeled by a nationally recognized testing laboratory acceptable to authorities having jurisdiction for applications in which used, and for specific types, sizes, and combinations of conductors and other items connected.

B. Bolted Connectors for Conductors and Pipes: Copper or copper alloy, bolted pressure-type, with at least two bolts.

1. Pipe Connectors: Clamp type, sized for pipe.

C. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.3 GROUNDING ELECTRODES

A. Ground Rods: Copper-Clad; 3/4-inch by10 feet (19 mm by 3 m).

PART 3 - EXECUTION

3.1 APPLICATIONS

A. Conductors: Install stranded conductors unless otherwise indicated.

B. Underground Grounding Conductors: Install bare copper conductor, No 2/0 AWG minimum. Bury at least 24 inches (600 mm) below grade.

C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.

D. Conductor Terminations and Connections:

1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.

2. Underground Connections: Welded connectors or irreversible crimp type, except at test wells and as otherwise indicated.

3. Connections to Ground Rods at Test Wells: Bolted connectors.

4. Connections to Structural Steel: Welded connectors or irreversible crimp type.

3.2 EQUIPMENT GROUNDING

A. Install insulated equipment grounding conductors with the following items, in addition to those required by CEC:

1. Feeders and branch circuits.

2. Lighting circuits.

3. Receptacle circuits.

4. Single-phase motor and appliance branch circuits.

5. Three-phase motor and appliance branch circuits.

6. Flexible raceway runs.

7. Armored and metal-clad cable runs.

8. Busway Supply Circuits: Install insulated equipment grounding conductor from grounding bus in the switchgear, switchboard, or distribution panel to equipment grounding bar terminal on busway.

9. Computer and Rack-Mounted Electronic Equipment Circuits: Install insulated equipment grounding conductor in branch-circuit runs from equipment-area power panels and power-distribution units.

B. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.

C. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

D. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.

E. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure and install a separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.

F. Signal and Communication Equipment: For telephone, alarm, voice and data, and other communication equipment, provide No. 4 AWG minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.

1. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a 1/4-by-2-by-12-inch (6-by-50-by-300-mm) grounding bus.

2. Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.

G. Metal Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and a separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors.

3.3 INSTALLATION

A. Grounding Conductors: Route along shortest and straightest paths possible, unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

B. Ground Rods: Drive rods until tops are 2-inches (50 mm) below finished floor or final grade, unless otherwise indicated.

1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating, if any.

2. For grounding electrode system, install at least 3 rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.

C. Test Wells: Ground rod driven through drilled hole in bottom of handhole. Handholes are specified in Section 26 05 33 Raceway and Boxes for Electrical Systems and shall be at least 12 inches (300 mm) deep, with cover.

1. Test Wells: Install at least one test well for each service, unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor.

D. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance, except where routed through short lengths of conduit.

1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.

2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install so vibration is not transmitted to rigidly mounted equipment.

3. Use exothermic-welded connectors for outdoor locations, but if a disconnect-type connection is required, use a bolted clamp.

E. Grounding and Bonding for Piping:

1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes, using a bolted clamp connector or by bolting a lug-type connector to a pipe flange, using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.

2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.

3. Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

END OF SECTION

SECTION 26 05 29

HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes:

1. Hangers and supports for electrical equipment and systems.

2. Construction requirements for concrete bases.

1.2 SUBMITTALS

A. Submit in accordance with Division 1.

B. Shop Drawings: Show fabrication and installation details and include calculations for the following:

1. Trapeze hangers. Include Product Data for components.

2. Steel slotted channel systems. Include Product Data for components.

3. Equipment supports.

1.3 QUALITY ASSURANCE

A. Comply with CEC.

PART 2 - PRODUCTS

2.1 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.

1. Manufacturer: Cooper B-Line, Inc.; a division of Cooper Industries or equal.

B. Raceway and Cable Supports: As described in NECA 1-2000 and NECA 101.

C. Conduit and Cable Support Devices: Steel hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported. Multi-function clips shall be allowable.

D. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.

E. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

F. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:

1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened Portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.

    a. Manufacturer: Powers by DeWalt or equal.

2. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated steel, for use in hardened Portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.

    a. Manufacturers: Cooper B-Line, Inc.; a division of Cooper Industries, Powers by DeWalt or equal.

3. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.

4. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.

5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.

6. Toggle Bolts: All-steel springhead type.

7. Hanger Rods: Threaded steel.

2.2 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Section 05 50 00 Metal Fabrications for steel shapes and plates.

PART 3 - EXECUTION

3.1 APPLICATION

A. Comply with NECA 1-2000 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.

B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as required by NFPA 70. Minimum rod size shall be 1/4 inch (6 mm) in diameter.

C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.

1. Secure raceways and cables to these supports with conduit clamps.

3.2 SUPPORT INSTALLATION

A. Comply with NECA 1-2000 and NECA 101 for installation requirements except as specified in this Article.

B. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb (90 kg).

C. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:

1. To Wood: Fasten with lag screws or through bolts.

2. To New Concrete: Bolt to concrete inserts.

3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.

4. To Existing Concrete: Expansion anchor fasteners.

5. To Light Steel: Sheet metal screws.

6. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that meet seismic-restraint strength and anchorage requirements.

D. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

3.3 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Section 05 50 00 Metal Fabrications for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

3.4 CONCRETE BASES by DIV 03 Contractor

A. Construct concrete bases of dimensions indicated but not less than 4 inches (100 mm) larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.

B. Use 3000-psi (20.7-MPa), 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Section 03 30 00 Cast-in-Place Concrete.

C. Anchor equipment to concrete base.

1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

2. Install anchor bolts to elevations required for proper attachment to supported equipment.

3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.5 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils (0.05 mm).

B. Touchup: Comply with requirements in Section 09 91 00 Painting for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780.

END OF SECTION

SECTION 26 05 33

RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes raceways, fittings, boxes, enclosures, cabinets, and underground duct banks for electrical wiring.

1.2 SUBMITTALS

A. Product Data: For surface raceways, wireways and fittings, floor boxes, hinged-cover enclosures, and cabinets.

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled by a Nationally Recognized Testing Laboratory (NRTL) and marked for intended use.

B. Comply with CEC.

PART 2 - PRODUCTS

2.1 METAL CONDUIT AND TUBING

A. Rigid Steel Conduit: ANSI C80.1.

B. IMC: ANSI C80.6.

C. EMT: ANSI C80.3.

D. FMC: Zinc-coated steel.

E. LFMC: Flexible steel conduit with PVC jacket.

F. Fittings for Conduit (Including all Types and Flexible and Liquidtight), EMT, and Cable: NEMA FB 1; listed for type and size raceway with which used, and for application and environment in which installed.

1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 886.

2. Fittings for EMT: Steel compression or Set Screw type, insulated throat.

2.2 NONMETALLIC CONDUIT AND TUBING

A. ENT: NEMA TC 13.

B. RNC: NEMA TC 2, Type EPC-40-PVC, unless otherwise indicated.

C. LFNC: UL 1660.

D. Fittings for ENT and RNC: NEMA TC 3; match to conduit or tubing type and material.

E. Fittings for LFNC: UL 514B.

2.3 METAL WIREWAYS

A. Manufacturers: Cooper B-Line, Inc., Hoffman, Square D; Schneider Electric, or equal.

B. Description: Sheet metal sized and shaped as indicated, NEMA 250, Type 1, unless otherwise indicated.

C. Fittings and Accessories: Include couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.

D. Wireway Covers: Screw-cover type, or as indicated.

E. Finish: Manufacturer's standard enamel finish.

2.4 SURFACE RACEWAYS

A. Surface Metal Raceways: Steel with snap-on covers Prime coating, ready for field painting.

1. Manufacturers: Thomas & Betts Corporation, Walker Systems, Inc.; Wiremold Company, or equal.

B. Surface Nonmetallic Raceways: Two-piece construction, manufactured of rigid PVC with texture and color selected by University’s Representative.

1. Manufacturers: Hubbell Incorporated; Wiring Device-Kellems Division, Walker Systems, Inc.; Wiremold Company, or equal.

2.5 BOXES, ENCLOSURES, AND CABINETS

A. Sheet Metal Outlet and Device Boxes: NEMA OS 1.

B. Cast-Metal Outlet and Device Boxes: NEMA FB 1, ferrous alloy or aluminum, Type FD, with gasketed cover.

C. Nonmetallic Outlet and Device Boxes: NEMA OS 2.

D. Metal Floor Boxes: Cast or sheet metal, semi-adjustable, rectangular.

E. Nonmetallic Floor Boxes: Nonadjustable, round.

F. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.

G. Cast-Metal Access, Pull, and Junction Boxes: NEMA FB 1, cast aluminum with gasketed cover.

H. Hinged-Cover Enclosures: NEMA 250, Type 1, with continuous-hinge cover with flush latch, unless otherwise indicated.

1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.

2. Nonmetallic Enclosures: Plastic.

I. Cabinets:

1. NEMA 250, Type 1, galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.

2. Hinged door in front cover with flush latch and concealed hinge.

3. Key latch to match panelboards.

4. Metal barriers to separate wiring of different systems and voltage.

5. Accessory feet where required for freestanding equipment.

PART 3 - EXECUTION

3.1 RACEWAY APPLICATION

A. Outdoors: Apply raceway products as specified below, unless otherwise indicated:

1. Exposed Conduit: Rigid steel conduit.

2. Concealed Conduit, Aboveground: EMT or MC Cable.

3. Underground Conduit: RNC, Type EPC-40-PVC, direct buried.

4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC

5. Exposed Boxes and Enclosures, Aboveground: NEMA 250, Type 3R

B. Indoors: Comply with the following indoor applications, unless otherwise indicated:

1. Exposed, Not Subject to Physical Damage: EMT.

2. Exposed, Not Subject to Severe Physical Damage: Rigid steel conduit.

3. Concealed in Ceilings and Interior Walls and Partitions: EMT or MC Cable

4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC, except use LFMC in damp or wet locations.

5. Damp or Wet Locations: Rigid steel conduit.

6. Raceways for Optical Fiber or Communications Cable: EMT, Flex, or Free Air Plenum.

7. Boxes and Enclosures: NEMA 250, Type 1, except use NEMA 250, Type 4, nonmetallic in damp or wet locations.

C. Minimum Raceway Size: Power: 3/4-inch trade size. Communications: 1-inch trade size. All raceways: maximum 40 percent fill.

D. Raceway Fittings: Compatible with raceways and suitable for use and location.

1. Rigid and Intermediate Steel Conduit: Threaded, or threadless compression-type fittings only.

2. Indoor EMT: Set screw or compression type, steel only. Die cast fittings will not be permitted.

3.2 INSTALLATION

A. Comply with NECA 1-2000 for installation requirements applicable to products specified in Part 2 except where requirements on Drawings or in this Article are stricter.

B.

C. Complete raceway installation before starting conductor installation.

D. Support raceways as specified in Section 26 05 29 Hangers and Supports for Electrical Systems.

E. Arrange stub-ups so curved portions of bends are not visible above the finished slab.

F. Install no more than the equal to of four 90-degree bends in any conduit run .

G. Raceways Embedded in Slabs:

1. Run conduit larger than 1-inch (27-mm) trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support.

2. Arrange raceways to cross building expansion joints at right angles with expansion fittings.

3. Change from ENT to RNC, Type EPC-40-PVC, rigid steel conduit, or IMC before rising above the floor.

4. Rigid steel conduit in direct contact with earth, sand or encased in concrete must be double-wrapped with 3M 10- mil tape or equal.

H. Raceway Terminations at Locations Subject to Moisture or Vibration: Use insulating bushings to protect conductors.

I. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than 200-lb (90-kg) tensile strength. Leave at least 12 inches (300 mm) of slack at each end of pull wire.

J. Expansion-Joint Fittings for RNC: Install in each run of aboveground conduit that is located where environmental temperature change may exceed 30 deg F (17 deg C), and that has straight-run length that exceeds 25 feet (7.6 m).

1. Install expansion-joint fittings for each of the following locations, and provide type and quantity of fittings that accommodate temperature change listed for location:

a. Outdoor Locations Not Exposed to Direct Sunlight: 125 deg F (70 deg C) temperature change.

b. Outdoor Locations Exposed to Direct Sunlight: 155 deg F (86 deg C) temperature change.

c. Indoor Spaces: Connected with the Outdoors without Physical Separation: 125 deg F (70 deg C temperature change.

d. Attics: 135 deg F (75 deg C) temperature change.

2. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per deg F (0.06 mm per meter of length of straight run per deg C) of temperature change.

3. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at the time of installation.

K. Flexible Conduit Connections: Use maximum of 72-inches (1830 mm) of flexible

conduit for**,** equipment subject to vibration, noise transmission, or movement; and for transformers and motors.

1. Use LFMC in damp or wet locations.

L. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block and install box flush with surface of wall.

M. Set metal floor boxes level and flush with finished floor surface.

N. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.

O. Color coding for junction boxes:

1. Fire alarm/life safety systems: Fluorescent red.

P. Legibly mark covers using black permanent ink felt pen; identify circuit(s) contained in the box by circuit number(s) and panel designation.

Q. Voice and data outlets shall have a minimum of one (1) 1-inch trade size conduit installed from the device box to readily accessible ceiling space with a standard 4-11/16-inch square by 2-1/8-inch deep device box with a single gang device ring installed flush mounted within the wall, unless otherwise noted.

3.3 INSTALLATION OF UNDERGROUND CONDUIT

1. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through the floor.

a. Couple steel conduits to ducts with adapters designed for this purpose.

b. For stub-ups at equipment mounted on outdoor concrete bases, extend steel conduit horizontally a minimum of 60-inches (1500 mm) from edge of equipment pad or foundation. Install insulated grounding bushings on terminations at equipment.

c. Rigid steel conduit in direct contact with earth, sand or encased in concrete must be double-wrapped with 3M 10-mil tape or equal.

d. Minimum radius of 48 inch for medium voltage conduits.

3.4 UNDERGROUND CONDUIT AND DUCT INSTALLATION

A. Duct lines shall be installed in accordance with the CEC, as shown on the drawings, and as specified.

B. Application:

1. Direct Burial Ducts: Schedule 40 or 80, minimum 24-inches below finished grade.

2. Below Building Slab-on-Grade: Schedule 40 or 80, minimum 4-inches below bottom of slab except that bends and penetrations through floor slab shall be PVC coated, or field-wrapped, galvanized rigid steel.

3. Below Roads and Paved Surfaces: Schedule 80, minimum 36-inches below finished grade.

4. Penetrations of building and equipment slabs: PVC insulated or field-wrapped rigid steel.

5. Concrete encased nonmetallic elbows are an acceptable substitute for rigid metal elbows.

C. Slope duct to drain towards manholes and handholes, and away from building and equipment entrances. Pitch not less than 4-inches per 100-feet.

D. Underground conduit stub-ups to inside of building and exterior equipment shall be PVC insulated rigid steel where it exits concrete.

E. Make joints in ducts and fittings watertight according to manufacturer's instructions. Stagger couplings so those of adjacent ducts do not lie in the same plane.

F. Terminate duct lines at manholes and handholes with end bells or precast terminators spaced 10-inches on center for 5-inch ducts and varied proportionately for other duct sizes. Change from regular spacing to end-bell spacing 10-feet from the end bell without reducing duct line slope and without forming trap in the line. Grout end bells into manhole walls from both sides to provide watertight entrance.

G. Separation between direct buried duct lines shall be 3-inches minimum for like systems and 12 inches minimum between power and signal ducts.

H. For concrete encased duct banks, install plastic spacers at maximum 5-ft. intervals and maintain 3-in. spacing between conduits. Install two reinforcing bars to anchor the conduits at 10-ft. intervals, to prevent floating during concrete pour.

I. Mandrel all ducts upon completion of installation and prior to pulling cables.

J. Medium voltage duct banks shall have minimum 3-inch cover on all sides, 2500 PSI Concrete with 10 lbs. red oxide per cubic yard. No color additive required on secondary duct banks.

3.5 FIRESTOPPING

A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to

restore original fire-resistance rating of assembly. Firestopping materials and installation requirements are specified in Section 07 84 00 Firestopping.

END OF SECTION

SECTION 26 05 53

IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Identification for raceways.
2. Identification of power and control cables.
3. Identification for conductors.
4. Underground-line warning tape.
5. Warning labels and signs.
6. Instruction signs.
7. Equipment identification labels.
8. Miscellaneous identification products.

1.2 SUBMITTALS

A. Submit in accordance with Division 1.

1. Submit one sample of each of the following:
   a. Underground Line Warning Tape (6-inch sample).
   b. Warning Sign (one).
   c. Instruction Sign (one).
   d. Equipment Identification Label (one).

1.3 QUALITY ASSURANCE

A. Comply with ANSI A13.1.

B. Comply with CEC.

C. Comply with 29 CFR 1910.144 and 29 CFR 1910.145.

D. Comply with ANSI Z535.4 for safety signs and labels.

E. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.

PART 2 - PRODUCTS

2.1 POWER AND CONTROL CABLE IDENTIFICATION MATERIALS

A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway and cable size.

B. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

C. Write-On Tags: Polyester tag, 0.010-inch (0.25 mm) thick, with corrosion-resistant grommet and cable tie for attachment to conductor or cable.

1. Marker for Tags: Machine-printed, permanent, waterproof, black ink marker recommended by printer manufacturer.

D. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeve, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.

E. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeve, 2 inches (50 mm) long, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.

2.2 FLOOR MARKING TAPE

A. 2-inch- (50-mm-) wide, 5-mil (0.125-mm) pressure-sensitive vinyl tape, with black and white stripes and clear vinyl overlay.

2.3 UNDERGROUND-LINE WARNING TAPE

A. Tape:

1. Recommended by manufacturer for the method of installation and suitable to identify and locate underground electrical and communications utility lines.

2. Printing on tape shall be permanent and shall not be damaged by burial operations.

3. Tape material and ink shall be chemically inert, and not subject to degrading when exposed to acids, alkalis, and other destructive substances commonly found in soils.

B. Color and Printing:

1. Comply with ANSI Z535.1 through ANSI Z535.5.

2. Inscriptions for Red-Colored Tapes: ELECTRIC LINE, HIGH VOLTAGE, Inscriptions for Orange-Colored Tapes: TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL FIBER CABLE.

C. Tag: Type I:

1. Pigmented polyolefin, bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.

2. Thickness: 4 mils (0.1 mm).

3. Weight: 18.5 lb./1000 sq. ft. (9.0 kg/100 sq. m).

4. 3-Inch (75-mm) Tensile According to ASTM D 882: 30 lbf (133.4 N), and 2500 psi (17.2 MPa).

D. Tag: Type ID:

1. Detectable three-layer laminate, consisting of a printed pigmented polyolefin film, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core, bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.

2. Overall Thickness: 5 mils (0.125 mm).

3. Foil Core Thickness: 0.35 mil (0.00889 mm).

4. Weight: 28 lb./1000 sq. ft. (13.7 kg/100 sq. m).

5. 3-inch (75-mm) Tensile According to ASTM D 882: 70 lbf (311.3 N), and 4600 psi (31.7 MPa).

2.4 WARNING LABELS AND SIGNS

A. Comply with NFPA 70 and 29 CFR 1910.145.

B. Baked-Enamel Warning Signs:

1. Preprinted aluminum signs punched or drilled for fasteners, with colors, legend, and size required for application.

2. 1/4-inch (6.4-mm) grommets in corners for mounting.

3. Nominal size, 7 by 10 inches (180 by 250 mm).

C. Warning label and sign shall include, but are not limited to, the following legends:

1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD EQUIPMENT HAS MULTIPLE POWER SOURCES."

2. Workspace Clearance Warning for 120/208V Equipment: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES." (For 277/480V equipment, increase distance to 42 inches)

2.5 EQUIPMENT IDENTIFICATION LABELS

A. Adhesive Film Label with Clear Protective Overlay: Machine printed, in black, by thermal transfer or equal process. Minimum letter height shall be 3/8-inch (10 mm). Overlay shall provide a weatherproof and UV-resistant seal for label.

B. Self-Adhesive, Engraved, Laminated Acrylic or Melamine Label: Adhesive backed, with white letters on a dark-gray background. Minimum letter height shall be 3/8-inch (10 mm).

C. Stenciled Legend: In nonfading, waterproof, black ink. Minimum letter height shall be 1-inch (25 mm).

2.6 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws, or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.

B. Apply identification devices to surfaces that require finish after completing finish work.

C. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.

D. Attach signs and plastic labels that are not self-adhesive type with mechanical fasteners appropriate to the location and substrate.

E. System Identification Color-Coding Bands for Raceways and Cables: Each color-coding band shall completely encircle cable or conduit. Place adjacent bands of two-color markings in contact, side by side. Locate bands at changes in direction, at penetrations of walls and floors, at 50-foot (15-m) maximum intervals in straight runs, and at 25-foot (7.6-m) maximum intervals in congested areas.

F. Underground-Line Warning Tape: During backfilling of trenches install continuous underground-line warning tape directly above line at 6 to 8-inches (150 to 200 mm) below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16-inches (400 mm) overall.

3.2 IDENTIFICATION SCHEDULE

A. Accessible Raceways and Metal-Clad Cables, 600 V or Less, for Service, Feeder, and Branch Circuits More Than 30 A, and 120 V to ground: Install labels at 30-foot (10-m) maximum intervals.

B. Accessible Raceways and Cables within Buildings: Identify the covers of each junction and pull box of the following systems with self-adhesive vinyl labels with the wiring system legend and system voltage. System legends shall be as follows:

1. Emergency Power.

2. Power.

3. UPS.

C. Power-Circuit Conductor Identification, 600 V or Less: For conductors in vaults, pull and junction boxes, manholes, and handholes, use color-coding conductor tape to identify the phase.

1. Color-Coding for Phase and Voltage Level Identification, 600 V or Less: Use colors listed below for ungrounded service feeder and branch-circuit conductors.

a. Color shall be factory applied or field applied for sizes larger than No. 8 AWG, if authorities having jurisdiction permit.

b. Colors for 480/277V Circuits:

1) Phase A – Brown.

2) Phase B – Orange.

3) Phase C – Yellow.

4) Neutral – White or Gray.

c. Colors for 208/120V Circuits:

1) Phase A: Black.

2) Phase B: Red.

3) Phase C: Blue.

4) Neutral: White

D. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, and signal connections.

1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.

2. Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.

3. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual.

E. Locations of Underground Lines: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable.

1. Limit use of underground-line warning tape to direct-buried cables.

2. Install underground-line warning tape for both direct-buried cables and cables in raceway.

F. Workspace Indication: Install floor marking tape to show working clearances in the direction of access to live parts. Workspace shall be as required by NFPA 70 and 29 CFR 1926.403 unless otherwise indicated. Do not install at flush-mounted panelboards and similar equipment in finished spaces.

G. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: or Baked enamel warning signs.

1. Comply with 29 CFR 1910.145.

2. Identify system voltage with black letters on an orange background.

3. Apply to exterior of door, cover, or other access.

4. For equipment with multiple power or control sources, apply to door or cover of equipment including, but not limited to, the following:

    a. Power transfer switches.

    b. Controls with external control power connections.

H. Operating Instruction Signs: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend where instructions are needed for system or equipment operation.

I. Emergency Operating Instruction Signs: Install instruction signs with white legend on a red background with minimum 3/8-inch- (10-mm-) high letters for emergency instructions at equipment used for power transfer.

J. Equipment Identification Labels: On each unit of equipment, install unique designation label that is consistent with wiring diagrams, schedules, and the Operation and Maintenance Manual. Apply labels to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.

1. Labeling Instructions:

    a. Indoor Equipment: Self-adhesive, engraved, laminated acrylic or melamine label. Unless otherwise indicated, provide a single line of text with 1/2-inch- (13-mm-) high letters on 1-1/2-inch- (38-mm-) high label; where two lines of text are required, use labels 2-inches (50 mm) high.

    b. Outdoor Equipment: Engraved, laminated acrylic or melamine label.

    c. Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.

    d. Unless provided with self-adhesive means of attachment, fasten labels with appropriate mechanical fasteners that do not change the NEMA or NRTL rating of the enclosure.

END OF SECTION

SECTION 26 05 73

SHORT CIRCUIT COORDINATION STUDY

PART 1 – GENERAL

1.1 SUMMARY

A. Provide a complete short circuit study, equipment interrupting or withstand evaluation, and a protective device coordination study for the electrical distribution system.

B. The study to include all portions of the electrical distribution system from the normal and alternate sources of power. Include all portions of the low voltage distribution systems as specified in this Section.

C. Study Basis: Thoroughly cover all normal or alternate operation modes that could produce maximum fault conditions.

1.2 REFERENCES

A. 2019 California Electrical Code - Part 3, Title 24, CCR.

B. NFPA 70 – National Electrical Code.

C. IEEE – Institute of Electronic and Electrical Engineers.

D. ANSI – American National Standard Institute.

1.3 SUBMITTALS

A. Comply with provisions of Division 1.

B. Submit study prior to final approval of the distribution equipment shop drawings.

1.4 QUALITY ASSURANCE

A. Study preparation by a registered electrical engineer, State of California.

B. Study based on the actual equipment and devices selected for the project.

C. Adhere to CEC requirements.

PART 2 – PRODUCTS – Not Used.

PART 3 - EXECUTION

3.1 SHORT-CIRCUIT STUDY

A. Perform study in accordance with applicable ANSI/IEEE Standards.

B. Study Input Data:

1. Utility company's short-circuit 1 and 2 phase contribution and the X/R ratio.
2. Resistance and reactance components of each feeder and branch impedance.
3. Motor and generator contributions.
4. All other applicable circuit parameters that contribute to the short-circuit duty.

C. Calculate the short-circuit momentary duties and interrupting duties on the basis of maximum available fault current at each switchgear bus, switchboard, motor control center, distribution panelboard, pertinent branch circuit panelboards, and other significant locations through the system.

3.2 EQUIPMENT EVALUATION STUDY

A. Perform an equipment evaluation study to determine the adequacy of circuit breakers, controllers, surge arresters, busways, switches, and fuses by tabulating and comparing the short-circuit ratings of these devices with the available fault currents.

B. Notify the IOR and General Contractor, in writing, about any problem areas or inadequacies in the equipment.

3.3 PROTECTIVE DEVICE COORDINATION STUDY

A. Perform a coordination study to select or check the selections of the following protective devices and components.

1. Power fuse ratings.
2. Protective relay characteristics and settings.
3. Ratios and characteristics of associated voltage and current transformers.
4. Low voltage breaker trip characteristics and settings.

B. Provide a coordination study that covers all voltage classes of equipment from the utility's incoming line protective device down to the following:

1. Medium voltage switchboards and distribution equipment.
2. Low voltage switchboards.
3. 480Y/277 and 208Y/120-volt distribution panels.
4. Motor Control Centers.
5. 480Y/277 and 208Y/120-volt panelboards.

C. Plot time-current characteristics of the specified protective devices using log-log paper. Include the following minimum information, as pertinent to system, on plots:

1. Complete titles.
2. Representation 1 line diagram and legends.
3. Power company's relays or fuse characteristics.
4. Significant motor starting characteristics.
5. Complete transformer parameters: include ANSI inrush and withstand curves.
6. Complete operating bands of low voltage circuit breaker trip curves.
7. Fuse curves.
8. Protective relay type selected and curves.
9. Cable damage curves.
10. Symmetrical and asymmetrical fault currents.

D. Maintain reasonable coordination intervals and separation of characteristic curves on plots.

E. Make coordination plots for phase and ground protective devices on a complete system basis.

F. Provide sufficient curves to clearly indicate the coordination achieved to utility main breaker, primary feeder breaker, unit substation primary protective device, main secondary breakers, substation feeder breakers, and load protective device rated 250 amperes or more.

G. A maximum of 8 protective devices are permitted for each plot.

H. Provide a separate tabulated list for the selection and settings of the protective devices. Include the following minimum information:

1. Circuit identification.
2. IEEE device number.
3. Current transformer ratios.
4. Manufacturer, device type and range of adjustment.
5. Recommended settings.

I. Provide a tabulation of recommended power fuse selections for the system.

J. Notify the IOR and General Contractor, in writing, about system discrepancies, problem areas or inadequacies.

3.4 STUDY REPORT

A. Summarized the results of the power system study in 1 bound final report.

B. Organize the report using the following sections:

1. Description, purpose, basis, written scope, and a single-line diagram of the portion of the power system which is included within the scope of study.
2. Tabulations of circuit breaker, fuse, and other equipment ratings versus calculated short-circuit duties, and commentary regarding same.
3. Protective device time versus current coordination curves, tabulations of relay and circuit breaker trip settings, fuse selection, and commentary regarding same.
4. Fault current tabulations including a definition of terms and a guide for interpretation.

3.5 IMPLEMENTATION

A. Coordinate with the provisions of Section 26 05 89 – ELECTRICAL STARTUP.

END OF SECTION

SECTION 26 05 89 - ELECTRICAL STARTUP

PART 1 - GENERAL

1.1 SUMMARY

A. This Section describes the requirements for start-up for Division 26 installed work, including but not limited to:

1. Power distribution system.
2. Emergency power system.

1.2 REFERENCES

A. National Electrical Testing Association (NETA).

B. American National Standard Institute (ANSI).

C. Institute of Electrical and Electronic Engineers (IEEE).

D. Per Section 260500.

E. Division 1 – GENERAL COMMISSIONING REQUIREMENTS.

1.3 SUBMITTALS

A. Comply with provisions of Division 1 - SUBMITTAL PROCEDURES.

B. Collaborate with the General Contractor to provide a complete start-up and training plan submittal for the electrical work.

1.4 QUALITY ASSURANCE

A. Provide testing equipment and accessories that are free of defects and are certified for use.

B. Provide testing equipment with current calibration labels.

C. Comply with start-up procedures to ANSI and IEEE guidelines. Incorporate manufacturer's recommended start-up procedures for equipment.

1.5 COORDINATION

A. Coordinate start-up work with the requirements of Division 1 - PROJECT MANAGEMENT & COORDINATION and GENERAL CONDITIONS.

B. Coordinate start-up requirements noted in other Division 26 Sections.

C. Coordinate commissioning requirements with the Owner's Commissioning Authority.

PART 2 - EXECUTION

3.1 EXAMINATION

A. Verify that equipment testing work is complete before starting functional performance of power equipment.

B. Verify that operational manuals are complete and been approved by the Architect before starting functional performance testing.

C. Inspect equipment and confirm that it is clean and ready for operation. All shipping tags removed, nameplates installed and equipment manuals in place.

3.2 PREPARATION

A. Provide at least one (1) journeyman electrician with tools and equipment necessary to perform functional testing.

B. Provide equipment factory representative for this work when needed.

C. Provide certified testing agency personnel for this work when needed.

3.3 POWER STARTUP

A. Perform start-up work after equipment is installed and system ready for operation.

B. Perform start-up work in accordance with Power Check Lists and equipment manufacturer's standard procedures and check lists, including but not limited to:

1 Verify test readings, such as:

a. Cable DC Hipot.

b. Circuit breaker tripping.

2. Verify that total power system is performing time delays outlined in the design intent under part and full load conditions.

C. Following installation of permanent panel directories, provide two electricians to perform the following verification process for all branch circuits and receptacles:

1. With one electrician stationed at panelboard and one electrician at receptacle or safety switch (in the case of equipment), connect tester and upon opening of corresponding circuit breaker, witness the circuit is de-energized. Provide as-builts as needed.

3.4 CHECKLIST - NORMAL POWER DISTRIBUTION

A. Prior to Functional Performance Test:

1. System in place, including all components indicated, and tested.

2. Connected to utility company power system on a permanent basis.
3. Wiring installed in conduits or other raceways.
4. System checked for unwanted grounds, short-circuits or open circuits.
5. Grounds installed as indicated, including transformers.
6. Equipment connections properly torqued.
7. Equipment, where indicated, on housekeeping pads.
8. Equipment cleaned and shipping blocks removed.
9. Proper ventilation of electrical rooms.
10. Electrical rooms free of foreign pipes and ducts.
11. Equipment labeled.
12. Boxes and nameplates meet color coding requirements.

B. Personnel to be present or assist as required to Perform Functional Performance Test:

1. General Contractor, Mechanical Contractor, Control Contractor, and Electrical Contractor, sub-contractor and specialty contractors as required.
2. Owner's Project Manager/Representative and/or Inspector of Record (I.O.R.).
3. Owner's maintenance staff, as desired.
4. Architect's Design Engineer(s).

C. Functional Performance Test: Demonstrate operation of normal power distribution system per specifications including the following:

1. Verify voltages and amperes at panelboards.
2. Verify voltages and amperes at mechanical motors and other major pieces of equipment.

D. Results:

1. If specified equipment performance is not verified, the General Contractor to have corrections made and reschedule Functional Performance Test as soon as possible after corrective work is completed.

3.5 CHECKLIST - EMERGENCY POWER DISTRIBUTION

A. Prior to Functional Performance Test:

1. System in place, including all components indicated, and tested.
2. Facility shall be connected to utility company power system on a permanent basis before emergency checklist is addressed.
3. Wiring installed in conduits or other raceways.
4. System checks for unwanted grounds, short circuits or open circuits.
5. Grounds installed as indicated, including transformers.

6. Ground fault settings made.
7. Equipment connections properly torqued.
8. Equipment, where indicated, on housekeeping pads.
9. Equipment cleaned and shipping blocks removed.
10. Proper ventilation of electrical rooms.
11. Electrical rooms free of foreign pipes and ducts.
12. Fuel oil in day tanks.
13. Intake and exhaust air, exhaust gas pipe and muffler, fuel oil piping installed.
14. Equipment labeled.
15. Boxes and nameplates meet color coding requirements.
16. Proper phase rotation coordinated between emergency and normal sources.

B. Personnel to be present or assist as required to performance Functional Performance Test:

1. General Contractor, Mechanical Contractor, Control Contractor, and Electrical Contractor, sub-contractors and specialty contractors as required.
2. Owner's Project Manager Representative and/or Inspector of Record (I.O.R.).
3. Owner's maintenance staff, as desired.
4. Architect's Design Engineer(s).

C. Results:

1. If specified equipment performance is not verified, the General Contractor to have corrections made and reschedule Functional Performance Test as soon as possible after corrective work is completed.

D. Reports

1. Submit reports of Functional Performance test (item C above) to Architect.

3.6 TRAINING

A. Coordinate with the training requirements of Division 1 - DEMONSTRATION AND TRAINING.

B. At job completion, allot a period of not less than 2 hours for instruction of building operating and maintenance personnel in the use of all systems. This instruction time (2 hours) is in addition to any instruction time called out in other Division 26 Sections.

C. Instruct all personnel at the same time. Contractor responsible for coordinating factory representative arrangements.

END OF SECTION 26 05 89

SECTION 26 09 13 - POWER MONITORING SYSTEMS AND CONTROL

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish and install a complete Power Monitoring and Control System (PMCS) as described in this specification. The system is defined to include, but not be limited to, remote devices for monitoring, control and protection, device communication interface hardware, inter-communication wiring, and ancillary equipment.

B. The manufacturer shall demonstrate that similar systems have been field installed and successfully operated for at least five years. The PMCS vendor shall have full responsibility for ensuring that the PMCS system performs as specified.

C. PMCS shall have a network system with gateway connection to BMS under Division 23.

1.2 RELATED WORK

A. Division 23.

B. Section 26 36 00: AUTOMATIC TRANSFER SWITCHES.

1.3 REFERENCES

A. All Power Meters shall be UL 508 Listed, CSA approved, and have CE marking. They shall also have certified revenue accuracy as per ANSI C12.20 and IEC 60687 class 0.5S or better.

B. The system shall comply with the applicable portions of NEMA standards. In addition, the control unit shall comply with FCC Emission Standards specified in Part 15, Sub-part J for Class A application.

1.4 SUBMITTALS

A. Indicate electrical characteristics and connection requirements. When PMCS components are installed by the power equipment manufacturer, the power equipment shop drawings shall clearly identify the components, the internal connections, and all contractor connections. The PMCS drawings shall show all PMCS components including necessary component dimensions; type, size, and weight; location of conduit entry and exit; single line diagram indicating external wiring requirements. Drawings shall identify terminal blocks used for interconnections and wire type to be used.

B. Product Data: Provide catalog sheets and technical data sheets to indicate physical data and electrical performance, electrical characteristics, and connection requirements.

1.5 QUALITY

A. The PMCS vendor shall be ISO 9000 registered to demonstrate quality compliance.

B. PMCS components included within the power equipment lineups shall be factory installed, wired, and tested prior to shipment to the job site.

PART 2 - PRODUCT

2.1 MANUFACTURERS

A. Square D Circuit Monitor Model PM8000 series.

B. Eaton IQ Analyzer Model IQA6600 series.

C. Approved equal.

2.2 POWER METERS

A. General Provisions:

1. All setup parameters required by the Power Meter shall be stored in nonvolatile memory and retained in the event of a control power interruption.
2. The Power Meter may be applied in three-phase, three- or four-wire systems.

B. Measured values:

1. The Power Meter shall provide the following, true RMS metered quantities:
   a. Real-Time Readings:
      1) Current (Per-Phase, N (calculated), 3-Phase Avg, % Unbalanced).
      2) Voltage (L–L Per-Phase, L-L 3-Phase Avg, L–N Per-Phase, 3-Phase Avg, % unbalanced).
      3) Real Power (Per-Phase, 3-Phase Total).
      4) Reactive Power (Per-Phase, 3-Phase Total).
      5) Apparent Power (Per-Phase, 3-Phase Total).
      6) Power Factor (Per-Phase, 3-Phase Total).
      7) Frequency.
      8) THD (Current and Voltage).
   b. Energy Readings:
      1) Accumulated Energy (Real kWh, Reactive kVarh, Apparent KVAh) (Signed/Absolute).
      2) Incremental Energy (Real kWh, Reactive kVarh, Apparent KVAh) (Signed/Absolute).

c. Demand Readings:

1) Demand Current Calculations (Per-Phase, 3-Phase Avg, Neutral):

(i) Present.

(ii) Running Average.

(iii) Last completed interval.

(iv) Peak.

2) Demand Real Power Calculations (3-Phase Total):

(i) Present.

(ii) Running Average.

(iii) Last completed interval.

(iv) Predicted.

(v) Peak.

(vi) Coincident with peak kVA Demand.

(vii) Coincident with kVAR Demand.

3) Demand Reactive Power Calculations (3-Phase Total):

(i) Present.

(ii) Running Average.

(iii) Last completed interval.

(iv) Predicted.

(v) Peak.

(vi) Coincident with peak kVA Demand.

(vii) Coincident kW Demand.

4) Demand Apparent Power Calculations (3-Phase Total):

(i) Present.

(ii) Running Average.

(iii) Last completed interval.

(iv) Predicted.

(v) Peak.

(vi) Coincident with peak kVA Demand.

(vii) Coincident kW Demand.

5) Average Power Factor Calculations, Demand Coincident (True), (3-Phase Total):

(i) Last completed interval.

(ii) Coincident with kW peak.

(iii) Coincident with kVAR peak.

(iv) Coincident with kVA peak.

d. Power Analysis Values:

1) THD – Voltage, Current (3-Phase, Per-Phase, Neutral).

2) THD - Voltage, Current (3-Phase, Per-Phase, Neutral).

3) Displacement Power Factor (Per-Phase, 3-Phase).

4) Fundamental Voltage, Magnitude and Angle (Per-Phase).

5) Fundamental Currents, Magnitude and Angle (Per-Phase).

6) Fundamental Real Power (Per-Phase, 3-Phase).

7) Fundamental Reactive Power (Per-Phase).

8) Harmonic Power (Per-Phase, 3-Phase).

9) Phase Rotation.

10) Unbalance (Current and Voltage).

11) Harmonic Magnitudes & Angles for Current and Voltages (Per Phase) up to the 31st.

C. Demand

1. All power demand calculations shall use one of the following calculation methods, selectable by the user:

a. Thermal demand using a sliding window updated every second for the present demand and at the end of the interval for the last interval. The window length shall be set by the user from 1-60 minutes in one-minute increments.

b. Block interval, with optional sub-intervals. The window length shall be set by the user from 1-60 minutes in 1-minute intervals. The user shall be able to set the sub-interval length from 1-60 minutes in 1-minute intervals.

D. Sampling

1. The current and voltage signals shall be digitally sampled at a rate high enough to provide true rms accuracy to the 63rd harmonic (fundamental of 60 Hz).

2. The Power Meter shall provide continuous sampling at a minimum of up to 128 samples/cycle, simultaneously on all voltage and current channels in the meter.

E. Minimum and Maximum Values:

1. The Power Meter shall provide monthly minimum and maximum values for the following parameters:

a. Voltage L-L.

b. Voltage L-N.

c. Current per phase.

d. Voltage L-L Unbalance.

e. Voltage L-N Unbalance.

f. True Power Factor.

g. Displacement Power Factor.

h. Real Power Total.

i. Reactive Power Total.

j. Apparent Power Total.

k. THD Voltage L-L.

l. THD Voltage L-N.

m. THD Current.

n. Frequency.

2. For each min/max value listed above, the Power Meter shall record the following attributes:

   a. Date/Time of the min/max value.

   b. Min/Max. Value.

   c. Phase of recorded Min/Max (for multi-phase quantities).

3. Minimum and maximum values shall be available via communications and display.

F. Harmonic Resolution

1. Advanced harmonic information shall be available via the Power Meter. This shall include the calculation of the harmonic magnitudes and angles for each phase voltage and current through the 31st harmonic.

2. Harmonic information shall be available for all three phases, current and voltage, plus the residual current. To ensure maximum accuracy for analysis, the current and voltage information for all phases shall be obtained simultaneously from the same cycle.

3. The harmonic magnitude shall be reported as a percentage of the fundamental or as a percentage of the rms values, as selected by the user.

G. Current Inputs

1. The Power Meter shall accept current inputs from standard instrument current transformers with 5-amp secondary output and shall have a metering range of 0-10 amps with the following withstand currents: 15 amp continuous, 50 amp 10 sec per hour, 500 amp 1 sec per hour.

2. Current transformer primaries through 327 kA shall be supported.

H. Voltage Inputs

1. The circuit monitor shall allow connection to circuit up to 600 volts AC without the use of potential transformers. The Power Meter shall also accept voltage inputs from standard instrument potential transformers with 120-volt secondary output. The Power Meter shall support PT primaries through 3.2 MV.
2. The nominal full-scale input of the circuit monitor shall be 347 Volts AC L-N, 600 Volts AC L-L. The meter shall accept a metering over-range of 50%. The input impedance shall be greater than 2 Ohm.

I. Accuracy

1. The Power Meter shall comply with ANSI C12.20 Class 0.5 and IEC 60687 Class 0.5 for revenue meters.
2. The Power Meter shall be accurate to 0.25% of reading + .025% of full scale for power and energy. Voltage and current shall be accurate to 0.075% of reading plus 0.025% of full scale. Power factor metering shall be accurate to ±.002 from 0.5 leading to 0.5 lagging. Frequency metering shall be accurate ±.01 Hz at 45-67 Hz.
3. These accuracies shall be maintained for both light and full loads.
4. No annual calibration shall be required to maintain this accuracy.

J. Alarming

1. Alarm events shall be user definable.
2. The user shall be able to define over 50 alarm conditions.
3. The following shall be available as alarm events:
   a. Over/under current.
   b. Over/under voltage.
   c. Current imbalance.
   d. Phase loss, current.
   e. Phase loss, voltage.
   f. Voltage imbalance.
   g. Over kW Demand.
   h. Phase reversal.
   i. Digital Input OFF/ON.
   j. End of incremental energy interval.
   k. End of demand interval.
4. For each over/under metered value alarm, the user shall be able to define a pick-up, drop-out, and delay.

5. There shall be four alarm severity levels in order make it easier for the user to respond to the most important events first.

6. Indication of an alarm condition shall be given on the front panel.

K. Feature Addition

1. It shall be possible to field upgrade the firmware in the Power Meter to enhance functionality. These firmware upgrades shall be done through the communication connection and shall allow upgrades of individual meters or groups. No disassembly or changing of integrated circuit chips shall be required and it will not be necessary to de-energize the circuit or the equipment to perform the upgrade.

L. Communications

1. The Power Meter shall communicate to the BACnet BMS via the Local Device Network. Coordinate protocol requirements with BMS Contractor.

M. Display

1. The Power Meter display terms in the English language.

2. The Power Meter display shall be back lit LCD for easy viewing, display shall also be anti-glare and scratch resistant.

3. The Display shall be capable of allowing the user to view four values on one screen at the same time. A summary screen shall also be available to allow the user to view a snapshot of the system.

4. The Power Meter display shall provide local access to the following metered quantities:

   a. Current, per phase rms, 3-phase average and neutral (if applicable).

   b. Voltage, phase-to-phase, phase-to-neutral, and 3-phase average (phase-to-phase and phase-to-neutral).

   c. Real power, per phase and 3-phase total.

   d. Reactive power, per phase and 3-phase total.

   e. Apparent power, per phase and 3-phase total.

   f. Power factor, 3-phase total and per phase.

   g. Frequency.

   h. Demand current, per phase and three phase average.

   i. Demand real power, three phase total.

   j. Demand apparent power, three phase total.

   k. Accumulated Energy, (MWh and MVARh).

   l. THD, current and voltage, per phase.

5. Reset of the following electrical parameters shall also be allowed from the Power Meter display:
   a. Peak demand current.
   b. Peak demand power (kW) and peak demand apparent power (kVA).
   c. Energy (MWh) and reactive energy (MVARh).
6. Setup for system requirements shall be allowed from the Power Meter display. Setup provisions shall include:
   a. CT rating.
   b. PT rating.
   c. System type.
   d. Watt-hours per pulse.

2.3 LOCAL DEVICE NETWORK

A. The local device network shall be interconnected with #18 gauge twisted pair shielded cable, 600 V Class Belden 9463 family, in properly sized conduit (when run outside of factory assembled equipment for the communication channel).

B. The local device network shall support up to five (5) data lines in a “star” configuration to minimize cable routing cost. The network shall support up to 200 devices on the five (5) data lines without repeaters providing the maximum cable distance between the ends of the longest lines is less than 10,000 feet.

C. The cabling shall be polarity insensitive. The communication speed at the device level shall be a minimum of 9600 baud. Devices shall communicate at their maximum baud rate regardless of the number of devices on the network.

D. All local device network communication system components shall have a dielectric isolation of a minimum of 2200 volts line-to-ground without damage to communication capability.

E. The local device network must permit the extension of the network via simple taps off of the main run without the need for doubling the cabling by inserting a new series connection into the main run.

F. Where Modbus interface to devices is required, (RS485PONI, MMINT, IQ7000, IQ230M & IQ330M), the contractor is to provide approved cabling and follow all Modbus wiring rules. Wiring to Modbus devices is to be limited to the appropriate number of devices per node, (i.e., 32), and is to include terminating resistors at the end of cable runs where required.

2.4 COMPONENT NETWORK INTERFACE

A. Furnish and install all required network interface modules for connection of the local device network to the BACnet BMS furnished under Division 23.

B. Coordinate with the BMS Contractor for physical media and protocol requirements. All work required for integration of the PMCS network and the BMS network is required under this Section of the Specifications.

PART 3 - EXECUTION

3.1 INSTALLATION

A. PMCS components, including Power Meters, Electronic Trip Units, Transformer Temperature Monitors, Motor Protection Devices, and Digital Relays, included within the power equipment lineups shall be factory installed, wired, and tested prior to shipment to the job site.

B. All control power, CT, PT and data communications wire shall be factory wired and harnessed within the equipment enclosure.

C. Where external circuit connections are required, terminal blocks shall be provided, and the manufacturer's drawings must clearly identify the interconnection requirements including wire type to be used.

D. All wiring required to externally connect equipment lineups shall be installed by the electrical contractor.

E. Contractor interconnection wiring requirements shall be clearly identified on the PMCS system drawings.

3.2 SYSTEM START-UP AND TRAINING

A. On-site start-up and training of the PMCS shall be included in the project bid.

B. Start-up shall include a complete working demonstration of the PMCS with simulation of possible operating conditions that may be encountered.

C. Training shall include any documentation and hands-on exercises necessary to enable electrical operations personnel to assume full operating responsibility for the PMCS after completion of the training period.

END OF SECTION 26 09 13

SECTION 26 09 43

NETWORK LIGHTING CONTROLS

PART 1 – GENERAL

1.1 INTRODUCTION

A. The work covered in this section is subject to the requirements in the General Conditions of the Specifications. Contractor shall coordinate the work in this section with the trades covered in other sections of the specification to provide a complete and operable system.

1.2 SYSTEM DESCRIPTION

A. Extent of lighting control system work is indicated by drawings and by the requirements of this section. It is the intent of this section to provide an integrated, energy saving lighting control system including Lighting Controllers, Photocells, Light Level Sensors, and Daylighting Controls from a single supplier. Contractor is responsible for confirming that all components operate as a single system.

1.3 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in the manufacture of lighting control equipment and ancillary equipment, of types and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Comply with CEC, NEMA, and FCC Emission requirements for Class A applications.

1.4 SUBMITTALS

A. Submit manufacturer's data on lighting control system and components including shop drawings, detailed point to point wiring diagrams, and floor plans showing occupancy and daylighting sensor locations. Provide typical mounting details for occupancy and daylighting sensors for this application.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. WattStopper Digital Lighting Management System

B. Approved equal:

1. Contractor shall be completely responsible for providing a system meeting this specification in its entirety.

2. All deviations from this specification must be listed and individually signed off by the consultant.

2.2 ADVANCED COMMUNICATIONS, INTEGRATION AND PC CONNECTIVITY

A. Provide an advanced communications network that supports PC connectivity, TCP/IP connections, advanced programming system documentation, enhanced diagnostics, historical and runtime accumulation, and graphic programming and control.

1. The system shall support the following advanced operating scenarios:
    a. Adjustable override periods for after hour use based upon the day of the week.
    b. Preemptive override before OFF to prevent blink warning and to start a new override time delay.
    c. Allow common areas to remain ON when specific relays in a panel are ON. Egress timer starts a countdown when the last watched relay turns OFF.
    d. Master Switch Control with blink option to provide a blink warning and five-minute countdown for occupants when a master switch is turned OFF.
    e. Interior daylighting control to turn OFF lights when available natural light meets occupants' lighting needs. Lights will only come on during occupied periods when enough natural light is not available.
    f. Occupancy Sensor Integration: Allows relays to automatically follow occupancy sensors' status or interlock the sensors with daily schedules.
2. Communications:
    a. Each panel shall support RS232 twisted pair and optional RS-485 connections. Either protocol may be used for programming, monitoring, and control. The data line shall allow simultaneous operation of multiple communications access points to support multiple operator terminals and communications with other building automation systems.
    b. Each panel shall be capable of stand-alone automatic operation and the network shall achieve full distributed processing.
    c. All programming shall be accomplished with a Windows based PC running compatible software package.
3. Hardware Features:
    a. Each communication control card shall be capable of providing all logic, control, runtime data, status information, and communications functions for up to 48 relays in a panel.
    b. EEPROM power loss memory and clock holdup time: 30 days.
    c. Self-diagnostics: Automatic diagnostics on all memory, input/output card modules, relays, and dataline.
    d. Clock: Digital with time, day of week, and date. Automatic leap year compensation. Programmable Daylight Savings Time and Standard Time adjustment.

4. Win Control Software:

a. Schedules:

1) Each communication control card shall support up to 24 unique weekly schedules out of a total of 1,000 available per system. Each schedule shall allow up to eight events per day for a repeating seven-day week.

2) Up to 32 holidays may be defined for any specific date. On that date any of the three holiday schedules may be assigned.

3) Relays may be programmed to switch to a different weekly schedule on any specific date, and then revert back to normal at another time. This allows for future schedule changes to be programmed ahead of time.

4) "Spring Ahead" and "Fall Back" dates for daylight savings time changes may be entered full two years ahead. Software also supports the ability to "Auto fill" in the next two occurrences of each of these dates.

b. Time Delay / Blink Warning:

1) Used during unoccupied periods, assignable for each relay.

(i) Time delays from 2 to 1,440 minutes.

(ii) Blink Warning: 1-second OFF blink followed by a 5-minute grace period before OFF.

(iii) An optional second blink warning one minute before OFF.

2) Operates automatically for all scheduled OFFs and time delay overrides.

3) Occupant overrides may be entered before the blink warning to prevent a scheduled blink and shutdown.

c. A total of 32 sets of trigger parameters may be established per panel.

d. Telephone Override:

1) Each relay shall respond to up to eight different telephone override codes. Maximum of 9999 telephone codes can be programmed.

e. Runtime Counters for Each Relay:

1) Cumulative runtime (up to 31 years) and number of cycles (up to 17 million) since last reset. User re-settable.

2) Daily runtime for the current day and each of the prior 40 days.

3) Monthly runtime for current and 14 prior months.

f. Activity Logs:

1) Store previous relay events including the time, new state, and cause for the change in state.

2) Annunciate over the dataline and RS232 port when the table is 25%, 50%, 75% and 100% full.

2.3 OPERATOR'S SOFTWARE

A. User programming and editing shall be conducted both online and offline in a Windows based software application.

B. Data shall be entered through a simple menu-driven user interface.

C. The software shall simplify integration with other software products by allowing the lighting control manufacturer's components to be embedded into other Windows applications. These features shall include the following:

1. BACnet connectivity with optional WebLink.
2. Drag and Drop interface programming supported throughout the program.

D. Basic operating software provides the following:

1. Site wiring documentation for all connected relay panels and system components.
2. English descriptions of each relay's circuit designation, circuit description, switch, and calculated load.
3. RS232 and TCP/IP Connection to Lighting Control Panel.
4. Monitor/Control all relays. Software shall show actual relay states, with an optional menu showing how and when the relay state occurred, and when next scheduled to change.
5. Simulate all functions.

E. System Parameters

1. System software to be sized based appropriately for the system – 250, 500, 750 or unlimited relays. Any number of sites may be programmed from a single software package (based on hard drive space).
2. Passwords Matrix Features allowed per site.
3. User defines functions accessible for each password (Document, Program, Initialize, Transfer from PC, Transfer to PC, Control, Simulate/Test).
4. Configure software to automatically contact remote sites using a modem or I/P address.

F. Other Features

1. Online help brings up a context sensitive help screen.
2. One step menu option to back up all site information to a backup drive.
3. The software shall include Trends and Relay Runtime Analysis that will allow the operator to analyze the operation of specific areas and identify those exceeding normal runtimes. Individual relays may be assigned a kWh weighted value or simply analyzed on a runtime basis. In both cases, the relays may be assigned to logical groups and plotted for the last 30 days or 12 months.

G. System Design Capability

1. From the lighting control system software database, the software shall be able to automatically create a system single line drawing, panel schedules and specifications that can be exported in DXF format for use in standard CAD drawings.

2.5 DIGITAL CONTROL DEVICES

A. Digital control devices shall be Wattstopper or equivalent:

1. Digital wall switch occupancy sensor: Wattstopper LMDW-102-W. Where device is shown with subscript “D,” program to dim.
2. Wall mounted dimmer control station: Wattstopper LMDM-101-W.
3. Wall mounted control station: Wattstopper LMSW-101-W.
4. Room controller relay: Wattstopper, as noted below:
   a. 1-switchleg, dimming: LMRC-211
   b. 2-switchleg, dimming: LMRC-212
   c. 3-switchleg, dimming: LMRC-213
   d. 1-switchleg, ON/OFF: LMRC-101
   e. 2-switchleg, ON/OFF: LMRC-102
5. Ceiling occupancy sensor: Wattstopper LMDC-100.
6. UL-924 emergency lighting short relay: Wattstopper ELCU-100

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer’s instructions.

B. Route wiring continuous between devices without splices.

C. Install all Class 1 line voltage wiring in conduit. Maintain complete separation between normal and emergency power wiring. Do not mix wiring of different voltage systems in the same conduits or boxes unless separated by metallic barrier.

D. Support Class 2 low voltage cable using bridle rings and J-hooks. Attach bridle rings to rod, using spring clips, above suspended ceilings.

E. Do not attach cable to ceiling wires, ceiling supports, conduits, ducts, or piping.

F. Use plenum rated cable for spaces used for environmental air.

G. Install Dataline riser cables in conduit.

H. Install cable in conduit above inaccessible ceiling spaces, in walls, and exposed wiring locations.

I. Install insulated throat fittings on conduit stub-outs for cable protection.

J. Install pull cord in empty conduits.

K. Provide nameplates and cable tags under provisions of Section 26 0553 – ELECTRICAL IDENTIFICATION.

3.2 WIRING

A. Terminate all wiring with manufacturer approved connectors.

B. All wiring shall be free from shorts and faults.

3.3 SYSTEM START UP AND COMMISSIONING

A. Manufacturer shall provide a factory authorized technician to confirm proper installation and operation of all lighting control system components. The startup requirement is intended to verify:

1. That all occupancy and daylighting sensors are located, installed, and adjusted as intended by the factory and the contract documents.
2. The occupancy sensors and daylighting sensors are operating within the manufacturer's specifications.
3. The sensors and relay panels interact as a complete and operational system to meet the design intent.

B. Manufacturer to provide a written statement verifying that the system meets the above requirements.

3.4 SYSTEM TRAINING

A. Manufacturer shall provide factory authorized technician to train owner personnel in the operation, programming and maintenance of the lighting control system including all occupancy sensors and daylighting controls.

3.5 SYSTEM PROGRAMMING

A. Manufacturer shall provide system programming including:

1. Wiring documentation.
2. Switch operation.
3. Telephone overrides.

Operating schedules.

3.7 RECORD DRAWINGS

A. Provide as built drawings of all installed components and associated wiring on building plans and system wiring diagrams.

END OF SECTION

SECTION 26 22 13 – LOW VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 SUMMARY

A. Two-winding transformers.

1.2 REFERENCES

A. NEMA ST 1 - Specialty Transformers (Except General-Purpose Type).

B. NEMA ST 20 - Dry-Type Transformers for General Applications.

C. Per Section 26 05 00.

1.3 SUBMITTALS

A. Comply with provisions Division 1 - SUBMITTAL PROCEDURES.

B. Product Data: Provide outline and support point dimensions of enclosures and accessories, unit weight, voltage, kVA, and impedance ratings and characteristics, tap configurations, insulation system type, and rated temperature rise.

C. Seismic Mounting: Provide transformer anchorage details.

1.4 QUALITY ASSURANCE

A. Furnish products listed and classified by Underwriters Laboratories, Inc. and suitable for purpose specified and indicated.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Division 1 - PRODUCT REQUIREMENTS: Transport, handle, store, and protect products.

B. Store in a clean, dry space. Maintain factory wrapping or provide an additional heavy canvas or heavy plastic cover to protect units from dirt, water, construction debris, and traffic.

C. Handle in accordance with manufacturer's written instructions. Lift only with lugs provided for the purpose. Handle carefully to avoid damage to transformer internal components, enclosure, and finish.

D. If exposed to weather of any kind, provide space heaters, and maintain winding temperature at minimum 70 deg. F for the duration of the exposure.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Square D.

B. Eaton.

C. PowerSmiths International Corp.

D. General Electric.

E.Or Equal

2.2 TWO-WINDING TRANSFORMERS

A. Description: NEMA ST 20, factory-assembled, air-cooled dry type transformers, ratings as indicated.

B. Primary Voltage: 480 volts, 3 phase.

C. Secondary Voltage: 208Y/120 volts, 3 phase.

D. Insulation system and average winding temperature rise for rated kVA as follows:

1. 1-15 kVA: Class 185 with 80 degrees C rise.
2. 16-500 kVA: Class 220 with 150 degrees C rise.

E. Case temperature: Do not exceed 40 degrees C (maximum) and 30 degrees C (average) rise above ambient at warmest point at full load.

F. Winding Taps:

1. Transformers Less than 15 kVA: Two 5 percent below rated voltage, full capacity taps on primary winding.
2. Transformers 15 kVA and Larger: NEMA ST 20.

G. Sound Levels: NEMA ST 20.

H. Basic Impulse Level: 10 kV for transformers less than 300 kVA, 30 kV for transformers 300 kVA and larger.

I. Ground core and coil assembly to enclosure by means of a visible flexible copper grounding strap.

J. Mounting:

1. 1-15 kVA: Suitable for wall mounting.
2. 16-75 kVA: Suitable for wall, floor, or trapeze mounting.
3. Larger than 75 kVA: Suitable for floor mounting.

K. Coil Conductors: Continuous copper or aluminum windings with terminations brazed or welded.

L. Enclosure: NEMA ST 20, Type 1 or 3R, ventilated, as indicated on the Drawings. Provide lifting eyes or brackets.

M. Isolate core and coil from enclosure using vibrating-absorbing mounts.

N. Energy Efficiency: All dry type transformers shall meet NEMA TP1 energy efficient (EE) requirements.

Nameplate: Include transformer connection data and overload capacity based on rated allowable temperature rise.

2.3 SOURCE QUALITY CONTROL

A. Production test each unit according to NEMA ST20.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Set transformer plumb and level.

B. Use flexible conduit, under the provisions of Section 26 05 33, 2 feet minimum length, for connections to transformer case. Make conduit connections to side panel of enclosure.

C. Mount wall-mounted transformers using integral flanges or accessory brackets furnished by the manufacturer.

D. Install floor-mounted transformers directly to floor slab per mounting details on drawings.

E. Mount trapeze-mounted transformers as indicated, otherwise floor mount.

F. Provide seismic restraints in accordance with California Building Code Title 24 and Uniform Building Code requirements.

G. Provide grounding and bonding in accordance with Section 26 05 26 - GROUNDING AND BONDING.

3.2 EQUIPMENT ENERGIZING

A. Clean and test equipment before energizing.

B. Maintain locked, clean and dust free premise for energized equipment.

3.3 TESTING & STARTUP

A. Refer to Section 26 05 89 -ELECTRICAL STARTUP requirements.

END OF SECTION 26 22 13

SECTION 26 24 13 - SWITCHBOARDS

PART 1 - GENERAL

1.1 SUMMARY

A. Switchboards.

B. Switchboard accessories.

1.2 REFERENCES

A. NEMA AB 1 - Molded Case Circuit Breakers.

B. NEMA PB 2 - Dead Front Distribution Switchboards.

C. NEMA PB 2.1 - Instructions for Safe Handling, Installation, Operation and Maintenance of Dead Front Switchboards Rated 600 Volts or Less.

D. UL 891 - Switchboards.

E. Per Section 26 05 00.

1.3 SUBMITTALS

A. Comply with provisions of Division 1 - SUBMITTAL PROCEDURES.

B. Product Data: Provide electrical characteristics including voltage, frame size and trip ratings, fault current withstand ratings, and time-current curves of all equipment and components.

C. Shop Drawings: Indicate front and side views of enclosures with overall dimensions shown; conduit entrance locations and requirements; nameplate legends; size and number of bus bars per phase, neutral, and ground; and switchboard instrument details.

D. Seismic Design: Provide switchboard anchorage detail and manufacturer’s seismic certification.

1.4 SUBMITTAL FOR CLOSEOUT

A. OPERATION AND MAINTENANCE DATA: Submittals for project closeout.

B. Record actual locations of switchboard in project record documents.

C. Maintenance Data: Include spare parts listing; source and current prices of replacement parts and supplies; and recommended maintenance procedures and intervals.

1.5 QUALITY ASSURANCE

A. Seismic Qualifications: Provide switchboard that is designed and constructed in accordance with earthquake regulations of the Uniform Building Code and California Title 24.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Division 1 - PRODUCT REQUIREMENTS: Transport, handle, store, and product products.

B. Deliver in 50-inch maximum width shipping splits, individually wrapped for protection, and mounted on shipping skids.

C. Store in a clean, dry space. Maintain factory wrapping or provide an additional heavy canvas or heavy plastic cover to protect units from dirt, water, construction debris, and traffic.

D. Handle in accordance with NEMA PB 2.1 and manufacturer's written instructions. Lift only with lugs provided for the purpose. Handle carefully to avoid damage to switchboard internal components, enclosure, and finish.

E. Protect switchgear from moisture by using appropriate heaters as instructed by the manufacturer.

1.7 FIELD MEASUREMENTS

A. Verify that field measurements are as indicated on shop drawings.

1.8 MAINTENANCE MATERIALS

A. Division 1 - CLOSEOUT PROCEDURES.

B.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Square D.

B. Eaton.

C. Other approved manufacturer.

2.2 SWITCHBOARD

A. Description: NEMA PB 2 switchboard with electrical ratings and configurations as indicated and specified.

B. Provide ratings as shown on the Drawings.

C. Line and Load Termination: Accessible from the front, suitable for the conductor material used.

D. Main and Distribution Section Devices: Group mounted for 1200 ampere and smaller. Individually mounted for larger than 1200 ampere.

E. Bus Material: Copper.

F. Bus Connections: Bolted, accessible from front for maintenance.

G. Feeder Circuit Breakers Larger than 1600 Ampere: NEMA PB 2, factory-assembled insulated case circuit breaker, fixed mounted construction, manually operated. Equip with electronic trip sensing.

H. Feeder Circuit Breakers 1600 Ampere and smaller: Provide molded case circuit breakers, manually operated. Equip with electronic trip sensing.

I. Electronic Sensing: provide microprocessor based selectable trip unit, self-contained and field changeable. Equip with following trip-timing functions and features:

1. Protection: Long Time/Short Time/Instantaneous.
2. Information: Provide cause of trip indications or alarm switch.
3. Testing: Provide field testing provisions. Include test accessories, such as test kit.
4. Field interchangeable rating plugs.
5. Ground Fault Protection: As indicated or otherwise noted.

J. Interrupting Capacity: Minimum capacity as indicated on the Drawings.

K. Future Provisions: Fully equip spaces for future devices with bussing and bus connections, suitably insulated and braced for short circuit currents. Provide continuous current rating as indicated.

L. Provide ground fault protection where indicated. Provide ground fault protection on all switchboard main devices. Protection shall be integral to the electronic trip unit or an external relay system when thermal-magnetic circuit breakers are provided.

2.3 FABRICATION

A. Comply with the requirements of NEMA PB 2.

B. Comply with seismic qualifications in accordance with the California Building Code.

C. Construction: Indoor.

D. Ground Bus: Copper; extend length of switchboard. Ampacity not less than 25 percent of main bus rating.

E. Bussing Arrangement: A-B-C arrangement, left-to-right, top-to-bottom, front-to-rear, as viewed from the front.

F. Provide 100 percent rated capacity neutral bus.

G. Provide 100 percent rated capacity main bus throughout switchboard.

H. Provide accessory fuse blocks, control devices and wiring as required. Use 14 AWG (minimum) grey switchboard type wire. Terminate conductors using terminal blocks.

I. Provide Infrared Scanning Windows in exterior enclosure for all field terminations. Scanning windows shall be at least 4-inch diameter. FLIR IRW-4C or approved equal.

2.4 FACTORY FINISHES

A. Clean surfaces before applying paint.

B. Apply corrosion-resisting primer to all surfaces.

C. Apply finish coat of baked enamel paint to 4 mils thick.

D. Finish Color: Manufacturer’s standard light grey finish.

2.5 NAMEPLATES

A. Nameplates and Warning Signs: Refer to Section 26 05 53 - ELECTRICAL IDENTIFICATION, for instructions.

2.6 SOURCE QUALITY CONTROL

A. Shop inspects and test switchboard according to NEMA PB 2.

PART 3 - EXECUTION

3.1 PREPARATION

A. Division 1 - PROJECT MANAGEMENT & COORDINATION: Verification of existing conditions prior to beginning work.

B. Provide concrete housekeeping pad.

3.2 SEISMIC MOUNTING

A. Provide switchboard anchorage details, coordinated with the switchboard mounting provision, prepared, and stamped by a licensed structural engineer.

B. Install switchboard in accordance with earthquake regulations of the California Building Code.

3.3 INSTALLATION

A. Install switchboard in locations shown on Drawings, according to NEMA PB 2.1.

B. Tighten and torque accessible bus connections and mechanical fasteners, in accordance with manufacturer’s instructions, after placing switchboard.

3.5 SWITCHBOARD ENERGIZING

A. Clean and test switchboard before energizing.

B. Maintain locked, clean and dust free premise for energized switchboard.

3.6 STARTUP

A. Refer to Section 26 05 89 - ELECTRICAL STARTUP requirements.

END OF SECTION 26 24 13

SECTION 26 24 16 - PANELBOARDS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes distribution panelboards and lighting and appliance branch-circuit panelboards.

1.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Panelboards shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For each panelboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.
2. Detail enclosure types and details for types other than NEMA 250, Type 1.
3. Detail bus configuration, current, and voltage ratings.
4. Short-circuit current rating of panelboards and overcurrent protective devices.
5. Include evidence of NRTL listing for series rating of installed devices.
6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
7. Include wiring diagrams for power, signal, and control wiring.
8. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards.

C. Seismic Qualification Certificates: Submit certification that panelboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in CBC Chapter 16.

D. Field quality-control reports.

E. Panelboard schedules for installation in panelboards.

F. Operation and maintenance data.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled by a Nationally Recognized Testing Laboratory (NRTL), and marked for intended location and application.

B. Comply with NEMA PB 1.

C. Comply with CEC.

1.5 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.

1. Warranty Period: 1 year upon substantial completion date.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR PANELBOARDS

A. Fabricate and test panelboards according to IEEE 344 to withstand seismic forces in accordance with CBC Chapter 16.

B. Enclosures Flush- and surface-mounted cabinets.

1. Rated for environmental conditions at installed location.

a. Indoor Dry and Clean Locations: NEMA 250, Type 1, or equal.

b. Outdoor Locations: NEMA 250, Type 3R, or equal.

c. Other Wet or Damp Indoor Locations: NEMA 250, Type 4, or equal.

2. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover.

3. Directory Card: Inside panelboard door, mounted in transparent card holder.

C. Incoming Mains Location: Top and bottom.

D. Phase, Neutral, and Ground Buses: Hard-drawn copper, 98 percent conductivity.

E. Conductor Connectors: Suitable for use with conductor material and sizes.

1. Material: Hard-drawn copper, 98 percent conductivity.

2. Main and Neutral Lugs: Mechanical type.

3. Ground Lugs and Bus Configured Terminators Mechanical type.

F. Service Equipment Label: NRTL labeled for use as service equipment for panelboards with one or more main service disconnecting and overcurrent protective devices.

G. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.

H. Panelboard Short-Circuit Current Rating: Series rating is not allowed. AIC Rating to conform to Power system study results.

2.2 DISTRIBUTION PANELBOARDS

A. Manufacturers: Square D, Eaton, or approved equal.

B. Panelboards: NEMA PB 1, power and feeder distribution type.

C. Mains: As indicated on Panel Schedules.

D. Branch Overcurrent Protective Devices: For Circuit-Breaker Frame Sizes 125 A and Smaller: Bolt-on circuit breakers.

E. Branch Overcurrent Protective Devices: For Circuit-Breaker Frame Sizes Larger than 125 A: Bolt-on circuit breakers; plug-in circuit breakers where individual positive- locking device requires mechanical release for removal.

2.3 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

A. Manufacturers: Square D, Eaton, or approved equal.

B. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.

C. Mains: Circuit breaker or lugs only.

D. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.

E. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike.

2.4 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

A. Manufacturers: Square D, Eaton, or approved equal.

B. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with series-connected rating to meet available fault currents.

1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front- mounted, field-adjustable trip setting.

3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings:

   a. Instantaneous trip.

   b. Long- and short-time pickup levels.

   c. Long- and short-time time adjustments.

   d. Ground-fault pickup level, time delay, and I^2t response.

4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.

5. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground- fault protection (6-mA trip).

6. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).

7. Arc-Fault Circuit Interrupter (AFCI) Circuit Breakers: Comply with UL 1699; 120/240-V, single-pole configuration.

8. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:

   a. Standard frame sizes, trip ratings, and number of poles.

   b. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor materials.

c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads: Type HID for feeding fluorescent and high intensity discharge (HID) lighting circuits.

d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.

e. Communication Capability: Universal-mounted communication module with functions and features compatible with power monitoring and control system specified in Section 26 09 13 Electrical Power Monitoring and Control.

f. Shunt Trip: 120 V trip coil energized from separate circuit, set to trip at 55 percent of rated voltage.

g. Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle in on or off position.

h. Handle Clamp: Loose attachment, for holding circuit-breaker handle in on position.

C. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.

1. Fuses, and Spare-Fuse Cabinet: Comply with requirements specified in Section 26 28 13 Fuses.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Receive, inspect, handle, store and install panelboards and accessories according to NEMA PB 1.1.

1. Comply with mounting and anchoring requirements in accordance with the 2005 CBC Chapter 16.

B. Mount top of trim 90 inches (2286 mm) > above finished floor unless otherwise indicated.

C. Mount panel board cabinet plumb and rigid without distortion of box. Mount recessed panel boards with fronts uniformly flush with wall finish and mating with back box.

D. Install overcurrent protective devices and controllers not already factory installed.

1. Set field-adjustable, circuit-breaker trip ranges.

E. Install filler plates in unused spaces.

F. Stub four 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four 1-inch empty conduits into raised floor space or below slab not on grade.

G. Arrange conductors in gutters into groups and bundle and wrap with wire ties.

H. Comply with NECA 1.

3.2 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with 26 05 53 Identification for Electrical Systems.

B. Create a directory to indicate installed circuit loads and incorporating the University's final room designations. Obtain approval before installing. Use a computer or typewriter to create directory; handwritten directories are not acceptable.

C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Section 26 05 53 Identification for Electrical Systems.

D. Device Nameplates: Label each branch circuit device in distribution panelboards with a nameplate complying with requirements for identification specified in Section 26 05 53 Identification for Electrical Systems.

3.3 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Acceptance Testing Preparation:

1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.

2. Test continuity of each circuit.

C. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

D. Panelboards will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION

SECTION 26 25 00 - ENCLOSED BUS ASSEMBLIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Feeder-bus assemblies.
2. Plug-in bus assemblies.
3. Bus plug-in devices.

1.3 DEFINITIONS

A. kAIC: kiloampere interrupting capacity.

B. SPD: Surge protective device.

1.4 SUBMITTALS

A. Shop Drawings: For each type of product.

1. Show fabrication and installation details for enclosed bus assemblies. Include plans, elevations, and sections of components. Designate components and accessories, including clamps, brackets, hanger rods, connectors, straight lengths, and fittings.
2. Show fittings, materials, fabrication, and installation methods for listed firestop barriers.
3. Indicate required clearances, method of field assembly, and location and size of each field connection.
4. Detail connections to switchboards, transformers, and panelboards.
5. Cable and conductor terminal sizes for bus and plug-in device terminations.

B. Coordination Drawings: Floor plans and sections, drawn to scale. Include scaled bus-assembly layouts and relationships between components and adjacent structural, mechanical, and electrical elements. Show the following:

1. Vertical and horizontal enclosed bus-assembly runs, offsets, and transitions.
2. Clearances for access above and to the side of enclosed bus assemblies.
3. Vertical elevation of enclosed bus assemblies above the floor or bottom of structure.
4. Support locations, type of support, and weight on each support.
5. Location of adjacent construction elements including luminaires, HVAC and plumbing equipment, fire sprinklers and piping, signal and control devices, and other equipment.

C. Seismic Qualification Certificates: For enclosed bus assemblies, plug-in devices, accessories, and components.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

D. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For enclosed bus assemblies to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications: Member company of NETA.

1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle enclosed bus assemblies according to NEMA BU 1.1, "General Instructions for Handling, Installation, Operation, and Maintenance of Busway Rated 600 Volts or Less."

PART 2 - PRODUCTS

2.1 ASSEMBLY DESCRIPTIONS

A. Source Limitations: Obtain enclosed bus assemblies and plug-in devices from single source from single manufacturer.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Comply with UL 857.

2.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Enclosed bus assemblies, plug-in devices, and components shall withstand the effects of earthquake motions determined according to California Building Code.

1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.3 ENCLOSED BUS ASSEMBLIES

A. Feeder-Bus Assemblies: Low-impedance bus assemblies in totally enclosed, nonventilated housing; single-bolt joints; ratings as indicated.

1. Acceptable Manufacturers: Square D, Eaton, or approved equal.
2. Electrical Characteristics:
    a. Voltage: 120/208V.
    b. Phase/Wire: 3-phase, 4-wire.
    c. Percent of Neutral Capacity: 100.
3. Temperature Rise: 55 deg C above 40 deg C ambient maximum for continuous rated current.
4. Bus Materials: Current-carrying copper or aluminum conductors, fully insulated with Class 130C insulation except at joints; plated surface at joints.
5. Voltage Drop:
    a. Measure voltage drop at 30 deg C ambient with bus thermally stabilized at full rated load.

b. Three-phase, line-to-line voltage drop less than 3.1 V per 100 feet at 40 percent power factor.

6. Ground: 50 percent capacity, internal bus bar of material matching bus material.
7. Enclosure: Steel, with manufacturer's standard finish.
8. Fittings and Accessories: Manufacturer's standard.
9. Firestop: Comply with UL 1479 firestop system, listed and labeled by an NRTL acceptable to authorities having jurisdiction for penetrations of fire-rated walls, ceilings, and floors.
10. Mounting: Arranged flat, edgewise, or vertically without derating. Rated for hanger spacing of up to 10 feet for horizontally mounted runs and up to 16 feet for vertically mounted runs.
11. Expansion Section: Manufacturer's standard expansion fitting for the provided busway with expansion capability to accommodate thermal expansion of bus and enclosure, and to accommodate movement across building expansion joints.

B. Plug-in Bus Assemblies: Low-impedance bus assemblies in totally enclosed, nonventilated housing; single-bolt joints; ratings as indicated.

1. Acceptable Manufacturer: Square D, Eaton, or approved equal.
2. Electrical Characteristics:

   a. Voltage: 120/208V.

   b. Phase/Wire: 3-phase, 4-wire.

   c. Percent of Neutral Capacity: 100.

3. Temperature Rise: 55 deg C above 40 deg C ambient maximum for continuous rated current.
4. Bus Materials: Current-carrying copper or aluminum conductors, fully insulated with Class 130C insulation except at stabs and joints; plated surface at stabs and joints.
5. Ground: 50 percent capacity, internal bus bar of material matching bus material.
6. Enclosure: Steel, with manufacturer's standard finish.
7. Plug-in Openings: 24 inches o.c. on each side of bus, and hinged covers over unused openings. Plug-in openings shall be finger-safe with covers open or closed.
8. Fittings and Accessories: Manufacturer's standard.
9. Firestop: Comply with UL 1479 firestop system, listed and labeled by an NRTL acceptable to authorities having jurisdiction for penetrations of fire-rated walls, ceilings, and floors.

10. Mounting: Arranged flat, edgewise, or vertically without derating. Rated for hanger spacing of up to 10 feet for horizontally mounted runs and up to 16 feet for vertically mounted runs.
11. Expansion Section: Manufacturer's standard expansion fitting for the provided busway with expansion capability to accommodate thermal expansion of bus and enclosure, and to accommodate movement across building expansion joints.

C. Joints:

1. Busway joints shall use one high-strength steel bolt with lock washers.
2. Bolts shall be torque indicating type and at ground potential.
3. Bolts shall be two-headed design to indicate when proper torque has been applied and require only a standard long handle wrench to be properly activated.
4. Access shall be required to only one side of the busway for tightening joint bolts.
5. Joint connection assemblies shall be removable without disturbing adjacent busway lengths.
6. Joint connection assemblies that rely on the joint cover to provide ground continuity are unacceptable.

2.4 PLUG-IN DEVICES

A. Fusible Switches: NEMA KS 1, heavy duty; with L-type fuse clips to accommodate specified fuses; handle lockable with two padlocks and interlocked with cover in closed position. Interlocked to prevent plug-in device insertion into or removal from bus with switch in closed position. See Section 26 28 13 "Fuses" for fuses and fuse installation requirements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate layout and installation of enclosed bus assemblies and suspension system with other construction that penetrates ceilings or floors or is supported by them, including luminaires, HVAC equipment, fire-suppression system, and partition assemblies.

B. Equipment Mounting:

1. Install enclosed bus assemblies on cast-in-place concrete equipment base(s).
2. Coordinate size and location of concrete curbs around openings for vertical bus. Concrete, reinforcement, and formwork requirements are specified with concrete.

C. Support bus assemblies independent of supports for other elements such as equipment enclosures at connections to panelboards and switchboards, pipes, conduits, ceilings, and ducts.

1. Design each fastener and support to carry load indicated by seismic requirements and to comply with seismic-restraint details according to Section 260548.16 "Seismic Controls for Electrical Systems."
2. Design each fastener and support to carry 200 lb. or 4 times the weight of bus assembly, whichever is greater.
3. Support bus assembly to prevent twisting from eccentric loading.
4. Support bus assembly with not less than 3/8-inch steel rods. Install side bracing to prevent swaying or movement of bus assembly. Modify supports after completion to eliminate strains and stresses on bus bars and housings.
5. Fasten supports securely to building structure according to Section 26 05 29 "Hangers and Supports for Electrical Systems."
6. Bolts and nuts that are loosened for any reason after tightening to manufacturer's recommended torque setting shall be discarded and replaced with new bolts and nuts.

D. Install expansion fittings at locations where bus assemblies cross building expansion joints. Install at other locations so distance between expansion fittings does not exceed manufacturer's recommended distance between fittings.

E. Construct rated firestop assemblies where bus assemblies penetrate fire-rated elements such as walls, floors, and ceilings.

F. Coordinate bus-assembly terminations to equipment enclosures to ensure proper phasing, connection, and closure.

G. Tighten bus-assembly joints with torque wrench or similar tool recommended by bus-assembly manufacturer. Tighten joints again after bus assemblies have been energized for 30 days.

H. Install bus-assembly, plug-in units. Support connecting conduit independent of plug-in unit.

I. Comply with NECA 1.

3.2 CONNECTIONS

A. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform the following tests and inspections:

1. After installing equipment test, for compliance with requirements according to NETA ATS.
2. Visual and Mechanical Inspection:
    a. Compare equipment nameplate data with Drawings and Specifications.
    b. Inspect physical and mechanical condition.
    c. Inspect anchorage, alignment, and grounding.
    d. Verify correct connection according to single-line diagram.
    e. Inspect bolted electrical connections for high resistance using one or more of the following methods:
        1) Use of low-resistance ohmmeter.
        2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method according to manufacturer's published data.
        3) Perform thermographic survey.
3. Electrical Tests:
    a. Perform insulation resistance measurements through bolted connections and bus joints with low-resistance ohmmeter.
    b. Perform insulation resistance tests of each busway, phase to phase, and phase to ground.
    c. Perform a dielectric withstand voltage test on each busway, phase to ground with phases not under test grounded for one minute.
    d. Measure resistance of assembled busway sections on insulated busway and compare values with adjacent phases.
    e. Perform phasing test on each busway tie section energized by separate sources.
    f. Verify operation of busway space heaters.
4.

D. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

E. Enclosed bus assemblies will be considered defective if they do not pass tests and inspections.

F. Prepare test and inspection reports.

3.4 CLEANING

A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION 26 25 00

SECTION 26 27 26

WIRING DEVICES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Receptacles, receptacles with integral GFCI, and associated device plates.

2. Snap switches and cover plates.

1.2 SUBMITTALS

A. Submit in accordance with Division 1.

B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

C. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing label warnings and instruction manuals that include labeling conditions.

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled by a Nationally Recognized Testing Laboratory (NRTL) and marked for intended use.

B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Pass & Seymour/Legrand; Wiring Devices & Accessories (Pass & Seymour), or equal.

2.2 STRAIGHT BLADE RECEPTACLES

A. Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498.

1. Products: Pass & Seymour 5351W (single), 5362 (duplex), or equal.

2.3 GFCI RECEPTACLES

A. General Description: Straight blade, feed -through type. Comply with NEMA WD 1, NEMA WD 6, UL 498, and UL 943, Class A, and include indicator light that is lighted when device is tripped.

B. Duplex GFCI Convenience Receptacles, 125V, 20A:

1. Products: Pass & Seymour 2095W, or equal.

2.4 ISOLATED GROUND RECEPTACLES.

A. Receptacles, 125V, 20A: Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498.

1. Products: Pass & Seymour IG5261 – Orange (single), IG6300 Orange (duplex), or equal.

2.5 SNAP SWITCHES

A. Comply with NEMA WD 1 and UL 20.

B. Switches, 120/277V, 20A:

1. Products: Pass & Seymour 20AC1 (single pole), 20AC2 (two pole), 20AC3 (three way), 20AC4 (four way), or equal.

C. Pilot Light Switches, 20A:

1. Products: Pass & Seymour PS20AC1-PLR for 120V, or equal.

2. Description: Single pole, with neon-lighted handle, illuminated when switch is "ON."

D. Key-Operated Switches, 120/277V, 20A:

1. Products: Pass & Seymour PS20AC1-L, or equal.

2. Description: Single pole, with factory-supplied key in lieu of switch handle.

E. Single-Pole, Double-Throw, Momentary Contact, Center-Off Switches, 120/277V, 20A; for use with mechanically held lighting contactors.

1. Products: Pass & Seymour 1251, or equal.

F. Key-Operated, Single-Pole, Double-Throw, Momentary Contact, Center-Off Switches,120/277V, 20A; for use with mechanically held lighting contactors, with factory-supplied key in lieu of switch handle.

G. Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:

1. Products: Subject to compliance with requirements, provide the following:

a. Pass & Seymour 1251L or equal.

2. Description: Passive-infrared type, 120/277 V, adjustable time delay up to 30 minutes, 180-degree field of view, with a minimum coverage area of 900 sq. ft. (84 sq. m).

2.6 WALL PLATES

A. Single and combination types to match corresponding wiring devices.

1. Plate-Securing Screws: Metal with head color to match plate finish.

2. Material for Finished Spaces: Steel with white baked enamel, suitable for field painting Smooth, high-impact thermoplastic 0.035-inch- (1-mm-) thick, satin-finished stainless steel 0.04-inch- (1-mm-) thick, brushed brass with factory polymer finish 0.05-inch- (1.2-mm-) thick anodized aluminum 0.04-inch- (1-mm-) thick steel with chrome-plated finish.

3. Material for Unfinished Spaces: Galvanized steel smooth, high-impact thermoplastic.

4. Material for Damp Locations: Thermoplastic Cast aluminum with spring-loaded lift cover, and listed and labeled for use in "wet locations."

B. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with type 3R weather-resistant thermoplastic with lockable cover.

2.7 FLOOR SERVICE FITTINGS

A. Type: Modular, flush-type or flap-type, dual-service units suitable for wiring method used.

B. Compartments: Barrier separates power from voice and data communication cabling.

C. Service Plate: Rectangular Round, die-cast aluminum solid brass with satin finish as indicated on drawings.

D. Power Receptacle: NEMA WD 6 configuration 5-20R, gray finish, unless otherwise indicated.

E. Voice and Data Communication Outlet: Blank cover with bushed cable opening

2.8 FINISHES

A. Color: Wiring device catalog numbers in Section Text do not designate device color.

1. Wiring Devices Connected to Normal Power System: As selected by Owner's Representative, unless otherwise indicated or required by NFPA 70 or device listing.

2. Wiring Devices Connected to Emergency Power System: Red.

3. TVSS Devices: Blue.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1, including the mounting heights listed in that standard, unless otherwise noted.

B. Coordination with Other Trades:

1. Take steps to ensure that devices and their boxes are protected. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of the boxes.

2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.

3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.

4. Install wiring devices after all wall preparation, including painting, is complete.

C. Conductors:

1. Do not strip insulation from conductors until just before they are spliced or terminated on devices.

2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.

3. The length of free conductors at outlets for devices shall meet provisions of CEC, Article 300, without pigtails.

4. Existing Conductors:

a. Cut back and pigtail or replace all damaged conductors.

b. Straighten conductors that remain and remove corrosion and foreign matter.

c. Pigtailing existing conductors is permitted provided the outlet box is large enough.

D. Device Installation:

1. Replace all devices that have been in temporary use during construction or that show signs that they were installed before building finishing operations were complete.

2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.

3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.

4. Connect devices to branch circuits using pigtails that are not less than 6 inches (152 mm) in length.

5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, 2/3 to 3/4 of the way around terminal screw.

6. Use a torque screwdriver when a torque is recommended or required by the manufacturer.

7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.

8. Tighten unused terminal screws on the device.

9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device mounting screws in yokes, allowing metal-to-metal contact.

E. Receptacle Orientation:

1. Install ground pin of vertically mounted receptacles down, and on horizontally mounted receptacles to the right.

F. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

G. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multi gang wall plates.

3.2 IDENTIFICATION

A. Comply with Section 26 05 53 Identification for Electrical Systems.

1. Receptacles: Identify panelboard and circuit number from which served. Use hot, stamped or engraved machine printing with black-filled lettering on face of plate, and durable wire markers or tags inside outlet boxes.

3.3 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

1. Test Instruments: Use instruments that comply with UL 1436.

2. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated LED indicators of measurement.

B. Tests for Convenience Receptacles:

1. Line Voltage: Acceptable range is 105 to 132 V.

2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is not acceptable.

3. Ground Impedance: Values of up to 2 ohms are acceptable.

4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.

5. Using the test plug, verify that the device and its outlet box are securely mounted.

C. The tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new, and retest as specified above.

END OF SECTION

SECTION 26 28 13

FUSES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Cartridge fuses rated 600-V ac and less for use in control circuits, enclosed switches, enclosed controllers, and motor-control centers.

1.2 SUBMITTALS

A. Submit in accordance with Division 1.

B. Operation and maintenance data.

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled by a Nationally Recognized Testing Laboratory (NRTL) and marked for intended location and application.

B. Comply with NEMA FU 1 for cartridge fuses.

C. Comply with CEC.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by the following :

1. Cooper Bussmann, Inc. or equal.

2.2 CARTRIDGE FUSES

A. Characteristics: NEMA FU 1, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.

PART 3 - EXECUTION

3.1 FUSE APPLICATIONS

A. Feeders: Class L, time delay.

B. Motor Branch Circuits: Class RK5, time delay.

C. Other Branch Circuits: Class RK1, time delay.

3.2 INSTALLATION

A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.

3.3 IDENTIFICATION

A. Install labels complying with requirements for identification specified in Section 26 05 53 Identification for Electrical Systems and indicating fuse replacement information on inside door of each fused switch and adjacent to each fuse block and holder.

END OF SECTION

SECTION 26 28 16

ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Fusible switches.
2. Non fusible switches.
3. Receptacle switches.
4. Shunt trip switches.
5. Molded-case circuit breakers (MCCBs).
6. Enclosures.

1.2 DEFINITIONS

A. NC: Normally closed.

B. NO: Normally open.

C. SPDT: Single pole, double throw.

1.3 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Enclosed switches and circuit breakers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.4 SUBMITTALS

A. Submit in accordance with Division 1.

B. Shop Drawings: For enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.

1. Wiring Diagrams: For power, signal, and control wiring.

C. Field quality-control reports.

D. Operation and maintenance data.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled by a Nationally Recognized Testing Laboratory (NRTL) and marked for intended location and application.

B. Comply with CEC.

PART 2 - PRODUCTS

2.1 FUSIBLE SWITCHES

A. Manufacturers: Square D, Eaton, or approved equal.

B. Type HD, Heavy Duty, Single Throw, 240or 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate indicated fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Double Throw, 240 or 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate indicated fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.

2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.

3. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.

4. Lugs: Suitable for number, size, and conductor material.

5. Service-Rated Switches: Labeled for use as service equipment.

2.2 NONFUSIBLE SWITCHES

A. Product: Square D, Eaton, or approved equal.

B. Type HD, Heavy Duty, Single Throw, 240 or 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Double Throw, 240 or 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.

2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.

3. Lugs: Suitable for number, size, and conductor material.

2.3 RECEPTACLE SWITCHES

A. Product: Subject to compliance with requirements, provide comparable product by the following: Square D, Eaton, or approved equal.

B. Type HD, Heavy-Duty, Single-Throw Fusible Switch: UL 98 and NEMA KS 1; horsepower rated, with clips or bolt pads to accommodate indicated fuses; lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

C. Type HD, Heavy-Duty, Single-Throw Nonfusible Switch: UL 98 and NEMA KS 1; horsepower rated, lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

D. Interlocking Linkage: Provided between the receptacle and switch mechanism to prevent inserting or removing plug while switch is in the on position, inserting any plug other than specified and turning switch on if an incorrect plug is inserted or correct plug has not been fully inserted into the receptacle.

E. Receptacle: Polarized, three-phase, four-wire receptacle (fourth wire connected to enclosure ground lug).

2.4 SHUNT TRIP SWITCHES

A. Product: Subject to compliance with requirements, provide comparable product by the following: Cooper Bussmann, Inc., or equal.

B. General Requirements: Comply with ASME A17.1, UL 50, and UL 98, with 200-kA interrupting and short-circuit current rating when fitted with Class J fuses.

C. Switches: Three-pole, horsepower rated, with integral shunt trip mechanism and Class J fuse block; lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

D. Control Circuit: 120-V ac; obtained from integral control power transformer, with primary and secondary fuses, with a control power transformer of enough apacity to operate shunt trip, connected pilot, and indicating and control devices.

E. Accessories:

1. Oiltight ON pilot light.

2. Isolated neutral lug.

3. Mechanically interlocked auxiliary contacts that change state when switch is opened and closed.

4. Form C alarm contacts that change state when switch is tripped.

5. Three-pole, double-throw, fire-safety and alarm relay; 24-V dc coil voltage.

6. Three-pole, double-throw, fire-alarm voltage monitoring relay complying with NFPA 72.

2.5 MOLDED-CASE CIRCUIT BREAKERS

A. Product: Subject to compliance with requirements, provide comparable product by the following: Square D, Eaton, or approved equal.

B. General Requirements: Comply with UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents.

C. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

D. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:

1. Instantaneous trip.

2. Long- and short-time pickup levels.

3. Long- and short-time time adjustments.

4. Ground-fault pickup level, time delay, and I^2t response.

E. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.

F. Features and Accessories:

1. Standard frame sizes, trip ratings, and number of poles.

2. Lugs: Suitable for number, size, trip ratings, and conductor material.

3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.

4. Ground-Fault Protection: Comply with UL 1053; remote-mounted and powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.

5. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.

2.6 ENCLOSURES

A. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.

1. Indoor, Dry and Clean Locations: NEMA 250, Type 1

2. Outdoor Locations: NEMA 250, Type 3R

3. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4

4. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

C. Install fuses in fusible devices.

D. Comply with NECA 1.

3.2 IDENTIFICATION

A. Comply with requirements in Section 26 05 53 Identification for Electrical Systems.

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.

2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.3 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Acceptance Testing Preparation:

1. Test insulation resistance for each enclosed switch and circuit breaker, component, connecting supply, feeder, and control circuit.

2. Test continuity of each circuit.

C. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

D. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies enclosed switches and circuit breakers and that describes scanning results. Include notation of deficiencies detected, remedial action taken and observations after remedial action.

END OF SECTION

SECTION 26 32 13

ENGINE GENERATORS

PART 1 - GENERAL

1.1 DESCRIPTION

A. Description: Work specified in this Section includes the new automatic starting diesel engine-driven generator, complete with auxiliary equipment for use as an emergency and standby source of lighting and power.

B. The installation of the power generation system shall include the following:

1. Engine-driven generator set.
2. Cooling system.
3. Fuel supply and return including fuel cooling.
4. Skid-mounted fuel oil day tank.
5. Exhaust silencer.
6. Generator set accessories.
7. Seismic mounting system.
8. System control and switchgear integration.

1.2 QUALITY ASSURANCE

A. Qualifications of the Manufacturer and Assembler:

1. Standard Catalog Product: The engine-generator assembly shall be the standard cataloged product of an assembler, in the capacity range specified for both engine and generator, and for which parts and service are readily available from nearest service facility on 4 hour notice. Engine and generator shall be torsionally analyzed and torsionally matched per NEMA Standards.
2. Source: Both engine and generator shall be of U.S. manufacture. See subsequent Specifications for acceptable manufacturers.
3. Generator shall be assembled to engine by a franchised distributor for the engine manufacturer, and this franchised distributor shall be qualified to

extend the warranty of the engine and generator manufacturer for the assembled engine-generator, and shall perform a full load test of engine-generator assembly and submit test results to the Architect.

B. Codes and Regulations:

1. General: Per requirements in Section 26 05 00.

2. Generator: NEMA MG-1.

3. Circuit Breaker and Enclosure: NEMA SG-3.

C. Factory Tests and Inspections: Manufacturer's tests as specified hereafter.

D. Field Tests: As specified hereafter.

1.3 SUBMITTALS

A. Product Data: Submittals as called for in Division 1 shall include all products and accessories specified in this Section.

B. Shop Drawings: Submit layout drawing for engine generator and all accessories for approval.

C. Submit layout drawings for coolant, fuel, and exhaust system.

D. Electrical control, alarm, circuit breaker and synchronizing controls shall be accompanied with diagrams and function descriptions.

E. Permits: The Contractor shall obtain all necessary permits for installation and operation of generator set with state and local Air Quality Management District. Charges for installation and operation permits shall be paid by the Owner.

F. Seismic Design: The equipment is considered essential and shall be suitable for and certified to meet all applicable seismic requirements of the California Building Code (CBC) for zone 4 application. Provide generator set anchorage details and manufacturer’s seismic certification complying with CBC requirements.

1.4 WARRANTY

A. The manufacturer and dealer shall warranty the complete system for a period of not less than one (1) years from the date of initial start-up of the system and shall include repair parts, labor, reasonable travel expense necessary for repairs at the jobsite, and expendables (lubricating oil, filters, antifreeze, and other service items made unusable by the defect) used during the course of repair. Running hours shall not be a limiting factor for the system warranty.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. MTU Onsite Energy.

B. Generac.

C. Cummins / Onan.

D. Caterpillar.

E. Or Approved Equal.

2.2 SYSTEM DESCRIPTION

A. The electric power generating system shall have a site capability as shown on one-line diagram, at 0.8 power factor, 277/480 volts, wye connected, three-phase, 60 hertz.

B. The system shall consist of one generator set, which includes all controls, protection, wiring, and accessories for automatic start-stop operation.

C. The engine-generator and its equipment are part of an emergency power system, comprised of the generator set, transfer switches, and remote annunciation. The Contractor shall coordinate the system as a whole system. Provide interconnect shop drawings with wiring and terminals shown.

2.3 ENGINE GENERATOR, GENERAL

A. Capacity and Characteristics: The unit shall be standby duty, with a capacity in kW/kVA as shown on the one-line diagram at 0.8 power factor, 277/480 volts, wye connected, three-phase, 60 hertz.

B. The generator unit and accessories shall be in accordance with NFPA 99 and 110, and the generator shall pick up its load and stabilize to 5% of rated frequency within 10 seconds after loss of normal power source.

C. Rotational speed shall not exceed 1800 rpm.

D. Overall Size: Fit space available with adequate clearance over unit for inspection and servicing; at least 3’-0” clearance over the topmost points of the assembled unit within space available for convenience in servicing.

E. Interference-Free: Engine, generator and controls shall not generator any radio or television interference.

F. Operating Sequence: Engine-generator shall start either manually, or automatically on closure of a remote relay. Restoration of normal power source will be automatic, but engine shall continue to run until shut off by time delay relay.

G. Accessories shall include everything required for automatic starting and continuous operation. Selection shall be by the manufacturer of the unit, unless specified otherwise.

H. Structural steel frame shall extend under both engine and generator and radiator with spring type isolator units provided under entire assembly.

I.

J. Finish: Factory-applied lacquer or enamel.

K. Battery Wiring: Provide wiring between batteries and starter, and from battery charger to batteries.

L. Rotational Balancing: Engine shall be balanced at operating speed to a peak vibration not over 0.1" per second measured on 3 planes as close as possible to the flywheel, using instruments similar to that made by IRD Mechanalysis.

2.4 ENGINE

A. Type: General purpose, stationary, internal combustion, diesel, water-cooled, two stroke or four stroke cycle, compression ignition, airless injection, naturally aspirated or turbo-charged.

B. Lubrication System: Include oil pump, oil cooler which uses engine coolant, and a full flow oil filter, metal screen or cotton packed replaceable cartridge type wit filtration equal to 170 mesh screen. Furnish two replacement cartridges. Air-cooled cooler is not acceptable.

C. Engine Cooling: By a glycol-water solution; protected to zero degrees F; forced circulation through engine jacket and oil cooler; design working pressure of 25 psi minimum. Engine pumps shall be adequate to circulate cooling solution through the radiator.

D. Thermostatic Valve: Include in the engine coolant circuit, to limit circulation to the engine only, until coolant temperature equals or exceeds 160 degrees; with circulation through radiator, only above this temperature; mounted with the engine, and capable of full load cooling with coolant as specified, in 110 degrees F ambient.

E. Electric Heaters for Jacket Coolant: Universal, Kim or Perfection manufacturer; in the engine jacket cooling solution circuit; thermal siphon, shall add heat to the coolant, 208 volt, single phase; controlled by an insertion thermostat set at 90

degrees F, with 15 degrees F increase above ambient in the engine jacket, through a magnetic switch.

F. Engine Starter: Electric motor-driven, battery-powered, with solenoid operated contactor for starting motor.

G. Air Intake Filter: Replaceable media type; shall filter all air to the engine. Furnish two replacement cartridges.

H. Fuel Oil Filter and Water Separator: Replaceable cartridge type, size of cartridge to suit the required fuel oil flow; visible bowl for water; Racor Series 1000.

I. Fuel Cooler: Fuel shall be piped from the filter/water separators to the intake of the engine fuel pump, and then to the engine. Excess fuel shall be piped through the fuel cooler and returned to the day tank. The fuel cooler shall be capable of exchanging heat rejected at full load with the cooling medium, including 10% reserve to accommodate fouling.

J. Instrument Panel: Include pressure gauges for fuel oil and lubricating oil; coolant temperature gauge; thermometers for jacket water and for lubricating oil, a direct indicating mechanically-connected tachometer and an engine running time meter. All gauges and thermometers shall be equipped with electronic transducers, which repeat the indicated amounts in panel. Make all necessary connections between panel and engine.

K. Automatic Safety Shutdown: Safety alarm switches for high coolant temperature and low lubricating oil pressure, high lubricating oil temperature, overspeed and overcrank shall sound an audible and indicating light alarm on Derangement Signal System specified hereinafter, and in less than 60 seconds of an alarm condition, shall stop the engine by solenoid or motor-driven control of the governor trip lever or plunger; except that the engine will be shut down immediately at 10% overspeed or minimum oil pressure, by a mechanical governor mechanism. Low coolant temperature shall also actuate a Derangement Alarm, but shall not prevent engine from starting. Safety devices shall include all features required in NFPA 99 and 110.

2.5 GENERATOR AND CONTROLS

A. Manufacture and Type: Marathon, Lima Electric, Kato or Caterpillar-Century. Synchronous revolving field type, torsionally coordinated with the engine, drip-proof ventilated enclosure 277/480 volt, 3-phase, 4-wire, 60 hertz. Conform to ANSI C50.1 and to NEMA MG-1. The generator and flywheel shall have sufficient fly-wheel effect to meet the requirements of regulation and operation as specified. The rotor shall have amortisseur windings in the pole faces of the rotating field.

B. Windings: Stator and rotor shall incorporate magnet wire meeting NEMA MW

35C or 36C specifications, and shall be encapsulated with epoxy resins by vacuum pressure impregnation. All insulation materials shall have a minimum temperature rating of Class 155C per IEEE Std. 1.

C. Direct Mounting to Engine: Generator shall be single or two bearing type, torsionally coordinated with, and close coupled to the engine-driver.

D. Environment: The alternator shall be designed for resistance to salt and moisture laden air to inhibit rusting of internal and external metal parts and the breakdown of winding insulation.

E. Exciter: NEMA Standard, direct-connected brushless type or integral statically excited; non-contact type. The exciter shall operate in conjunction with the voltage regulator to supply the necessary generator excitation when the generator is connected for parallel operation, with power loads ranging from 0 to 125% of rated generator capacity. The exciter voltage regulator combination shall be capable of maintaining satisfactory generator output voltage at all loads from 0 to 125% of rated full load. Exciter shall be suitable for system as specified.

F. Voltage Regulator: Solid-state constant volts per hertz type to protect unit from an underspeed condition; shall automatically maintain terminal voltage within 1.0% of rated voltage, at all constant loads from no-load to full-load. Stable voltage conditions shall be re-established within 4 seconds following any sudden change of load. Vibrating contact type not acceptable.

G. Generator Control Panel

1. The generator set control panel shall control, protect, meter and annunciate all functions necessary to confirm the operational status of the generator set. It shall be designed and built by the engine generator manufacturer and incorporate 100% solid state microprocessor based control circuitry, with circuitry, keypad controls, and digital metering. Annunciation shall include individual alarm lights, which will allow fault identification while retaining a view of generator operating parameters, and a silencable audible alarm. Fault condition set points shall be verified without exposing the generator set to the actual condition.

2. Engine governing and overspeed fault circuitry shall utilize individual circuitry to assure speed control protection. Circuitry shall be sealed in a dust tight and watertight module with sealed wire entries into the enclosure. Internal terminal strips shall be both crimped and soldered to assure circuit integrity. Panel module shall comply with IP64 and NEMA 4 for environmental protection, while the total panel shall quality as NEMA 12.

3. Alternator AC output metering devices: Backlit LCD shall display frequency, three-phase voltage and amperage, with minimum numeral

height of 0.6 in. Accuracy shall exceed 0.5% true RMS.

4. Engine monitoring devices: Backlit LCD to sequentially rotate display of operating hours (reprogrammable), engine RPM, battery DC volts, oil pressure, and jacket water temperature. A momentary switch shall be provided to continuously display a selected operating parameter. The display shall provide specific codes for fault shutdown, cycle programming, and diagnostic codes for trouble shooting. Set points shall be programmable through a front mounted keypad, and sensor operation confirmed by a verification procedure. Engine monitoring signals provided by pulse wide modulated (PWM) lubricating oil pressure and coolant temperature sensors and communicated directly to the panel control module. The safety logic shall alarm or shut the engine down if the signal is lost.

5. Controls: Alternator voltage level rheostat and frequency control shall be mounted on the panel face. The engine start-stop switch shall be door mounted and include positions for off/reset, stop, and automatic mode. Start-stop logic shall have provisions for cycle cranking programmable from 5-60 second cycles, for total crank time of 5 to 120 seconds. Cooldown operation shall be programmable from 0 to 30 minutes with a signal to allow removal of the load from the generator set during cool down.

6. Safety Devices: ISO red emergency stop pushbutton shall be provided, and all controls, annunciation, and monitors labeled with ISO symbols.

7. Service: Complete viewing and programming of panel functions shall be possible from the panel face. Features shall include a fault history log, engine alarm and shutdown set points, password protection, spare input programming, hourmeter programming, voltmeter/ammeter programming, and AC calibration.

H. Generator Auxiliary Contacts: To indicate "run" status; control relay connected to circuits in generator shall close when generator is running, to actuate indicator circuits and for Automatic Transfer Switch Control. Refer to remote annunciator panel detail on the Drawings.

2.6 ENGINE-GENERATOR ACCESSORIES

A. Starting Controls Systems:

1. Scope: Provide all control equipment for automatic cranking and starting of the engine-generator unit.

2. Starting Control Relay: Include an adjustable cranking time limiter which shall cause three automatically cycled engine cranking intervals with a maximum of 30 seconds for each interval, followed by manual reset if engine fails to start; mounted in a cabinet. Include timing relays adjustable over 1-15 minutes, which will shut off the engine after it has run at no load for this length of time.

3. Mode Control Switch: On Generator Control Panel with "Manual," "Automatic" and "Test" positions.

B. Batteries and Battery Charging Equipment:

1. Scope: Provide a complete set of starting batteries and charging equipment for normal use.

2. Type of Batteries: Lead acid, 24 volt; capable of 8 hour recharge from full rated discharge without damage to battery plates.

3. Capacity of Batteries: Sufficient for not less than 90 seconds continuous cranking time with engine at a temperature of 50 degrees F. 380 ampere-hour minimum.

4. Condition: Batteries shall be new products at the time of startup of engine-generator. Do not add acid until startup, if batteries are dry charge type.

5. Battery Box: A battery tray shall be provided for the batteries and shall conform to CEC 480-7(b). It shall be treated to be resistant to deterioration by battery electrolyte. Construction shall be such that any spillage or boil-over battery electrolyte shall be contained within the box to prevent a direct path to ground.

6. Battery Charger: LaMarche, Ratelco or Sens manufacturer, float voltage type with equalizing charge capability, line compensation, and an 8 hour recharge rate at full battery discharge; shall include silicon diode full wave rectifier, overload protection, voltage surge suppressors, D-C ammeter, fused A-C input, manually adjustable float voltage, 0-24 hour equalizing cycle timer with manual start; and charge failure visual alarm signal to indicate charging circuit malfunctions. Input shall be 120 volts.

7. Grounding: Polarity of battery connections to engine per engine manufacturer's recommendations.

8. Starting Motor Leads: Flexible stranded copper conductors and connectors (sized to carry the starting current draw for 60 seconds continuously without heating), insulated, with oil-resistive jacket; bolted bronze clamps at all battery terminals, protective coated to resist corrosion.

C. Engine Exhaust Silencer

1. Scope: Provide an Engine Exhaust Silencer with all required accessories and appurtenances for each generator. Silencer shall operate within the engine's maximum allowable exhaust backpressure limits. Silencer shall provide 25-35dbA attenuation.

2. Silencer shall be heavy duty steel construction with ANSI flanged connections.

3. Finish shall be high heat powder coat black paint. The system shall be insulated by installing contractor as required to maintain proper room temperature for generation.

D. Engine Coolant:

1. Description: Ethylene-glycol base, anti-freeze and water solution; 35% minimum by weight of ethylene-glycol; freezing protection to 0 degree F. Dow "Dowtherm" Type SR-1; glycol base.

2. Anti-Freeze Manufacture and Type: Dow "Dowgard;" industrial grade with rust inhibitors and anti-foaming agents, automotive grade anti-freezes not allowed. Submit name of supply source to the Architect for approval.

E. Derangement Signal and Annunciator System:

1. Description: A system of audible and visual derangement signals; powered by the diesel engine starting batteries; with two annunciators to indicate fault and operating conditions.

2. Signals: Per NFPA 99 and the following:

   a. Individual Visual Signals Shall Indicate:
      1) When the emergency or auxiliary power source is operating to supply power to load.
      2) When the battery charger is malfunctioning.
   b. Individual Visual Signals Plus a Common Audible Signal to Warn of an Engine-Generator Alarm Condition Shall Indicate:
      1) Low lubricating oil pressure.
      2) Low water temperature.
      3) Excessive water temperature.
      4) Low fuel when the main fuel storage tank contains less than a three-hour operating supply.
      5) Overcrank (failure to start).
      6) Overspeed.

3. Power Supply: Direct current from the engine starting batteries.

4. Audible Alarm Horn and Silencing Switch and Reset Switch: In the

annunciator.

5. Field Wiring: Provide in accordance with manufacturer's requirements.

6. Sensing elements shall be furnished for all conditions, except low fuel level contact in storage tank will be with level gauge specified in Division 15.

7. Annunciators: Provide one annunciator installation in local switchgear. Annunciator shall have a metal cabinet, and individual signals in the annunciator; shall require manual resetting after a fault condition has taken place. Annunciator shall use plug-in solid state elements and internal illumination.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Engine-Generator: Bolt unit to vibration isolators and provide anchor bolts for isolators to slab.

B. Provide anchorage details, coordinated with the substation mounting provision, prepared and stamped by a licensed structural engineer.

C. Install in accordance with earthquake regulations of the California Building Code.

3.2 FIELD TESTING

A. The emergency generator unit shall be field tested. The Contractor shall supply to the Architect all test data and results, and shall certify that such records are correct. All equipment and materials necessary for the test, including lubricating oil and fuel and all measuring and load equipment necessary for the tests, shall be provided by the Contractor. Tests shall prove that the performance of the unit is in conformance with the Specifications. Submit test forms and test procedures for approval at least one week before test date is established.

B. General Requirements:

1. Engine: Shall have complete electrical, lubricating oil, fuel, combustion air, starting and cooling systems.

2. Engine Instrumentation and Controls: The instrumentation and controls to the engine shall be complete.

3. Generator: The generator, complete with necessary exciter controls and regulator shall be tested.

4. Preliminary Test and Check-Off: Shall be made by a representative of the manufacturer, of fuel and lubricating oil levels, coolant levels and pump, safety controls, and all piping and electrical conditions.

C. Test Procedures:

1. Test Sequence: The sequence in which the tests are to be conducted shall be in the order specified hereinafter. Deviations from listed sequence is allowable at the discretion of the Architect.

2. Data Recording: Test data shall be recorded on forms furnished by the manufacturer. Data shall be legibly recorded and read to the units and decimal places specified on the sheet. When parameters listed on the data sheet do not apply, a diagonal line shall be drawn through the recording space provided. For each test operation, purpose and time of initiating the start shall be recorded, when it was stopped, with reason for stop. The unit instrumentation shall be used where applicable. Any replacement of parts shall be noted, stating reasons for replacement.

3. Operation conditions shall be observed by a representative of the manufacturer at all times of tests. All tests shall be conducted with the systems correctly connected. No protection or control systems shall be bypassed, unless it is specified.

4. Test Conditions Requiring Corrective Action: The unit shall be shut down if any of the following conditions occur and the tests shall be discontinued until the condition is corrected:

   a. Oil, fuel, air or water leaks.

   b. Abnormal engine noise or vibration.

   c. Persistent shutdown or warning by the unit's protection system.

   d. Relay arcing.

   e. Excessive engine or generator temperatures.

   f. Loss of oil pressure.

D. Fuel, Lubricants and Coolants:

1. Fuel: Engine shall be tested using No. 2 diesel oil.

2. Lubrication: The lubricating oil and other lubricants to be used shall be as designated and supplied by the manufacturer of the equipment.

3. Starting Power: Batteries provided with the unit shall be used for starting the engine.

4. Coolants: The ethylene glycol-water coolant provided with the unit shall be used.

E. Test Instruments:

1. General: The test instruments shall be calibrated and certified as being accurate. Instruments supplied with the unit shall be used when available; calibration of these instruments shall be certified by the manufacturer.

2. Recorder Instrumentation: A recorder shall be used to record transients of parameters listed below. The test number, name, and time of the test shall be entered on the trace immediately prior to obtaining the trace. Instrument transformers as required shall be provided. Transients of the following parameters are required during the load test and sudden load change test:

   a. General voltage, line-to-line, and line-to-ground, single phase (volts).
   b. Generator amperage, line current (amps), each phase.
   c. Generator frequency (Hz).
   d. Generator kilowatts, 3 phase, 2-1/2 or 3 element measuring (Kw).

3. Fuel Oil Meter: A meter and necessary piping connections shall be provided for measuring fuel oil consumption during the load test.

F. Generator system shall be tested per NFPA-110 7.13.

END OF SECTION

SECTION 26 36 00

TRANSFER SWITCHES

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included: Labor, materials, and equipment necessary to complete the installation required for the item specified under this Division, including but not limited to:

1. Automatic transfer switch.

2. Non-automatic transfer switch.

B. Related Work: Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete installation.

1. Section 26 09 13 - Power Monitoring & Control.

1.2 REFERENCES

A. Comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:

1. American National Standards Institute, Inc. (ANSI):

ANSI C37.90.1 - IEEE Guide for Surge Withstand Capability (SWC) Tests.

2. National Electrical Manufacturer Association (NEMA):

a. NEMA ICS 1 - General Standards for Industrial Control and Systems.
b. NEMA ICS 2 - Standards for Industrial Control Devices, Controllers, and Assemblies.
c. NEMA ICS 4 - Terminal Blocks.
d. NEMA ICS 6 - Enclosures for Industrial Controls and Systems.

3. Underwriters Laboratories, Inc. (UL):

a. UL 467 - Grounding and Bonding Equipment.
b. UL 468A - Wire Connectors and Wiring Lugs for Use with Copper Conductors.
c. UL 1008 - Automatic Transfer Switches.

4. National Fire Protection Association (NFPA):

a. NFPA 110 - Emergency and Standby Power Systems.

1.3 SUBMITTALS

A. Submit in accordance with the requirements of Division 1 – SUBMITTALS PROCEDURES. Submit the following items:

1. Data/catalog cuts for each product and component specified herein, listing all physical and electrical characteristics and ratings indicating compliance with all listed standards.

2. Describe system operation, equipment, dimensions and indicate features of each component.

3. Clearly mark on each data sheet the specific item(s) being submitted and the proposed application.

4. Shop drawings to include:

   a. Front, plan and side view elevations with overall dimensions shown.
   b. Location of devices and instruments and the make type, size and rating of all equipment.
   c. Dimensional locations of conduit entry points and locations of barrier plates.
   d. Nameplate legends.
   e. AIC rating.
   f. Size and number of bus bars per phase, neutral and ground.
   g. Detailed point-to-point wiring diagram, differentiating between manufacturer-installed and field-installed wiring.

5. Furnish structural calculations for equipment anchorage as described in Section 26 0500: Common Work Results for Electrical.

7. Certified independent laboratory test data shall be provided to confirm that the switch rating and design conforms to UL 1008.

8. Submit manufacturer's installation instructions.

9. Complete Bill of Material listing all components.

10. Warranty.

C. Dimensions and configurations of transfer switches shall conform to the space allocated on the drawings. The contractor shall submit a revised layout if equipment furnished varies in size from that shown on drawings for the engineer's approval.

1.4 OPERATION AND MAINTENANCE MANUAL

A. Furnish under provisions of Division 1 - CLOSEOUT PROCEDURES. Include the following:

1. A detailed explanation of the operation of the system.

2. Instructions for routine maintenance.

3. Detailed instructions for repair of the transfer switch.

4. Pictorial parts list and part numbers.

5. Pictorial and schematic electrical drawings of wiring systems, including operating and safety devices, control panels, instrumentation, and annunciators.

6. Telephone numbers for the authorized parts and service distributors.

7. Include all service bulletins and torque specifications for all terminations.

8. Final testing reports.

1.5 QUALITY ASSURANCE

A. All materials, equipment and parts comprising the units specified herein shall be new and unused, and of current manufacturer.

B. Only products and applications listed in this Section may be used on the project unless otherwise submitted.

C. Manufacturer qualifications: Firms regularly engaged in manufacture of transfer switches, of types and sizes required, and whose products have been in satisfactory use in similar service for not less than 5 years.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery: Transfer switch components shall not be delivered to the site until protected storage space is available. Storage outdoors covered by rainproof material is not acceptable. Equipment damaged during shipment shall be replaced and returned to manufacturer at no cost to Owner. Components shall be properly packaged in factory-fabricated containers and mounted on shipping skids.

B. Storage: Store in a clean, dry, ventilated space free from temperature extremes. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic. Provide heat where required to prevent condensation.

C. Handling: Handle in accordance with NEMA PB2.1 and manufacturer's written instructions. Be careful to prevent internal component damage, breakage, denting and scoring. Damaged units shall not be installed. Replace damaged units and return equipment to manufacturer.

1.7 WARRANTY

A. Units and components offered under this Section shall be covered by a 1 year parts and labor warranty for malfunctions resulting from defects in materials and workmanship. Warranty shall begin upon project substantial completion date.

1.8 SYSTEM START-UP

A. Upon completion of installation, initial start-up of the transfer switch shall be performed by a factory trained dealer service representative. Sufficient time shall be allowed to properly check the system out and perform required minor adjustments before the witnessed test shall begin.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Automatic Switch Company (ASCO).

B. Russelectric Inc.

C. Square D Company.

D. Or Approved Equal

2.2 GENERAL REQUIREMENTS

A. Transfer switches shall be in accordance with specifications and as shown on the drawings.

B. Electrically operated by motor mechanism energized from the source to which the load is to be transferred. Mechanically and electrically interlocked in both directions.

C. Double-throw type switching arrangement, mechanically held in both directions.

D. Switch contacts shall be silver composition for switching load current. Units rated 225 amperes and more shall have separate arcing contacts.

E. Where 4-pole switches are indicated, provide 100 percent rated neutral switching capacity.

F. Train and bundle factory wiring and identify consistently with shop drawings, either by color code or by numbered or lettered wire and cable tape markers at terminations.

1. Designated terminals accommodate field wiring.

2. Power terminals arrangement and field wiring space.

3. Pressure-type terminals, suitable for copper or aluminum conductors,

sized as indicated.

4. Control wiring equipped with lugs suitable for connection to terminal strips.

G. Transfer switch ratings:

1. Voltage: 480/277 volts, 3-phase, 3- or 4- wire as shown on the drawings, 60 Hz.

2. Switched poles: 3- or 4-pole with switched neutral as shown on the drawings.

3. Switch operation: Open transition.

4. Continuous rating: as indicated on the drawings.

5. Interrupting capacity: 100 percent of continuous rating.

6. Withstand current rating: UL-1008; rated to withstand the available RMS symmetrical short circuit current. Rating shall match or exceed the value shown on drawings at distribution equipment serving transfer switch (on utility service side).

2.3 AUTOMATIC TRANSFER SWITCH (ATS)

A. The ATS shall be mechanically interlocked to allow the main contacts to be in only one of three positions:

1. Closed on the normal source.

2. Closed on the emergency source.

3. Center-off position.

B. The ATS shall be equipped with a safe manual operator, permanently attached to the motor operator, designed to prevent injury to operating personnel. The manual operator shall provide the same contact-to-contact transfer speed as the electrical operator to prevent a flashover from switching the main contacts slowly.

C. The ATS control section shall be supplied with a protective cover and be mounted at a location within the transfer switch enclosure suitable for ease of maintenance. Sensing and control logic shall be solid state type. Printed circuit boards shall be keyed to prevent incorrect installation. Interfacing relays shall be industrial control grade plug in type with dust covers.

D. The ATS shall be a lockable, non ventilated wall or floor mounted enclosure. The enclosure shall be NEMA 1 type, unless otherwise shown on the drawings.

E. All switch and relay contacts, coils, springs and control elements shall be removable from the front of the ATS without removal of the switch from the enclosure and without disconnection of drive linkages or power conductors.

F. All control relays shall be continuous duty, industrial type with wiping contacts rated at least 10 amperes.

G. The thermal capacity of the main contacts shall not be less than 20 times the continuous duty rating for a minimum of 3 electrical cycles as established by certified test data.

H. The ATS shall be provided with a front panel-mounted electronic power meter as specified in Section 26 09 13 - Power Monitoring System.

2.4 ATS CONTROL OPERATION

A. The control shall include, but not necessarily be limited to the following:

1. Voltage and frequency sensing monitors. Monitors shall initiate a standby sequence of operation upon complete loss or reduction of any phase to phase voltage to an adjustable range of 70% to 95% of rated voltage. The switch shall transfer to the standby source when its voltage reaches 95% of rated frequency and an adjustable value between 85% and 95% of rated voltage.

2. The switch shall retransfer to normal when the voltage reaches an adjustable value between 85% and 95% and all time delays have expired.

3. The standby sequence of operation shall be initiated upon loss or reduction of normal source voltage, after an adjustable time period of between 0 and 5 seconds. Retransfer to the normal source shall occur after the normal source has been restored for an adjustable time period of between 0 and 30 minutes. This time delay shall automatically be bypassed if the standby source should fail and the normal source is available. After retransfer to the normal source, the generator(s) shall continue to run for an adjustable time period between 0 and 5 minutes.

B. Accessories:

1. Form-C contact that operates when normal source fails for initiating engine starting, rated 10 amps, 32 VDC. Contacts shall be gold plated for low voltage service.

2. Green signal light to indicate when the ATS is connected to the normal source. A red signal light to indicate when the automatic transfer switch is connected to the emergency source.

3. Two white signal lights to indicate availability of both sources. The light shall illuminate only when the source is truly available, i.e. within normal

voltage and frequency tolerances; monitor three phases on the utility and one phase on the emergency.

4. All lights shall be visible without opening the cover. Provide single pushbutton to test all indicating lights.

5. Two auxiliary contacts that are closed when the automatic transfer switch is connected to normal and two auxiliary contacts that are closed when the ATS is connected to emergency. Rated 10 amps, 120 VAC. These contacts shall be used in remote annunciation of the ATS position therefore, provide a labeled terminal strip for field connected wires from this remote location.

6. A test pushbutton switch to momentarily simulate normal source failure. Pushbutton shall be spring maintained in the automatic position. Locate the pushbutton on the outside of the front cover. Provide for remote actuation of test signal from the engine generator paralleling switchgear.

7. Adjustable voltage sensing relays on each phase of normal source set to drop out and start the generator at 85% of normal and restore to utility at 90% of normal rating.

8. Voltage and frequency monitors to prevent transfer to emergency until the emergency source reaches 90% of its voltage and 95% of its frequency rating.

9. Time delay on restoring load to normal after power failure has ended, adjustable 0-30 minutes, set at 30 minutes. Any momentary dips in the line will cause the time delay to reset and start its time cycle over. This time delay shall be automatically by passed if the emergency source fails and the normal source is available.

10. Provide a pushbutton switch for manual transfer to normal to bypass the time delay. However, if the normal source fails, retransfer to emergency source should be automatic if the emergency source is available. Pushbutton shall be mounted to the front cover.

11. Time delay to delay generator-start signal and override momentary normal source outages, adjustable 0.5-6 seconds, set at 1 second.

12. Time delay on transfer to emergency source after emergency source becomes available, adjustable 0-5 minutes, set at 0 seconds for backup priority sequencing of loads. Primary priority sequencing of loads shall be performed by the engine generator paralleling switchgear.

13. Delayed transition switches shall have the following additional features:

    a. Time delay on transfer to emergency and re-transfer to normal of 0-300 seconds, during which the switch is held in the center-off position.

b. Two sets of Form-C auxiliary contacts to operate upon initiation of transfer and when transfer is complete.
c. Two sets of Form-C auxiliary contacts to operate upon transfer to the emergency source.

14. Provisions to permit load "shedding" by switching the main contacts to the center-off position via the closing of an external set of dry contacts, rated 120 VAC, 10 amperes.

15. A three position switch, TEST NO LOAD/TEST WITH LOAD/REMOTE, such that when in the TEST NO LOAD position and the test switch is activated the generators shall start but the transfer switch shall remain in the normal position. In the TEST WITH LOAD position the transfer switch will transfer to the emergency source. In the REMOTE position, transfer to emergency source is controlled by a remote signal from the engine generator paralleling switchgear. In any position, the transfer switch shall automatically transfer to the live source in the event of a failure of the other source. Mount switch to outside of front cover.

16. Provide an in-phase monitor which automatically measures the frequency difference between the two sources and initiates transfer at appropriate phase angles to minimize disturbances from transferring motor loads.

17. The above user adjustable devices, shall be adjustable without the use of tools, power supplies, meters, etc. The above settings shall be set at the factory.

18. Equipment grounding lug sized for ground wires shown on drawings.

19. Provide long barrel, 2 hole, high compression circumferential crimp type lugs for the feeder conductors, size as specified on the drawings. Bussing shall be designed to accommodate the number of crimp type lugs as required by the feeder size shown in the drawings.

20. All control wires shall be 600 volt, rated.

2.5 NON-AUTOMATIC TRANSFER SWITCH (NATS)

A. Electrically operated actuation by means of pushbuttons designated "normal source" and "alternate source." In addition, removable external manual handle, operable only with door closed, provides quick-make, quick-break manual switching action. NATS shall be capable of electrically or manually transferring the load in either direction with one or both sources energized. The control circuit disconnects from the electrical operator during manual operation.

B. Double-throw switching arrangement shall be incapable of pauses or intermediate position stops during switching sequence.

C. Accessories:

1. Pilot lights indicating source to which the load is connected. Green signal light to indicate when the ATS is connected to the normal source. A red signal light to indicate when the automatic transfer switch is connected to the emergency source.

2. Source available indicating lights which supervise sources via the NATS normal and alternate source sensing circuits, respectively. White lights with nameplates engraved "Normal Source Available" and "Alternate Source Available" respectively.

3. Provide one set of normally closed unassigned auxiliary contacts for each switch position, rated 10 amperes at 120 VAC.

2.6 ENCLOSURE

A. Transfer switch shall be wall mounted or free-standing, floor-mounted as shown on the drawings, NEMA ICS 6, type 1 smooth sheet metal enclosure constructed in accordance with UL 1008.

B Finish: Five step zinc phosphatizing pretreatment, one coat of rust inhibiting dichromate primer and one coat baked-on enamel finish, ANSI 49 (light gray).

2.7 SOURCE QUALITY CONTROL

A. Factory tests:

1. Transfer switch shall be completely assembled, wired, adjusted and tested, per ANSI C37.20, at the factory under simulated service conditions to assure the accuracy of the wiring and the functioning of all equipment. The minimum of the following tests shall be performed and the documentation and measurements shall be included in Operation and Maintenance Manual.

2. Dielectric test.

3. Mechanical test.

4. Grounding of instrument transformers test.

5. Electrical operation and control wiring test.

6. Control wiring.

7. Polarity test.

B. Submit the certified test reports to the Engineer to confirm that all components have been tested to substantiate designs according to applicable ANSI and NEMA Standards. Tests shall verify the performance of the components as well as the suitability of the enclosure venting, rigidity and bus bracing.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Contractor shall thoroughly examine site conditions for acceptance of switchboard installation to verify conformance with manufacturer and specification tolerances. Do not commence with installation until all conditions are made satisfactory.

3.2 PREPARATION

A. Ensure all conduit stub-ups for bottom entry into switchboard are in place and located as required per shop drawings.

3.3 INSTALLATION

A. Install transfer switch in accordance with manufacturer's written instructions, as shown on the drawings and as specified herein.

B. Seismic Mounting:

1. Transfer switches shall be accurately aligned, leveled and bolted in place on full length channels securely fastened.

2. Provide anchorage details, coordinated with the transfer switch mounting provision, prepared and stamped by a licensed structural engineer.

3. Install in accordance with earthquake regulations of the Uniform Building Code and California Title 24.

C. Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in NETA Standard Tables.

D. Mark torqued bolt head using red or pink paint.

E. Replace any panel pieces, doors or trims having dents, bends, warps or poor fit which may impede ready access, security or integrity.

F. Conduits terminating in concentric, eccentric or oversized knockouts at transfer switch shall have ground bushings and bonding jumpers installed interconnecting all such conduits and the switch enclosure.

G. In damp and wet locations mount transfer switch with a minimum 1" of air space between enclosure and the wall or other supporting material.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's field service: Electrical contractor shall arrange and pay for the services of a factory-authorized service representative to supervise the initial start-up, pre-testing and adjustment of the switchboard.

B. At least three weeks prior to any testing, notify the electrical engineer so that arrangement can be made for witnessing test, if deemed necessary. All pre-testing shall have been tested satisfactorily prior to the engineer's witnessed test.

C. The electrical contractor shall supply a suitable and stable source of electrical power to each test site. The testing agency shall specify the specific power requirements.

D. Testing of overcurrent protective devices shall be done only after all devices are installed and system is energized.

E. Pre-testing:

1. Insulation resistance tests of buses, components, feeders and branch circuit conductors, and control circuits.

2. Continuity tests of circuits.

3. Provide testing agency with contract documents and manufacturer instructions for installation and testing.

4. Perform manual transfer.

F. Visual and mechanical inspection:

1. Inspect for physical damage, defects alignment and fit.

2. Perform mechanical operational tests in accordance with manufacturer's instructions.

3. Compare nameplate information and connections to contract documents.

4. Check tightness of all control and power connections.

5. Check that all covers, barriers, and doors are secure.

6. Perform manual transfer operation.

7. Confirm proper lubrication.

8. Check switch to ensure positive mechanical interlock between normal and alternate sources.

9. Ensure manual transfer warnings are attached and visible.

G. Electrical tests:

1. Perform insulation-resistance tests phase-to-phase and phase-to-ground with switch in both source positions. Test voltage shall be 1000-volts DC.

2. Perform a contact-resistance test across all main contacts.

3. Verify settings and operation of control devices in accordance with the specifications.

4. Calibrate and test all relays and timers including voltage and frequency-sensing relays, in-phase monitor (synchronism check), engine start and cooldown timers, transfer and retransfer timers, etc.

5. Perform automatic transfer tests:

   a. Simulate loss of normal power.
   b. Return to normal power.
   c. Simulate loss of emergency power.
   d. Simulate all forms of single-phase conditions.
   e. Monitor and verify correct operation and timing of the following simulations:
      i. Normal voltage-sensing relays.
      ii. Engine start sequence.
      iii. Time delay upon transfer.
      iv. Alternate voltage-sensing relays.
      v. Automatic transfer operation.
      vi. Interlocks and limit switch function.
      vii. Time delay and retransfer upon normal power restoration.
      viii. Engine cooldown and shutdown feature.

H. In the event that the system fails to function properly during the testing as a result of inadequate pre-testing or preparation. The contractor shall bear all costs incurred by the necessity for retesting including test equipment, transportation, subsistence and the engineer's hourly rate.

I. Contractor shall replace at no costs to the Owner all devices which are found defective or do not operate within factory specified tolerances.

J. Contractor shall submit the testing agency's final report to the engineer for review prior to project close-out and final acceptance by the Owner. Test report shall indicate test dates, devices tested, results, observation, deficiencies and remedies. Test report shall be included in the operation and maintenance manuals.

3.5 CLEANING

A. Prior to energizing of transfer switch the contractor shall thoroughly clean the interior of enclosure clean the interior of enclosure of all construction debris, scrap wire, etc. using manufacturer's approved methods and materials.

B. Upon completion of project prior to final acceptance the contractor shall thoroughly clean both the interior and exterior of transfer switch per manufacturer's approved methods and materials. Remove paint splatters and other spots, dirt, and debris.

C. Touch-up paint any marks, blemishes, or other finish damage suffered during installation.

3.6 TRAINING

A. Factory authorized service representative shall conduct training for Owner's Representatives upon completion and acceptance of system. Instructions shall include safe operation, maintenance and testing of equipment with both classroom training and hands-on instruction.

B. Contractor shall schedule training with a minimum of 7 days advance notice.

END OF SECTION

SECTION 26 51 00

INTERIOR LIGHTING

PART 1 - GENERAL

1.1 SUMMARY

A. Furnish and install lighting systems including:

1. Interior lighting fixtures, LED lamps, LED arrays, and drivers.
2. Exterior light fixture, LED lamps, LED arrays, drivers and poles.
3. Exit signs.
4. Lighting fixture supports.

B. Related Sections:

1. Section 26 27 26 Wiring Devices for manual wall-box dimmers and wall switch occupancy sensors.
2. Section 26 09 43 Network Lighting Controls for digital lighting controls.

1.2 DEFINITIONS

A. CCT: Correlated color temperature.

B. CRI: Color-rendering index.

C. LED: Light Emitting Diode

D. LER: Luminaire efficacy rating.

E. Lumen: Measured light output of lamp and luminaire, or both.

F. Luminaire: Complete lighting fixture, including driver housing if provided.

G. Pole: Luminaire support structure.

1.3 SUBMITTALS

A. Product Data: For each type of luminaire, pole and support structure, arranged in order of fixture designation in the fixture schedule. Include data on features, accessories, finishes, and the following:

1. Physical description of lighting fixture including dimensions.
2. LED drivers. Including milliamp output and variable and adjustment parameters available.

3. Energy-efficiency data. Any exceptions to this requirement must be CLEARLY identified along with the reason for the exception.
4. Life, output (lumens, CCT, and CRI), and energy-efficiency data for lamps. Provide input watts for fixtures.
5. Photometric data and adjustment factors based on laboratory tests, complying with IESNA Lighting Measurements Testing & Calculation Guides, of each lighting fixture type. The adjustment factors shall be for LED light engines, drivers, and accessories identical to those indicated for the lighting fixture as applied in this Project.
   a. Testing Agency Certified Data: For indicated fixtures, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining fixtures shall be certified by manufacturer.
   b. Manufacturer Certified Data: Photometric data shall be certified by a manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.
6. Methods of field assembly and rough-in.
7. Poles: materials, dimensions, finishes, anchor bolts.

B. Shop Drawings: For nonstandard or custom lighting fixtures. Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Wiring Diagrams: For power, signal, and control wiring.
   3. Anchor bolt templates, keyed to specific poles and certified by manufacturer.

C. Installation instructions.

D. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Lighting fixtures.
   2. Suspended ceiling components.
      3. Partitions and millwork that penetrate the ceiling or extends to within 12 inches of the plane of the luminaires.
      4. Ceiling-mounted projectors.
      5. Structural members to which suspension systems for lighting fixtures will be attached.
      6. Other items in finished ceiling including the following, where applicable:
         a. Air outlets and inlets.

b. Speakers.
c. Sprinklers.
d. Fire Alarm Devices.
e. Occupancy sensors.
f. Access panels.
g. Telemetry antennas.
h. Wi-Fi antennas.

7. Perimeter moldings.

E. Qualification Data: For qualified agencies providing photometric data for lighting fixtures.

F. Field quality-control reports.

G. Operation and Maintenance Data: For lighting equipment and fixtures to include in emergency, operation, and maintenance manuals.

1. Provide a list of all the different drivers used in the complete fixture package for use by the operations staff.

H. Warranty: Provide complete warranty information for all lighting products.

1.4 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.

B. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910, complying with the IESNA Lighting Measurements Testing & Calculation Guides.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in California Electrical Code (CEC), by a qualified testing agency, and marked for intended location and application.

D. Comply with CEC.

E. FM Global Compliance: Lighting fixtures for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

1.5 COORDINATION

A. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.

1.6 WARRANTY

A. Special Warranty for Emergency Lighting Batteries: Manufacturer's standard form in which manufacturer of battery-powered emergency lighting unit agrees to repair or replace components of rechargeable batteries that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Emergency LED Driver Batteries: 1 year from date of Substantial Completion. Full warranty shall apply for first year, and prorated warranty for the remaining years.

B. LED Fixtures: Provide minimum 1 year limited warranty on standard components or obtain written approval if less.

1.7 DELIVERY, STORAGE AND HANDLING

A. Package aluminum poles for shipping according to ASTM B 660.

B. Store poles on decay-resistant-treated skids at least 12 inches above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.

C. Retain factory-applied pole wrappings on metal poles until right before pole installation. For poles with nonmetallic finishes, handle with web fabric straps.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, provide products by manufacturers and type only as specified in the documents for light fixtures and related lighting equipment.

2.2 GENERAL REQUIREMENTS FOR LIGHTING FIXTURES AND COMPONENTS

A. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.

B. Metal Parts: Free of burrs and sharp corners and edges.

C. Sheet Metal Components: Steel unless otherwise indicated. Form and support to prevent warping and sagging.

D. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit replacement of LED light engine without unnecessary disassembly. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during light engine replacement and when secured in operating position.

E. Diffusers and Globes:

1. Acrylic Lighting Diffusers: 100 percent virgin acrylic plastic. High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
   a. Lens Thickness: At least 0.125 inch minimum unless otherwise indicated.
   b. UV stabilized.
2. Glass: As noted on fixture schedule.

F. Factory-Applied Labels: Comply with UL 1598. Include driver information. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when LED circuit boards are in place.

G. Exterior Luminaires shall be labelled for installation in wet locations.

2.3 EXIT SIGNS

A. General Requirements for Exit Signs: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.

B. Internally Lighted Signs:

1. Lamps for AC Operation: LEDs, 50,000 hours minimum rated lamp life.

2.4 LIGHTING FIXTURE SUPPORT COMPONENTS

A. Comply with Section 26 05 29 Hangers and Supports for Electrical Systems for channel- and angle-iron supports and nonmetallic channel and angle supports.

B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture. Must swing 45°.

C. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.

D. Aircraft cable wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, 12 gage.

E. Aircraft cable wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, 12 gauge.

F. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.

G. Hook Hangers: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking-type plug.

2.5 POLES AND SUPPORT COMPONENTS, GENERAL REQUIREMENTS

A. Structural Characteristics:

1. Wind-Load Strength of Poles: Adequate at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of speed, with a gust factor of 1.3.
2. Strength Analysis: For each pole, multiply the actual equivalent projected area of luminaires and brackets by a factor of 1.1 to obtain the equivalent projected area to be used in pole selection strength analysis.

B. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts, unless otherwise indicated.

C. Mounting, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.

1. Materials: Shall not cause galvanic action at contact points.
2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication, unless stainless-steel items are indicated.
3. Anchor-Bolt Template: Plywood or steel.

D. Concrete Pole Foundations: Cast in place, with anchor bolts to match pole-base flange. Concrete reinforcement and formwork are specified in Division 03 Section "Cast-in-Place Concrete".

2.6 ALUMINUM POLES

A. Poles: Seamless, extruded structural tube complying with ASTM B 429, Alloy 6063-T6 with access handhole in pole wall.

B. Poles: ASTM B 209, 5052-H34 marine sheet alloy with access handhole in pole wall.

1. Shape: As noted in fixture schedule.
2. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.

C. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.

D. Grounding and Bonding Lugs: Welded ½-inch threaded lug, complying with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.

E. Brackets for Luminaires: Detachable, with pole and adapter fittings of cast aluminum. Adapter fitting welded to pole and bracket, then bolted together with stainless-steel bolts.

1. Tapered oval cross section, with straight tubular end section to accommodate luminaire.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Lighting fixtures:

1. Set level, plumb, and square with ceilings and walls unless otherwise indicated.
2. Wall mounted fixtures within the same field of vision shall be at the same height.
3. If wall construction is less than smooth, install wall mounted fixtures spaced off the wall with brackets so as not to accentuate the imperfect wall surface.

B. Permanent lighting used during construction: As the project gets closed up and parts of the building are complete and if approved by Architect, contractor may use permanent luminaires for temporary lighting, install and energize the minimum number of luminaires necessary. When construction is sufficiently complete, inspect luminaires for any wear and repair to an “as new” condition. Provide new lamps and/or drivers if failure occurs.

C. Remote Mounting of Drivers: Distance between the driver and fixture shall not exceed that recommended by fixture manufacturer. Verify, with fixture manufacturers, maximum distance between driver and luminaire.

D. Lay-in Ceiling Lighting Fixtures Supports: Use grid as a support element.

1. Install ceiling support system rods or wires, independent of the ceiling suspension devices, for each fixture. Locate not more than 6 inches from lighting fixture corners.
2. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
3. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently to the structure.
4. Install at least one independent support rod or wire from structure to a tab on lighting fixture. Wire or rod shall have breaking strength of the weight of fixture at a safety factor of 3.
5. The exact location of all fixtures shall be determined from dimensions derived in the Revit model and transferred to the Architectural reflected ceiling plan. Contractor shall compare the electrical lighting plan to the Architectural reflected ceiling plan and document any discrepancies. Install the light fixtures related to discrepancies as directed by response to discrepancy documentation.

E. Suspended Lighting Fixture Support:

1. Pendants and Rods: Where longer than 48 inches or otherwise required, brace to limit swinging.
2. Stem-Mounted, Single-Unit Fixtures: Suspend with twin-stem hangers.

3. Continuous Rows: Use aircraft cable support and power cable for wiring at one point and additional aircraft cable wires for suspension for each unit length of fixture chassis, including one at each end. Follow spacing recommendation of manufacturer and structural engineer.
4. Do not use grid as support for pendant luminaires. Connect support wires or rods to building structure.

F. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

G. Pole/Bollard Installation:

1. Align pole foundations, poles and bollards for optimum directional alignment of luminaires and their mounting provisions on the pole.
2. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in Division 03 Section “Cast-in-Place Concrete”.

3.2 IDENTIFICATION

A. Install labels with panel and circuit numbers on concealed junction and outlet boxes. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

3.3 FIELD QUALITY CONTROL

A. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery and retransfer to normal.

B. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes, but is not necessarily limited to:

1. Common standards and procedures for the Communications Work.

2. Design, engineer and provide complete, all means of support, suspension, attachment, fastening, bracing, and restraint (hereinafter "support") of the Communications Systems. Provide engineering of such support by parties licensed to perform work of this type in the Project jurisdiction.

B. Provisions of this Section apply to Communications Work, including the following Sections:

1. Section 27 05 26 – Grounding and Bonding for Communications Systems

2. Section 27 05 29 – Hangers and Supports for Communications Systems

3. Section 27 05 33 – Conduits and Backboxes for Communications Systems

4. Section 27 05 53 – Identification for Communications Systems

5. Section 27 10 00 – Structured Cabling, Basic Materials and Methods

6. Section 27 11 16 – Communications Cabinets, Racks, Frames and Enclosures

7. Section 27 11 19 – Communications Termination Blocks and Patch Panels

8. Section 27 11 23 – Communications Cable Management

9. Section 27 13 00 – Communications Indoor Backbone Cabling

10. Section 27 15 00 – Communications Horizontal Cabling

11. Section 27 41 16 – Integrated Audiovisual Systems and Equipment

1.3 DEFINITIONS

A. General Abbreviations used in these specifications. Refer additionally to the abbreviations list appearing on the Drawings.

1.	ADA	Americans With Disabilities Act.
2.	AFC	Above Finished Ceiling.
3.	AFF	Above the Finished Floor.
4.	BLDG	Building
5.	CAT	Category
6.	CL	Centerline
7.	DIV	Division
8.	(E)	Existing
9.	FBO	Furnished By Owner
10.	HR	Home Run
11.	ID	Inside Diameter
12.	LAN	Local Area Network
13.	MAX	Maximum
14.	NIC	Not In Contract.
15.	OD	Outside Diameter
16.	OFE	Owner Furnished Equipment.
17.	PSRH	Project Standard Receptacle Height.
18.	PSSH	Project Standard Switch Height.
19.	TYP	Typical
20.	UON	Unless Otherwise Noted.

B. Reference to Named Products

1. Selected Item: Item so noted was selected based on comparative testing of similar products. Procedure for determination of equivalence is noted in the specification for the item(s).

2. System Design Basis: Item so noted interacts with other system items to produce total system function. Substitution of this item may require coordinated substitution of other system items.

3. Design Basis: Item so noted was used as basis for system drawings to establish features, size, etc. Use of specified equivalents may require adjustment of

physical layout or wiring, but does not affect system function. No preference is implied.

1.4 SUBMITTALS

A. Comply with the following:

1. Submit all materials for review arranged in same order as Specifications, individually referenced to Specification Section, Paragraph and Contract Drawing number. Conform in every detail as applies to each referencing Section.

2. Submit 8 ½ in.x 11 in. items bound in volumes and drawings in edge bound sets. Submit all drawings on sheets of the same size.

3. Make each specified submittal as a coordinated package complete with all information specified herein. Incomplete or uncoordinated submittals will be returned with no review action.

B. Manufacturer's Product Data:

1. Manufacturer's Product Data Sheets. Collate in sequence of List of Materials:

2. Data sheet for each item in each Communications Section, including all accessories, clearly marked for proposed product.

3. Material Safety Data Sheet, where applies.

4. List of Materials Schedule. For each item, include:

a. Referencing Specification Section

b. Referencing Paragraph

c. Referencing Drawing, if specified only on plans

d. Manufacturer.

e. Model number.

f. Listing, including name of Nationally Recognized Testing Laboratory.

g. Precede each submittal book with a summary schedule, with columns for each item above and rows for each item submitted.

1) Example:

Specification Section	Paragraph	Contract Drawing Reference	Manufacturer	Model No.	UL/ CLA Listed
27 05 00	2.03C		XYZ	123	Y
27 15 00	2.07A1		AAA	34-56	Y
		T402	ZZY	456	Y

C. Field Installation and Shop Drawings:

1. General

a. Drawings shall use the makes and models of devices proposed for use this project; replace vendor neutral nomenclature used in bid set with.

b. Where the existing systems and/or infrastructure are used and integrated into the work of the project, indicate them on drawings, including points of interface and demarcation of existing and new work.

c. Collate, in sequence, at least the following minimum drawings, for each infrastructure and system to be installed under the work of this contract:

2. Drawing index/symbol sheet.

3. Site plans, floor plans and reflected ceiling plans.

a. General
   1) The identifier for each termination and cable shall appear on the drawings, either directly on the floor plans, through an associated schedule or an unique identifier associated with a fully annotated single line diagram.
   2) Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Drawings shall indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices.
   3) At scale of Contract Documents, show:
      a) Device locations and type
      b) Rough-in.
      c) Mounting height.
      d) Conduit size.
      e) J-hook routes
      f) Wire type.
      g) Wire fill.
   4) On the floor plans, indicate floor and wall mounted devices and pathway below a height of 7 feet above finish floor. Indicate the locations of the communications rooms and provide reference to the enlarged communications rooms plans.
   5) On the reflected ceiling plan, indicate ceiling and wall mounted devices and pathway above a height of 7 feet above finish floor. Indicate the locations of the communications rooms and provide reference to the enlarged communications rooms plans.

b. Communications Infrastructure
   1) Provide registered communications distribution designer (RCDD) approved, drawings depicting a complete communication infrastructure in accordance with ANSI/TIA/EIA-606-A. The drawings should provide details required to prove that the distribution system shall properly support connectivity from the communications rooms including EF, ER, CD's, BD's, and FD's to the telecommunications work area outlets.
   2) The following drawings shall be provided as a minimum:
      a) T1- Layout of complete building per floor - Building Area/Serving Zone Boundaries, Backbone Systems, and Horizontal Pathways. Layout of complete building per floor. The drawing indicates location of building areas, serving zones, vertical backbone

diagrams, telecommunications rooms, access points, pathways, grounding system, and other systems that need to be viewed from the complete building perspective.

b) T-2 Serving Zones/Building Area Drawings - Drop Locations and Cable Identification (ID'S). Shows a building area or serving zone. These drawings show drop locations, telecommunications rooms, access points and detail call outs for common equipment rooms and other congested areas.

3) Indicate:
   a) Device locations, orientation and depict integration of systems that need to be viewed from the complete building perspective.
   b) For distributed speaker systems, indicate limits of zones of coverage.
   c) Vertical and horizontal pathways
   d) Equipment rooms and racks
   e) Reference to enlarged plans and related details.

4. Enlarged Plans

a. General
   1) Indicate at least as much information as is provided in the Contract Documents, supplemented by the dimensions and arrangement of the proposed equipment, trade coordination and field conditions.

b. Communications Infrastructure.
   1) Communications Rooms Drawings
      a) Provide T3 drawings in accordance with EIA TIA/EIA-606-A that include telecommunications rooms plan views, pathway layout (cable tray, racks, ladder-racks, etc.), mechanical/electrical layout, and cabinet, rack, backboard and wall elevations. Include rack details, proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearance for maintenance and operation.
      b) At scale of Contract Documents, the Contractor shall submit scaled drawing elevations (showing dimensions, mounting locations and associated frames & equipment) for all required assemblies, including but not limited to:
         (1) Rack locations
         (2) Telephone termination boards
         (3) Wall mounted backbone cabling and major station cable bundles.
         (4) Wall mounted splice cases
         (5) Wall mounted copper cable protectors and terminal blocks.
         (6) Wall mounted fiber optic cable terminations.
         (7) Clearances
         (8) Backboard Wire and Cable Management
         (9) Rack elevations, including
            i. Copper cable patch panels.

ii. Fiber optic cable patch panels.
iii. Rack mounted wire managers
iv. Hold clears for equipment provided by Others.
v. Reference to mounting details.
vi. Power strips
vii. UPS

2) Drawings may also be an enlargement of a congested area of T1 or T2 drawings.

5. Detail Drawings

a. Mounting details:
1) Specific details of restraints including anchor bolts submitted under the Section 27 05 29 for mounting and maximum loading at each location, showing compliance and coordination with Code and the project Architectural, Structural and Mechanical Documents.
2) Stamped and signed by an Engineer licensed in the Project jurisdiction for work of this type.
a) Submit an accompanying Engineering analysis stamped and signed by an Engineer licensed in California for work of this type, indicating that the Equipment Enclosure System will comply with California Building Code for the Project Seismic Zone when loaded with the weight of the equipment submitted.
b) Show calculations on drawings or in bound volume for review by Authorities having jurisdiction.
3) Show loads, type and strength of connections, sizes, dimensions, materials, etc.
4) Provide details for:
a) Equipment Rack anchorage.
b) Wall Mounted Racks and Enclosures.
c) Cable Runway and Cable Tray
d) Ceiling and Wall Supported Projectors
e) Motorized and Manual Projection Screens
f) Wall and ceiling loudspeakers weighing 20 pounds or more.

b. Faceplate and Receptacles
1) Receptacle and jack arrangement for each condition.
2) Labeling of receptacle/jacks and plate
3) Plate material.
4) Plate finish.
5) Connector types.
6) Connector dimensioned layout.

c. Pathway
1) Cable tray installation details, indicating complete system of fittings and radiussed pathways provided.
2) Firestopping
3) Details of flexible raceway connections to be made to vibrating equipment

4) An itemized list of all items of equipment to be fitted with flexible electrical connections.
5) Conduit racking details.

d. California Access Compliance Manual and Americans with Disabilities Act (ADA) compliance.

e. For systems with contractor or manufacturer programmed control and human interfaces submit at least:
1) Narrative of the sequence of operation.
2) Color, full-size layouts of each touchpanel and/or computer screen (menu) image, cross-referenced to the sequence of operations.
3) Show chaining of sub-menus.

f. Terminal cabinets: Terminations.

g. Voice cable plant: Cut sheets for use by Owner's PBX Contractor

D. Samples: Samples for review by the Owner's Representative of all finishes/materials which will be visible to the public, including but not limited to:

1. Receptacles. The Contractor shall submit a mock up sample of each type of communication outlet including conduit, wall box, faceplate, communication cables, jacks and jack identifying labels.

2. The Contractor shall submit a sample of each type of label to be used for labeling cables, patch panels, termination frames, and faceplates for the telephone and data systems.

3. Surface Raceway, for each type:

a. Raceway base and cover, at least 5 foot section.

b. Boxes, at least two of each type to be used.

c. For other items, provide at least 2 in.x 2 in. sample.

E. Test Plan

1. Submit complete documentation of the proposed test plan and equipment to be used to document that the performance of the cabling, equipment, sub-systems and complete systems installed under the work of this project conform with the performance standards outlined in each specification section.

2. Submit not less than 45 days prior to the proposed test date. Include procedures for certification, validation, and testing.

F. Test Reports

1. Manufacturer's Field Reports

a. Factory reel tests

2. Project Site Test Reports:

a. Submit following system completion and prior to and as condition precedent to Acceptance Review and Testing of the Work of this Section.

b. Schedule: Submit test reports in timely manner relative to Project schedule such that the Owner's Representative may conduct verification of submitted test data without delay of scheduled progress.

c. Project Site test report:

d. Content: Include at least:
   1) Time and date of test.
   2) Personnel conducting test.
   3) Test equipment, including serial and date of calibration.
   4) Test object.
   5) Procedure used.
   6) Results of test
   7) Numerical or graphical presentation.
   8) Electronic file in format and media directed by the Owner's Representative.

1.5 QUALITY ASSURANCE

A. Designated Supervisor: Provide a designated supervisor present and in responsible charge in the fabrication shop and on the Project Site during all phases of installation and testing of the Work of this Section. This supervisor shall be the same individual through the execution of the Work unless illness, loss of personnel, or other circumstances reasonably beyond the control of the Contractor intervene.

B. Reference Documents: At all times when the work is in progress, maintain at the workplace, fabrication shop or Project Site as applies.

1. A complete set of the latest stamped, actioned submittals of record.

2. A complete set of manufacturer's original operation, instruction and service manuals for each equipment item.

C. Standard Products

1. Telecommunications Equipment. Provide telecommunications materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products shall have been in satisfactory commercial or industrial use for 1 year prior to bid opening. The 1-year period shall include applications of equipment and materials under similar circumstances and of similar size. The product shall have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 1-year period.

   a. Alternative Qualifications. Products having less than a 1-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 4000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

2. Material and Equipment Manufacturing Date

   a. Products manufactured more than 3 years prior to date of delivery to site shall not be used, unless specified otherwise.

D. Test Equipment

1. Requirements:

a. Maintain and operate test equipment at the fabrication shop and the job site for both routine and Acceptance Testing of the Work of this Section.

b. Maintain test equipment at the job site while work is in progress from installation of equipment racks until Owner Acceptance of this Work; thereafter remove all of this test equipment from the job site.

c. Unless otherwise indicated, test equipment shall remain property of the Contractor.

d. Provide all required test cables, jigs and adapters.

e. Provide equipment with traceable calibration, with calibration date not greater than one year prior to the date of the use of the equipment to perform the specified testing.

f. Calibration on test equipment must be verified by District Representative prior to beginning testing. Notify the District Representative 48 hours in advance of testing.

E. Qualifications

1. Communications Infrastructure work shall be performed by and the equipment shall be provided by the telecommunications contractor and key personnel. Qualifications shall be provided for:
   1) the telecommunications system contractor,
   2) the telecommunications system installer,
   3) and the supervisor (if different from the installer).

b. A minimum of 30 days prior to installation, submit documentation of the experience of the telecommunications contractor and of the key personnel.

2. Key Personnel, General

a. Indicate the proposed key persons that are currently employed by the telecommunications contractor or who have a commitment to the low voltage systems and infrastructure contractor for the work of this project. All key persons shall be employed by the low voltage systems and infrastructure contractor at the date of issuance of this project, or if not, have a commitment to the low voltage systems and infrastructure contractor to work on this project by the date that the bid was due to the District's Representative.

b. Note that only the key personnel approved by the District's Representative in the successful proposal shall perform work on this project's low voltage systems and infrastructure systems. Key personnel shall function in the same roles in this contract, as they functioned in the offered successful experience. Any substitutions for the low voltage systems and infrastructure contractor's key personnel requires approval from the District's Representative.

3. Telecommunications Contractor

a. The telecommunications contractor shall be a firm which is regularly and professionally engaged in the business of the applications, installation, and testing of the specified telecommunications systems and equipment.
   1) The telecommunications contractor shall demonstrate experience in providing successful telecommunications systems within the past 3 years.
   2) Submit documentation for a minimum of three and a maximum of five successful telecommunication system installations for the telecommunications contractor.

b. Key Personnel
   1) Provide key personnel who are regularly and professionally engaged in the business of the application, installation and testing of the specified telecommunications systems and equipment. There may be one key person or more key persons proposed for this project depending upon how many of the key roles each has successfully provided. Each of the key personnel shall demonstrate experience in providing successful telecommunications systems within the past 3 years.
   2) Supervisors and installers assigned to the installation of this system or any of its components shall be Building Industry Consulting Services International (BICSI) Registered Cabling Installers, Technician Level. Submit documentation of current BICSI certification for each of the key personnel.
   3) In lieu of BICSI certification, supervisors and installers assigned to the installation of this system or any of its components shall have a minimum of 3 years experience in the installation of the specified copper and fiber optic cable and components. They shall have factory or factory approved certification from each equipment manufacturer indicating that they are qualified to install and test the provided products. Submit documentation for a minimum of three and a maximum of five successful telecommunication system installations for each of the key personnel. Documentation for each key person shall include at least two successful system installations provided that are equivalent in system size and in construction complexity to the telecommunications system proposed for this project. Include specific experience in installing and testing telecommunications systems and provide the names and locations of at least two project installations successfully completed using optical fiber and copper telecommunications cabling systems. All of the existing telecommunications system installations offered by the key persons as successful experience shall have been in successful full-time service for at least 18 months prior to the issuance date for this project. Provide the name and role of the key person, the title, location, and completed installation date of the referenced project, the referenced project owner point of contact information including name, organization, title, and telephone number, and generally, the referenced project description including system size and construction complexity

4. Minimum Communications Infrastructure Manufacturer Qualifications

a. Cabling, equipment and hardware manufacturers shall have a minimum of 3 years experience in the manufacturing, assembly, and factory testing of components which comply with ANSI/TIA/EIA-568-B.1, ANSI/TIA/EIA-568-B.2 and ANSI/TIA/EIA-568-B.3.

b. The contractor to be trained and certified to provide the following minimum manufacturer's warranty:
   1) Twenty (20) Year extended product warranty. A 20 Year extended product warranty shall ensure against product defects, that all approved cabling components exceed the specifications of TIA/EIA 568 and ISO/IEC IS 11801, and provide and end-to-end solution. The warranty shall apply to all passive cabling components. The 20 Year extended product warranty shall cover the replacement or repair of defective product(s) and labor for the replacement or repair of such defective product(s) for a twenty (20) year period.

c. Twenty (20) Year application assurance. A 20 Year application assurance shall cover the failure of the wiring system to support the application which it was designed to support.

1.6 REGULATORY REQUIREMENTS

A. Regulations Applicable:

1. Nothing in the Contract Documents shall be construed to permit Work not conforming to applicable laws, ordinances, rules, or regulations.

2. Safety Agency Listing: All devices provided under the Work of this Section which are connected to the Project electrical system shall be listed by a Nationally Recognized Testing Laboratory, and shall be so labeled.

3. In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Owner's Representative. Equipment, materials, installation, and workmanship shall be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.7 DELIVERY, STORAGE AND HANDLING

A. General

1. Provide protection from weather, moisture, extreme heat and cold, dirt, dust, and other contaminants for telecommunications cabling and equipment placed in storage.

1.8 ENVIRONMENTAL REQUIREMENTS

A. Connecting hardware shall be rated for operation under ambient conditions of 32 to 140 degrees F and in the range of 0 to 95 percent relative humidity, non-condensing.

1.9 SEQUENCING

A. Comply with the following.

1. Sequence.

a. Follow Foothill's Guidelines.

2. Reproduceables:

a. 1 set of reproducible bond.

b. CAD files: 1 set.

3. Contractor to use these number in preparing their shop drawings and in executing the work of the Project.

1.10 OPERATING AND MAINTENANCE DATA

A. Commercial off the shelf manuals shall be furnished for operation, installation, configuration, and maintenance of products provided as a part of the telecommunications cabling and pathway system. Precede the manuals with a systems narrative specific to this Project, outlining the major systems functionality, the major systems components, and identifying which manuals document the performance of which subsystems.

1. Submit operations and maintenance data and as specified herein not later than 2 months prior to the date of beneficial occupancy or as specified in Division 1, whichever is sooner.

1.11 PROJECT RECORD DOCUMENTS

A. Comply with and the following. Include at least as much information as required for the submittal drawings.

1. Record Drawings

a. CAD.
1) Use a computer aided drafting (CAD) system in the preparation of record drawings for this Project. CAD system shall produce files in AutoCAD® .DWG format, version 2010 or later.

b. Except where prohibited by Contract, Owner's Representative will furnish CAD backgrounds in AutoCAD® .DWG format, for use by the Contractor in preparing Record Drawings.

c. Contractor shall be responsible for updating building and communications plans to reflect as-built conditions.
1) Indicate actual work on Drawings; indicate actual products used, replace vendor neutral nomenclature used in bid set with makes and models of actual installed devices.

d. Disk copy of Record Drawings: Provide 2 separate copies of each drawing file in the format noted above. Submit on CD-R disk.

e. Reproduceables: Provide 1 set of Bond paper.

2. Provide T5 drawings including documentation on cables and termination hardware in accordance with ANSI/TIA/EIA-606-A. T5 drawings shall include schedules to show information for cut-overs and cable plant management, patch panel layouts and cover plate assignments, cross-connect information and connecting terminal layout as a minimum. Provide the following T5 drawing documentation as a minimum:

   a. Cables - A record of installed cable shall be provided in accordance with ANSI/EIA/TIA-606-A. The cable records shall include the required data fields for each cable and complete end-to-end circuit report for each complete circuit from the assigned outlet to the entry facility in accordance with ANSI/TIA/EIA-606-A. Include manufacture date of cable with submittal.

   b. Termination Hardware - A record of installed patch panels, cross-connect points, distribution frames, terminating block arrangements and type, and outlets shall be provided in accordance with EIA TIA/EIA-606-A. Documentation shall include the required data fields as a minimum in accordance with EIA TIA/EIA-606-A.

1.12 WARRANTY SERVICE

A. Provide the following.

1. Response Time: Provide a qualified technician familiar with the work at the Project Site within 24 hours after receipt of a notice of malfunction. Provide the Owner's Representative with telephone number attended 8 hours a day, 5 days a week, to be called in the event of a malfunction.

B. Provide all additional Warranties as defined in each Communication Systems Section.

1.13 ACCEPTANCE REVIEW AND TESTING PROCEDURES

A. Complete all Work of this Section. Submit Test Report. Submit review copies of Operating and Maintenance Manuals, less reduced set of Record Drawings. Notify the Owner's Representative in writing that the Work of these Sections is complete and fully complies with the Contract Documents. Request Acceptance Review and Testing. The Owner's Representative will conduct Verification of Submitted Test Data, and otherwise direct testing and adjustment of this Work. These procedures may be performed at any hour of the day or night as required by the Owner's Representative to comply with the Project Schedule and avoid conflict with Residents. Provide all specified personnel and equipment at any time without claim for additional cost or time.

B. Personnel: Provide services of the designated supervisor and additional technicians familiar with work of this Section. Provide quantity of technicians as required to comply with Project Schedule.

C. In Addition, Provide:

1. All tools appropriate for performance of adjustment of and corrections to this Work. Include spare wire and connectors and specified tooling for application.

2. Ladders, scaffolding and/or lifts as required to access high devices.
3. All test equipment.
4. Complete set of latest stamped, actioned submittals of record for reference.
5. Complete set of Test Reports.
6. Complete set of manufacturer's original operation, instruction and service manuals for each equipment item for reference.
7. Demonstrate: Complete operation of all systems and equipment, including Portable Equipment.
8. Adjust: As directed by the Owner's Representative.
9. Correct: In timely manner, failure to comply with the Contract Documents, as reasonably determined by the Owner's Representative.

D. Temporary Equipment: Provide and operate, without claim for additional cost or time, temporary equipment and/or systems to provide reasonably equivalent function, as determined by the Owner's Representative, in place of the Work of this Section which is incomplete or found not in conformance with the Contract Documents as of seven (7) days prior to the scheduled completion date. Provide such temporary equipment until Acceptance of the Work of this Section. Thereafter, remove such temporary equipment.

1.14 CLOSEOUT

A. Punch List: Perform any and all remedial work, at no claim for additional cost or time. Where required, retest and submit Test Report. Notify the Owner's Representative of completion of Punch List.

B. Portable Equipment: Furnish all portable equipment and spares to the Owner's Representative, along with complete documentation of the materials presented. Where applicable, furnish portable equipment in the original manufacturer's packing.

C. Operating and Maintenance Data: Install framed operating and maintenance instructions. Submit Manuals.

D. Project Record Documents: Submit print and digital copies as defined above.

E. Keys: If applicable, replace construction locks with permanent locks. Provide 5 sets of keys to the Owner's Representative.

F. Instruction: Conduct specified instruction.

G. Warranty: Submit Warranty dated to run from date of Acceptance of the Work of this Section.

PART 2 - PRODUCTS

2.1 GENERAL

A. Where a particular material, device, piece of equipment or system is specified directly, the current manufacturer's specification for the same shall be considered to be a part of these specifications, as if completely contained herein in every detail.

B. Each material, device or piece of equipment shall comply with all of the manufacturer's current published specifications for that item.

C. Products shall be made by manufacturers regularly engaged in the production of such products.

D. Provide quantity as shown on Contract Drawings, or as otherwise indicated.

E. Provide all auxiliary and incidental materials and equipment necessary for the operation and protection of the Work of this Section as if specified in full herein.

F. Unless recycled content is specified, provide new materials.

G. Provide the manufacturer's latest design/model, permanently labeled with the manufacturer's name, model number and serial number.

H. Where products are of similar type or use, provide products of the same manufacturer, unless otherwise indicated.

I. Components

1. UL or third party certified. Cabling and interconnecting hardware and components for telecommunications systems shall be UL listed or third party independent testing laboratory certified, and shall comply with NFPA 70 and conform to the requirements specified herein.

2. Where equipment or materials are specified to conform to industry and technical society reference standards of the organizations, submit proof of such compliance.

   a. The label or listing by the specified organization will be acceptable evidence of compliance.

   b. In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the Owner's Representative.

   c. The certificate shall state that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

J. Enclosures:

1. Provide steel frames and enclosures designed and wired to eliminate all induced currents.

2. Make bolted connections with self-locking devices.

K. Finishes: Any item or component of the Work of this Section which is visible shall comply with the following.

1. Finishes noted or scheduled on the Contract Drawings take precedence.

2. Where design location requires that products, materials or equipment are visible to the public, no manufacturer's logos larger than 1/2 inch shall be visible. Unless otherwise noted or directed, neatly remove or permanently paint out such logos.

3. Where finishes are not noted or otherwise defined in the Contract Documents, submit manufacturer's standard finish samples for selection by the Owner's Representative.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine existing conditions before starting work. Submit conflicts in a timely manner for resolution

3.2 PREPARATION

A. Prepare and sequence the work to minimize disruption to each room environment and existing communications systems.

B. Protection: Cover all computers, electronic equipment, desks, chairs, furniture and other articles when working at ceiling level and/or performing dust producing tasks.

3.3 REPAIR AND RESTORATION

A. Where working in spaces occupied by the Owner, return to their original positions any furniture or articles relocated to perform the work.

3.4 CLEANING

A. Where working in spaces occupied by the Owner:

1. Immediately after completing work within each space, clean up and remove all materials, scrap and dust.

2. All scrap material in work area shall be picked up and removed from the building at the end of each day.

3. All dust resulting from work performed shall be vacuumed up daily.

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. Section includes grounding and bonding of Communications Work, including but not limited to:

1. Communications Raceways
2. Cable Runway
3. Cable Shields
4. Protector Fields
5. Communications cabinets and enclosures.

B. Related Work Under Other Sections

1. Related Sections:
   a. Section 27 05 00 – Common Work Results for Communications
   b. Section 27 05 29 – Hangers and Supports for Communications Systems
   c. Section 27 05 33 – Conduits and Backboxes for Communications Systems
   d. Section 27 05 36 – Cable Trays for Communications Systems
   e. Section 27 10 00 – Structured Cabling, Basic Materials and Methods
   f. Section 27 11 16 – Communications Cabinets, Racks, Frames and Enclosures
   g. Section 27 11 19 – Communications Termination Blocks and Patch Panels
   h. Section 27 11 23 – Communications Cable Management
   i. Section 27 13 00 – Communications Interior Backbone Cabling
   j. Section 27 15 00 – Communications Horizontal Cabling

1.2 SYSTEM DESCRIPTION

A. Provide telecommunications system grounding conductor as described herein and indicate on drawings.

B. Except as otherwise indicated, the complete communications installation including the metallic conduits and raceways, cable trays, boxes, cabinets and equipment shall be completely and effectively grounded in accordance with all code requirements, whether or not such connections are specifically shown or specified.

C. Resistance:

1. Resistance from the farthest ground bus through the ground electrode to earth shall not exceed 5 Ohms or the requirements of ANSI-J-STD-607-A-2002, whichever is more restrictive.

1.3 REFERENCES

A. American National Standards Institute (ANSI)

1. ANSI/TIA/EIA-606-B-2016 Administration Standard for the Telecommunications Infrastructure of Commercial Buildings

2. ANSI/TIA-607-D-2019 Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

3. Underwriters Laboratories (UL)

4. UL 467 (1993); R 2004 Grounding and Bonding Equipment

1.4 SUBMITTALS

A. Conform with the requirements of Section 01 30 00 – Administrative Requirements and Section 27 05 00 Common Work Results for Communications.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Equal products by the following manufacturers will be considered providing that all features of the specified product are provided:

1. Ground Rod:

a. High strength high carbon steel, with electrolytically bonded jacket of copper on surface

b. UL spec. 467

c. ANSI C-33.8-1072.

d. Manufacturer:
1) Allied Bolt
2) Inwesco 12A60
3) Blackburn
4) Cooper Power Systems
5) Weaver.
6) Erico "Cadweld" Products, Inc.
7) ITT Blackburn.
8) Or equal.

2. Ground Wells:

a. Christy Concrete Products, Inc.

b. Forni Corp.

c. Or equal.

3. Ground Bushings, Connectors, Jumpers and Bus:
   a. O-Z/Gedney.
   b. Thomas & Betts Corp.
   c. Or equal.
4. Compression Connector Lug
   a. Panduit
   b. B-Line SB-479 Series
   c. Thomas & Betts
   d. Or equal.
5. Telecommunications Ground Bus Bar
   a. Description:
      1) Meets EIA/TIA 607.
      2) Provide compression-type lugs.
      3) Material:
         a) ASTM A36 structural steel.
         b) ASTM B187-C11000 copper bar.
         c) Polyster resin fiberglass insulator.
         d) Steel – Yellow Finish.
         e) At least 20 inches wide.
         f) Wall Mountable.
   b. Manufacturer:
      1) B-Line SBTMGB20
      2) CPI 40153-020
      3) Or Equal.
6. Rack and Cabinet Grounding
   a. Panduit Structured Ground Kit
   b. Chatsworth Products Inc.
   c. or equal.
7. Bonding Ribbon:
   a. Annealed solid copper 3/8 inch wide x 1/16 inch thick, tin plated.
   b. Manufacturer:
      1) Inwesco 12A55
      2) Corning Cable Systems
      3) Preformed Line Products.
      4) or equal.
8. Bonding Ribbon Clamp:
   a. Soft lead

b. 1/16 inch thick

c. Bolt hole for attachment

d. Manufacturer:
   1) Inwesco 12A56
   2) Corning Cable Systems
   3) Preformed Line Products.
   4) Or equal.

9. Fargo Clamp:

   a. Cast copper, silver plated, furnished with copper bolt.

   b. RUS Listed

   c. Manufacturer:
      1) Allied Bolt
      2) Inwesco 12A57
      3) Corning Cable Systems
      4) or equal.

10. Ground Inserts:

   a. Cast Bronze w 1/4 Copper Rod.

   b. Provide minimum one each maintenance hole or vault.

   c. Manufacturer:
      1) Inwesco 12H69
      2) or equal by vault or manhole manufacturer.
      3) or equal.

2.2 GROUND CONDUCTORS

A. General purpose insulated:

1. NRTL listed and code sized copper conductor, with dual rated THHN/THWN insulation, color solid green. The jacket may have a yellow stripe.

2. The jacket shall include markings that indicate conductor, manufacturer, and NRTL listing.

3. Minimum wire size is #6 AWG UON. Grounding conductors larger than 4 AWG (5 mm) shall be stranded. Use solid conductors for 4 AWG (5 mm) and smaller.

4. Use stranded grounding conductors at locations subject to vibration or repeated flexing, regardless of size.

5. Where continuous color-coded conductors are not commercially available, provide a minimum 4 in. long color band with green, non-aging, plastic tape in accordance with NEC. The band shall be located within 152 mm (6 in.) of each termination and splice and at 1.2 m (4 ft.) intervals along its run.

6. Plenum rated, if run in plenum spaces.

B. Telecommunications Bonding Backbone (TBB)

1. A TBB shall be provided between the TMGB and each TGB.
2. The TBB shall be sized at 2 kcmil per linear foot of conductor length up to a maximum size of 168 kcmil (No. 3/0 AWG; 12 mm).

C. Bonding Conductor for Telecommunications (BCT)

1. A BCT shall be provided between each TMGB and the building's service equipment (power) ground.
2. The BCT shall be the same size as, or larger than, the largest TBB.

D. Rack Bonding Conductor (RBC)

1. A separate RBC shall be provided between each cabinet or rack and the TGB or TMGB in the room.
2. Each RBC shall be sized as a 6 AWG (4 mm).

E. Unit Bonding Conductor (UBC)

1. Separate UBCs shall be provided for each piece of active equipment in a rack/cabinet that has a ground connection point separate from its power source.
2. The UBCs shall be connected between the active equipment and the RGB of the cabinet/rack.
3. The UBC shall be a minimum 12 AWG (2 mm).

F. Bonding Jumpers

1. Bonding jumpers shall be used wherever two metallic parts meet in an electrically insecure connection. Examples include, without limitation, cable tray sections and cabinet or rack components and doors.
2. Bonding jumpers shall be factory pre-terminated.

G. Outside Plant Applications

1. Grounding conductors shall be bare copper, meeting ASTM B 8 soft-drawn unless otherwise indicated. Aluminum is not acceptable.

H. Bonding pigtails: Insulated copper conductor, identified green, sized per code, and provided with termination screw or lug. Provide solid conductors for #10 AWG or smaller and stranded conductors for #8 AWG or larger.

2.3 COMPRESSION CONNECTOR LUG

A. Description

1. Connector lug with compression connection to conductor.
2. Copper alloy body.
3. Provide lug size to match conductor being terminated.

4. Provide 2 hole pattern lugs.

5. Provide each lug with silicon bronze hardware, including 2 bolts, 2 split lock washers and 2 nuts.

2.4 INSULATED GROUNDING BUSHINGS

A. Plated malleable iron or steel body with 150 degree Centigrade molded plastic insulating throat and lay-in grounding lug.

2.5 CONNECTIONS TO PIPE

A. For cable to pipe: UL listed bolted connection complying with CEC requirements.

2.6 CONNECTIONS TO STRUCTURAL STEEL, GROUND RODS, OR SPLICES

A. Where required by the Drawings or Specifications, grounding conductors shall be spliced together, connected to ground rods or connected to structural steel using exothermic welds or high pressure compression type connectors.

B. Exothermic welds shall be used for cable-to-cable and cable-to-ground rod and for cable to structural steel surfaces. Exothermic weld kits shall be as manufactured by Cadweld, Thermoweld or equal. Each particular type of weld shall use a kit unique to that type of weld.

C. High-pressure compression type connectors shall be used for cable-to-cable and cable-to-ground rod connections. Connections shall be as manufactured by Thomas & Betts #53000 series, Burndy “Hy-Ground” or equal.

2.7 EXTRA FLEXIBLE, FLAT BONDING JUMPERS

A. Where required by the drawing or specified herein.

PART 3 - EXECUTION

3.1 GENERAL

A. Provide Grounding and Bonding according to the most restrictive requirements of:

1. ANSI-J-STD-607-B-2011.

2. California Electrical Code Article 250 and references therein.

3. California Electrical Code Article 800.

B. In the event of conflicting requirements, California Electrical Code requirements shall prevail.

3.2 BONDED COMPONENTS:

A. Bonding conductors or jumpers are to be installed within each Telecommunications Space between the TMGB/TGB and the following components:

1. The communications building entrance protectors.
2. Metallic shielding of outside cable plant.
3. Metallic shielding of inside cables, where required by Code.
4. Electrical panel board (if in the same room as TMGB/TGB).
5. Building steel (if accessible in the same room as TMGB/TGB or close by external to the room).
6. Telecommunications ladder rack and cable tray.
7. Telecommunications equipment racks and cabinets via the RGBs.
8. Wall-mounted metallic enclosures.
9. Metallic conduit longer that 1 m (3 ft.) and not secured to a grounded enclosure in an electrically continuous manner.
10. Access floor systems.

B. Where a metallic raceway connects two or more Telecommunications Spaces, bond to the Telecommunications Ground Busbar at each end

C. Point of Connection

1. Under Work of this Section, make connections to Communications Ground Busbars provided under Work of Division 26, or by separate project, as applies.

D. Grounding Busbars

1. Install busbars per manufacturer's instructions and at locations shown on the plans. If locations are unclear, apply for and conform to direction from the University's Representative.
2. Locate all busbars so that they are accessible to telecommunications personnel, yet not exposed to casual contact. Other cable types must not be allowed to contact the busbars or pass within 152 mm (6 in.) of the busbar.
    a. TMGBs and TGBs shall be located on or near the wall opposite the entrance, at least 2.1 m (7 ft.) above finished floor (AFF).
    b. RGBs shall be located on the rear of the cabinet/rack. Horizontal RGBs shall be as near the top of the rails as space allows. Vertical RGBs shall be used only in closed cabinets.

E. TMGB

1. The TMGB shall be bonded directly to the closest point of the building's earth grounding electrode system and to building steel. Building steel should be tested to verify its ground conductivity to earth.
2. All metallic raceways for telecommunications cabling located within the same room or space as the TMGB shall be bonded to the TMGB.
3. Insulate the TMGB 51 mm (2") from the wall.
4. For outside plant cables entering a building with a cable shield isolation gap, bond the cable shield (on the building side of the gap) to the TMGB. Outside plant protectors shall be bonded to the TMGB with a No. 4 AWG (5 mm) conductor.
5. Connections to the busbar shall be made with 2-hole lugs.
6. Connections shall be made by cleaning the area of connection on the busbar and on the two-hole lug and then applying a thin coating of anti-oxidant compound.

F. TGB

1. The TGB shall be bonded directly to the TMGB and to building steel. Building steel should be tested to verify its ground conductivity to earth.
2. All metallic racks, cabinets, enclosures and raceways for telecommunications cabling located within the same room or space as the TGB shall be bonded to the TGB.
3. Insulate the TGB 51 mm (2") from the wall.
4. Connections to the busbar shall be made with 2-hole lugs.
5. Connections shall be made by cleaning the area of connection on the busbar and on the two-hole lug and then applying a thin coating of anti-oxidant compound.

G. RGB

1. An RGB shall be installed on/in all racks and cabinets.
   a. The paint or other coating of the cabinet/rack shall be removed and the bare metal cleaned around each point where the RGB contacts the cabinet/rack.
   b. A thin coating of anti-oxidant compound shall then be applied to the contact points before the RGB is bolted down.
   c. The mounting screws should be of the thread-forming type, not self-tapping or sheet metal screws, if possible.
2. Each RGB shall be bonded to the TGB or TMGB in the same room with a dedicated RBC.
   a. Each piece of active equipment in a rack/cabinet that has a ground connection point separate from its power source shall be bonded to the RGB.

H. Routing

1. Bonding conductors shall be routed in as direct a route as possible to the point of termination while adhering to the following: No bonding conductor shall vertically traverse a wall except at wall corners.
2. Must not be daisy-chained among equipment, racks or pathways.
3. Shall have no twists, loops or sharp bends. Conductors shall be routed with smooth wide bends.
4. Should not be spliced. When necessary, use an approved Listed connection and position it in an accessible location.
5. Must be protected from physical damage, by its location or with a non-metallic barrier.
6. Should not be placed in metallic conduit. If it is necessary to place grounding and bonding conductors in metallic conduit that exceeds 1 m (3 ft) in length, the conduit must be grounded at both ends to the same ground point as the conductor.
7. Jacketed conductors run in plenum spaces must be plenum rated.
8. The maximum current on any grounding conductor under normal operation should be less than 1A AC and 500mA DC.
9. Shall be sized per code, depending on the length.

I. Mechanical Connections

1. Except where a manufacturer provided grounding lug is provided, the paint or other coating of the component (rack, cabinet, cable tray, etc.) shall be removed and the bare metal cleaned around each point where a conductor lug is connected.
2. A thin coating of anti-oxidant compound shall then be applied to the contact points before the lug is bolted down.
3. Mounting screws should be of the thread-forming type, not self-tapping or sheet metal screws.
4. Cable trays and conduit shall not be used as a grounding conductor, even if they are so rated.
5. Clean ground bars prior to terminating bonding conductors.
6. Torque threaded fasteners to manufacturer’s recommended values.

J. Bonding Jumpers

1. Install manufacturer’s bonding clips, plates or bonding jumpers:
2. Across the joint where sections of cable tray (mesh or ladder) meet.
3. Between a cabinet’s door and its frame.

4. Between all other separate panels of a cabinet and the frame; such as the top, bottom & side panels and air ducting baffles.

5. Across all frame joints of cabinets and racks, unless the cabinet/rack is factory welded and fully assembled on arrival.

K. Cabinet and Rack Continuity

1. As an alternative to using jumpers across all separate parts and frame joints of a cabinet/rack, one of the following options may be used.

2. Remove the paint or other coating of both parts being joined to create a bare metal area at least the same diameter as the bolt head. Clean both bare metal areas and apply a thin coating of anti-oxidant compound before connecting the parts.

3. Use aggressive Type “B” internal-external tooth lock washers. Torque the bolts per manufacturer’s instructions to create an acceptable bond. Two washers are necessary to accomplish this: one under the bolt head contacting and cutting paint and one under the nut.

L. Grounding Lugs

1. Wires shall be inserted to the full depth of the lug.

2. Space between wire insulation and the body of the compression lug shall be kept to a maximum of 3 mm (1/8 in.)

3. Lug must be sized with wire size.

4. To assure proper die is used with the specified connector, manufacturer's embossed coding systems shall be adhered to.

5. Connectors shall not be modified in any way.

6. Daisy chaining and stacking (piggy backing) of ground lugs is prohibited.

7. Bolts, nuts and washers used to secure ground connections shall match the diameter of the hole.

8. Make compression connections with the lug or fitting manufacturer’s recommended tooling, with the tooling set to the recommended force and stroke.

M. Cable Tray and Cable Runway

1. Coordinate with the Work of Section 27 05 36 – Cable Trays for Communications Systems

2. Provide manufacturer’s bonding clips, plates or jumpers as required to comply with the UL Classified conditions for use as an equipment grounding conductor.

3. Bond the Cable Runway to the Communications Ground Busbar at the Communications Room served.

N. Cable Shields

1. Comply with California Electrical Code Article 800.

O. Protector Fields

1. Comply with California Electrical Code Article 800.

P. Emergency/Information Telephone enclosures

1. Bond as detailed on Communications Drawings.

Q. Communications Broadband Systems

1. Comply with California Electrical Code Article 820.
2. Ground Broadband passives as shown on Communications Drawings.

3.3 LABELING

A. All labels shall be permanent, computer-generated and nonmetallic, printed with wording in high contrast to the background. Comply with Section 27 05 53 - Identification for Communications Systems.

B. Each telecommunications bonding conductor shall be labeled as close as practicable to its point of termination in a readable position. Labels shall have:

1. The statement, “If this connector or cable is loose or must be removed, please call the building telecommunications manager”.
2. An identification label providing the source and destination of the grounding conductor.
3. Conductors contained completely within one room need not have the source and destination label.
4. Instead, label the busbar at each connection with the name of bonded equipment (rack, tray, etc.) connected at that point.

C. The BCT, or the conduit containing it, shall be labeled:

1. At the TMGB with tag or adhesive label that states “Building Conductor for Telecommunications (BCT) to Main Electrical Service Ground Connection”.
2. At the main electrical service ground connection with tag or adhesive label that states “Building Conductor for Telecommunications (BCT) to Telecommunications Main Grounding Busbar (TMGB)”.

3.4 TESTING

A. All grounding connections shall be tested for continuity and resistance after installation but prior to substantial completion. The telecommunications contractor is to invite the University’s Representative to witness a portion of this testing while it is being performed.

B. The test performed shall use an earth ground resistance tester that is configured for a continuity test, otherwise known as a two-point test or a “dead earth” test. Tests shall be conducted between the electrical entrance ground and the TMGB as well as at each TGB. This resistance shall be less than 0.05 Ohms.

3.5 GROUNDING AND BONDING OUTSIDE CABLE PLANT (OSP)

A. Underground Communications Structure Ground Rods

1. Ground rods shall be installed at new communications handholes, vaults and pullboxes installed by the work of this Project. A ground rod shall be installed at new communications handholes, vaults, manholes and pullboxes installed by the work of this Project, or at existing underground structures used by the work of this Project lacking a ground rod.

   a. Provide two ground rods at maintenance holes.

   b. Elsewhere provide one ground rod.

2. Ground rods shall be driven into the earth before the manhole floor is poured so that approximately 4 inches of the ground rod will extend above the manhole floor. When precast concrete manholes are used, the top of the ground rod may be below the manhole floor and a No. 1/0 AWG ground conductor brought into the manhole through a watertight sleeve in the manhole wall.

3. Ground rods installed in manholes, handholes, or concrete pullboxes shall be connected to cable racks, cable-pulling irons, the cable shielding, metallic sheath, and armor at each cable joint or splice by means of a No. 4 AWG braided tinned copper wire. Connections to metallic cable sheaths shall be by means of tinned terminals soldered to ground wires and to cable sheaths.

   a. Care shall be taken in soldering not to damage metallic cable sheaths or shields. Ground rods shall be protected with a double wrapping of pressure-sensitive plastic tape for a distance of 2 inches above and 6 inches below concrete penetrations.

   b. Grounding electrode conductors shall be neatly and firmly attached to manhole or handhole walls and the amount of exposed bare wire shall be held to a minimum.

B. Underground Cable Bonding

1. Cables used in underground conduit systems have either an outer metallic sheath or a plastic sheath. Cables with an outer metallic sheath shall be bonded at each Maintenance Hole (MH). Cables with an outer plastic sheath shall be bonded at MHs where a splice is made. When using OSP cable for a LAN drop, splices should not be made.

END OF SECTION 27 05 26

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. The work covered under this section consists of the furnishing of all necessary labor, supervision, materials, equipment, and services to completely execute the provision of communications supports and cable hook system as described in this specification, including but not limited to:

1. Strut supports
2. Cable Hooks (J-hooks)
3. Beam clamps
4. Concrete Fasteners
5. Touch-Up Materials
6. Conduit supports.
7. Equipment supports.
8. Fastening hardware.

B. Related work: Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete installation.

1. Section 27 05 00 – Common Work Results for Communications
2. Section 27 05 33 – Conduits and Backboxes for Communications Systems
3. Section 27 05 53 – Identification for Communications Systems
4. Section 27 10 00 – Structured Cabling, Basic Materials and Methods
5. Section 27 11 16 – Communications Cabinets, Racks, Frames and Enclosures
6. Section 27 11 23 – Communications Cable Management
7. Section 27 15 00 – Communications Horizontal Cabling

1.2 SYSTEM DESCRIPTION

A. Provide devices specified in this Section and related Sections for support of communications equipment specified for this Project.

B. Provide support systems that are adequate for the weight of equipment, conduit and wiring to be supported.

1.3 REFERENCES

A. American Society For Testing and Materials (ASTM)

1. ASTM A123/A123M-02 Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products

2. ASTM A153/A153M-04 Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware

3. ASTM B633-98e1 Specification for Electro-deposited Coatings of Zinc on Iron and Steel.

4. ASTM A653/A653M-04a Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

B. American National Standards Institute (ANSI)

1. ANSI/TIA/EIA-568-B.1-2001, Commercial Building Telecommunications Cabling Standard – Part1: General Requirements

2. ANSI/TIA/EIA-568-B.2-2001, Commercial Building Telecommunications Cabling Standard – Part2: Balanced Twisted Pair Cabling Components

3. ANSI/TIA/EIA-568-B.3-2000, Optical Fiber Cabling Components Standard

4. ANSI/ TIA/ EIA 569-B Commercial Building Standard for Telecommunications Pathways and Spaces

C. National Fire Protection Association

1. NFPA 70, National Electrical Code

1.4 SUBMITTALS

A. Conform with the following:

1. As part of the project submittals, the contractor to provide engineered shop drawings indicating the proposed design for mounting all work of this Division weighing more than 20 pounds, inclusive of mounting systems, and for equipment mounted at the exterior, inclusive of its effective wind load under conditions the range of conditions experience

a. Shop drawings to be accompanied by anchorage calculations indicating that it shall remain attached to the mounting surface after experiencing forces in conformance with CCR, Title 24, Table 23P, Part II and with Section 2312 "Earthquake Regulations" of the "Uniform Building Code" for Seismic Zone 4 Area, Importance Factor of 1.25.

b. Structural Calculations shall be prepared and signed by a California Registered Structural Engineer. Specify proof loads for drilled-in anchors, if used.

2. Interior Paints and Coatings:

a. Manufacturers' product data and material safety data sheets (MSDS) for paints and coatings used on the interior of the building including printed statement of VOC Content in g/L.

1.5 QUALITY ASSURANCE

A. All materials, equipment and parts comprising the units specified herein shall be new and unused, and of current manufacturer.

B. Cable hooks shall be listed and labeled by Underwriters Laboratories (UL) as required.

C. Cable hooks shall have the manufacturers name and part number stamped in the part itself for identification.

PART 2 - PRODUCTS

2.1 GENERAL

A. Interior Paints and Coatings:

1. For interior applications use paints and coatings that comply with Green Seal's Standard GS-11, summarized by the following upper limits for VOC Content when calculated according to 40 CFR 59, Subpart D (EPA Method 24) and the following chemical restrictions:

Flat Paints and Coatings	50 g/L	Waterproofing Sealers	250 g/L
Non-Flat Paints and Coatings	150 g/L	Sanding Sealants	275 g/L
Anti-Corrosive Coatings	250 g/L	All other Sealants	200 g/L
Clear Wood Finishes: Varnishes	350 g/L	Stains	250 g/L
Floor Coatings	100 g/L	Clear Shellacs	730 g/L
Paint Primer	150 g/L	Pigmented Shellacs	55 g/L

2.2 SUPPORTING DEVICES

A. General

1. Supports to be sized to suit load and selected to match mounting conditions

B. Manufacturers

1. Equal products by the following manufacturers will be considered providing that all features of the specified product are provided:

a. Concrete fasteners:
1) Phillips "Red-Head".
2) Remington.
3) Ramset.
4) Hilti
5) Simpson Strong-Tie

6) or equal.

b. Concrete inserts and construction channel:
   1) Unistrut Corp.
   2) GS Metals "Globe Strut."
   3) Thomas & Betts "Kindorf" Corp.
   4) Or equal.

c. Conduit straps:
   1) O-Z/Gedney.
   2) Erico "Caddy" Fastening Products.
   3) Thomas & Betts "Kindorf" Corp.
   4) Or equal.

d. Beam Clamps
   1) Cooper B-Line
   2) SuperStrut
   3) Unistrut
   4) or equal

e. Aircraft Cable Sway Braces
   1) Mason Industries
   2) M.W. Sausse/Vibrex
   3) Loos & Company, Inc.
   4) or equal.

C. Concrete Fasteners

1. Provide expansion-shield type concrete anchors.

2. Provide powder driven concrete fasteners with washers. Obtain approval by Owner's Representative prior to use.

D. Concrete Inserts

1. Provide pressed galvanized steel, concrete spot insert, with oval slot capable of accepting square or rectangular support nuts of ¼ inch to ½ inch diameter thread for rod support.

E. Aircraft cable sway braces

1. Steel rope sized to meet load.

F. Construction Channel:

1. Construction:

   a. 1-5/8 in. square galvanized channel formed from U.S.S.G No. 12 or 0.109 inch cold formed steel with 17/32-inch diameter bolt holes, and 1-1/2 inch on center in the base of the channel.

   b. 10 foot sections.

2. All supporting materials by same manufacturer.

G. Beam Clamps

1. Malleable iron electro-galvanized steel beam clamps selected to match building structural steel members.

H. Conduit Straps

1. One hole strap, steel or malleable iron, with malleable iron clamp-back spacer for surface mounted wall and ceiling applications.
   a. Use malleable strap with spacers for exterior and wet locations.
   b. Use steel strap without spacers for interior locations.
2. Steel channel conduit strap for support from construction channel.
3. Steel conduit hanger for pendant support with threaded rod
4. Steel wire conduit support strap for support from independent #12 gauge hanger wires.

I. Threaded rods, couplings, screws and nuts:

1. Electrolytically coated with zinc, 2 oz. zinc per square foot of surface, ASTM A123 or A153.

J. Miscellaneous Parts

1. Hot dipped galvanized after fabrication; after cutting, de-burring and hole drilling. Coated with zinc, 2 oz. zinc per square foot of surface, ASTM A123 or A153.

K. Paint/Tape for Touch-up:

1. Zinc: CRC "Zinc-It", Glyptal, Enterprise Galvanizing “Galambra”, or equal.

2.3 CABLE HANGERS

A. Ceiling Hung J-Hooks

1. Drawing Reference(s):
   a. WMJ
   b. ACJ
2. Features/Functions/Construction
   a. Specifically intended to carry the load of up to 50 communications cables without applying excess forces to cables at bottom of bundle.
   b. Integral broad bottom edge to spread cable load with flat bottom and provide a minimum of 1-5/8 inch cable bearing surface.
   c. Integral hanger rod attachment hardware at top.
   d. Load rated for application.

e. Incorporates smooth 90-degree radiused edges to prevent snagging cable jackets on installation.

f. Designed so the mounting hardware is recessed to prevent cable damage.

g. Integral mechanical cable latch retainer to provide containment of cables within the hook. The retainer shall be removable and reusable.

h. Suitable for direct attachment to walls, hanger rods, beam flanges, purlins, strut, floor posts, etc. to meet job conditions.

i. Multi-tiered cable hooks to be used where required to provide separate cabling compartments, or where additional capacity is needed.

j. Finishes:
   1) Cable hooks for non-corrosive areas shall be pre-galvanized steel, ASTM A653. Where additional strength is required, cable hooks shall be spring steel with a zinc-plated finish, ASTM B633, SC3.
   2) Cable hooks for corrosive areas shall be stainless steel, AISI Type 304.

3. Manufacturer

   a. Cooper B-Line series BCH21, BCH32, BCH64

   b. Caddy/Erico CableCat

   c. or equal.

PART 3 - EXECUTION

3.1 GENERAL

A. The Owner's Representative reserves the right to request additional supports where in their sole opinion said supports are required. Any additional supports shall be installed at no additional cost to the Owner.

3.2 EXAMINATION

A. Thoroughly examine site conditions for acceptance of supporting device installation to verify conformance with manufacturer and specification tolerances. Do not commence with installation until all conditions are made satisfactory.

3.3 PREPARATION

A. Coordinate size, shape and location of concrete pads required for equipment installation with Base Building General Contractor.

B. Layout support devices to maintain headroom, neat mechanical appearance and to support the equipment loads.

C. Where shown on the Drawings or Specifications, install freestanding communications equipment on concrete pads.

3.4 INSTALLATION

A. Furnish and install supporting devices as noted throughout the Communications Systems work.

B. Communications device and conduit supports shall be independent of all other system supports that are not structural elements of the building, unless otherwise noted.

C. Fasten hanger rods, conduit clamps, outlet and junction boxes to building structure using precast inserts, expansion anchors, preset inserts or beam clamps.

D. Use toggle bolts or hollow wall fasteners in hollow masonry, plaster or gypsum board partitions and walls.

E. Use expansion anchors or preset inserts in solid masonry walls.

F. Use self-drilling anchors, expansion anchor, or preset inserts on concrete surfaces.

G. Use sheet metal screws in sheet metal studs and wood screws in wood construction.

H. Do not fasten supports to piping, ductwork, mechanical equipment, conduit, or acoustical ceiling suspension wires.

I. Do not drill structural steel members unless first approved in writing by the Owner's Representative.

J. Fabricate supports from structural steel or steel channel, rigidly welded or bolted to present a neat appearance. Use hexagon head bolts with spring lock washers under all nuts.

K. Install surface-mounted cabinets with minimum of four anchors. Provide additional support backing in stud walls prior to sheet rocking as required to adequately support cabinets and panels.

L. Bridge studs top and bottom with channels to support flush mounted cabinets and panelboards in stud walls.

3.5 ERECTION OF METAL SUPPORTS

A. Cut, fit, and place miscellaneous metal fabrications accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

B. Field Welding: Comply with AWS "Structural Welding Code."

3.6 WOOD SUPPORTS

A. Cut, fit, and place wood grounds, nailers, blocking, and anchorage accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

3.7 DISTRIBUTION PATHWAY VIA CEILING HUNG CABLE HOOKS (J-HOOKS):

A. Void, Plenum or Suspended Ceiling Exposed Cable Installation. Where drawings specifically show or permit use of exposed cable installation in voids, conform to the most restrictive requirements of Code, TIA-569-B and this Section.

B. Provide support for all cabling. Do not place or attach directly to T-bar grid, concealed spline grid, flexible or rigid ductwork, HVAC registers, sprinkler piping or fixtures, light fixtures or building structure. Conform to the California Electric Code.

C. Placement:

1. All pathways created by ceiling hung cable hooks shall be reviewed by the Owner's Representative prior to installation.

2. Ceiling hung cable hooks and cabling supported by same shall not obscure access to access doors, hatches, air dampers, valves, filter sections, VAV boxes, cable trays, junction boxes, pull boxes or similar areas of access required by other trades.

3. All ceiling hung cable hooks shall be mounted close enough together such that upon completion of the station cable installation a minimum amount of cable droop occurs between adjacent rings. The distance between supporting rings shall not exceed 48 inches or as required by the current edition of TIA-569-B.

4. Refer to the separation requirements listed in Section 27 15 00 – Communications Horizontal Cabling for minimum distances from electrical power and other electro-magnetic sources.

D. Follow manufacturer's recommendations for allowable fill capacity for each size of cable hook.

1. Cable hooks shall be capable of supporting a minimum of 30 pounds with a safety factor of 3.

2. Spring steel cable hooks shall be capable of supporting a minimum of 100 pounds with a safety factor of 3 where extra strength is required.

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE OF WORK:

A. Provide telecommunications pathways in accordance with EIA TIA/EIA-569-B, as specified in this Section and as shown on the plans. Provide system furniture pathways in accordance with UL 1286. Provision of all low voltage Communications Systems Pathway and Electronic Security and Safety System Pathway, including:

1. Rigid steel conduit and fittings.
2. PVC insulated rigid steel conduit and fittings.
3. Intermediate metal conduit and fittings.
4. Electrical metallic tubing and fittings.
5. Flexible metallic conduit and fittings.
6. Liquidtight flexible metallic conduit and fittings.
7. Miscellaneous conduit fittings and products.
8. Junction Boxes
9. Floor Boxes
10. Hinged cover enclosures.
11. Pullboxes and Terminal Cabinets.

B. At Hazardous Occupancies, installation conforms to the requirements of California Electric Code for Class and Division rating of spaces.

1.2 RELATED WORK IN OTHER SECTIONS:

A. Related work: Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete installation.

1. Section 27 05 00 – Common Work Results for Communications.
2. Section 27 05 29 – Hangers and Supports for Communications Systems
3. Section 27 05 33 – Conduits and Backboxes for Communications Systems
4. Section 27 05 36 – Cable Trays for Communications Systems
5. Section 27 10 00 – Structured Cabling, Basic Materials and Methods
6. Section 27 15 00 – Communications Horizontal Cabling

1.4 QUALITY ASSURANCE

A. All materials, equipment and parts comprising the units specified herein shall be new and unused, and of current manufacturer.

B. Only products and applications listed in this Section may be used on the project unless otherwise submitted and approved by the Architect.

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide the following types of conduit systems listed by their commonly used generic name.

2.2 RACEWAY

A. Manufacturers:

1. Raceway:
   a. Allied Tube and Conduit Co.
   b. Triangle PWC, Inc.
   c. Western Tube and Conduit Corp.
   d. Spring City Electrical Manufacturing Co.
   e. Occidental Coating Co. (OCAL).
   f. Alflex Corp.
   g. American Flexible Metal Conduit Co.
   h. Anaconda.
   i. Or equal.
2. Fittings:
   a. Appleton Electric Co.
   b. OZ/Gedney.
   c. Thomas & Betts Corp.
   d. Spring City Electrical Manufacturing Co.
   e. Occidental Coating Co. (OCAL).

f. Carlon.

g. or equal.

B. Rigid Steel Conduit.

1. Drawing and Spec Reference: RSC.

2. Construction:

a. Conduit: Full weight, threaded, hot-dip galvanized steel, conforming to ANSI C80.1 and UL 6.

b. Standard threaded couplings, locknuts, bushings, and elbows: Only materials of steel or malleable iron are acceptable. Locknuts shall be bonding type with sharp edges for digging into the metal wall of an enclosure.

c. Three piece couplings: Electroplated, cast malleable iron.

d. Insulating bushings: Threaded polypropylene or thermosetting phenolic rated 150 degree C minimum.

e. Insulated grounding bushings: Threaded cast malleable iron body with insulated throat and steel "lay-in" ground lug with compression screw.

f. Insulated metallic bushings: Threaded cast malleable iron body with plastic insulated throat rated 150 degrees C.

g. All fittings and connectors shall be threaded.

C. Coated Rigid Steel Conduit:

1. Drawing and Spec Reference: CRSC.

2. Conduit: Full weight, threaded, hot-dip galvanized steel, conforming to ANSI C80.1 and NEMA RN-1 with nominal 40 mil thermoplastic vinyl coating, heat fused and bonded to the exterior of the conduit.

3. Fittings:

a. Conduit couplings and connectors shall be as specified for galvanized rigid steel conduit and shall be factory PVC coated with an insulating jacket equivalent to that of the coated material.

b. Fittings over-sleeve to extend 1 conduit diameter or 1-1/2 in. beyond fitting, whichever is less.

4. Performance:

a. Tensile Strength: 3500 psi.

5. Approvals:

a. NEMA RN1 (Type 40 - 40 mils thick)

b. CalTrans Type 2

6. Manufacturers:

a. Plastibond by RobRoy Industries.

b. Occal-40 by Occidental Coating Company.

c. KorKap by Plastic Applicators.

d. Ocal-Blue

e. or equal.

D. Intermediate Metal Conduit

1. Drawing Reference: IMC

2. Conduit: Hot dip galvanized steel meeting the requirements of CEC Article 345 and conforming to ANSI C80.6 and UL 1242.

3. Fittings: Conduit couplings, connector and bushing shall be as specified for galvanized rigid steel conduit. Integral retractable type IMC couplings are also acceptable.

E. Electrical Metallic Tubing.

1. Drawing and Spec Reference: EMT.

2. Conduit: Shall be formed of cold rolled strip steel, electrical resistance welded continuously along the longitudinal seam and hot dip galvanized after fabrication. Conduit shall conform to ANSI C80.3 specifications and shall meet UL classifications.

3. Set screw type couplings: Electroplated, steel or cast malleable iron, UL listed concrete tight. Use set screw type couplings with four setscrews each of conduit sizes over 2 inches. Setscrews shall be of case hardened steel with hex head and cup point to firmly seat in wall of conduit for positive grounding.

4. Set screw type connectors: Electroplated steel or cast malleable iron UL listed concrete tight with male hub and insulated plastic throat, 150 degree C temperature rated. Setscrew shall be same as for couplings.

5. Raintight couplings: Electroplate steel or cast malleable iron; UL listed raintight and concrete tight, using gland and ring compression type construction.

6. Raintight connectors: Electroplated steel or cast malleable iron, UL listed raintight and concrete tight, with insulated throat, using gland and ring compression type construction.

F. Flexible Conduit:

1. Drawing Reference: FLEX

2. Construction:

a. Flexible steel, zinc coated on both inside and outside by hot-dipping process.

b. Interlocking spirally wound continuous steel strip.

c. 3/4 in. minimum size.

3. Fittings: Connectors shall be of the single screw clamp variety with steel or cast malleable iron bodies and threaded male hubs with insulated throats. Exception: Pressure cast screw-in connectors shall be acceptable for fixture connection in suspended ceilings and cut-in outlet boxes within existing furred walls.

4. Approvals:

   a. UL 1

G. Liquidtight Flexible Metallic Conduit

1. Drawing Reference: Liquidtight

2. Conduit: Shall be fabricated in continuous lengths from galvanized steel strips, interlocking spirally wound, covered with extruded liquidtight jacket of polyvinyl chloride (PVC) and conforming to UL 360. Provide conduit with a continuous copper-bonding conductor wound spirally between the convolutions.

3. Fittings: Connector body and gland nut shall be of cadmium plated steel or cast malleable iron, with tapered, male, threaded hub; insulated throat and neoprene "O" ring gasket recessed into the face of the stop nut. The clamping gland shall be of molded nylon with an integral brass push-in ferrule.

2.3 MISCELLANEOUS CONDUIT FITTINGS AND PRODUCTS

A. General

1. UL 514B.

2. Listed in UL Electrical Construction Materials List.

B. Conduit Fittings, Insulated Throat Grounding Bushings

1. Description

   a. Threaded for Rigid Steel Conduit and Intermediate Metal Conduit.

   b. UL Listed for use with copper conductors.

   c. Thermoplastic insulated liner for 105 degrees Celsius.

   d. Body of malleable iron, zinc plated; or die cast zinc.

2. Manufacturer

   a. Thomas & Betts (Steel City) BG-801 Series

   b. O-Z/Gedney

   c. or equal.

C. Watertight conduit entrance seals: Steel or cast malleable iron bodies and pressure clamps with PVC sleeve, neoprene sealing grommets and PVC coated steel pressure rings. Fittings shall be supplied with neoprene sealing rings between the body and PVC sleeve.

D. Watertight cable sealing bushings: One piece, compression molded sealing ring with PVC coated steel pressure disks, stainless steel sealing screws and zinc plated cast malleable iron locking collar.

E. Expansion fittings: Multi-piece unit comprised of a hot dip galvanized malleable iron or steel body and outside pressure bussing designed to allow a maximum of 4 in. conduit movement (2 in. in either direction). Furnish with external braid tinned copper bonding jumper. Unit shall be UL listed for wet or dry locations.

F. Expansion/deflection couplings: Multi-piece unit comprised of a neoprene sleeve with internal flexible tinned copper braid attached to bronze end couplings with stainless steel bands. Coupling shall accommodate .75-inch deflection, expansion, or contraction in any direction, and allow 30-degree angular deflections. Flexible, corrosion-resistant, watertight, moisture and heat resistant molded rubber jacket and stainless steel jacket clamps. Unit shall comply with UL467 and UL514.

1. Manufacturer:
    a. OZ/Gedney Type DX
    b. Steel City Type EDF
    c. or equal.

G. Fire rated penetration seals:

1. UL classified.
2. Conduit penetrations in fire rated separation shall be sealed with a UL classified assembly consisting of fill, void or cavity materials.
3. The fire rated sealant material shall be the product best suited for each type of penetration, and may be a caulk, putty, composite sheet or wrap/strip.
4. Penetrations of rated floors shall be sealed with an assembly having both F and T ratings at least equal to rating of the floor.
5. Penetrations of rated walls shall be sealed with an assembly having an F rating at least equal to the rating of the wall.

H. Standard products not herein specified:

1. Submit for review a listing of standard electrical conduit hardware and fittings not herein specified prior to use or installation, i.e. locknuts, bushings, etc.
2. Listing shall include manufacturers name, part numbers, and a written description of the item indicating type of material and construction.
3. Miscellaneous components shall be equal in quality, material, and construction to similar items herein specified.

I. Hazardous area fittings: UL listed for the application.

2.4 JUNCTION AND DEVICE BOXES

A. Junction and Device Boxes

1. Drawing References: As shown on Symbol Schedule
2. Construction:
   a. Concealed/Flush Mounted:
   b. One or two piece welded knockout boxes.
   c. UL 514A, cadmium or zinc-coated 1.25 oz/sq. ft., if ferrous metal.
   d. Pressed sheet steel, for indoor locations.
   e. UL 514C approved if non-metallic.
   f. At hollow masonry, tile walls and plaster walls, provide with device rings as required.
   g. Surface mounted:
      1) Exterior - Conform to the Junction and/or PullBox construction scheduled on the Plans. Where construction not otherwise scheduled or noted on the plans, conform to the following.:
         a) Cast iron or aluminum with threaded hubs and mounting lugs.
         b) Gasketed cover with spring lid.
      2) Concrete floor embedded:
         a) Cast iron concrete pour boxes with screwed brass cover, unless otherwise noted.
         b) Cadmium plated screw cover attachment at least 6 in. on center.
   h. If size not otherwise noted, at least 4S (4 in. square) by 2-1/8 in. deep, or Code minimum size, whichever is larger.
      1) Wherever 4S is indicated, contractor may at their option substitute 4-11/16 in. square boxes while maintaining the minimum depth required by these specifications and the drawings.
      2) At recessed masonry wall installations, provide gangable masonry boxes.
   i. Provide complete with approved type of connectors and required accessories, including attachment lugs or hangers. Provide raised device covers as required to accept scheduled device.
3. Approvals.
   a. UL 514A
4. Manufacturers:
   a. Interior:
      1) Steel City.
      2) Bowers
      3) or equal.
   b. Exterior, exposed with cover of same construction.
      1) Appleton

2) Pyle-National
3) or equal.

c. Other conditions:
1) Any meeting approvals and requirements.

B. Flat Panel Wall Box (framed wall condition)

1. Drawing Reference: FPWB

2. Features, functions and construction:

a. Box provides means to install audiovisual, network and power receptacles flush in wall behind flat-panel display. With box cover installed, connectors are concealed and cables, both power and communications pass through slot at base of cover plate into connection points on back of flat-panel.

b. Cover plate protrudes less than 1/2 in. from face of wall.

c. 16 gauge box construction with 1/16 in. inch thick minimum cover plate, white finish baked enamel or powder coat, field paintable

d. Box incorporates provisions to mount up to two electrical device boxes for provision of duplex power receptacles either from above or below.

e. Additionally box mounts manufacturers low-voltage conduit entry box which accommodates manufacturer's line of audiovisual connector inserts. Design of FPWB permits installation of up to two low-voltage conduit entry boxes, which may be mounted either above or below the FPWB.

f. Manufacturers audiovisual insert line shall support at least the following receptacles:
1) BNC, in combinations of 1 to 5 BNC's, color-coded for composite, component analog and RGBHV video formats, as required.
2) RCA, in combinations of 1 to 3 RCA's color-coded for Composite and component analog video formats, as required.
3) S-Video.
4) XLR, 3 and 4 pin.
5) DB-15
6) DB-9
7) Neutrik Speakon.
8) DVI
9) HDMI
10) 1/4 in. and mini TRS.

g. Provide with manufacturer's connector inserts as required to terminate cabling types and applications indicated on the single-line diagrams. Punch blank panel inserts and provide other receptacle types as required or indicated to fulfill the requirements of the contract documents. Fill remaining openings with blank inserts.

3. Manufacturers:

a. FSR Inc. PWB-100

b. Or equal (No known equal).

C. Flat Panel Wall Box (concrete wall condition)

1. Drawing Reference: FPWB2

2. Features, functions and construction:

a. Box provides means to install audiovisual, network and power receptacles flush in wall behind flat-panel display. With box cover installed, connectors are concealed and cables, both power and communications pass through slot in cover plate into connection points on back of flat-panel.

b. Cover plate protrudes less than 1/2 in. from face of wall.

c. 16 gauge box construction with 1/16 in. inch thick minimum cover plate, white finish baked enamel or powder coat, field paintable

d. Box incorporates provisions to mount up to two electrical device boxes for provision of duplex power receptacles.

e. Additionally box mounts manufacturers low-voltage conduit entry box which accommodates manufacturer's line of audiovisual connector inserts. Design of FPWB2 permits installation of up to two low-voltage conduit entry boxes, which may be mounted within the FPWB.

f. Manufacturers audiovisual insert line shall support at least the following receptacles:
1) BNC, in combinations of 1 to 5 BNC's, color-coded for composite, component analog and RGBHV video formats, as required.
2) RCA, in combinations of 1 to 3 RCA's color-coded for Composite and component analog video formats, as required.
3) S-Video.
4) XLR, 3 and 4 pin.
5) DB-15
6) DB-9
7) Neutrik Speakon.
8) DVI
9) HDMI
10) 1/4 in. and mini TRS.

g. Provide with manufacturer's connector inserts as required to terminate cabling types and applications indicated on the single-line diagrams. Punch blank panel inserts and provide other receptacle types as required or indicated to fulfill the requirements of the contract documents. Fill remaining openings with blank inserts.

3. Manufacturers:

a. FSR Inc. PWB-CMU8-B with PWB-CMU8-WHT-C cover

b. Or equal (No known equal).

2.5 CABINETS AND ENCLOSURES

A. Terminal Cabinets:

1. Drawing Reference: As Scheduled.

2. Construction:

   a. Zinc Coated Sheet Steel, code gauge with standard concentric knockouts for conduit terminations.

   b. Interior dimensions not less than those scheduled.

   c. Finish: Manufacturer's standard gray baked enamel finish.

   d. Covers: Trim fitted, continuous hinged steel door, flush catch – lockable and keyed to match. Screw fastened doors not acceptable.
      1) Door face to be not less than 95% of panel interior dimensions.

   e. Provide with 3/4 in. fire retardant treated ply backboard.

3. Mounting:

   a. Flush cabinets shall be furnished with concealed trim clamps and shall be not less than 4 inches deep.

   b. Surface cabinets shall be furnished with screw cover trim, flush hinged door and shall not be less than 6 inches deep.

   c. Interior Applications:
      1) NEMA 250 Type 1, unless otherwise noted. Refer to plans and schedules.

   d. Exterior Applications:
      1) NEMA 250 Type - As Scheduled, not less than NEMA 3R.

4. Manufacturers:

   a. B-Line Electrical Enclosures

   b. Circle AW Products.

   c. Hammond

   d. Henessey.

   e. Hoffman.

   f. Myers Electric Products

   g. Rittal.

   h. or equal.

2.6 FLOOR BOXES, POKE-THROUGHS AND MONUMENTS

A. Floor Box, Cast Iron, Recessed Devices, with Lid Designed to meet UL Scrub Water Listing
   1. Drawing Reference: FC4
   2. Construction
      a. Use in above grade and on-grade floor applications.
      b. Boxes shall have the ability to accept a component that will allow the box to be installed in polished concrete or terrazzo floors.

c. Boxes shall be painted with a fusion-bonded epoxy designed for use on metal reinforcement bar and related accessories before encapsulation in concrete, and be approved for use on-grade and above grade floors.
d. Dimension: 15-1/8" L x 11-3/16" W x 6" H
e. Eight (8) independent wiring compartments that allow for up to eight (8) duplex receptacles, communication and/or audio/video services.
f. Removable and relocatable dividers to permit custom configuration of compartments as well as permit feed to adjacent compartments.
g. The compartments shall be removable from the top of the floor box with two (2) cable guides to organize and maintain the cables egress out of the box.
h. Boxes shall be fully adjustable, accommodating a maximum 2-inch [51mm] pre-concrete pour and a maximum 1/2" [12.7mm] post-concrete pour adjustment.
i. The box shall be able to accept 2-3/4" x 4-1/2" standard size wall plates. Include mounting brackets with the boxes that will accommodate 15 amp, 20 amp straight blade, 20 amp turn loc, 30 amp straight blade and 30 amp turn loc receptacles, data connectivity and modular adapters, a variety of audio/video devices from most manufacturers, and other open system devices.

3. Manufacturers
   a. Wiremold EFB8S-OG Floor Box. Provide EFB610xxxxx Cover Assemblies to match floor conditions. The Architect will select the finish. Provide internal device brackets to match specified communications devices and plates. Coordinate electrical rough-in with requirements of Division 26. Provide rough-in as required to mount specified communications fill.
   b. or equal (No known equal).

B. AV Floor Box, High Capacity
   1. Plan Reference: FC6
   2. Features
      a. UL Listed
      b. Box
         1) Size at least 13.5 inches by 12 inches by 6 inches deep.
         2) Two compartments, with standard electrical plate mounting brackets.
         3) The back boxes contain two identical angled mounting brackets and either side can be configured up to six gangs per side.
      c. Knockouts of 2 inch and concentric combination of 1 inch, 1.25 and 1.5 inch.
      d. At least 11 gage steel.
      e. Within cover, provide a lift-off, full-access door, open area approximately 6.5 inches by 8 inches.
      f. Within the lift-off, full-access door, provide a hinged, fold-back cable exit port.
      g. Open area of cable pass-through approximately 2 inches by 2 inches.
      h. Flush in closed position.
   3. Approvals:
      a. UL listed.
   4. Manufacturers

a. FSR Inc.FL-600P-xxx-6. Cover assemblies to match floor conditions. The Architect will select the finish. Provide manufacturer's "Pour Pan" FL-GRD2 or FL-GRD4 to protect from moisture at installations at grade level. Coordinate electrical rough-in with requirements of Division 26. Provide rough-in as required to mount specified communications fill.
b. Or equal (No known equal).

A. On Grade Floor Box, Furniture Feed

1. Drawing Reference: FF1

2. Features

a. UL Listed

b. Box
1) Stamped steel approved for use in above grade and on-grade floor applications.
2) Boxes shall have the ability to accept a component (FP-CTR) that will allow the box to be installed in polished concrete or terrazzo floors.
3) Boxes shall be painted with a fusion-bonded epoxy designed for use on metal reinforcement bar and related accessories before encapsulation in concrete, and be approved for use on-grade and above grade floors.
4) Dimensions: 7-1/16 in. L x 6-5/8 in. W x 4-1/8 in. H
5) Provide boxes with provisions that enable installation into concrete floors, raised floors, or wood floors without having to purchase additional components or accessories.
6) Provide boxes with two (2) independent wiring compartments that allow for power, communication and/or audio/video services. Each of the two (2) wiring compartments shall have a minimum wiring capacity of 64-1/2-in3.
7) The box shall be equipped with a metal divider to separate the services and maintain code requirements.
8) The box shall contain the following number of knockouts: four (4) ½ in. trade size, four (4) 3/4 in. trade size, one (1) 1 in. trade size, six (6) 1-1/4 in. trade size, one (1) 1-1/2 in. trade size, and two (2) 2 in. trade size.
9) Boxes shall be fully adjustable, accommodating a maximum 2 in. pre-concrete pour and a maximum 1/2 in. post-concrete pour adjustment.

c. Cover
1) Manufactured of die-cast aluminum or die-cast zinc, and available in brushed aluminum finish and powder-coated paint finishes (black, gray, bronze, nickel and brass). Activation covers shall be available in flanged version. Covers shall come equipped with one (1) 1-inch trade size screw plug opening and one (1) combination 1-1/4-inch and 2-inch trade size screw plug.
2) Flanged covers shall be 7-3/4 in. L x 6-9/16 in. W.
3) Powder coat finish, color comes in black, gray, brass, nickel and bronze. Finish to be selected by the Architect.

3. Manufacturers

   a. Wiremold EFBFF-OG with Floor Port FPFFTC Series Covers. Finish to be selected by the Architect.

   b. or equal (No known equal).

B. Poke-Thru Assembly, Furniture Feed

1. Drawing Reference: FP1

2. Features

   a. UL Listed

   b. Poke-Thru Assembly

      1) Consists of an insert and activation cover. Overall poke-thru assembly length shall be 16-15/16.
      2) Insert: Insert body shall have the necessary channels to provide complete separation of power and communication services. There shall be one (1) 3/4-inch trade size channel for power and one (1) 1-1/2-inch trade size channel for communication cabling.
      3) The body will consist of an intumescent fire stop material to maintain the fire rating of the floor slab. The intumescent material will be held securely in place in the insert body and shall not have to be adjusted to maintain the fire rating of the unit and the floor slab. Insert shall have a spring-steel retaining ring that will hold the poke-thru device in the floor slab without additional fasteners. The poke-thru insert shall also consist of one (1) 3/4-inch trade size conduit stub and one 1-1/2-inch trade size conduit stub that are connected to the insert body. There shall also be a 24.5 cu in stamped steel junction box for wire splices and connections. The stamped steel junction box shall also contain the necessary means to electrically ground the poke-thru assembly.
      4) Activation Cover: The activation cover shall provide two (2) conduit openings to feed modular furniture applications and provide a flush appearance. The activation cover trim flange shall be one-piece and be manufactured of die-cast aluminum alloy and be capable of being powder coated or plated. Coated finish is to be textured, two-stage epoxy paint in gray, black, brass, nickel, bronze. Activation cover trim flange shall also be available in brushed aluminum finish. Aluminum finish shall be a brushed finish with a lacquer sealant. The activation cover shall be 8-1/4 inches in diameter. A gasket is attached to the underside of the trim flange assembly to maintain scrub water tightness by preventing water, dirt, and dust from entering the power and communication compartments.
      5) The activation cover insert shall provide one (1) 3/4-inch NPSM threaded opening for power and one (1) 1-1/2-inch NPSM threaded opening for communication to feed modular furniture workstations. Each activation cover shall also be supplied with one (1) 3/4-inch trade size and one (1) 1-1/2-inch trade size threaded conduit connectors and one (1) 3/4-inch trade size and one (1) 1-1/2-inch trade size conduit closure plugs.

3. Manufacturers

   a. Wiremold 4FFATC15 Furniture Feed Poke-Thru Assembly. Finish to be selected by the Architect.

   b. or equal (No known equal).

C. Recessed Poke-thru, 6”

1. Drawing Reference: FP6

2. Construction

   a. FP6 Poke-Thru Assembly: Poke-thru device assemblies shall consist of an insert and an activation cover. Assembly length: 16-3/4 inches (425mm). Insert body shall recess the devices a minimum of 2-3/4 inches (69mm) and have a polyester based backing enamel finished interior; ivory color. Furnish with necessary channels to provide complete separation of power and communication services. Provide five (3) compartments that allow for up to five (3) duplex receptacles that can be wired as a standard receptacle or isolated ground and/or 12 communication ports and/or 10 Legrand AVIP AV devices or 10 Extron® Electronics MAAP™ and/or two (2) AAP™ devices.
   b. Body consists of an intumescent firestop material to maintain fire rating of the floor slab. Hold intumescent material securely in place in insert body. Intumescent material will not have to be adjusted to maintain fire rating of the unit and the floor slab. Provide insert with a retaining feature to hold the poke-thru device in the floor slab without additional fasteners. Poke-thru insert shall also consist of a 3/4-inch trade size conduit stub that is connected to the insert body and a 24.5 cu in (402ml) stamped steel junction box for wire splicing and connections. Stamped steel junction box shall also contain the means necessary to electrically ground the poke-thru device to the system ground.
   c. FP6 Activation Cover: Manufactured of die-cast aluminum alloy; finished in powder-coated [gray] [black] [brass] [nickel] [bronze], finish selected by Architect. Provide with two (2) gaskets (one (1) for carpet and one (1) for tile) to go under the trim flange to maintain scrub water tightness. Activation cover is 7-1/4 inches (184mm) in diameter. Provide cover with spring-loaded slides to allow cables to egress out of the unit and maintain as small an egress opening as possible.
   d. Communication Modules Mounting Accessories: Provide activation unit with three locations to mount communication connectors. Mount connectors using a mounting bracket capable of accepting up to 12 Ortonics® TracJack™ Category 6 insert modules or TechChoice™ Category 6 discrete keystone connectors. Also provide unit with two (2) Category 6 discrete keystone connectors and two (2) industry standard keystones and accommodate a mechanism to permit protection of communication cabling. Fabricate mechanism from stamped steel construction. Mechanism shall accept both flexible and rigid 3/4-inch, 1-1/4-inch or two-inch trade size conduit.

3. Manufacturers

a. FP6 - Wiremold Evolution 6AT series poke-thru and cover assemblies to match floor conditions. Finish as selected by Architect. Provide internal device brackets to match specified communications devices and plates. Coordinate electrical rough-in with requirements of Division 26. Provide rough-in as required to mount specified communications fill.
b. Or equal (No known equal).

2.7 THROUGH PENETRATION SEALANT ASSEMBLY, AUTOMATIC FILL ADJUSTMENT

A. Through Penetration Sealant Assembly, Automatic Fill Adjustment

1. Drawing Reference: TPS 2 in. x 2 in., TPS 3 in. x 3 in., TPS 4 in. x 4 in.

2. Functions

a. Where indicated, cables passing through fire-rated floors or walls shall pass through fire-rated assemblies which contain an intumescent insert material that adjusts automatically to cable additions or subtractions.

b. Assemblies shall have an F Rating equal to the rating of the barrier in which the device is installed.

c. Assemblies shall be capable of allowing a 0 to 100-percent visual fill of cables.

d. Assemblies to be provided with steel wall plates allowing for single or multiple devices to be ganged together.

3. Acceptable Manufacturers:

a. Specified Technologies Inc. (STI) EZ-Path Fire Rated Pathway
1) TPS 2 in. x 2 in.
a) EZD22 Series 22 Full Kit
2) TPS 3 in. x 3 in.
a) EZDP33FWS Series 33 Full Kit
3) TPS 4 in. x 4 in.
a) EZDP44S Series 44+ Full Kit

b. Or equal.

PART 3 - EXECUTION

3.1 CONDUIT APPLICATION

A. General: Install the following types of conduits and fittings in the locations listed, unless otherwise noted in the drawings:

1. Exterior, Exposed:

a. Type RSC for applications up to 8 feet AFF or to first pull box, whichever is first, applications subject to physical abuse or for applications greater than 4 in. diameter.

b. EMT acceptable in all other applications not noted above up to 4 in., where used in conjunction with specified Raintight (compression) couplers.

2. Interior, Exposed, Wet and Damp Locations:
   a. Type RSC.
   b. At interior locations over 8 feet above finished floor, EMT acceptable.
3. Interior, Hazardous Locations
   a. Type RSC
   b. Type IMC, where permitted by the CEC.
4. Interior, exposed or concealed, dry locations:
   a. RSC, if subject to physical abuse.
   b. EMT, if not subject to physical abuse.
5. Interior, concealed, damp locations, including in masonry walls.
   a. RSC
6. Embedded in Concrete
   a. RSC or rigid non-metallic conduit.
   b. PVC Type DB-120.
7. Transition from walls to open plan furniture systems:
   a. Liquidtight

3.2 GENERAL REQUIREMENTS

A. Refer to the manufacturer's instructions and conform thereto.

B. Distribution Pathway via EMT Raceway:

1. EMT conduit is to be installed meeting the NEC handbook Article 348 Installation Specifications.
2. Provide escutcheon plates for all through wall conduit stubs.
3. All ends of conduits shall be cut square, reamed and fitted with insulated bushing.
4. All conduit which passes through fire walls shall be sealed with fire stop putty after all station wire has been installed.

3.3 MOUNTING AND INSTALLATION – DEVICE BOXES

A. Conform to the more restrictive of NEMA OS 3-2002 and the following.

B. Provide backboxes at all communications systems devices. Installation of device plates directly to wall surface without use of a backbox, unless specifically directed on plans, is unacceptable.

C. The distance between pull boxes shall not exceed 150 feet or more than two 90 degree bends.

D. Align boxes plumb with floor and surrounding construction. At door frames, locate 4 in. from frame. Verify placement with Architect details to ensure that box clears all trim, etc.

E. Support and fasten boxes securely. At stud walls use rigid bar hangers, attached to hanger with stud and nut.

F. At existing locations, provide cutting, patching and finishing as required to maintain or restore finishes so that resulting installation is integrated into the Architectural decor of the particular location.

G. Mounting Height: the mounting height of a wall-mounted outlet box is defined as the height from the finished floor to the horizontal center line of the cover plate.

H. Mount outlet boxes with the long axis vertical. Three or more gang boxes shall be mounted with the long axis horizontal.

I. Install wiring jacks and outlet devices only in boxes which are clean; free from excess building materials, dirt, and debris.

J. Install wiring jacks and outlet devices after wiring work is complete.

3.4 TERMINAL CABINETS, JUNCTION BOXES AND PULL BOXES

A. General

1. Thoroughly examine site conditions for acceptance of cabinets and enclosures installation to verify conformance with manufacturer and specification tolerances. Do not commence with installation until all conditions are made satisfactory.

B. Set cabinets and enclosures plumb and symmetrical with building lines. Furnish and install all construction channel bolts, angles, etc. required to mount all equipment furnished under this Section of the Specifications.

C. Cabinets and enclosures shall be anchored and braced to withstand seismic forces calculated in accordance with standards referenced in Section 27 05 29.

D. "Train" interior wiring, bundle and clamp using specified plastic wire wraps. Separate power and signal wiring.

E. Replace doors or trim exhibiting dents, bends, warps or poor fit that may impede ready access, security or integrity.

F. Terminate conduit in cabinet with lock nut and grounding bushing.

G. Cleaning

1. Touch-up paint any marks, blemishes or other finish damage suffered during installation.

2. Vacuum clean cabinet on completion of installation.

3.5 SUPPORT

A. Provide supports for raceways as specified in Section 27 05 29 – Hangers and Supports for Communications Systems.

B. All raceways installed in exposed dry locations shall be grouped in a like arrangement and supported by means of conduit straps, wall brackets or trapeze hangers in accordance with Code and the requirements of the this Section and Section 27 05 29 – Hangers and Supports for Communications Systems. Fasten all hangers from the building structural system.

C. Provide supports and mounting attachments per the most restrictive of Code and the following.

Raceway Size (inches)	No of cables in run	Location	Support Spacing (feet)	
			RSC	EMT
Horizontal Runs				
1≥	1-2	Flat ceiling or wall	6	6
1≥	1-2	Where access limited to building structure	10	10
1≥	3≥	Any locations	10	10
Any	Any	Concealed	10	10
Vertical Runs				
1, 1-1/4	Any	Exposed	8	8
1-1/2≥	Any	Exposed	10	10

D. Install no more than one coupling or device between supports.

E. Conduit support

1. As specified in Section 27 05 29 – Hangers and Supports for Communications Systems

F. The Architect reserves the right to request additional supports where in their sole opinion said supports are required. Any additional supports shall be installed at no additional cost to the Owner.

3.6 PENETRATIONS

A. Gypsum Wall Board Penetrations: Provide circular penetrations maximum 1/8 in. inch larger than outer diameter of conduit being used. On both sides of the wall fill space between conduit and wall with joint compound, depth to match gypsum board thickness.

B. Install UL listed fire-stop system whenever a raceway penetrates a firewall in conformance with the manufacturer's directions, the published systems assembly requirements, CBC Section 709 and 710 and CEC 300-21, whichever is the most restrictive. At cable tray penetrations, provide pillow type removable fire stop per CBC Section 709 and 710, the published systems assembly requirements and the manufacturer's directions, whichever is the most restrictive.

C. All communications systems conduit openings in walls and floors are the responsibility of the Contractor. Install sleeves shown on the drawings when the concrete is poured. Any openings required after the concrete has set maybe core drilled.

3.7 RACEWAY INSTALLATION, GENERAL

A. Raceway runs are shown schematically. Install concealed unless specifically shown otherwise. Supports, pull boxes, junction boxes and similar generally not indicated. Provide where designated.

1. Install exposed conduit and raceway parallel and perpendicular to nearby surfaces or exposed structural members, and follow the surface contours. Level and square conduit and raceway runs.

2. Raceway runs shall be mechanically and electrically continuous between all each equipment rack and utility demarcation point, receptacle and/or surface raceway strip, as applies.

3. Each conduit shall enter and be securely connected to a cabinet, junction box, pull box, or outlet by means of a locknut on the outside and a bushing on the inside or by means of a liquid-tight, threaded, self-locking, cold-weld type wedge adapter.

4. Bends

a. All bends or elbows shall have a minimum radius as follows:

Conduit Size	Min. Radius (Inches)
1-1/4 in.	18
2 in.	24
2-1/2 in.	24
3 in.	30
3-1/2 in.	30
4 in.	30
5 in.	36
6 in.	42

b. Use factory elbows or machine bends for conduit bends 1-1/4 in. and larger.

5. Make bends and offsets so the inside diameter is not effectively reduced. Make bends in parallel or banked runs from the same center line so that the bends are parallel.

6. Install at least one (1) 3/8 in., 200 pound strength nylon pull cord in all empty raceways.

7. Raceways crossing building expansion joints or in straight runs exceeding 100 feet shall be provided with UL listed expansion fittings.

8. Install conduit seals and drains to prevent accumulated moisture in conduits from entering Communications System enclosures.

B. Do not install conduit in concrete slabs unless specifically directed by Architect. Embedded conduits in concrete slab walls, and columns shall be installed in center third between upper and lower layers of reinforcing steel as directed by the Architect. Space conduits 8 in. on center except at cabinet locations where slab thickness shall be increased as directed by the Architect.

C. All conduits to be kept 12 in. away from steam or hot water lines. Install horizontal conduit and raceway runs below water and steam piping.

D. Conduit dropping down to equipment shall be as straight as possible without any offsets, parallel or perpendicular to walls, ceilings and other building features.

E. Conduit installed on any equipment shall be run symmetrical with the equipment and in such a manner as to:

1. not to be exposed to damage;

2. not interfere with access to components of the equipment that will interfere with maintenance operation or;

3. not to be in a manner that the Owner deems detrimental to its operation.

F. Whenever an installation such as that listed occurs, the Contractor shall make all necessary changes at no additional cost to the Owner.

G. All cut ends of conduit, scratches, tool marks, etc. on any metallic raceway installed in the ground or on the exterior of the building shall be treated with two coats of specified Touch Up Paint/Tape.

H. Exposed conduit and metallic surface raceway installed in finished spaces shall be painted to match surrounding surfaces using paint and methods directed by the Architect.

I. All raceways stubbing up into equipment or racks shall be sealed. Raceways with conductors shall be plugged with duct-seal. Spare raceways shall be capped. Prevent foreign matter from entering conduit and raceway; use temporary closure protection. Replace conduits containing concrete, varnish or other foreign material.

J. Complete installation of conduit and raceway runs before starting installation of cables/wires within conduit and raceway.

K. Use specified conduit and raceway fittings that are of types compatible with the associated conduit and raceway and suitable for the use and location. Join and

terminate conduit and raceway with fittings designed and approved for the purpose of the conduit and raceway system and make up tight.

L. Where chase nipples are used, align the raceway and coupling square to the box and tighten the chase nipple so no threads are exposed.

M. Horizontal conduit or EMT runs, where required and permitted, shall be installed as close to ceiling or ceiling beams as practical. Coordinate routing with the Architect.

N. Conduit and EMT connected to wall outlets shall be run in such a manner that they will not cross water, steam or waste pipes or radiator branches.

O. Conduit and EMT shall not be run through beams, purlins or columns except where permission is granted by Architect in writing.

P. Bond installed metallic raceway in accordance with the requirements of the CEC.

Q. Provide insulated bushing at the end of each conduit to prevent cable abrasion during installation.

3.8 REUSE OF EXISTING CONDUIT

A. Existing conduit is to be used as a pathway only where so shown on the drawings.

B. Prior to beginning work involving the use of an existing conduit, the Contractor shall consult with the Architect in order to establish whether or not the conduit contains active service.

C. If no active service exists within the conduit, all cable is to be removed, and work is to proceed.

D. If active service does exist within the conduit and it has been determined that service needs to be disrupted, then work on that conduit shall not proceed until a schedule of service outage has been established by the University's Representative. Once given permission to proceed, the Contractor shall within the time period of one (1) working day; remove the old cable, install, terminate and test the new cables, and notify the University's Representative of the work using the specific conduit has been completed. The Contractor shall be responsible for the disconnection and reconnecting of the active service cross-connects within the terminal closet(s).

E. Conduit preparation procedure:

1. Remove existing Wires and Cables (if any).

2. Run a mandrel ½ in. smaller than the inside diameter of the conduit through the conduit receiving new wires and cables.

3. If the specified size mandrel will not pass through the existing conduit, start with a smaller size mandrel and increase mandrel size until the specified sized mandrel will pass.

4. Run a wire brush and clean rag with an outside diameter 1/8 in. larger than the inside of the conduit through the conduit receiving new wires and cables.

5. Repeat above until conduit is clean and materials detrimental to the wire and cables to be installed no longer exit conduit with the clean rag.

3.9 STATION CABLE PATHWAY INSTALLATION

A. Station Outlet Boxes:

1. Unless otherwise noted on the plans, all cut in boxes and surface station outlet boxes are to be installed at a height of 18 in. A.F.F.(above finished floor) to center, except for those intended to be used for telephone wall jacks. Those plates or boxes that are to be used for telephone wall jacks shall be installed at a height of 54 in. A.F.F to center.

2. All station outlets shall be installed so that their edges are parallel to the vertical and horizontal edges of the surface on which they are mounted.

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. Cable Trays for Communications Cabling

1. Cable Trays
2. Cable Runways

B. Cable Tray Support

1.2 RELATED WORK UNDER OTHER SECTIONS

A. Section 27 05 00 – Common Work Results for Communications

B. Section 27 05 26 – Grounding and Bonding for Communications Systems

C. Section 27 05 29 – Hangers and Supports for Communications Systems

   a. NEMA FG 1 1-1998 Fiberglass Cable Tray Systems
   b. NEMA VE 1 1-1998 Metal Cable Tray Systems.
   c. NEMA VE 2 2001 Metal Cable Tray Installation Guidelines

1.4 SUBMITTALS

A. Conform with the requirements of Section 01 30 00 – Administrative Requirements and Section 27 05 00 Common Work Results for Communications.

1.5 DELIVERY, STORAGE AND HANDLING

A. Procedures: In accordance with Section 01 60 00 – Product Requirements.

PART 2 - PRODUCTS

2.1 CABLE TRAY AND CABLE RUNWAY

A. Cable Runway (To be installed in BDF and IDF Rooms)

1. Drawing and spec reference: CR*, where "*" denotes nominal width of cable runway in inches.
2. Construction:
   a. Solid Steel Side Bar per ASTM A-36 or Tubular Steel Side Bar per ASTM A-513.
   b. 1.5" x 0.375 minimum tubular side stringers.
   c. UL Classified splice kits.
   d. Designed to support at least 100 pounds per foot load with a Safe Working Load deflection of ½" or less.
3. Finish: Telco gray powder coat or gold on zinc plating.
4. Approvals:
   a. ASTM A513
   b. UL Classified as an equipment grounding conductor.
   c. California Electrical Code, Article 318
5. Manufacturers:
   a. B-Line Telecom-Saunders SB-17.
   b. Chatsworth Products Inc. 11275 series.
   c. PW Industries
   d. or equal

B. Basket Cable Tray, Open Wire

1. Drawing and spec reference(s): CTW xx-y , where xx denotes the tray width and y the depth of the tray, in inches.
2. Construction
   a. Welded wire mesh with continuous safety edge wire lip.
   b. Mesh forms grid at nominally 2" by 4"
   c. Carbon Steel
   d. Electroplated zinc galvanized
   e. All bends, seams and joints field fabricated from basic straight section pieces and splice components as supplied by the manufacturer.
   f. Provide a complete system of accessories, including bonding and grounding connections, conduit connectors, to terminate conduits extended

to basket edge, radius shields to protect cabling at inside corners, and waterfall drop-outs at each end of cabling racks and cabinets indicated on the plans scheduled or indicated to terminate open wiring systems.

g. Provides pathway complying with ANSI/TIA-569C and NEMA Publications VE1 & VE2

h. Meets requirements of National Electrical Code, Article 318

3. Approvals:

a. NEMA Publications VE1 & VE2

4. Manufacturers:

a. B-Line Wire Basket Runway

b. Cablofil

PART 3 - EXECUTION

3.1 INSTALLATION:

A. Provide all required supports, fittings and accessories for a complete system as described in NEMA VE-2, by Code, manufacturer recommendation or as shown on the plans, whichever is most restrictive.

B. Bond sections to one another and to building ground.

C. Access Clearance. Maintain access for use by City's personnel to tray as described below. Coordinate installation with work of structural, mechanical, plumbing/fire protection and electrical trades to maintain required access.

1. Unless shown otherwise on the plans, provide a clear access of at least 24" wide along one side of each tray for use by City's personnel.

2. Unless shown otherwise on the plans, installation to maintain at least 12" vertical clearance over the top of each tray for use by City's personnel.

3.2 SUPPORT

A. Support in accordance with the most restrictive of the following:

1. Contractor’s engineered means of engineered support submitted in accordance with the requirements of 27 05 00 – Common Work Results for Communications and Section 27 05 29 – Hangers and Supports for Communications Systems.

2. California Building Code, including but not limited to requirements of Volume 2, Chapter 16, Division IV, Section 1632 and Table 16-O.

3. Metallic Cable Tray: NEMA VE 2-2001, or latest edition

4. Fiberglass Cable Tray: NEMA FG-1-1998, or latest edition.

B. Provide lateral sway bracing as required by Code.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

A. Provide all labor, materials, transportation and equipment to complete the furnishing, installation, assembly, and set up of the Communications System Raceway, Conduit and Backbone work indicated on the drawings and specified herein. Notwithstanding any detailed information in this Section, provide complete, contiguous working raceway systems.

B. Communications Outside Plant Ductwork - refer to the drawings for demarcation of the work of this Project.

1. Communications Outside Plant Ductwork.
2. Communications Manholes
3. Communications Pullboxes
4. Connection of underground ductbanks to campus buildings

1.2 RELATED WORK IN OTHER SECTIONS:

A. Section 31 23 17 – Trenching, Backfilling, and Compacting

B. Section 27 05 00 – Common Work Results for Communications Systems.

C. Section 27 05 26 – Grounding and Bonding for Communications Systems

D. Section 27 05 33 – Communications, Raceways, Boxes and Fittings

1.3 REGULATORY REQUIREMENTS

A. In addition to requirements of Division 1, comply with the following.

1. Public Utilities Commission of the State of California.
   a. Rules for Overhead Electric line Construction, General Order No. 95 inclusive of all Decisions or Resolutions thereto authorized with Date Effective up to and including 30 days prior to the bid opening day.
   b. Rules for Underground Electric Line Construction, General Order No. 128 inclusive of all Decisions or Resolutions thereto authorized with Date Effective up to and including 30 days prior to the bid opening day.

1.5 SUBMITTALS

A. Conform with the requirements of Division 1 and Section 27 05 00 Common Work Results for Communications.

1.6 DELIVERY, STORAGE AND HANDLING

A. Procedures: In accordance with Division 1.

1.7 SEQUENCING

A. Not Used.

PART 2 - PRODUCTS

2.1 DUCTBANK CONSTRUCTION

A. PVC Conduit

1. Drawing and Spec Reference: PVC.

2. Construction:

a. 4" trade diameter, unless otherwise noted.

b. Poly-vinyl chloride.

c. Schedule by Application
   1) Straight segments, Schedule 40.
   2) Flat elbows, Schedule 40.
   3) Vertical elbows sweep up to grade, Schedule 80.
   4) Above grade, Schedule 80.

d. Elbows.
   1) Where innerduct liner is scheduled – CRSC.
   2) Elsewhere, Schedule 80.
   3) 90° C rated.
   4) Solvent welded joints, joints by pipe manufacturer.

e. Application.
   1) Soil Backfill/Direct Burial
      a) RUS Type II, Type C or Type DB
      b) Schedule 40.
   2) Concrete Encasement:
      a) PVC Type DB-120,

b) RUS Type I, Type B or Type EB
c) Any meeting Soil Backfill/Direct Burial.

3) Boring
a) HDPE.
b) RUS Type Flexible Plastic.

f. Performance:
1) Tensile Strength: 7,000 psi at 73.4° F.
2) Flexural Strength: 11,000 psi.
3) Compressive Strength: 8,600 psi.

g. Approvals:
1) RUS Listed for Telephone Cable Installation 5-99 Edition, or latest release thereof.
2) NEMA TC-2, PVC Type EPC-40 and EPC-80.
3) NEMA TC-3.
4) NEMA TC14 Fiberglass Conduit.
5) UL 514 fittings.
6) UL 651.
7) ANSI C33.91.

h. Manufacturers:

2) or equal

2.2 FITTINGS

A. Couplings, adaptors, transition fittings, etc., shall be molded PVC, slip on, solvent weld type conforming to NEMA TC3 for Schedule 40 or 80 and NEMA TC 9 for type EB or DB.

B. Fitting Types

1. Expansion Fittings, 12”, Metallic:

2. Function: At road or bridge expansion joints requiring up to 12” of expansion compensation.

3. Approvals:

a. CalTrans

4. Construction
   a. Steel, hot dip galvanized.
   b. Nylon wear bushings
   c. O-ring seal
   d. Bonding jumper
5. Manufacturers:
   a. O-Z Gedney Type AX, Type AX-8, and Type EX fittings with Type BJ Bonding Jumper.
   b. TVC/Vikimatic VB0285X series.
   c. Or Equal.

C. Expansion Fittings, 6”, Non-metallic:
1. Function: At road or bridge expansion joints requiring up to 6” of expansion compensation.
2. Construction
   a. Fiberglass
   b. Provide bonding jumper.
3. Manufacturers:
   a. TVC Communications HW or Extra Heavy Wall Expansion Joint.
   b. Vikimatic
   c. FRE Composites, Inc.
   d. Or Equal.

D. Caps, Underground Conduit Stubs
1. Provide at each location indicated for future expansion.
2. Wateright.
3. Manufacturers:
   a. Carlon E985N
   b. Vikimatic

E. Refer to Section 27 05 33 – Communications, Raceways, Boxes and Fittings for additional fittings.

2.3 UNDERGROUND STRUCTURES

A. Vaults, PullBoxes and Manholes, Precast, General

1. Precast units shall be the product of a manufacturer regularly engaged in the manufacture of precast concrete products, including precast manholes, boxes and handholes.

2. Construction

   a. General
      1) Castings shall be free from warp and blow holes that may impair strength or appearance.
      2) Structures shall be precast to the design and details indicated, precast monolithically and placed as a unit, or structures may be assembled in sections, designed and produced by the manufacturer in accordance with the requirements specified.
      3) Structures shall be identified with the manufacturer's name embedded in or otherwise permanently attached to an interior wall face.
      4) Structure top and wall shall be of a uniform thickness of not less than 4 inches except at knockouts.
      5) The minimum concrete cover for reinforcing steel shall be 2 inches.
      6) All steel, except reinforcing steel, shall be hot dip galvanized after fabrication.
      7) Knockouts & Windows
         a) Thin-walled knock-out panels designed for future duct bank entrances are permitted.
         b) Sides of precast windows shall be a minimum of 4 inches from the inside surface of adjacent walls, floors, or ceilings.
         c) Form of the perimeter of precast window openings to have a keyed or inward flared surface to provide a positive interlock with the mating duct bank envelope.
         d) Provide welded wire-fabric reinforcing through window openings for in-field cutting and flaring into duct bank envelopes.
         e) Provide additional reinforcing steel comprised of at least 2 No. 4 bars around window openings.
      8) Extension Rings
         a) Provide extension rings as-required to extend from finished grade to communications utilities.
      9) Bottom and Drain Sumps
         a) Provide solid concrete bottom surface.
         b) Provide drain sumps for precast structures a minimum of 12 inches in diameter and 4 inches deep.

3. Joints:

   a. Provide tongue-and-groove or shiplap joints on mating edges of precast components.

   b. Design joints to firmly interlock adjoining components and to provide waterproof junctions, and adequate shear transfer.

   c. Seal joints watertight using preformed plastic strip conforming to AASHTO M198, Type B.

4. Frames and Covers

a. Covers to match across all utilities.

b. Provide fiber composite lids at pedestrian rated covers, H-20 steel slip resistant covers otherwise.

c. Labeling
   1) Provide labeling as follows:
      a) "Communications"
      b) Owner's Manhole or Vault No, as shown on drawings or provided to Contractor prior to vault order placement.
   2) Labeling shall be:
      a) Cast in concrete lids
      b) Written in weld on steel lids
      c) Alternatively, for pedestrian grade vault lids and for the vault number only, provide 1/8" min. thickness lamacoid label, rivet attached to box top in recess area below surface of lid.

5. Pulling-In-Irons

   a. Steel bars bent in the form indicated and cast in the walls and floors.

   b. Install a pulling-in iron in the wall opposite each duct line entrance at walls, not less than 6 inches above or below, and opposite the conduits entering the manhole.

   c. Pulling-in irons shall project into the manhole approximately 4 inches, or be cast in a pocket. Iron shall be hot-dipped galvanized after fabrication.

   d. Provide cable racks, including rack arms, minimum two (2) 12" arms each manhole or vault face.

B. Underground Pull Boxes and Vaults, Concrete

1. Drawing and Specification References:

   a. PB1P

   b. PB1T

   c. PB2P

   d. PB2T

   e. PB3T

2. Minimum Size

   a. As scheduled on the drawings. Provide scheduled or larger size.

3. Lid Construction:

   a. As scheduled on the plans

4. Cover Components

   a. PB1 and PB2 Size: One piece construction

   b. PB3 Size: Two piece hinged lids with torsion spring lifters.

5. Pulling-In-Irons

a. Steel bars bent in the form indicated and cast in the walls and floors.

b. Install a pulling-in iron in the wall opposite each duct line entrance at walls, not less than 6 inches above or below, and opposite the conduits entering the manhole.

c. Pulling-in irons shall project into the manhole approximately 4 inches, or be cast in a pocket. Iron shall be hot-dipped galvanized after fabrication.

6. Provide cable racks, including rack arms, minimum two (2) 12" arms each vault face.

7. Manufacturers:

a. Brooks Products
   1) 1P & 1T: 5 Series and extension rings as required
   2) 2P & 2T: 67 Series and extension rings as required
   3) 3T: 400 Series with 11C Type Lid.

b. Jensen PreCast
   1) PB1P: P9 with FL9D lid, P9BA base and extension rings as required.
   2) PB1T P9 with P9-61 lid, P9BA base and extension rings as required
   3) PB2P: P36 with FL36D cover, P36BA base and extension rings as required
   4) PB2T: P36 with P36-61D lid, P36BA base and extension rings as required
   5) PB3T: 35TA

c. Utility Vault Company, Inc./Oldcastle Precast
   1) PB3T: PTS-3660, with H-20-44 loading cover, with 3660-06 and 3660-12 extensions as required.

d. Associated Concrete Products

e. Forni Corporation.

f. Or equal.

C. Manhole/Maintenance Hole

1. Drawing and Specification Reference:

a. MH: Maintenance Hole, 4 feet 6 inches by 8 feet 6 inches inside.

2. Construction:

a. SBC Reference Specification PTS-65 for overall size and shape.
   1) Arrange duct bank entry per latest BICSI outside plant manual, not SBC standard
   2) Provide non-metallic racking and cable support arms, not SBC standard metallic arms.
   3) Increase wall thickness where indicated installation depth exceeds rating of PTS-65 assembly.

b. Ladder
   1) Provide 1 ladder per maintenance hold

2) Steel, hooks to rungs at top of maintenance hold neck, long enough to reach bottom of maintenance hole.

3. Manufacturers

a. Utility Vault Company, Inc. 38-PTS-65, with cover with nameplate "Communications", with 3606 and 3612 extensions as required, with ladder.

b. Jensen PreCast PTS-65

c. Associated Concrete Products

d. Forni Corporation.

e. Or equal.

2.4 MISCELLANEOUS UNDERGROUND PRODUCTS

A. Cable Warning Tape

1. Provide

a. 6 inches wide minimum.

b. 5 mil plastic.

c. Metallic backing at least 10 feet o.c.

d. 1 mil metallic foil core.

e. Orange in color

f. Suitable for buried applications.

g. Continuously imprinted with the words "WARNING - COMMUNICATIONS CABLE BELOW" or similar at not more than 48 inch intervals.

2. Manufacturers:

a. Carlon Telecom Systems.

b. Vikimatic

c. Or equal.

B. Pull Rope

1. At least 3/4 inch diameter polyethylene or polyester.

2. 2500 pound strength.

3. Manufacturers:

a. Carlon Telecom Systems.

b. Vikimatic

c. Or equal.

C. Length Marked Tape

1. Provide 1/2 inch flat tape with sequential markings in whole feet.
2. Manufacturers:
    a. Carlon Telecom Systems.
    b. Greenlee
    c. Vikimatic
    d. Or equal.

D. Conduit Plugs

1. Provide universal blank duct plug type, with eye for tying rope and tape.
2. Manufacturers:
    a. Carlon Telecom Systems.
    b. Condux International, Inc.
    c. Or equal.

E. Line Marker Post

1. Orange polyethylene, post height 4 feet above surface.
2. Soil anchor.
3. Manufacturers:
    a. Carlon Telecom Systems.
    b. Vikimatic
    c. Or equal.

F. Conduit Spacer, Trench

1. Construction
    a. Non-metallic.
    b. Sized to snap around conduits as shown on Drawings.
    c. Interlocking.
2. Manufacturers:
    a. Underground Devices Wunpeece.
    b. GS Industries Underground Products Spacer System.
    c. Or equal.

G. Pulling In Irons

1. 7/8" Diameter
    a. 6" exposed length minimum after imbedment
    b. RUS approved

2. Manufacturer
    a. Cooper Power Systems
    b. Or equal.

H. Cable Racks & Supports

1. Construction:
    a. Non-metallic
    b. 12" minimum rack arms
    c. Snap into vertical strut sections provided with new manhole, pullboxes and vaults, or into Owner's existing vaults, where indicated.

2. Approvals
    a. RUS
    b. NEMA

3. Manufacturers:
    a. Underground Devices
    b. Inwesco
    c. Cooper Power Systems
    d. Or Equal

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

A. Refer to the most restrictive of the Code, the manufacturer's instructions, these specifications and the relevant NEMA, CalTrans or RUS guidelines and conform.

3.2 CONDUIT APPLICATION

A. General: Install the following types of conduits and fittings in the locations listed, unless otherwise noted in the drawings:

1. Underground Ductbanks, Concrete Encased
    a. PVC

B. Exterior, Exposed:

1. Type RSC for applications up to 8 feet AFF or to first pull box, whichever is first, applications subject to physical abuse or for applications greater than 4" diameter.

2. EMT acceptable in all other applications not noted above up to 4", where used in conjunction with specified Raintight (compression) couplers.

C. Embedded in Concrete

1. RSC or rigid non-metallic conduit.
2. PVC

D. In Utility Tunnel

1. RSC
2. CRSC
3. IMC

3.3 RACEWAY INSTALLATION, GENERAL

A. Refer to Section 27 05 33 – Conduits and Backboxes for Communications Systems

3.4 UNDERGROUND CONSTRUCTION:

A. Duct and Conduit Placement.

1. Duct lines shall have a continuous slope downward toward underground structures and away from buildings with a minimum pitch of 3 inches in 100 feet.
2. Except at conduit risers, accomplish changes in direction of runs exceeding a total of 10 degrees, either vertical or horizontal, by long sweep bends having a minimum radius of curvature of 25 feet. Sweep bends may be made up of one or more curved or straight sections or combinations thereof. Manufactured bends shall have a minimum radius of 18 inches for use with conduits of less than 3 inches in diameter and a minimum radius of 36 inches for ducts of 3 inches in diameter and larger.
3. Excavate trenches along straight lines from structure to structure before ducts are laid or structure constructed so the elevation can be adjusted, if necessary, to avoid unseen obstruction.

B. Duct Bank.

1. Duct Entrance Arrangement - Conform to Table 3.27 and applicable arrangement diagrams 3.57-3.64 of 2004 BISCI Customer Owned Outside Plant Design Manual.
2. Terminate conduits in end-bells where duct lines enter underground structures.
3. Stagger conduit joints by rows and layers to strengthen the duct bank.
4. Provide plastic duct spacers that interlock vertically and horizontally. Spacer assembly shall consist of base spacers, intermediate spacers and top spacers to provide a completely enclosed and locked-in duct bank. Install spacers per manufacturer's instructions, but provide a minimum of two spacer assemblies per 10 feet of duct bank. Before pouring concrete or backfilling, as applies, anchor duct bank assemblies to prevent the assemblies from floating. Anchoring shall be

done by driving reinforcing rods adjacent to every other duct spacer assembly and attaching the rod to the spacer assembly.

5. As each section of a duct line is completed from structure to structure, for conduit sizes 3 inches and larger draw a flexible testing mandrel approximately 12 inches long with a diameter less than the diameter of the conduit through a conduit. After which, draw a stiff bristle brush having the same diameter of the conduit through the conduit, until conduit is clear of particles of earth, sand, and gravel; then immediately install end plugs. For conduit sizes less than 3 inches, draw a stiff bristle brush through the conduit, until conduit is clear of particles of earth, sand, and gravel; then immediately install end plugs.

6. Unless otherwise noted, exterior communications conduit runs shall be buried a minimum of **30"** below finished grade or as required to conform to local utility requirements. Where new trenching is required, backfill and compaction requirements shall be as defined in other Sections.

7. Where concrete encasement indicated, construct underground duct lines of individual conduits encased in concrete. Do not mix different kinds of conduit in any one duct bank. Ducts shall not be smaller than shown. The concrete encasement surrounding the bank shall be rectangular in cross-section and shall provide at least 3 inches of concrete cover for ducts. Separate conduits by a minimum concrete thickness of 2 inches, except separate light and power conduits from communications conduits by a minimum concrete thickness of 4 inches. The top of the concrete encasement shall not be less than 18 inches below grade except that under roads and pavement concrete be a minimum of 24 inches below grade.

C. Where conduit runs under existing roads, cut and patch the pavement as indicated.

D. Conduit Plugs and Pull Rope. New conduit indicated as being unused or empty shall be provided with plugs on each end. Plugs shall contain a weephole or screen to allow water drainage. Provide a 3/8 inch nylon pull rope having 3 feet of slack at each end of unused or empty conduits.

E. Partially Completed Duct Banks. During construction wherever a construction joint is necessary in a duct bank, prevent debris such as mud, sand and dirt from entering ducts by providing suitable conduit plugs. Fit concrete envelope of a partially completed duct bank with reinforcing steel extending a minimum of 2 feet back into the envelope and a minimum of 2 feet beyond the end of the envelope. Provide one No. 4 bar in each corner, 3 inches from the edge of the envelope. Secure corner bars with two No. 3 ties, spaced approximately 1 foot apart. Restrain reinforcing assembly from moving during concrete pouring.

F. Connections to Existing Manholes. For duct line connections to existing structures, break the structure wall out to the dimensions required and preserve steel in the structure wall. Cut steel and bend out to tie into the reinforcing of the duct line encasement. Chip out the structure wall to form a key for the duct line encasement.

G. Mark locations of future provision underground raceways by pre-cast reinforced concrete pullbox set flush in ground with stamped brass disk identification plate tied to conduit end with “Ty-Wrap”, “Quick-Wrap” or equal.

H. In existing facilities underground construction, the Contractor shall promptly repair any indicated utility lines or systems damaged by Contractor operations. Damage to lines or systems not indicated, which are caused by Contractor operations, shall be brought to the immediate attention of the Owner’s Representative. If the Contractor is advised in writing of the location of a non-indicated line or system, such notice shall provide that portion of the line or system with "indicated" status in determining liability for damages. In any event, the Contractor shall immediately notify the Owner’s Representative of any such damage.

I. At twelve inches below grade, place specified warning tape continuously.

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. Provisions of:

1. Flexible communications raceway connections to vibrating machinery
2. Sealing of communications device boxes related installed in sound rated walls.
3. Coordination of airtight installation requirements at Mechanical and Electrical Rooms and/or duct enclosures.

PART 2 - PRODUCTS

2.1 FLEXIBLE COMMUNICATIONS CONNECTIONS:

A. Make communications connections to vibrating equipment flexible as follows:

1. For conduit over 1 in. O.D. make communications connections to vibrating equipment via a flexible expansion/deflection conduit coupling sized as required. Coupling shall have flexible and watertight outer jacket, internal grounding strap, plastic inner sleeve to maintain smooth wireway, and end hubs with threads to fit standard threaded metal conduit.
2. Manufacturers:
   a. XD Xpansion Deflection Coupling by Crouse-Hinds of Syracuse, N.Y.
   b. Type DF Expansion and Deflection fitting by Spring City Electrical Mfg. Co.
   c. or equal.

2.2 J-BOX MASTIC:

A. At all electrical boxes penetrating sound isolating partitions, STC 40 or greater, utilize sheet form adhesive mastic as directed elsewhere herein

B. Manufacturers:

1. Insul-Pad by Dottie Corp.
2. Duct-Seal by Gardner Bender, Inc.
3. or equal.

2.3 RESILIENT PENETRATIONS:

A. For conduit:

1. Sleeves: Sleeves of appropriate gage galvanized sheet metal shall be formed to at least the thickness of the penetrated construction and 3/4 in. to 1 in. larger in each cross-sectional dimension than the penetrating element.

    a. Manufacturers:
        1) Century-Line Sleeves by Thunderline Corporation
        2) Custom by Contractor
        3) or equal.

2. Batt: Glass fiber of batt or mineral wool, 1 to 3 lb./cu. ft. density.

    a. Manufacturers
        1) Certain-Teed
        2) Johns-Manville
        3) or equal.

3. Acoustical Sealant:

    a. Manufacturers
        1) DAP
        2) Pecora
        3) or equal.

4. Firestop Sealant:

    a. Where required, resilient firestop caulking may be used in lieu of Acoustical Sealant when installed in strict conformance with the manufacturer's directions. Fully hardened firestop caulk shall develop a Shore A hardness of no greater than 35. Refer to the requirements of Section 27 05 33.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS, CONNECTION TO VIBRATING EQUIPMENT

A. The Contractor shall not install any vibrating equipment or conduit attached thereto which makes rigid contact with the "building" unless it is approved in this specification or by the Owner's Representative. "Building" includes, but is not limited to slabs, beams, columns, walls, partitions, ceilings, studs, ceiling framing and suspension systems.

B. Prior to installation, the Contractor shall bring to the Owner' Representative's attention any conflicts between trades which will result in unavoidable rigid contact at equipment, conduit, piping, ducts, etc., as described herein, due to inadequate space or other unforeseen conditions. Corrective work necessitated by conflicts after installation shall be at the responsible contractor's expense.

3.2 INSPECTION OF CONDITIONS:

A. Examine related Work and surfaces before starting Work of this Section. Report to the Owner's Representative, in writing, conditions which will prevent proper provision of this work. Beginning the Work of this Section without reporting unsuitable conditions to

the Architect constitutes acceptance of such conditions by Contractor. Perform any required removal, repair, or replacement of this Work caused by unsuitable conditions at no additional cost to the Owner.

B. Coordination

1. Coordinate with the work of the Base Building Construction Contract. Coordinate Work of this Section with all other impacted trades.

3.3 INSTALLATION REQUIREMENTS, FLEXIBLE ELECTRICAL CONNECTIONS

A. The installation of flexible electrical connections to vibration isolated equipment shall in no way impair or restrain the function of the vibration isolation installed by the work by Others.

1. Using gross slack. Install flexible conduit in a grossly slack loop form or shallow "U" form. Install stranded conductors with sufficient slack to accommodate maximum possible movement.

2. Using flexible coupling. The flexible coupling shall be free and not in contact with any nearby building construction and shall be installed slack, and free of strain in any direction. Install stranded conductors as above

3.4 INSTALLATION REQUIREMENTS, J-BOX MASTIC

A. Application: All Communications Systems work in sound isolating assemblies, including but not limited to residential rooms, offices, mechanical rooms, electrical rooms and related to utilize backboxes for all services, including but not limited to low voltage communication. Installation of backboxes to conform with following:

1. Space outlet boxes on opposite faces of the wall by more than 24 in. o.c. Where daisy chainned conduits indicated on the plans, connect such boxes by slack flexible conduit (2 times longer than distance between outlets).

2. Cutouts for electrical boxes and penetrating piping/conduit shall be no more than 1/4 in. oversize.

3.5 INSTALLATION REQUIREMENTS, RESILIENT PENETRATIONS

A. Penetrations included in this Section of the Specifications include all communications conduit connected to vibrating equipment within 30 feet of such equipment

B. Method for round or rectangular penetrations.

1. Cut a clean opening in the penetrated construction very nearly the size of the sleeve for each penetrating element. Provide lintels above, relief structure below and vertical framing between and to the sides, as required. Provide the above, escutcheon plates and such related construction as is necessary to make the penetrated structure as solid and massive near the penetrations as the surrounding construction.

2. Set the metal sleeve into the penetrated construction in an airtight manner around its outer periphery, using grout, dry packing, plaster or drywall compound

full depth and all around - but only to a maximum width of ½ in. - or the requirements of the above paragraph shall not have been satisfied.

3.6 MECHANICAL AND ELECTRICAL ROOMS REQUIREMENTS

A. All mechanical and electrical rooms, plenums, duct shafts and drywall duct enclosures and other enclosures of high noise sources shall be constructed airtight. This means that every precaution shall be taken to maintain construction completely airtight around a room so designated. Construction joints, duct penetrations, electrical boxes, frames, supports, cabinets, doors, access panels, fixtures, etc., all shall be built or installed in such a manner as to prevent sound transmission through any construction enclosing a room horizontally or vertically. Appropriate lintels, frames, blocking, escutcheons, grouting, gaskets, packing, caulking, taping, filling, etc., all shall be employed to prevent sound transmission. Refer to requirements of this Section for Resilient Penetrations.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY:

A. Provide all labor, materials, tools, and equipment required for permanent intelligible labeling on, or adjacent to, all cabling, connectors, innerduct, faceplates, jacks, receptacles, controls, fuses, circuit breakers, patching jacks, and racks.

B. This section includes minimum requirements for the following:

1. Labeling Communications Cabling
2. Labeling Closet Hardware
3. Labeling Work Stations
4. Labeling Pathways, Spaces, Grounding and Bonding.

C. Refer to detailed plans for additional requirements.

D. Clearly and distinctly indicate the function of the item.

E. Coordinate with Record Drawings

1.2 REFERENCES:

A. Usage:

1. American Society for Testing and Materials (ASTM)
   a. ASTM D 709(2001) Laminated Thermosetting Materials
2. Electronic Industries Alliance (EIA)
   a. EIA TIA/EIA-606-A(2002) Administration Standard for Commercial Telecommunications Infrastructure (ANSI/TIA/EIA-606)
3. Underwriters Laboratories (UL)
   a. UL 969 (1995; R 2001) Marking and Labeling Systems

1.3 QUALITY ASSURANCE

A. Identification and administration work specified herein shall comply with the applicable requirements of:

1. ANSI/TIA/EIA – 606-A Administration Standards.
2. ANSI/TIA/EIA – 569B Pathway and Spaces
3. ANSI/TIA/EIA – 568B Telecommunications Cabling Standard.
4. BICSI Telecommunications Distribution Methods Manual.

5. UL 969 (1995; R 2001) Marking and Labeling Systems.

PART 2 - PRODUCTS

2.1 COMMUNICATION CABLING LABELS, INTERIOR

A. Shall meet the legibility, defacement, exposure and adhesion requirements of UL 969.

B. Shall be preprinted or computer printed type. Hand written labels are not acceptable.

C. Provide vinyl substrate with a white printing area and black print. If cable jacket is white, provide cable label with printing area that is any other color than white, preferably orange or yellow – so that the labels are easily distinguishable.

D. Shall be flexible vinyl or other substrates to apply easy and flex as cables are bent.

E. Shall use aggressive adhesives that stay attached even to the most difficult to adhere to jacketing.

F. Manufacturers:

1. Cable Type – Silver Satin
    a. Brady TLS2200 labels – PTL-31-427, PTL-32-427
    b. Brady Laser tab labels – LAT-18-361, LAT-53-361
    c. Hubbell
    d. Leviton
    e. Panduit.
    f. or equal.
2. Cable Type – 4 pair UTP
    a. Brady TLS2200 labels – PTL-31-427,PTL-32-427
    b. Brady Laser tab labels – LAT-18-361, LAT-53-361
    c. Hubbell
    d. Leviton
    e. Panduit.
    f. or equal.
3. Cable Type – 4 pair STP
    a. Brady TLS2200 labels – PTL-21-427
    b. Brady Laser tab labels – LAT-19-361
    c. Hubbell
    d. Leviton

e. Panduit.

f. or equal.

4. Cable Type – 25 pair copper
   a. Brady TLS2200 labels – PTL-21-427
   b. Brady Laser tab labels – LAT-19-361
   c. Panduit.
   d. or equal.
5. Cable Type – 50 pair copper
   a. Brady TLS2200 labels – PTL-33-427
   b. Panduit.
   c. or equal.
6. Cable Type – 100 pair copper
   a. Brady TLS2200 labels – PTL-34-427
   b. Brady
   c. Panduit.
   d. or equal.
7. Cable Type – 2 strand fiber
   a. Brady TLS2200 labels – PTL-19-427
   b. Brady Laser tab labels– LAT-17-361
   c. Panduit.
   d. or equal.
8. Cable Type – 4-12 strand fiber
   a. Brady TLS2200 labels – PTL-21-427
   b. Brady Laser tab labels – LAT-19-361
   c. Panduit.
   d. or equal.
9. Cable Type – RG-6 Coax
   a. Brady TLS2200 labels – PTL-31-427, PTL-32-427
   b. Brady Laser tab labels –LAT-18-361, LAT-53-361
   c. Panduit.
   d. or equal.
10. Cable Type – RG-59 Coax
    a. Brady TLS2200 labels – PTL-31-427, PTL-32-427

b. Brady Laser tab labels – LAT-18-361, LAT-53-361

c. Panduit.

d. or equal.

11. Cable Bundles

a. Brady TLS2200 labels – PTL-12-109

b. Panduit.

c. or equal.

2.2 COMMUNICATIONS CABLE LABELS, OUTSIDE PLANT

A. Cable Tags in Manholes, Handholes, and Vaults

1. Provide tags for communications cable or wire located in manholes, handholes, and vaults.

a. The tags shall be polyethylene.

b. Machine printed - Do not provide handwritten letters.

2. Polyethylene Cable Tags

a. Provide tags of polyethylene that have an average tensile strength of 3250 pounds per square inch; and that are 0.08 inch thick (minimum), non-corrosive non-conductive; resistive to acids, alkalis, organic solvents, and salt water; and distortion resistant to 170 degrees F.

b. Provide 0.05 inch (minimum) thick black polyethylene tag holder.

c. Provide a one-piece nylon, self-locking tie at each end of the cable tag.

d. Ties shall have a minimum loop tensile strength of 175 pounds. The cable tags shall have black block letters, numbers, and symbols one inch high on a yellow background.

e. Letters, numbers, and symbols shall not fall off or change positions regardless of the cable tags' orientation.

3. Manufacturers:

a. Panduit

b. Brady

c. or equal.

2.3 CLOSET HARDWARE LABELS

A. Shall meet the legibility, defacement, exposure and adhesion requirements of UL 969.

B. Shall be preprinted or computer printed type. Hand written labels are not acceptable.

C. Where insert type labels are used provide clear plastic cover over label.

D. Manufacturer:

1. Copper Patch Panels
    a. 4 port group
        1) Brady Laser tab labels – 2.8 in. x 0.375 in. LAT-43-707
        2) Hubbell XPLPPA series
        3) Leviton
        4) Panduit.
        5) or equal.
    b. 6 port group
        1) Brady Laser tab labels – 3.6 in. x 0.375 in., LAT-44-707
        2) Hubbell
        3) Leviton
        4) Panduit.
        5) or equal.
    c. Individual port
        1) Brady
            a) TLS2200 labels – 0.5 in. x 0.375 in.white, PTL-44-422
            b) Laser tab labels – 0.5 in. x 0.375 in. white, LAT-45-707
            c) TLS2200 labels – 0.5 in. x 0.375 in.clear, PTL-44-430
            d) Laser tab labels – 0.5 in. x 0.375 in. clear, LAT-45-712
            e) TLS2200 labels – 0.5 in. x 0.5 in. white, PTL-7-422
            f) Laser tab labels – 0.5 in. x 0.5 in. white, LAT-46-707
            g) TLS2200 labels – 0.5 in. x 0.5 in. clear, PTL-7-430
            h) Laser tab labels – 0.5 in. x 0.5 in. clear, LAT-46-712
        2) Hubbell
        3) Leviton
        4) Panduit.
        5) or equal
    d. Patch Panel Name Label.
        1) Hubbell XOLPPID Series
        2) Brady
        3) Leviton
        4) Panduit
        5) or equal.
2. Non-keystone based fiber patch panels
    a. Hubbell XPLFOSEPAW
    b. Brady
    c. Leviton
    d. Panduit
    e. as provided with Patch Panel by the manufacturer
    f. or equal.
3. 110 blocks

a. Brady Laser tab labels – 7.9 in. x 0.475 in. (200.6mm x 12.07mm), LAT-177-124

b. Hubbell XPL110 series.

c. Leviton

d. Panduit.

e. or equal.

2.4 GROUNDING AND BONDING, PATHWAY, AND SPACE LABELS

A. Shall meet the legibility, defacement, exposure and adhesion requirements of UL 969.

B. Shall be preprinted or computer printed type. Hand written labels are not acceptable.

C. Manufacturers:

1. Brady Corporation

a. TLS2200 labels
1) PTL-20-422, Size 2.0 in. x 1.0 in.
2) PTL-22-422, Size 3.0 in. x 1.0 in.
3) PTL-37-422, Size 3.0 in. x 1.9 in.
4) PTL-23-422, Size 4.0 in. x 1.0 in.
5) PTL-38-422, Size 4.0 in. x 1.0 in.

b. Laser tab labels
1) LAT-13-747, Size 1.875 in. x 0.833 in.
2) LAT-24-747, Size 1.75 in. x 1.0 in.
3) LAT-32-747, Size 3.0 in. x 0.9 in.
4) LAT-33-747, Size 2.0 in. x 1.437 in.
5) LAT-34-747, Size 3.0 in. x 1.437 in.

c. Continuous tape for TLS2200
1) PTL-8-422, Size 0.5 in. white polyester
2) PTL-8-430, Size 0.5 in. clear polyester
3) PTL-8-439, Size 0.5 in. white vinyl
4) PTL-42-439, Size 1.0 in. white vinyl
5) PTL-43-439, Size 1.9 in. white vinyl

2. Panduit.

3. or equal.

2.5 WORKSTATION LABELS

A. Shall meet the legibility, defacement, exposure and adhesion requirements of UL 969.

B. Shall be preprinted or computer printed type. Hand written labels are not acceptable.

C. Where insert type labels are used provide clear plastic cover over label.

D. Manufacturers:

1. Brady Corporation
    a. Desi-strip inserts
        1) TLS2200 labels –1.9 in.x0.375 in. white, PLT-40-412
        2) Laser tab labels –1.9 in.x0.375 in. white, LAT-176-124
    b. Location ID
        1) TLS2200 labels - 1.0 in. x 0.375 in. white, PTL-16-422
        2) Laser tab labels –1.0 in. x 0.375 in. white, LAT-47-707
        3) TLS2200 labels- 1.0 in. x 0.375 in. clear, PTL-16-430
        4) Laser tab labels –1.0 in. x 0.375 in. clear, LAT-8-712
        5) TLS2200 labels- 1.0 in. x 0.5 in. white, PTL-17-422
        6) Laser tab labels –1.0 in. x 0.5 in. white, LAT-7-707
        7) TLS2200 labels- 1.0 in. x 0.5 in. clear, PTL-17-430
        8) Laser tab labels- 1.0 in. x 0.5 in. clear, LAT-7-712
        9) TLS2200 labels- 1.5 in. x 0.375 in. white, PTL-45-422
        10) Laser tab labels- 1.5 in. x 0.375 in. white, LAT-47-707
        11) TLS2200 labels- 1.5 in. x 0.375 in. clear, PTL-45-430
        12) Laser tab labels-1.5 in. x 0.375 in. clear, LAT-47-712
        13) TLS2200 labels- 1.5 in. x 0.5 in. white, PTL-29-422
        14) Laser tab labels- 1.5 in. x 0.5 in. white, LAT-47-707
        15) TLS2200 labels- 1.5 in. x 0.5 in. clear, PTL-29-430
        16) Laser tab labels-1.5 in. x 0.5 in. clear, LAT-47-712
    c. Outlet/Jack ID
        1) TLS2200 labels -0.5 in. x 0.375 in. white, PTL-44-422
        2) Laser tab labels – 0.5 in. x 0.375 in. white, LAT-45-707
        3) TLS2200 labels - 0.5 in. x 0.375 in. clear, PTL-44-430
        4) Laser tab labels –0.5 in. x 0.375 in. clear, LAT-45-712
        5) TLS2200 labels - 0.5 in. x 0.5 in. white, PTL-7-422
        6) Laser tab labels- 0.5 in. x 0.5 in. white, LAT-46-707
        7) TLS2200 labels - 0.5 in. x 0.5 in. clear, PTL-7-430
        8) Laser tab labels - 0.5 in. x 0.5 in. clear, LAT-46-712
    d. General Use Labels
        1) TLS2200 labels - 0.375 in. cont. white, PTL-46-422
        2) TLS2200 labels - 0.375 in. cont. clear, PTL-46-430
2. Hubbell
    a. Location ID
        1) Desi-Strip Style
            a) XPLFP10W
        2) Adhesive
            a) XPLFPA10W, XPLFPA10W,
    b. Outlet/Jack ID
        1) XPLIPA10W, XPLIPA10C
3. Leviton
4. Panduit.

5. or equal.

2.6 NAMEPLATE

A. Field Fabricated Nameplates

1. Features/Function/Construction

a. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings.

b. Comply with ASTM D 709.

c. Each nameplate inscription shall identify the function and, when applicable, the position.

d. Nameplates shall be melamine plastic, 0.125 inch thick, white with black center core.

e. Surface shall be matte finish.

f. Corners shall be square.

g. Accurately align lettering and engrave into the core.

h. Minimum size of nameplates shall be one by 2.5 inches.

i. Lettering shall be a minimum of 0.25 inch high normal block style

PART 3 - EXECUTION

3.1 GENERAL

A. Apply labeling to clean surfaces free of oil, dust, solvents or loose material.

B. Apply after Project painting in area of application is complete.

C. Apply to locations where labeling will not be damaged, covered over or in the way of the ordinary maintenance and operation of the installed communications infrastructure or system.

D. Apply labeling right side up, parallel to major edges of surfaces to which it is applied. When no line is evident, apply parallel to floor line. Correct conditions of labeling applied out of true.

E. Protect installed labeling from damage.

F. Replace labeling that is defaced, illegible or peeling off of the surface to which it is applied.

3.2 WORKSTATION JACK, CABLE AND PATCH PANEL ASSIGNED CIRCUIT NUMBERS

A. The Owner's representative will provide the Contractor copies of the Contract Drawings showing station outlets with Owner assigned data & voice jack ID numbers. Label all installed work according to this master set.

B. The cover plate area directly above and beneath the jacks are the labeling areas. In the top area, using the specified means, label the faceplate number assigned on the contract documents.

3.3 IDENTIFICATION & LABELING

A. Pathways

1. Pathways shall be marked at each endpoint and at all intermediate pull or junction boxes. In the case of partitioned pathways (i.e. innerduct) each partition shall have a unique identifier.

2. Label pathways using the appropriate abbreviation and a number.

3. Use adhesive type labels.

B. Labels shall be affixed at the entry to all telecommunications rooms and spaces (Includes entrance facilities, communication equipment rooms, communication equipment spaces and work areas)

1. Use adhesive type labels for all communications space labeling,

2. Affix labels to entrance doors – coordinate location with Owner's Representative.

C. Cables

1. Horizontal and Indoor Backbone Cables shall be marked within 12 in. of each endpoint or to innerduct in which the cable is installed.

2. Except where installed in innerduct or conduit, all backbone fiber optic cable shall have affixed to the outer jacket, labels of a bright color that contain at least the legend "FIBER OPTIC CABLE." These labels must be affixed at separations no greater than 10 ft.

3. Within every manhole/vault/pullbox and within 4 ft of the entrance into a building every backbone cable’s assigned identifier shall be affixed to either the cable’s outer jacket or to innerduct in which the cable is installed.

4. Any cable installed in conduit shall be labeled at all intermediate pull or junction boxes.

5. Label cables using the appropriate circuit ID.

6. Use adhesive type labels for all communications cable labels.

7. Affix labels to cables – marking cable is not permitted.

8. Where cable is fully encased in innerduct label the outside of the innerduct with the cable label and, where the contents are fiber optic cabling, the "FIBER OPTIC CABLE" label.

9. Horizontal Cables:

    a. Example: “BDF1.1- 107-01-D1-CAT6AE”
        1) First field: the originating MDF/ BDF/IDF room identity; for example: “AD1.1”.
        2) Second field: the destination room number; for example: “107”.
        3) Third field: a unique sequential outlet number; for example: “01” (1st outlet in the room).
        4) Fourth field: a unique port number; for example: “D1” (“D” for data service, 1st port of the outlet).

D. Patch Panels

1. Fiber patch panels shall be marked using adhesive labels indicating the range of circuits installed to it. All fiber optic cable patch panels shall be labeled with both the pair count of every fiber pair, the cable’s assigned identifier, and where shown on the plans, the patch panel's assigned identifier.

2. Category rated patch panels shall be labeled with an identifier, individual ports shall be labeled to indicate circuit and identification of station plate in which the circuit terminates.

    a. Example: “107-D1”
        1) First field: the end user room number; for example: “107”.
        2) Second field: outlet port number; for example: “D1” (“D” for data service, 1st port of the outlet)

E. 110 blocks

1. Each cable termination position on 110 blocks shall be labeled with number designators.

    a. All backbone copper cable termination blocks shall be labeled with both the pair count of every 5th pair and the cable’s assigned identifier.

2. Where insert type labels are used install clear plastic cover over reprinted or Laser printed type label.

F. Workstations

1. All faceplate labels shall indicate the faceplate number and the circuit ID for each cable that it houses

    a. Example: “BDF1.1-107-01”
        1) First field: The originating MDF/BDF/IDF room identity; for example: “BDF1.1”.
        2) Second field: the destination room number; for example: “107”.
        3) Third field: a unique sequential outlet number; for example: “01” (1st outlet in the room).

2. Individual ports at the outlets:
    a. Example: “D1” (data service, 1st port of the outlet)
        1) First field: the cable’s intended service type followed by a unique sequential number.
3. For faceplates where insert type labels are used install clear plastic cover over preprinted or Laser printed type label.
4. For faceplates without insert type labels use adhesive type labels affix labels to faceplate – marking faceplates is not permitted.
5. Patch cords cords installed under the work of this Project shall be labeled at each endpoint using the appropriate circuit ID.
6. Use adhesive type labels for all communications cable labels.
7. Affix labels to cables – marking cable is not permitted.

G. Wireless AP label:
1. Example: “107-AP1-9AFF”
    a. First field: the end user room number; for example: “107”
    b. Second field: Wireless AP number AP1, AP2, etc.
    c. Third filed: last 4 digit of the AP Ethernet port MAC address.

H. Grounding and Bonding
1. The TMGB(s) (telecommunications main ground bar) shall be labeled as such with an adhesive type label(s) affix label(s) to TMGB.
2. The conductor connecting the TMGB (telecommunications main ground bar) to the building ground shall be labeled at each end with an affixed label in a visible location as close as practicable to the bonding point at each end of the conductor.

I. Firestopping
1. Each firestopping location shall be labeled at each location where firestopping is installed, on each side of the penetrated fire barrier, within 12 in. of the firestopping material.

END OF SECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions and Division 1 Specification Sections, apply to this Section.

1.2 RELATED WORK IN OTHER DIVISION 27 SECTIONS

A. Section 27 05 00 – Common Work Results for Communications applies to the work of this Section.

1.3 SUMMARY

A. This section specifies common standards, means and methods for the work of the following Sections:

1. Section 27 11 19 – Communications Termination Blocks and Patch Panels
2. Section 27 11 23 – Communications Cable Management
3. Section 27 15 00 – Communications Horizontal Cabling

1.4 REFERENCES

A. Usage: In accordance with Division 1.

B. In Addition to the requirements of Section 27 05 00 – Common Work Results for Communications, conform to the applicable portions of the following standards agencies:

1. National Fire Protection Association (NFPA)
   a. NFPA 70 National Electrical Code
2. Telecommunications Industry Association (ANSI/TIA)
   a. ANSI/TIA-568-C.0, Generic Telecommunications Cabling for Customer Premises
   b. ANSI/TIA-568-C.1, Commercial Building Telecommunications Cabling Standard, 2009
   c. ANSI/TIA-568-C.2, Balanced Twisted-Pair Telecommunication Cabling and Components Standard, published 2009
   d. ANSI/TIA-568-C.3, Optical Fiber Cabling Components Standard, published 2008, including errata issued in October, 2008.
   e. ANSI/TIA 569-C (2012) Telecommunications Pathways and Spaces
   f. ANSI/TIA-606-B (2012) Administration Standard Telecommunications Infrastructure

g. ANSI- J-STD-607-B (2011) Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

1.5 SUBMITTALS

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 27 05 00 Common Work Results for Communications.

1.6 QUALITY ASSURANCE

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 27 05 00 Common Work Results for Communications.

1.7 DELIVERY, STORAGE AND HANDLING

B. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and the following:

A. Shipping Conditions:

1. All cable shall be shipped on reels or manufacturer supplied “handy boxes”.
2. The diameter of the drum shall be at least 13 times the diameter of the cable.
3. The reels shall be substantial and so constructed as to prevent damage during shipment and handling.
4. Secure the outer end of the cable to the reel head so as to prevent the cable from becoming loose in transit.
5. Project the inner end of the cable into a slot in the side of the reel, or into a housing on the inner slot of the drum, in such a manner and with sufficient length to make it available for testing.
6. The inner end shall be fastened so as to prevent the cable from becoming loose during installation. End seals shall be applied to each of the cables to prevent moisture from entering the cable.

B. Storage:

1. Do not roll or store cable reels without an appropriate underlay.
2. Retain factory cable protection until installation. Supplement with heavy gauge plastic sheeting if factory protective membrane is pierced prior to installation. Tape ends and seams water and dust tight.
3. The reels with cable shall be suitable for outside storage conditions when the temperature ranges from minus 40 degrees C to plus 65 degrees C, with relative humidity from 0 to 100 percent.
4. Protect cable reels from physical damage from site construction vehicles or from settling into the soil.

5. Equipment, other than outside plant rated cable protected with fully watertight cable caps, to be delivered and placed in storage, suitably protected from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

C. Handling

1. Cabling other than outside plant cabling exposed to standing water or other liquids at any time during storage, delivery or placement shall be replaced at no expense to the Owner.

2. Cut ends of outside plant rated cabling or portions of outside plant rated cable with a damaged jacket shall not be exposed to standing water or other liquids at any time during storage, delivery or placement. Where such conditions occur, the Owner's representative may require that the cable be replaced at no cost to the Owner.

1.8 WARRANTY

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 27 05 00 Common Work Results for Communications.

1.9 PERFORMANCE STANDARDS

A. Horizontal (Station) Category 6A Copper Cabling – Permanent Link

1. Testing shall commence while the Owner's equipment in the area of service is operational and creating worst case emissions associated with its operation while in good working order. Every effort shall be made to include worst case influence on the materials install shall be taken.

2. In accordance with the field test specifications defined in ANSI/TIA-568-C.2 "*Commercial Balanced Twisted-Pair Telecommunications Cabling and Components Standard*", every horizontal station cabling link in the project shall be tested for:

a. Wire Map

b. Length

c. Insertion Loss

d. NEXT Loss

e. PS NEXT Loss

f. ACR-F Loss

g. PS ACR-F Loss

h. Return Loss

i. Propagation Delay

j. Delay Skew

3. Using the listed Category 6A cable test set, test installed cabling using Permanent Link procedure and submit report demonstrating that the link meets the following parameters:

Frequency (MHz)	Insertion Loss (dB/100m)	NEXT (dB)	PSNEXT (dB)	ACRF (dB)	PSANEXT (dB)	Return Loss
1.0	2.10	74.3	72.3	67.8	67.0	20.0
4.0	3.8	65.3	63.3	55.8	67.0	23.0
10.0	5.9	59.3	57.3	47.8	67.0	25.0
16.0	7.5	56.2	54.2	43.7	67.0	25.0
20.0	8.4	54.8	52.8	41.8	67.0	25.0
31.3	10.5	51.9	49.9	37.9	67.0	23.6
62.5	15.0	47.4	45.4	31.9	65.6	21.5
100.0	19.10	44.3	42.3	27.8	62.5	20.10
250.0	31.10	38.3	36.3	19.8	56.5	17.30
350.0	37.20	36.1	34.1	16.9	--	16.30

   a. Each permanent link shall demonstrate a positive PSACR beyond 350 MHz to meet and exceed the bandwidth requirements of TIA-568-C.2 Category 6A standards. Each permanent link shall demonstrate 2 dB of cross talk headroom over TIA-568-C.2 Category 6A standard for NEXT, PSNEXT, ACRF and PSANEXT bit error rate.

4. Report whether tested link passes or fails

5. Note exceptions to required Category standards. Remedy and retest

1.10 CATEGORY 6A STATION CABLING PERFORMANCE TESTING

A. General Requirements

1. In accordance with the field test specifications defined in ANSI/TIA-568-C.2 "*Commercial Balanced Twisted-Pair Telecommunications Cabling and Components Standard*" (TIA Cat 6A Standard), every cabling link in the installation shall be tested for:

   a. Wire Map

   b. Length

   c. Insertion Loss

   d. NEXT Loss

   e. PS NEXT Loss

   f. ACR-F Loss

   g. PS ACR-F Loss

h. Return Loss

i. Propagation Delay

j. Delay Skew

2. In addition to testing the “In-link” performance parameters specified above, Alien Crosstalk testing or “Between-link” testing shall be carried out in accordance with Section 4.7 of ANSI/TIA-1152. Alien crosstalk testing includes the PS ANEXT and PS AACR-F (Power sum alien attenuation-to-crosstalk ratio from the far end) performance parameters. The standards refer to the link-under-test for Alien Crosstalk as the *disturbed* link.

3. PS ANEXT and PS AACR-F shall meet or exceed the limits defined in Section 6 of the TIA Cat 6A Standard.

   a. Selection of disturbed links: 1 % of the links in the cabling installation or 5 links, whichever is more. Chose short, medium and long links equally.

   b. Selection of disturber links. Select all of the links that are in the same cable bundle and the most consistently positioned relative to the disturbed link as disturbing links.

4. If the margin of PS ANEXT and PS AACR-F exceeds 5 dB for the first three short, medium and long links (nine in total), further alien crosstalk testing can be discontinued.

5. The installed twisted-pair horizontal links shall be tested from the IDF in the telecommunications room to the telecommunication wall outlet in the work area for compliance with the “*Permanent Link*” performance specification as defined in the TIA Cat 6A Standard.

6. One hundred percent of the installed cabling links must pass the requirements of the standards mentioned in above and as further detailed below. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for all links shall be provided in the test results documentation in accordance Section 27 05 00.

7. Trained technicians who have successfully attended an appropriate training program and have obtained a certificate as proof thereof shall execute the tests. Appropriate training programs include but are not limited to installation certification programs provided by BICSI or the ACP (Association of Cabling Professionals).

8. The test equipment (tester) shall comply with the accuracy requirements for Level IIIe field testers as defined in ANSI/TIA-1152. The tester including the appropriate interface adapter must meet the specified accuracy requirements. The accuracy requirements for the permanent link test configuration (baseline accuracy *plus* adapter contribution) are specified in Table 4 of ANSI/TIA-1152.

9. The RJ45 test plug shall fall within the values specified in ANSI/TIA-568-C Annex C for NEXT, FEXT and Return Loss.

10. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.

11. The tester interface adapters must be of high quality and the cable shall not show any twisting or kinking resulting from coiling and storing of the tester interface adapters. In order to deliver optimum accuracy, preference is given to a permanent link interface adapter for the tester that can be calibrated to extend the reference plane of the Return Loss measurement to the permanent link interface. The contractor shall provide proof that the interface has been calibrated within the period recommended by the vendor. To ensure that normal handling on the job does not cause measurable Return Loss change, the adapter cord cable shall not be of twisted-pair construction.

12. The Pass or Fail condition for the link-under-test is determined by the results of the required individual tests (detailed in Section 4.2.2 of ANSI/TIA-1152). Any Fail or Fail* result yields a Fail for the link-under-test. In order to achieve an overall Pass condition, the results for each individual test parameter must Pass or Pass*.

13. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter. The test result of a parameter shall be marked with an asterisk (*) when the result is closer to the test limit than the accuracy of the field tester. The field tester manufacturer must provide documentation as an aid to interpret results marked with asterisks. To which extent '*' results shall determine approval or disapproval of the element under test shall be defined in the relevant detail specification, or agreed on as a part of a contractual specification.

14. The Owner's Representative will select a random sample of 5% of the installed links. The representative (or his authorized delegate) shall test these randomly selected links and the results are to be stored as specified herein above. The results obtained shall be compared to the data provided by the installation contractor. If more than 2% of the sample results differ in terms of the pass/fail determination, the installation contractor under supervision of the end-user representative shall repeat 100% testing and the cost shall be borne by the installation contractor.

B. Performance Test Parameters.

C. The test parameters for Cat 6A are defined in the TIA Cat 6A standard. The test of each link shall contain all of the following parameters as detailed below. In order to pass the test, all measurements (at each frequency in the range from 1 MHz through 500 MHz) must meet or exceed the limit value determined in the above-mentioned standard.

1. Wire Map. Shall report Pass if the wiring of each wire-pair from end to end is determined to be correct. The Wire Map results shall include the continuity of the shield connection if present.

2. Length. The field tester shall be capable of measuring length of all pairs of a basic link or channel based on the propagation delay measurement and the average value for Nominal Velocity of Propagation (NVP). The physical length of the link shall be calculated using the pair with the shortest electrical delay. This

length figure shall be reported and shall be used for making the Pass/Fail decision. The Pass/Fail criteria are based on the maximum length allowed for the Permanent Link configuration (90 meters – 295 feet) plus 10% to allow for the variation and uncertainty of NVP.

3. Insertion Loss (Attenuation). Insertion Loss is a measure of signal loss in the permanent link or channel. The term “Attenuation” has been used to designate “Insertion Loss.” Insertion Loss shall be tested from 1 MHz through 500 MHz in maximum step size of 1 MHz. It is preferred to measure insertion loss at the same frequency intervals as NEXT Loss in order to provide a more accurate calculation of the Attenuation-to-Crosstalk ratio (ACR) parameter. Minimum test results documentation (summary results): Identify the worst wire pair (1 of 4 possible). The test results for the worst wire pair must show the highest attenuation value measured (worst case), the frequency at which this worst case value occurs, and the test limit value at this frequency.

4. NEXT Loss. Pair-to-pair near-end crosstalk loss (abbreviated as NEXT Loss) shall be tested for each wire pair combination from each end of the link (a total of 12 pair combinations). This parameter is to be measured from 1 through 500 MHz. NEXT Loss measures the crosstalk disturbance on a wire pair at the end from which the disturbance signal is transmitted (near-end) on the disturbing pair. The maximum step size for NEXT Loss measurements shall not exceed the maximum step size defined in the standard as shown in Table 1. . Minimum test results documentation (summary results): Identify the wire pair combination that exhibits the worst case NEXT margin (2) and the wire pair combination that exhibits the worst value of NEXT (worst case). NEXT is to be measured from each end of the link-under-test. These wire pair combinations must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.

Maximum frequency step size as defined in ANSI/TIA-1152	
Frequency Range (MHz)	Maximum Step size (MHz)
1 – 31.25	0.15
31.26 – 100	0.25
100 – 250	0.50
250 – 500	1.00

5. PS NEXT Loss. Power Sum NEXT Loss shall be evaluated and reported for each wire pair from both ends of the link under-test (a total of eight results). PS NEXT Loss captures the combined near-end crosstalk effect (statistical) on a wire pair when all other pairs actively transmit signals. Like NEXT this test parameter must be evaluated from 1 through 500 MHz and the step size may not exceed the maximum step size defined in the standard as shown in Table 1. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst-case margin and the wire pair that exhibits the worst value for PS NEXT.

These wire pairs must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.

6. ACR-F, pair-to-pair. Attenuation Crosstalk Ratio Far-end is calculated from the pair-to-pair FEXT Loss. It shall be measured for each wire-pair combination from both ends of the link under-test. FEXT Loss measures the crosstalk disturbance on a wire pair at the opposite end (far-end) from which the transmitter emits the disturbing signal on the disturbing pair. FEXT is measured to compute ACR-F Loss that must be evaluated and reported in the test results. ACR-F measures the relative strength of the far-end crosstalk disturbance relative to the attenuated signal that arrives at the end of the link. This test yields 24 wire pair combinations. ACR-F is to be measured from 1 through 500 MHz and the maximum step size for FEXT Loss measurements shall not exceed the maximum step size defined in the standard as in Table 1. Minimum test results documentation (summary results): Identify the wire pair combination that exhibits the worst-case margin and the wire pair combination that exhibits the worst value for ACR-F. These wire pairs must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.

7. PS ACR-F Loss. Power Sum Attenuation Crosstalk Ratio Far-end is a calculated parameter that combines the effect of the FEXT disturbance from three wire pairs on the fourth one. This test yields eight wire-pair combinations. Each wire-pair is evaluated from 1 through 500 MHz in frequency increments that do not exceed the maximum step size defined in the standard as shown in Table 1. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst pair combinations must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.

8. Return Loss. Return Loss (RL) measures the total energy reflected on each wire pair. Return Loss is to be measured from both ends of the link-under-test for each wire pair. This parameter is also to be measured form 1 through 500 MHz in frequency increments that do not exceed the maximum step size defined in the standard as shown in Table 1. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst-case margin and the wire pair that exhibits the worst value for Return Loss. These wire pairs must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.

9. Propagation Delay. Propagation delay is the time required for the signal to travel from one of the link to the other. This measurement is to be performed for each of the four wire pairs. Minimum test results documentation (summary results): Identify the wire pair with the worst-case propagation delay. The report shall include the propagation delay value measured as well as the test limit value.

10. Delay Skew [as defined in the TIA Cat 6A Standard; Section 6.2.19] This parameter shows the difference in propagation delay between the four wire pairs. The pair with the shortest propagation delay is the reference pair with a delay skew value of zero. Minimum test results documentation (summary results):

Identify the wire pair with the worst-case propagation delay (the longest propagation delay). The report shall include the delay skew value measured as well as the test limit value.

11. PS ANEXT. Pair-to-pair Alien NEXT (ANEXT) contributions is measured by applying the stimulus signal at the near end to one wire pair of a disturbing link and measuring the coupled signal at the near end of a wire pair in a disturbed link. This process is repeated for every wire pair in a disturbing link. The PS ANEXT for each wire pair in a disturbed link is obtained by the power sum addition of all the pair-to-pair ANEXT results to that wire pair from all wire pairs in disturbing links. All the links that are bundles with the disturbed link need to be included as disturbing links. In addition, links that are terminated in adjacent positions in a patch panel or interconnect panel should also be included as disturbing links in this test.

    a. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst-case margin and the wire pair that exhibits the worst value for PS ANEXT. These wire pairs must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.

12. PS AACR-F. The pair-to-pair Alien Far End crosstalk (AFEXT) contributions is measured by applying the signal at the near end to one wire pair of a disturbing channel or permanent link and measuring the coupled signal at the far end of a wire pair in a disturbed channel or permanent link. This process is repeated for every wire pair in a disturbing link and for all links in close proximity. A normalization, which is dependent on the relative length of disturbing and disturbed link, is applied to each pair-to-pair alien FEXT measurement. Then the PS Alien Attenuation-to-Crosstalk Ratio from the Far end (PS AACR-F) for each wire pair in a disturbed channel or permanent link is obtained by the power sum addition of all the normalized pair-to-pair far end alien crosstalk results to that wire pair from all wire pairs in disturbing links in close proximity.

    a. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst-case margin and the wire pair that exhibits the worst value for PS AACR-F. If the link or channel connects two patch panels (data center), these wire pairs must be identified for the tests performed from both ends. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.

D. Test Result Documentation

1. The test results/measurements shall be transferred into a Windows™-based database utility that allows for the maintenance, inspection and archiving of these test records. A guarantee must be made that the measurement results are transferred to the PC unaltered, i.e., “as saved in the tester” at the end of each test and that these results cannot be modified at a later time.

2. The database for the completed job shall be stored and delivered on CD-ROM or DVD or equivalent media selected by the Owner’s Representative, including the software tools required to view, inspect, and print any selection of test reports.

3. A PDF copy of the test results shall be provided that lists all the links that have been tested with the following summary information
    a. The identification of the link in accordance with the naming convention defined in the overall system documentation
    b. The overall Pass/Fail evaluation of the link-under-test including the NEXT Headroom (overall worst case) number
    c. The date and time the test results were saved in the memory of the tester.
4. General Information to be provided in the electronic data base with the test results information for each link:
    a. The identification of the customer site as specified by the end-user
    b. The identification of the link in accordance with the naming convention defined in the overall system documentation
    c. The overall Pass/Fail evaluation of the link-under-test
    d. The name of the standard selected to execute the stored test results
    e. The cable type and the value of NVP used for length calculations
    f. The date and time the test results were saved in the memory of the tester
    g. The brand name, model and serial number of the tester
    h. The identification of the tester interface
    i. The revision of the tester software and the revision of the test standards database in the tester
5. In-link (In-Channel) detailed test results. The detailed test results data to be provided in the electronic database for must contain the following information:
    a. For each of the frequency-dependent test parameters, the value measured at every frequency during the test is stored. The PC-resident database program must be able to process the stored results to display and print a color graph of the measured parameters. The PC-resident software must also provide a summary numeric format in which some critical information is provided numerically as defined by the summary results (minimum numeric test results documentation) as outlined above for each of the test parameters.
    b. Length: Identify the wire-pair with the shortest electrical length, the value of the length rounded to the nearest 0.1 m and the test limit value
    c. Propagation delay: Identify the pair with the shortest propagation delay, the value measured in nanoseconds (ns) and the test limit value
    d. Delay Skew: Identify the pair with the largest value for delay skew, the value calculated in nanoseconds (ns) and the test limit value
    e. Insertion Loss (Attenuation): Minimum test results documentation as explained in Section B for the worst pair
    f. Return Loss: Minimum test results documentation as explained in Section B for the worst pair as measured from each end of the link

g. NEXT, ACR-F: Minimum test results documentation as explained in Section B for the worst pair combination as measured from each end of the link

h. PS NEXT and PS ACR-F: Minimum test results documentation as explained in Section B for the worst pair as measured from each end of the link

6. Between-Link (Between-Channel) Test Results Data. A test report shall be provided for each disturbed link included in the Alien Crosstalk sample test. This test report must contain

a. PS ANEXT results at each frequency for each wire pair in a victim link as well as the PS ANEXT results for the average of these four wire pairs. The worst case margin and the worst values shall be provided for each wire pair and the average of the four wire pairs. PS ANEXT shall be measured and tested from the end of the link or channel where all cables are terminated at a distribution panel. In case the cabling runs from panel to panel (data center) where the worst case PS ANEXT margin is less than 2 dB, the PS ANEXT test results for each disturbed link shall be collected and saved from both ends (both panels) of the disturbed link.

b. PS AACR-F results at each frequency tested for each wire pair in a disturbed link as well as the PS AACR-F results for the average of the four wire pairs. The worst case margin and the worst values shall be provided for each wire pair and the average of the four wire pairs. PS AACR-F only needs to be measured and tested from one end of the link or channel.

E. Fiber Optic Cabling - as specified herein below.

1.11 TESTING

A. General

1. In addition to the tests detailed in this specification section, the contractor shall notify the Owner's Representative of any additional tests that are deemed necessary to guarantee a fully functional system. The contractor shall carry out and record any additional measurement results at no additional charge

2. Test and report on each intermediate cabling segment separately, including station cabling, horizontal distribution (each segment, if multiple) and telecommunications room wiring.

3. Test each end to end cable link.

4. Submit machine-generated documentation and raw data of all test results on Contractor-provided, and Owner's Representative approved, forms; and in electronic format approved by the Owner's Representative.

5. Provide machine-generated data on an appropriate disk media (CD-ROM CD-R format) to be transferred to the Owner's computers.

a. Where the machine-generated documentation requires use of a proprietary computer program to view the data, provide the Owner with 1 licensed copy of the software.

6. Provide registered testing software used for the actual tests to the Owner for review of test data.

B. Test Equipment:

1. Provide in conformance with the applicable requirements of 27 05 00 - Common Work Results for Communications.

2. Test systems using at least one (1) each of the following test measurement devices or their functional equivalents:

a. Level IIIe field testers as defined in ANSI/TIA-1152 - Fluke DSX, Agilent or equal.
   1) The tester including the appropriate interface adapter must meet the specified accuracy requirements. The accuracy requirements for the permanent link test configuration (baseline accuracy plus adapter contribution) are specified in Table 4 of ANSI/TIA-1152 (Table 4 in this TIA document also specifies the accuracy requirements for the Channel configuration).
   2) The RJ45 test plug shall fall within the values specified in ANSI/TIA-568-C Annex C for NEXT, FEXT and Return Loss.
   3) The tester interface adapters must be of high quality and the cable shall not show any twisting or kinking resulting from coiling and storing of the tester interface adapters. In order to deliver optimum accuracy, preference is given to a permanent link interface adapter for the tester that can be calibrated to extend the reference plane of the Return Loss measurement to the permanent link interface. The contractor shall provide proof that the interface has been calibrated within the period recommended by the vendor. To ensure that normal handling on the job does not cause measurable Return Loss change, the adapter cord cable shall not be of twisted-pair construction..

b. Outside Plant Voice Cabling Plant tester - capable of detecting shorts, opens, reversals, mis-wiring and crosstwists. (Siemon STM-8, Fluke or equal).

c. Tone Test Sets.

d. Optical Power Meter (Corning Cable Systems, Fluke DSX or equal)
   1) Power measurement uncertainty of ± 0.25 dB.
   2) Store reference power measurement.
   3) Save at least 100 results in internal memory.
   4) PC interface (serial or USB).
   5) Minimum Performance - Single Mode Power Meter
      a) 1300nm and 1500nm (± 20 nm) wavelength dual laser light sources.
      b) Output power of –10 dBm minimum
      c) Output Stability +/- 0.40 dB from 0 to 50 degrees C
      d) Long Term output stability +/- 0.10dB at 25 degrees C
      e) Measurement range shall be from 10 to -60 dBm
      f) Accuracy shall be +/- 5% at 0 to -50dBm and +/- 10% 10 to 0dBm and -50 to -60 dBm.
      g) Resolution shall be 0.1 dB

h) Connector types shall include: LC, ST, SC.

e. Optical Time Domain Reflectometer. (Fluke, JDSU or equal).
1) Singlemode OTDR
a) Wavelengths of 1310 nm (± 20 nm) and 1550 nm (± 20 nm).
b) Event deadzones of 3.5 m maximum at 1310 nm and 1550 nm.
c) Attenuation deadzones of 10 m maximum at 1310 nm and 12 m maximum at 1550 nm.
d) Distance range not less than 10000 m.
e) Dynamic range at least 10 dB at 1310 nm and 1550 nm

f. Site portable communications systems (walkie-talkie, cell phone or similar).

g. Any other items of equipment or materials required to demonstrate conformance with the Contract Documents.

C. Station Wiring, General

1. Test station wire only after all pairs of station wire in a work area have been terminated at both ends, and no work of this Section or other Sections may cause physical disturbance to the wiring.

2. Correct any and all transpositions found. Retest.

3. If any conductor in a station wire tests either open or short, then the entire station wire is to be removed, replaced, and re-tested.

D. Inside Category 6A Cabling.

1. Using the listed Category 6A cable test set, test and submit report on the parameters specified for Category 6A cabling in this Section. Report whether tested link passes or fails the Category 6A standards. Cables must pass TIA Permanent Link Certification for the cable type being installed. A "Marginal" test result will not be accepted.

2. Note exceptions to required Category standards. Remedy and retest.

PART 2 - PRODUCTS

2.1 UNAUTHORIZED MATERIALS

A. Materials and products required for work of this section shall not contain asbestos, polychlorinated biphenyls (PCB) or other hazardous materials identified by the Owner.

2.2 ACCEPTABLE MANUFACTURERS

A. Products of the manufacturers specified in this section establish the minimum functional, aesthetic and quality standards required for work of this section.

2.3 COMMUNICATIONS CABLES AND RELATED

A. GENERAL:

1. Cabling shall be UL listed for the application and shall comply with TIA-568-C.1, TIA-568-C.2, TIA-568-C.3 and NFPA 70.
2. Ship cable on reels and/or in boxes bearing manufacture date for UTP in accordance with ICEA S-90-661 and optical fiber cables in accordance with ICEA S-83-596 for all cable used on this project.
3. Cabling manufactured more than 12 months prior to date of installation shall not be used.
4. Comply with applicable Code for insulation, jacket, marking and listing for applicable use.
   a. At plenums, provide type CMP or OFNP cabling.
   b. At risers, provide type CMR or OFNR cabling
   c. At horizontal wiring conditions, provide type CM or OFN cabling.
5. Refer to Section 27 14 00 - Communications Outside Plant Backbone Cabling for underground cabling installation

PART 3 - EXECUTION

3.1 GENERAL

A. All system cabling and terminations be installed in accordance with the manufacturer's instructions and as shown.

B. All necessary interconnections, services, and adjustments required for a complete and operable system shall be provided. All installation work must be done in accordance with the safety requirements set forth in the general requirements of ANSI C2 and NFPA 70.

C. Coordinate insulation displacement (quick connect) terminal devices with wire size and type. Comply with manufacturer's recommendations. Make connections with automatic impact type tooling set to recommended force.

D. Dress, lace or harness all wire and cable to prevent mechanical stress on electrical connections. No wire or cable shall be supported by a connection point. Provide service loops where harnesses of different classes cross, or where hinged panels are to be interconnected.

E. The Contractor shall be responsible for all damage to the cable during placement.
   1. Cabling shall be maintained free of splits, holes or blisters.
   2. Cabling shall not be painted or exposed to construction solvents or other caustic chemicals unless rated and warrantied for such exposure by its manufacturer.

F. Correct unacceptable wiring conditions including but not limited to:
   1. Deformed, brittle or cracked insulation.

2. Torn or worn cable jacket.

3. Excessively scored cable jackets.

4. Insulation shrunken or stripped further than 1/8 in. away from the actual point of connection within a connector, or on a punch block.

5. Ungrommeted, unbushed, or uninsulated wire or cable entries.

6. Deformation or improper radius of wire or cable.

3.2 PULLING IN

A. Verify that all raceway has been de-burred and properly joined, coupled, and terminated prior to installation of cables. Verify that all raceway is clear of foreign matter and substances prior to installation of wire or cable.

B. Inspect all conduit bends to verify proper radius. Comply with Code for minimum permissible radius and maximum permissible deformation.

C. Apply a chemically inert lubricant to all wire and cable prior to pulling in conduit. Do not subject wire and cable to tension greater than that recommended by the manufacturer. Use multi-spool rollers where cable is pulled in place around bends. Do not pull reverse bends.

D. Provide a box loop for all wire and cable routed through junction boxes or distribution panels. Cable loops and bends shall not be bent at a radius greater than that recommended by the manufacturer.

E. Pull Rope/Tape

1. For ISP installations, pull new pull rope through all conduits while placing new backbone cable. Leave a pull rope in the utilized conduits for future use.

F. Do not leave cable slack on cable runway

G. Firestop all sleeves, station cable conduit and ISP backbone conduit openings through rated partitions after the cable installation is complete.

3.3 SUPPORT

A. Support: Provide support for all cabling. Conform to the restrictions of the California Electric Code and Section 27 05 29. Secure all wire and cable run vertically for continuous distances greater than thirty (30) feet. Secure robust non-coaxial cables with screw-flange nylon cable ties or similar devices appropriate to weight of cable. For all other cables, provide symmetrical conforming nonmetallic bushings or woven cable grips appropriate to weight of cable.

B. Separation from sources of Electromagnetic Interference: Conform with the requirements of ANSI/TIA-569-C, 9.3 Pathway Separation from EMI sources.

3.4 CATEGORY RATED STATION PROOF OF PERFORMANCE DEMONSTRATION

A. Comply with the requirements of Part 1 of this Section and the following:

1. After submittal of test result documentation and the associated as-built drawings, the Owner's Representative shall randomly pick five percent (5%) of the submitted cable plant installation for re-test.

2. If more than 2% of the sample results differ in terms of the pass/fail determination, the installation contractor under supervision of the representative shall repeat 100% testing at no cost to the Owner.

3.5 LABELING

A. Reference Section 27 05 53 - Identification for Communications Systems, the plans and the specifications.

B. Comply with labeling instructions to include, but not be limited to, the following:

1. Label technology to be utilized;

2. Label content;

3. Label placement

3.6 REMOVAL OF ABANDONED CABLING

A. The California Electrical Code (CEC) requires all unused telecommunications cable intended for future use to be terminated in a patch panel or cross-connect and labeled for such use. Any other unused cable is considered abandoned including cable abandoned due to installation of new cabling under the work of this Project.

B. Abandoned cable must be removed and disposed of, per CEC 770.53(A) & 770.53(B) (fiber) and 800.52(B), 800.53(A) & 800.53(B) (copper). Similar requirements are elsewhere in the CEC for other types of cable.

C. Refer to Division1 regarding means and methods to be employed in the disposal of construction waste materials including material subject to recycling such as abandoned copper cabling.

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. Communications racks and cabinets.

B. Communications Rack Mounted Power Protection and Power Strips

1.2 RELATED WORK IN OTHER SECTIONS

A. Section 27 05 26 – Grounding and Bonding for Communications Systems

1. Bonds racks and cabinets.

B. Section 27 05 33 – Conduits and Backboxes for Communications Systems

1. Signal systems raceways at communications rooms

C. Section 27 05 36 – Cable Trays for Communications Systems

1. Signal systems cable tray at communications rooms

D. Section 27 11 26 – Communications Rack Mounted Power Protection and Power Strips

1. Installation of rack mounted power strips, protection and distribution units.

E. Section 27 13 00 – Communications Indoor Backbone Cabling

1. Inside Backbone Terminations at communications rooms.

F. Section 27 15 00 Communications Horizontal Cabling

1. Rack mounted horizontal patch panels.

1.4 SUBMITTALS

A. Conform with the requirements of Section 01 30 00 – Administrative Requirements and Section 27 05 00 - Common Work Results for Communications.

1.5 DELIVERY, STORAGE AND HANDLING

A. Procedures: In accordance with Section 01 60 00 – Product Requirements and Section 27 10 00 – Structured Cabling, Basic Materials and Methods.

PART 2 - PRODUCTS

2.1 GENERAL

A. KEYS

1. Key all boxes, cabinets, enclosures, panels, controls, doors and related provided for similar usage within a system identically.

2.2 EQUIPMENT ENCLOSURE SYSTEMS

A. General:

1. Provide enclosure systems including, but not limited to enclosures, cabinets, cases and related panels and accessories as specified herein. Provide size and quantity as shown on drawings or scheduled.

2. Provide color as shown on drawings. If no color is shown on drawings, submit manufacturer's standard color chips for selection.

3. Provide enclosure systems conforming to the CBC, latest edition, for seismic design.

4. Equipment Enclosures: Each rack provided with frame angles tapped 10-32, ANSI/EIA 310-D Universal Spaced.

B. Equipment Rack, Undercounter, Pullout and Pivoting

1. Drawing Reference: R18

2. Features/Construction:

a. EIA compliant 19 in. rotating slide-out equipment rack intended for permanent installation and integration into a millwork or cabinet opening.

b. Overall dimensions of rack shall be not more than 19.25 in. wide x 20 in. deep

c. Rack shall support up to a 300 pound loading, in closed and pull-out operation.

d. Rack shall pull out 19 in. on integrated ball bearing slides and rotate 90º for equipment servicing. When rotating rack, locking detent shall allow rack to lock in place at 0, 60 and 90 degrees of rotation.

e. Rackrail shall be 11-gauge steel with tapped 10-32 holes in universal EIA spacing. Rackrail shall be finished in black e-coat with marked rackspaces.

f. Rough-in pan shall be 14-gauge steel.

g. Finish on assembly shall be durable flat black powder coat.

h. Trim/locking panel shall lock SRSR in closed position and be 11-gauge aluminum with brushed black anodized finish.

i. Unless otherwise noted, completely enclose interior of enclosure, or ensembles of enclosures with equipment, blank or vent panels

3. Manufacturers

a. Middle Atlantic SRSR–4-14.

b. Or equal (no known equal).

C. Relay Rack, Integrated Vertical Wire Chase, Zone 4 rated

1. Drawing Reference(s)

a. R15

2. Construction

a. Capacity: 1,000 lb and meet Telecordia Technologies GR-63-CORE Network Equipment Building Systems (NEBS) Zone 4 requirements.

b. Mounting Channels: Punched on the front and rear flange with the EIA-310-D Universal hole pattern

c. Supports 19 in. EIA-310-D compliant rack-mount equipment like patch panels and

d. network switches

e. #12-24 threaded equipment mounting rails

f. Equipment mounting rails to have marked and numbered rack-mount spaces (U). Numbering start at bottom of the rack.

g. Fully bonded rack with two masked grounding locations and includes a two mounting hole. Ground Terminal Block for easy connection to the Telecommunications Grounding Busbar.

h. Overall width shall be no more than 24 in..

i. 44 EIA Rack Units minimum.

j. Provide fifty (50) 12-24 rack mounting screws per rack.

k. Separate front and rear 6 in.W x 6.38 in.D cable managers attach with included offset brackets to align with the front and rear of the rack.

3. Manufacturers, Zone 4 rated assembly - subject to minimum panel opening criteria scheduled above:

a. CPI Seismic Frame Two Post Rack 13853-703 with Seismic Frame Two-Post Vertical Cabling Section 13704-703.

b. B-Line Advantage Seismic Relay Rack SB-852-19-084 FB.

D. Drawing References: R28

1. Minimum Features, Function & Construction:

a. Manufacturer tested Zone 4 assembly, rated for at least 900 pounds of uniformly distributed load, upper floor load, of essential equipment per California Building Code/Uniform Building Code.

b. Fully welded construction provides:
   1) Static load capacity: 10,000 lbs.
   2) UL Listed load capacity: 2,500lbs.
   3) Seismic Certified load capacity: 755 lbs.

c. Seismic certified to the following codes and standards: 2007 & 2010 CBC; 2006, 2009 & 2012 IBC; ASCE 7-05 (2005 Edition) & ASCE 7-10 (2010 Edition) and the 2006 & 2009 editions of NFPA 5000 for use in areas of high seismicity – Zone 4 or Seismic Design Category (SDC) "D". Intended for use in Mission Critical and/or High-Importance Installations in locations with the highest level of seismicity and top floor or rooftop installations including those within UBC and CBC Essential facilities or IBC, ASCE 7, and NFPA 5000 Seismic Use Group III facilities. For all codes, the Importance factor (Ip) is 1.5.

d. Vertical Height (Min): 44 RU

e. Outside depth: 40” minimum - 42 inches maximum.

f. Width: Not to exceed 30 inches

g. Lockable, 70% open area perforated mesh full height front and rear doors:
   1) Front door with wire mesh insert covers rack contents - swing shall be field adjustable to swing from either right or left.
   2) Rear doors to be a pair of half width doors, each with a wire mesh to cover rack contents.
   3) Wire mesh, vertical center split rear door pair.

h. Front and rear 19" mounting rail pairs DIN square holes on EIA spacing standard are fully adjustable in depth of setback from front to rear.

i. Vertical cable management rings, continuous, full height cable management system shall be installed:
   1) fully inside of the rack enclosure, with 2" minimum clearance behind front and rear rack frame.
   2) fully outside (to left of left rail and to right of right rail, and out of conflict with EIA Rails. Cable management system mounting shall not occupy rail screw openings.
   3) Front managers shall be accessible from front in fully loaded equipment rack.
   4) Rear managers shall be accessible from rear in fully loaded equipment rack

j. 60% or greater perforated top panel occupying at least 50% of the stop surface of the cabinet allows passive heat radiation from rack interior to the exterior.

k. Cutouts and removable covers in cabinet top accommodates vertical transition of cabling from tray above into rack interior.

l. Gangable. Racks have been designed such that they are suitable for installation either as a single, standalone unit, or in a row of identical racks (gangable).
   1) Single rack installation. Provide side panels at both sides.
   2) Multirack installation in a row. Bolt racks together using means provided by manufacturer. Omit side panels except at ends of row of racks – provide at ends of rows of racks.

2. Manufacturers. Provide manufacturer's accessories or 3rd party accessories as specified elsewhere in this Section for other specified elements. Coordinate selected shelves, fans and similar with rack submitted for finish and mounting means.:

   a. Middle Atlantic DRK19-44-42PRO with DLVFD-44 front door, DCLVRD-44 rear doors, MRK-Z4 Base angles, 2 pair DRK-44DUCT (front and rear, 4 total vertical ducts),MW-LVT 64% open area top insert. Keylocked side panels SPN-44-36 at ends of rows.

   b. Equal by CPI Z4-Series Seismic Frame Cabinet System

E. AV Credenza with Equipment Rackbay

1. Drawing Reference: R42, refer to keynotes on plans for locations below displays in Conference and Group Study Spaces

2. Manufacturer:

   a. Middle Atlantic C3-FF32, coordinate finish w/ Architect

   b. Or equal

2.3 RACK PANELS AND ACCESSORIES

A. Rack Mounting Screws:

1. Screws 10-24; length as required for at least 1/4 in. excess when fully seated; oval head with black plastic non marring cup washer or equivalent ornamental head; nickel, cadmium or black plated; Phillips, Allen Hex, Square-Tip or Torx drive. Slotted screws are not acceptable.

B. Vertical Lacer Strips

1. 44RU high vertical steel strips with points for attachment of velco cable ties at at least 6 in. o.c.

2. Manufacturer:

   a. CPI

C. Horizontal Lacer Bars

1. EIA 19 in. Width steel strips or bars suitable to provide support to large cable dressed horizontally through racks

2. Size to suit load and mounting width.

3. Manufacturer:

a. CPI.

PART 3 - EXECUTION

3.1 MOUNTING

A. Unless otherwise noted, all floor supported equipment racks shall be bolted to the structure in accordance with the requirements of the CBC and the contractors approved structural engineering submittal demonstrating the method to be used to conform to these requirements.

B. Rows of identical racks shall be bolted together, in addition to being bolted to the floor, and bonded to form a single electrical ground plane.

C. Wall mounted equipment racks and cabinets shall similarly be bolted to structural members in accordance with the requirements of the CBC and the contractors approved structural engineering submittal demonstrating the method to be used to conform to these requirements.

3.2 EQUIPMENT ENCLOSURE (RACK) AND EQUIPMENT BACKBOARD FABRICATION

A. Combustible material, other than incidental trim of indicated equipment, is prohibited within equipment racks.

B. Provide permanent labels for all equipment and devices.

C. Floor racks to be bolted floor unless otherwise indicated.

D. Access shall not require demounting or de-energizing of equipment. Install access covers, hinged panels, or pull-out drawers to insure complete access to terminals and interior components.

E. Provide a permanent label on the front of each equipment rack including the rack designation, and the circuit breaker number and associated electrical distribution panel designation servicing same.

F. Where wiring of mixed types are called for on the plans, maintain separation of wiring classifications as specified in the individual sections of the Communications Work. Separately dress, route and land microphone, audio line level and data cables and related on the right side of the equipment enclosure, as viewed from the rear; dress, route, and land loudspeaker level, data and control cables on the left side of the equipment enclosure, as viewed from the rear.

G. Provide vertical wire management of cabling within the rack independent of the adjustable EIA mounting rails. Vertical wiring management provided by the contractor within the rack shall not prevent such rails from being moved as required by the Owner.

H. Dress and support cabling at a minimum of 24 inch on center.

I. Access shall not require demounting or de-energizing of equipment or cabling. Install access covers, hinged panels, or pull-out drawers to insure complete access to terminals and interior components.

J. Fasten removable covers containing any wired component with a continuous hinge along one side, with associated wiring secured and dressed to provide an adequate service loop. Provide an appropriate stop locks to hold all hinged panels and drawers in a serviceable position.

K. Provide permanent labels for all equipment and devices. Where possible, fasten such labels to the rack frame or to blank or vent panels which will remain in place when active equipment is removed for possible service.

3.3 SIGNAL GROUNDING & BONDING PROCEDURES

A. Comply with National Electrical Code and the California Electric Code. Bond equipment racks to ground in accordance with the California Electric Code and ANSI/ EIA/ TIA 607 and Section 27 05 26

B. Unless otherwise noted maintain a unipoint ground scheme.

C. Equipment enclosures shall not be permitted to touch each other unless bolted together and electrically bonded.

END OF SECTION

PART 1 - PGENERAL

1.1 SCOPE OF WORK

A. This Section defines material standards for:

1. Copper Termination Assemblies, including
   a. Rack and cabinet mounted copper patch panels
   b. Backboard, rack and cabinet mounted terminal blocks

1.2 RELATED WORK UNDER OTHER SECTIONS

A. Section 27 05 00 – Common Work Results for Communications

B. Section 27 05 26 – Grounding and Bonding for Communications Systems

A. Procedures: In accordance with Section 27 10 00 – Structured Cabling, Basic Materials and Methods.

PART 2 - PRODUCTS

2.1 COPPER CABLE TERMINATION DEVICES AND RELATED

A. Category 5e Terminal Block.

1. Drawing reference(s):
   a. 110TB100 100 pair
   b. 110TB300 300 pair

2. General: Insulation displacements connector blocks consisting of oxygen free mechanical fastening system arranged in a flame-retardant molded plastic fastened to a mounting bracket.
3. Features/Functions
    a. “110 type” punch down type.
    b. Cable routing space behind the blocks.
4. Conforms with TIA/EIA-568-B.2 Category 5e standard.
5. Construction/Implementation
    a. Provide complete with standoff mounting brackets
    b. Provide trough at the bottom of each column of blocks.
    c. Unless otherwise noted, provide WMP between each column of blocks, and at the outside edges of each group of block columns.
6. Manufacturer:
    a. Panduit. P110KT3004Y with P110VCM300.
    b. or equal.

B. Category 5e 19 in. Rack Mount Terminal Block

1. Drawing reference(s):
2. RM110TB200 200 pair
3. General: Insulation displacements connector blocks consisting of oxygen free mechanical fastening system arranged in a flame-retardant molded plastic fastened to a 19 in. rack mount panel.
4. Features/Functions
    a. “110 type” punch down type.
    b. Cable routing space behind the blocks.
5. Conforms with TIA/EIA-568-B.2 Category 5e standard.
6. Manufacturer:
    a. PanduitP110B1005R4WJY.
    b. Or equal.

C. Data Patch Panels, Category 6A, Modular

1. Drawing Reference(s): *** CXPP, where *** refers to port count and X to Category rating of ports.
2. Functions/Features:
    a. Flat, 19 in. EIA rack mountable.
    b. 48 ports per EIA rack unit (3.50 in.).

c. Industry standard RJ-45 jacks inserted in openings in steel plate
   1) arranged in rows on steel panel,
   2) jacks on front,
   3) terminations on rear.
   4) Patch panel and Port identifier label space on front – label per Section 27 05 53 - Identification for Communications Systems.

d. Each opening to be filled with jacks as specified in Section 27 15 00 - Communications Horizontal Cabling. Match the color coding specified. Provide blank panels on all unused ports.

3. Manufacturer

   a. Panduit DP246X88TGY (24 port) and DP486X88TGY (48port). Provide strain relief bar SRB19D7BL for each patch panel.

D. Cross-Connect Wire

1. Drawing Reference: None

2. Provide quantities of voice cross-connect wire in each Communications Room for use by the District's Staff as follows:

   a. 22 gauge, Solid Core

   b. USOC color coded

   c. Paired cables without overall jacket

   d. BDF/EF/ER
      1) One 1000 foot minimum spool - Yellow/Blue
      2) Two 1000 foot minimum spool - White/Red

   e. IDF/TR
      1) One 1000 foot minimum spool - Yellow/Blue
      2) One 1000 foot minimum spool - White/Red

3. Manufacturer

   a. Belden

   b. General

   c. Berk-Tek

   d. Superior/Essex

   e. or equal.

PART 3 - EXECUTION

3.1 GENERAL

A. Refer to Section 27 13 00 Communications Indoor Backbone Cabling for requirements for termination of Riser and Outside Plant Cabling within IDF/HC's, and BDF/EF's.

B. Refer to Section 27 10 00 – Structured Cabling, Basic Materials and Methods and Section 27 15 00 – Communications Horizontal Cabling.

END OF SECTION

PAGE LEFT BLANK INTENTIONALLY

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. Section includes provision of cable management for cabling installed under the work of this Project as well as for Contractor furnished patch cords at equipment racks.

B. Scope includes:

1. Cable End Spillway
2. Backboard Cable Management
3. Patch Panel Cable Management at racks and cabinets

1.2 RELATED WORK IN OTHER SECTIONS

1. Section 27 05 33 – Conduits and Backboxes for Communications Systems
2. Section 27 05 53 – Identification for Communications Systems
3. Section 27 10 00 – Structured Cabling, Basic Materials and Methods
4. Section 27 11 19 – Communications Termination Blocks and Patch Panels
5. Section 27 15 00 – Communications Horizontal Cabling

1.3 REFERENCES

1. American Society For Testing and Materials (ASTM)
2. ASTM D2239-03 Standard Specification for Polyethylene (PE) Plastic Pipe (SIDR-PR) Based on Controlled Inside Diameter

B. Underwriters Laboratories (UL)

1. UL 910 Test for Flame-Propagation and Smoke-Density Values for Electrical and Optical-Fiber Cables used in Spaces Transporting Environmental Air (Nov. 1998)

1.4 DELIVERY, STORAGE AND HANDLING

A. Procedures: In accordance with Section 27 10 00 – Structured Cabling, Basic Materials and Methods.

PART 2 - PRODUCTS

2.1 INNERDUCT

A. Woven Mesh Innerduct

1. Drawing Reference: WMID

2. Features/Functions

   a. Three inch wide woven mesh assembly contains at least three continuous pullable sleeves, each can accommodate a cable of at least 1" diameter.

   b. Systems providing fewer than 3 integrally woven sleeves per WMID assembly not acceptable.

   c. Includes color coded pull tape in each sleeve.

   d. Pre-Lubricated for cable pulling

   e. Non-Hydroscopic

   f. 2500 Pound Tensile Strength

   g. 480 degree melting point.

   h. At least 5 years prior field use including at least 25 million feet of product in use.

   i. Provide plenum rated assembly at plenum locations as defined by the National Electric Code.

3. Manufacturers:

   a. Maxcell/TVC 3" 3-cell in three unique colors per duct.

   b. or equal (No known equal with identical 3 sleeves woven into a single assembly nor equal industry usage).

2.2 CONDUIT CABLE MANAGEMENT

A. Conduit End Waterfall Spillway

1. Drawing Reference: CEW

2. Features/Functions

   a. Spillway fastens to end of EMT conduit, provides radius sweep, open on top, solid from below

   b. Maintains proper bend radii for fiber/cable

   c. Provides tie points for fire pillow retention

   d. Supports up to 100 lbs. of hanging fiber/cable

   e. Clamp for securing to EMT

   f. Self-fastening tie down system for supporting cabling

3. Construction:

   a. Fire Retardant ABS

4. Manufacturers:

   a. Bejed BJ-2049 Spillway.

   b. or equal (no known equal).

2.3 PATCH PANEL CABLE MANAGEMENT

A. Patch Panel Wire Management, Rack Mounted, Snap Cover.

1. Drawing References:
   a. 2 RU Version: WMP, Wire Management Panel
2. Construction
   a. EIA 19 in. Rack Mount, as required
   b. Continuous flexible system of fingers and slots along top and panel, deburred to avoid snagging patch cord jacket.
   c. Snap Cover
3. Capacity
   a. 2 RU - accommodates at least 70 patch cords.
4. Manufacturers:
   a. Panduit WMPH2.
   b. or equal.

2.4 BACKBOARD CABLE MANAGEMENT

A. Fiber Management Ring, Preformed Loop

1. Drawing Reference: FMR
2. Construction:
   a. 24 inch diameter steel ring stores fiber slack using Velco fasteners at regular intervals around ring.
   b. Screw fastens to backboard at BDF or IDF.
3. Manufacturer
   a. Leviton 48900-IFR for inside plant riser fiber and Leviton 48900-OFR for outside plant fiber.
   b. or equal (no known equal)

B. Wire Management Rings, Wall/Ceiling Mounted:

1. Drawing References/Functions Features:
   a. WMRB - Bridle Ring Type, Threaded Lag Screw
   b. WMRC - Closed Ring, U shaped assembly with two screw holes at ends,
   c. WMRO - Open, Re-enterable Split Ring permitting cables to be inserted midspan, two screw holes at ends
   d. WMP** - Steel back board with 4 inch deep min, 8 inch wide vertical wire management rings, front enterable. Provide trough at bottom of each column of WMP.

e. WMP**T - Narrow, steel back board with 4 inch deep min, 3 inch wide vertical wire management rings, front enterable.

2. Provide as required to support indicated cable bundle and location.

3. Provide type WMRB at wood frame construction for cable hung from underside of ceiling, unless otherwise noted.

4. Manufacturers:

a. WMRB:
1) B-Line Fasteners, BR Series
2) Senior Industries
3) T&B
4) or equal.

b. WMRC
1) Chatworth Products Wall Mount Closed D Ring.
2) Senior Industries
3) or equal.

c. WMRO
1) Chatworth Products Wall Mount Open Ring.
2) AllenTel
3) Commscope/Systimax, Inc.
4) Siemon
5) or equal.

d. WMP
1) Siemon S188-*** to match adjacent terminal blocks with S188-WD
2) Ortronics OR-806003194 or OR-806003196 to match terminal blocks.
3) By any manufacturer listed for 110TB under Section 27 11 19 – Communications Termination Blocks and Patch Panels
4) or equal.

e. WMP**T

f. Siemon S110M-WM-*** to match adjacent terminal blocks

g. By any manufacturer of listed for 110TB under Section 27 11 19 – Communications Termination Blocks and Patch Panels

h. or equal.

PART 3 - EXECUTION

3.1 GENERAL

A. Refer to Section 27 13 00 Communications Indoor Backbone Cabling for requirements of cable routing within IDF/HC's, and BDF/EF's.

3.2 CONDUIT END WATERFALL

A. Fasten securely to conduit end wherever cabling will exit conduit 18 in. or more above the cable tray to prevent damage due to cabling due to weight of cable bearing on a conduit end.

B. Secure cabling with integral cable restraint system.

END OF SECTION

PAGE LEFT BLANK INTENTIONALLY

PART 1 - GENERAL

1.1 SCOPE OF WORK:

A. Work of this Section includes:

1. Indoor Copper Backbone Cabling between Communications Rooms and communications terminal nodes other than station cabling.

2. Terminate copper cabling on terminal blocks as specified in Section 27 11 19. Provide terminal block, high pair count copper connector cabling and rack mounted patch panels to permit District's telephone contractor to cross-connect the entrance and riser cabling to individual station ports using District furnished patch cords.

3. For all cabling:

a. Test cabling to demonstrate performance to specified standards or better using test equipment and methods as specified in Section 27 10 00.

b. Label cables, jacks, plates and patch panels as specified in Section 27 05 53.

c. Document on Record Documents as described in Section 27 05 00.

B. Related work in other Sections

1. Section 27 05 29 – Hangers and Supports for Communications Systems

2. Section 27 05 33 – Conduits and Backboxes for Communications Systems

3. Section 27 05 53 – Identification for Communications Systems

4. Section 27 10 00 – Structured Cabling, Basic Materials and Methods

5. Section 27 11 19 – Communications Termination Blocks and Patch Panels

6. Section 27 11 23 – Communications Cable Management

7. Section 27 15 00 – Communications Horizontal Cabling

1.2 REFERENCES

A. Refer to Section 27 10 00 – Structured Cabling, Basic Materials and Methods

1.3 DELIVERY, STORAGE AND HANDLING

A. Procedures: In accordance with Section 27 10 00 – Structured Cabling, Basic Materials and Methods.

PART 2 - PRODUCTS

2.1 FIBER OPTIC COMMUNICATIONS CABLING AND RELATED:

A. Fiber count per cable to comply with minimum counts indicated on the plans. Comply with applicable Code for insulation, jacket, marking and listing for applicable use.

B. FIBER, SINGLEMODE - GENERAL

1. Meeting EIA/TIA 568

2. Construction:

a. Standards Compliance ITU-T G.652.D | ITU-T G.657.A1 | TIA-492CAAB (OS2)

b. Attenuation, maximum 0.22 dB/km @ 1,550 nm | 0.23 dB/km @ 1,575 nm | 0.25 dB/km @ 1,490 nm | 0.25 dB/km @ 1,625 nm | 0.31 dB/km @ 1,385 nm | 0.34 dB/km @ 1,310 nm | 0.35 dB/km @ 1,650 nm

c. Dispersion, maximum 18 ps(nm-km) at 1550 nm | 3.5 ps(nm-km) from 1285 nm to 1330 nm at 1310 nm

d. Mode Field Diameter 10.4 µm @ 1,550 nm | 9.2 µm @ 1,310 nm | 9.6 µm @ 1,385 nm

e. Mode Field Diameter Tolerance ±0.3 µm @ 1310 nm | ±0.5 µm @ 1550 nm | ±0.6 µm @ 1385 nm

f. Index of Refraction 1.467 @ 1,310 nm | 1.468 @ 1,385 nm | 1.468 @ 1,550 nm

g. Polarization Mode Dispersion Link Design Value, maximum 0.04 ps/sqrt(km)

h. Cladding Diameter 125.0 µm

i. Cladding Diameter Tolerance ±0.7 µm

j. Cladding Non-Circularity, maximum 0.7 %

k. Coating Diameter (Colored) 253 µm

l. Coating Diameter (Uncolored) 240 µm

m. Coating Diameter Tolerance (Colored) ±7 µm

n. Coating Diameter Tolerance (Uncolored) ±5 µm

o. Coating/Cladding Concentricity Error, maximum 12 µm

p. Core/Clad Offset, maximum 0.5 µm

q. Cabled Cutoff Wavelength, maximum 1260 nm

r. Point Defects, maximum 0.10 dB

s. Zero Dispersion Slope, maximum 0.090 ps/[km-nm-nm]

t. Zero Dispersion Wavelength, maximum 1322 nm

u. Zero Dispersion Wavelength, minimum 1302 nm

3. Manufacturer:
   a. Corning OS2 Singlemode Fiber
   b. Or equal

C. FIBER OPTIC CABLE CONSTRUCTION, GENERAL

1. All Dielectric, unless otherwise noted.
2. Color Code:
   a. Per EIA/TIA-598A.
   b. Colors shall be across specified storage/installation temperature range.
   c. Means of providing conforming colors shall not degrade performance of cable.
3. Jacket:
   a. Free of splits, holes or blisters.
   b. Marked in conformance with NEC 350G
4. Heavy duty construction, Fiberglass Epoxy Rod/Kevlar strength member(s).
5. Each fiber to be 100% attenuation tested by the Manufacturer prior to shipping to indicate conformance of shipped cable to requirements herein. Manufacturer's test to be affixed to shipping reel.
6. Performance:
   a. Temperature Sensitivity:
      1) Storage: -40C° to +70C°.
      2) Installation: -30C° to +70C°.
      3) Variance:
         a) Single Mode: Average change, not more than 0.05 dB/km at 1550 -40C° to +70C°. Maximum change not more than 0.15 dB/km at 1550 nm.

D. Fiber Optic Cable, Plenum Rated:

1. Drawing References:
   a. XX FOS-P Singlemode, Plenum where XX indicates fiber count.
2. Fiber: Refer to
   a. FIBER, SINGLE MODE, GENERAL, as shown in this section.
3. Application: Intra-building distribution in building plenum and duct space
4. Listing: Meeting NEC OFNP, Listing by nationally recognized testing agency.
5. Construction:
   a. Refer additionally to Fiber Cable Construction, General, elsewhere herein.

b. Jacket: Subject to listing and rating for plenum cable.

c. Tight Buffer construction only, “Core Lock” not required.

d. Dimensions, not to exceed the following:
   1) 1 to 4 Fibers: 0.20"
   2) 5 to 12 Fibers: 0.28"
   3) 12 to 24 Fibers: 0.50"
   4) 25 to 60 Fibers: 0.80"
   5) 61 to 108 Fibers: 0.90"
   6) 109 to 144 Fibers: 1.10"

6. Mechanical Specifications
   a. Min. Bend Radius Installation 75 mm (2.95 in)
   b. Min. Bend Radius Operation 50 mm (1.97 in)
   c. Max. Tensile Strength, Long-Term, ≤12F 132 N
   d. Max. Tensile Strength, Long-Term, >12F 200 N
   e. Max. Tensile Strength, Short-Term, ≤12F 440 N
   f. Max. Tensile Strength, Short-Term, >12F 660 N
7. Cable Design
   a. Central Element Yarn
   b. Outer Jacket Color Yellow
   c. Outer Jacket Material Flame-retardant
8. General Specifications
   a. Environment Indoor
   b. Cable Type Tight-Buffered
   c. Fiber Category Single-mode (OS2)
   d. Flame Rating Plenum (OFNP)
9. Manufacturer:
   a. Corning MIC Tight-Buffered Plenum, Single Mode (OS2)
   b. Or equal

2.2 COPPER BACKBONE CABLING

A. General

1. Each conductor shall be a minimum of 22 or 24 AWG.
2. Complies with
   a. ICEA S-90-661
   b. EIA TIA/EIA-568-B.1

c. EIA TIA/EIA-568-B.2

d. NEMA WC 63.1

e. UL 444

3. Solid conductor 100 ohm multipair UTP (Unshielded twisted pair), formed into 25 pair binder groups covered with a gray thermoplastic jacket.

4. Imprinted with

a. Manufacturers name or identifier,

b. Flammability rating,

c. Gauge of conductor,

d. Transmission performance rating (category designation)

e. At regular intervals not to exceed 2 feet.

5. The word "FEET" or the abbreviation "FT" shall appear after each length marking.

6. Provide communications general purpose (CM or CMG), communications plenum (CMP) or communications riser (CMR) rated cabling in accordance with NFPA 70.

a. Type CMP and CMR may be substituted for type CM or CMG and type CMP may be substituted for type CMR in accordance with NFPA 70.

7. Color coding shall comply with industry standards for 25 pair cables.

B. Inside Distribution Wire, Horizontal

1. Drawing Reference ** pr. T-IDW, where ** refers to required pair count.

2. Construction:

a. 2 to 600 pair count voice pair cabling in overall jacket.

b. Meets EIA/TIA Category 3

c. USOC color code.

d. NEC Type CM or CMG.

e. Nominal Outside Diameter, not to exceed the following:

Pair Count	Outside Diameter (inches)
6 pr.	0.23
12 pr.	0.25
25 pr.	0.34
50 pr.	0.47
100 pr.	0.64
200 pr.	0.97
300 pr.	1.07
400 pr.	1.30
600 pr.	1.50

3. Manufacturer:
    a. Superior/Essex
    b. General Cable
    c. Mohawk
    d. NORDX/CDT
    e. or equal.

PART 3 - EXECUTION

3.1 COPPER BACKBONE TIE CABLE INSTALLATION AND TERMINATION

A. General:

1. Backbone cable(s) shall be installed in conduit system unless otherwise noted.

B. Sequencing:

1. If the installation of a tie cable requires the disconnection and removal of any existing cable(s) carrying active service prior to installation
    a. Notify the District's Representative no less than 5 working days in advance of when this work is to be performed.
2. When this work is performed, the newly installed cables must be installed, tested and passed in one 24 hour period beginning when the active service on the existing cable is interrupted.

C. Installation of Tie Cable:

1. All tie cable between terminal blocks at IDF/HC rooms shall be continuous, unspliced runs.
2. Termination of Voice or Shared Use Tie Cable:
    a. Cable shall be terminated on the 110 Type punch blocks system using C4 connecting blocks in the following order.
        1) Terminate pairs and groups in order top to bottom and then left to right according to insulation or binder color as listed below.
        2) "Mate" is the first wire of the pair to be terminated, "Wire" is the second.
    b. Comply with the following table:

Group or Pair Number	Mate	Binder or Wire
1	White	Blue
2	White	Orange
3	White	Green
4	White	Brown
5	White	Slate
6	Red	Blue

7	Red	Orange
8	Red	Green
9	Red	Brown
10	Red	Slate
11	Black	Blue
12	Black	Orange
13	Black	Green
14	Black	Brown
15	Black	Slate
16	Yellow	Blue
17	Yellow	Orange
18	Yellow	Green
19	Yellow	Brown
20	Yellow	Slate
21	Violet	Blue
22	Violet	Orange
23	Violet	Green
24	Violet	Brown
25	Violet	Slate

3. Cables containing pair counts of 50 or greater shall be terminated as follows:
    1) Columns of punch blocks stacked 2 high shall be mounted on the backboard.
    2) Beginning at the top right of the 1st column, first the blue binder will be punched down, followed by the orange binder directly beneath it.
    3) Binder punch will continue top to bottom, and then left to right until the entire cable has been terminated.
    4) Thus a 50-pair cable requires two punch blocks.

b. Upon completing the termination of all cables within an IDF/HC, install a clear plastic cover at each punch block.

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE OF WORK:

A. Work of this Section includes:

1. Outdoor (Outside Plant) Communications Cabling placed underground in new and existing communications ducts between the MDF and IDF's of this Project selected pedestal locations, including:
    a. High pair count copper cabling
    b. Fiber Optic Cabling
2. Terminate fiber on patch panels as specified in Section 27 11 19.
3. Terminate copper cabling on lightning protectors as specified in Section 27 11 13.
4. For all cabling:
    a. Test cabling to demonstrate performance to specified standards or better using test equipment and methods as specified in Section 27 10 00.
    b. Label cables, jacks, plates and patch panels as specified in Section 27 05 53.
    c. Document on Record Documents as described in Section 27 05 00.

B. Related work in other Sections

1. Section 27 05 26 – Grounding and Bonding for Communications Systems
2. Section 27 05 29 – Hangers and Supports for Communications Systems
3. Section 27 05 33 – Conduits and Backboxes for Communications Systems
4. Section 27 05 36 – Cable Trays for Communications Systems
5. Section 27 05 43 – Underground Ducts and Raceways for Communications Systems
6. Section 27 05 48 – Noise and Vibration Controls for Communications Systems
7. Section 27 05 53 – Identification for Communications Systems

C. Conform with the requirements of Division 1 and Section 27 05 00 - Common Work Results for Communications Systems.

1.3 DELIVERY, STORAGE AND HANDLING

A. Procedures: In accordance with Division 1 and Section 27 10 00 – Structured Cabling, Basic Materials and Methods.

PART 2 - PRODUCTS

2.1 FIBER OPTIC CABLING

A. Fiber Optic Cable, Indoor Plenum/Outdoor Rated:

1. Drawing References:
   a. XX FOS-OPP Singlemode, Indoor Plenum/Outdoor, where XX indicates fiber count.
2. Fiber: Refer to:
   a. FIBER, SINGLE MODE, GENERAL, as specified under section 27 13 00.
3. Application: Inter-building site distribution in manholes and site conduit. Conform to NEC and CEC limits on placement within building envelope.
4. Listing: NEC OFNP, Listing by nationally recognized testing agency.
5. Construction:
   a. Refer additionally to Fiber Cable Construction, General, elsewhere herein.
   b. Suitable and Code approved for wet location installed inside duct.
   c. Provide Loose Tube Gel Free Construction Water Blocking Construction.
   d. Mechanical Specifications
      1) Max. Tensile Strength, Long-Term 810 N
      2) Max. Tensile Strength, Short-Term 2700 N
      3) Min. Bend Radius Installation 171 mm (6.73 in)
      4) Min. Bend Radius Operation 114 mm (4.49 in)
   e. Cable Design
      1) Central Element Dielectric
      2) Buffer Tube Color Coding Yellow
      3) Number of Ripcords 2
      4) Outer Jacket Color Black
      5) Outer Jacket Material Flame-Retardant, UV-Resistant
      6) Tensile Strength Elements and/or Armoring Layer 1 - Dielectric strength members
      7) Fiber Coloring Blue, Orange, Green, Brown, Slate, White, Red, Black, Yellow, Violet, Rose,Aqua
      8) Fibers per Tube 12
   f. General Specifications
      1) Environment Indoor/Outdoor
      2) Cable Type Loose Tube
      3) Product Type Dielectric

4) Fiber Category Single-mode (OS2)
5) Flame Rating Plenum (OFNP)
6) Application Aerial , Direct Buried , Duct , General Purpose Horizontal

6. Manufacturer
   a. Corning FREEDM Loose Tube, Gel Free, Plenum Single Mode (OS2)
   b. Or equal

2.2 FIBER OPTIC SPLICE CLOSURE, OUTSIDE PLANT RATED

A. Drawing Reference: FOSC-OP

1. Functions/Features:
   a. Supports stranded loose tube or ribbon fiber cables in either armored or dielectric configurations.
   b. Fully sealed to protect fiber and splices
   c. Re-enterable underground up to 5 meters.
   d. Fusion splice protection chamber
   e. Designed and tested to Telcordia GR-771 requirements
   f. Rural Utilities Service (RUS) Listed
2. Manufacturers
   a. AFL LightGuard 250. Provide splice trays, cable grounding kits and hanger brackets.
   b. Commscope FOSC450. Provide splice trays, cable grounding kits and hanger brackets.

2.3 COPPER OSP CABLING

A. Telephone, Outside Plant, Underground in Ductbank

1. Drawing Reference: T-OPD, with pair counts as indicated.
2. Features/Functions:
   a. Solid round copper wire.
   b. Solid aluminum tape overall shield.
   c. Gel filled.
   d. Polyethylene Overall Jacket.
   e. Suitable for direct burial.
3. Manufacturer:
   a. Alcatel
   b. Superior/Essex
   c. General Cable

d. NORDX/CDT

e. Any meeting REA PE-39 for cable smaller than 400 pair,

f. Any meeting REA PE-39 or REA PE-89 for cable 400 pair or larger.

g. or equal.

B. Shield Connectors:

1. Shield connectors shall make a stable, low-impedance electrical connection between the shield of the communications cable and a conductor such as a strap, bar, or wire.

2. The connector shall be made of tin-plated tempered brass.

3. Shield bond connectors shall comply with REA PE-33.

C. Grounding Braid:

1. Grounding braid shall provide low electrical impedance connections for dependable shield bonding.

2. The braid shall be made from flat tin-plated copper.

2.4 OUTSIDE PLANT TELEPHONE CABLING CLOSURES

A. In Building Telephone Closure:

1. Drawing Reference: IBTC

2. Features and Functions:

a. Provides transition point from unlisted, gel-filled Outside Plant Cabling to Interior (T-IDW) cabling

b. Can house a straight, butt, and branch splice in a protective housing.

c. Not pressurized or encapsulated.

d. Fire-retardant Plastic construction, meeting PUB55006 for interior (in-building) installation.

e. RUS (formerly REA) listed for application.

f. Provide a suitable means for mounting to backboard.

3. Manufacturer:

a. 3M K&B Series

b. Preformed Line Products Coyote Splice Case

c. or equal.

B. Telephone Closure, Outside Plant

1. Drawing Reference: TSC-OP

2. Features/Functions

a. Can house a straight, butt, and branch splice in a protective housing.

b. Rigid outer protective body

c. Suitable for periodic water immersion - air and watertight.

d. Renter able.

e. Gel Filled, Injected encapsulant using precision means

3. Manufacturer:

a. 3M 900 Series Direct Injection

b. Preformed Line Products Armadillo Stainless

c. or equal.

C. Multipair Splicing Connectors

1. Drawing Reference:None. Provide at all IBTC, OTC and similar locations where shown on the plans or required in the field.

2. Function:

a. Can gas tight terminate large pair counts of copper cabling to connectorized ends and reliable mate ends in compact area.

b. Industry standard termination means.

3. Manufacturer:

a. 3M 710 (Industry standard item)

b. or equal (no known equal).

2.5 BOLLARD/PEDESTAL WIFI ENCLOSURE

A. Drawing References: PW1

B. Features/Functions:

1. Design: Cylindrical polyethylene plastic Wi-Fi bollard. Designed to protect APs and antennas in outdoor public spaces. Fiberglass interior equipment stand for mounting APs and antennas minimizes impact on wireless signals.

2. Performance: Designed to protect equipment from tampering, spilling liquids and weather. NEMA 3R performance for indoor/ outdoor environments.

3. Anchors to pre-installed concrete pedestal.

4. Available in 14 standard colors

5. Includes anchor base, equipment stand, hardware to fasten APs and antennas. Tamper resistant hardware

6. Construction:

a. Nominally 0.25 in. thick, UV and cleaning chemical resistant UL-94HB Polyethylene plastic.

b. Zinc coated, 0.25 in. thick steel anchor base.

c. Fiberglass equipment mounting stand.

d. Size:
   1) Up to 60 in. (1,524 mm)
   2) 11.5 in. (292 mm) inner diameter
   3) Anchor base is 10.9 in. (305mm) diameter

7. Manufacturers:

   a. Oberon Model 3032-LH-xx-48 (Lighthouse). Selection of finish by Architect. Submit for approval.

   b. No known equal.

2.6 MISCELLANEOUS UNDERGROUND PRODUCTS

A. Pull Rope

1. 1/4 inch diameter polyethylene.

2. 200 pound strength.

3. Manufacturers:

   a. Carlon Telecom Systems.

   b. Vikimatic

   c. or equal.

B. Length Marked Tape

1. Provide 1/2 inch flat tape with sequential markings in whole feet.

2. Manufacturers:

   a. Carlon Telecom Systems.

   b. Greenlee

   c. Vikimatic

   d. or equal.

C. Conduit Plugs

1. Provide universal blank duct plug type, with eye for tying rope and tape.

2. Manufacturers:

   a. Carlon Telecom Systems.

   b. Condux International, Inc.

   c. or equal.

D. Bonding Ribbon:

1. Annealed solid copper 3/8 inch wide x 1/16 inch thick, tin plated.

2. Manufacturer:
    a. Inwesco 12A55
    b. Corning Cable Systems
    c. Preformed Line Products.
    d. or equal.

E. Bonding Ribbon Clamp:
1. Soft lead
2. 1/16 inch thick
3. Bolt hole for attachment
4. Manufacturer:
    a. Inwesco 12A56
    b. Corning Cable Systems
    c. Preformed Line Products.
    d. or equal.

F. Fargo Clamp:
1. Cast copper, silver plated, furnished with copper bolt.
2. RUS Listed
3. Manufacturer:
    a. Allied Bolt
    b. Inwesco 12A57
    c. Corning Cable Systems
    d. or equal.

PART 3 - EXECUTION

3.1 GENERAL

A. Provide safety barriers and flag persons for all open manholes and pullboxes that are located in areas accessible to the public.

B. Provide traffic control in accordance with the requirements of Division 1.

C. Conform to OSHA guidelines when accessing manholes and handholes, inclusive of the requirement for air sampling. Provide continuous measurements. Provide the Owner's Representative with contractor maintained logs of air samples taken at most two hours apart.

D. Provide sufficient personnel to permit one individual to remain above the surface at all times, in visual contact with persons in manholes and similar. Provide the observer with a appropriate means of obtaining assistance.

E. Provide ladders for access to manholes. Do not permit workers to use cables or splice cases as ladders.

F. Install a 3/8 in. nylon pullrope with all underground cables.

3.2 CABLE PULLING.

A. Test existing duct lines with a mandrel and thoroughly swab out to remove foreign material before pulling cables.

B. Pull cables down grade with the feed-in point at the manhole or buildings of the highest elevation.

C. Use flexible cable feeds to convey cables through manhole opening and into duct runs.

D. Accumulate cable slack at each manhole or junction box where space permits by training cable around the interior to form one complete loop.

E. Maintain minimum allowable bending radii in forming such loops.

F. Do not exceed the specified cable bending radii when installing cable under any conditions, including turnups into outdoor pedestals or other enclosures.

G. Cable with tape shield shall have a bending radius not less than 12 times the overall diameter of the completed cable.

H. If basket-grip type cable-pulling devices are used to pull cable in place, cut off the section of cable under the grip before splicing and terminating.

3.3 CABLES IN MANHOLES, PULL BOXES AND HANDHOLES.

A. Do not install cables utilizing the shortest route, but route along those walls providing the longest route and the maximum spare cable lengths.

B. Form cables to closely parallel walls, not to interfere with duct entrances, and support on brackets and cable insulators.

C. In existing manholes and handholes where new ducts are to be terminated or where new cables are to be installed, locate the existing installation of cables, cable supports and grounding as required for a uniform installation with cables carefully arranged and supported.

D. Support cable splices in underground structures by racks on each side of the splice.

E. Located splices to prevent cyclic bending in the spliced sheath.

F. Install cables at middle and bottom of cable racks, leaving top space opening or future cables, except as otherwise indicated for existing installations.

3.4 SERVICE LOOP AND TRANSITION SPLICE AT BUILDING ENTRY

A. For outside plant, flooded cables of 100 pair or greater entering a BD or EF, provide a transition in a splice case, Type IBTC, to non-flooded cable prior to termination on the protector blocks. Unless otherwise indicated on the plans, position the splice case high on the backboard, parallel to the floor at location suitable for service and where gel will not be drawn from the serving outside plant cabling into the IBTC.

B. At IDF's and BDF's, at both ends of cables, provide at least 20 feet of cable in excess of that required to reach the protectors or terminal block by a dressed route. Form into a storage loop, typically around the perimeter of the backboard and fix in place as directed by the Owner's Representative.

C. Refer to Section 27 13 00 Communications Indoor Backbone Cabling for additional requirements for termination within IDF's, BDF's and Telecommunication Building.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes, but is not necessarily limited to provision of:

1. Horizontal Station Cabling

a. Horizontal copper station cabling, meeting ANSI/TIA Category 6A standards, homerun from receptacles to indicated IDF or BDF. Terminated on rack mounted patch panels, as indicated.

2. For all cabling:

a. Terminate on patch panels as specified in Section 27 11 19 – Communications Termination Blocks and Patch Panels.

b. Test cabling to demonstrate performance to specified standards or better using test equipment and methods as specified in Section 27 10 00 - Structured Cabling – Basic Materials & Methods.

c. Label cables, jacks, plates and patch panels as specified in Section 27 05 53 – Identification for Communications Systems.

d. Document on Record Documents as described in Section 27 05 00 – Common Work Results for Communications.

B. Related Documents:

1. Specification Section 27 05 00 – Common Work Results for Communications applies to this Section.

C. Related Work in Other Sections:

1. Section 27 05 29 – Hangers and Supports for Communications Systems

2. Section 27 05 33 – Conduits and Backboxes for Communications Systems

3. Section 27 05 53 – Identification for Communications Systems

4. Section 27 11 19 – Communications Termination Blocks and Patch Panels

5. Section 27 11 23 – Communications Cable Management

1.2 REFERENCES

A. As listed in Section 27 05 00 - Common Work Results for Communications and 27 10 00 - Structured Cabling.

1.3 SUBMITTALS

A. Conform with the requirements of Section 27 05 00 - Common Work Results for Communications.

1.4 DELIVERY, STORAGE AND HANDLING

A. Procedures: In accordance with Section 27 05 00 - Common Work Results for Communications.

PART 2 - PRODUCTS

2.1 COPPER CABLING, CATEGORY RATED DATA/VOICE

A. General

1. Provide horizontal cable in compliance with NFPA 70 and performance characteristics in accordance with ANSI/TIA 568-B.1.

B. High Speed, ANSI/TIA Category Cabling, UTP, Plenum Rated

1. Drawing Reference:** UTP6A-4P, where ** denotes cable count

2. Construction:

a. Provide horizontal copper cable in accordance with:
1) ISO 11801 Class EA
2) ANSI/TIA-568-C.2 Category 6A standards for swept frequencies up to 500 MHz

b. UTP (unshielded twisted pair), 100 ohm impedance

c. Conductors/insulators: 23 AWG solid bare copper wire covered by HDPE and Foam PE insulation

d. Nominal Cable Diameter: 0.23 in.

e. Cable jacket: FEP plenum (CMP) flame retardant PVC

f. PoE compliance: Meets IEEE 802.3af, IEEE 802.3at and IEEE 802.3bt for PoE applications

g. Installation tension: 110 N (25 lbf) maximum

h. Color: Blue

3. Manufacturers:

a. Panduit Category 6A UTP Copper Cable PUP6AHD04BU-G (PCCD Standard).

2.2 TELECOMMUNICATIONS OUTLETS

A. Category 6A Data Jacks Performance Requirements, General

1. Jack

a. Construction:
1) High impact, flame retardant UL-rated 94V-0 thermoplastic.

2) The jack shall be designed with an integral locking mechanism which, upon insertion of a modular plug, provide maximum pullout strength at the plug/jack interface.

b. Performance - The jack shall meet or exceed the following standards.
   1) Meet or exceed requirements of ANSI/TIA-568-C.2 Category 6A, IEEE 802.3an-2006, and ISO 11801 Class E channel standards.
   2) UL listed

c. Physical - The modular jacks shall meet the following physical requirements.
   1) Terminate 4-pair, Wire cap compatible with 22 – 26 AWG solid or stranded cable with conductor insulation diameters of 0.060 in. max and overall cable O.D. of 0.200 in. to 0.330 in.
   2) Color: Blue
   3) Blank jack cover: White to match plate.

2. Manufacturers – Cat 6A Jacks:
   a. Panduit Mini-Com TX6A Jacks. Part no. CJ6X88TGBL (PCCD Standard).

3. Manufacturers - Blank Module.
   a. Panduit Mini-Com Blank Module CMBIW-X
   b. or equal.

B. Telecommunications Outlets, New, Copper Jacks, Wall Mount,Flush

1. Drawing Reference(s):
   a. MMP6

2. Assembly. Provide complete telecommunications outlet assembly, including but not limited to:
   a. Shall be able to fit the jack as specified above.
   b. Blank connector modules at faceplate openings not filled with connector modules.
   c. Labels and label holders.

3. Faceplate.
   a. Features:
      1) Single gang.
      2) Front Loading
      3) Openings for up to 6 jack connector modules –MMP6.
      4) Label holders with space to label the plate number and the number of each jack.
   b. Color: White.

4. Manufacturers:
   a. Panduit
      1) 4 port: CFPL4WHY

2) 6 port: CFPL6WHY
3) or equal.

C. Voice Telephone, Station Plates & Jack/Receptacles:

1. Drawing References:
   a. Wall Mounted Telephone, Flush:
   b. 630A
2. Station jacks shall be modular four or 8 wire type and conform to FCC Part 68.
3. Construction, where not otherwise specified, scheduled or indicated:
   a. Cat 6A Modular as specified above.
   b. Jack is fully recessed behind plate.
   c. Spring Wire Contacts, at least 50 microinches gold on 100 microinches nickel.
   d. Mechanically fastened to Building or Similar. Adhesive fastening not acceptable.
   e. Stainless Steel.
   f. Mounts to Single Gang Ring.
   g. Single Gang Wall Plate with two integral wall telephone mounting studs.
   h. Insulation displacement (punchdown) termination.
4. Manufacturers, Flush Wall Mounted Wall Telephone.
   a. Panduit KWP6PY
   b. or equal.

D. Small Diameter Category 6A Patch Cords – One patch cord per patch panel port and one patch cord per station jack including WAPs and CCTV cameras. Verify length of patch cords required after patch panels and switches have been installed. Verify length of patch cords required in the field and to be confirmed after furniture or device installation. Exact counts to be coordinated with UCB ITS before ordering. Provide 10% of the total count for spare.

1. Color
   a. Data: Blue
   b. Wireless Access Point: Yellow
   c. Security Camera: Green
2. Manufacturers:
   a. Panduit TX6A-28 Cat 6A Small Diameter Patch Cord.

E. Singlemode Fiber Patch Cords - One patch cord per patch panel port. Verify length of patch cords required after patch panels and switches have been installed. Provide 20% of the total count for spare.

1. Manufacturers:
    a. Panduit LC-LC duplex patch cords.
    b. Or equal

PART 3 - EXECUTION

3.1 SIGNAL POLARITY AND COLOR CODE CONVENTION

A. Category 6A Station Wire, RJ45 - Per EIA/TIA-568, designation T568 B.

3.2 STATION CABLE INSTALLATION AND TERMINATION PROCEDURES

A. General:

1. All station cable, between the station outlets and the IDF terminal blocks, shall be continuous unspliced runs.
2. Station cable shall run loose throughout all pathways. At no time shall any station cable be secured by a tywrap, electrical tape or similar bindings.
3. At Cable Trays in Communications Rooms, bundle station cable loosely into a bundle using velcro wraps applied at 3 ft o.c. typically. At no time permit the cables to be deformed by such cable bundling.

B. Run Lengths:

1. Station, Horizontal and IDF/HC Links:
    a. Horizontal Distribution runs (including vertical portions) shall not exceed 295 feet from station outlet to the associated communications closet.
    b. Station cabling runs to be 10 feet) or less.
    c. IDF/HC room distribution wiring not to exceed 19.5 feet
    d. Alternately, total length not to exceed 328 feet.
    e. Report to the Owner’s Representative conditions exceeding these requirements.
2. Limit cable bends to a minimum radius of 8 times cable diameter except where otherwise noted herein.
3. Service loop
    a. Copper. Provide 3 feet of slack at the station outlet end.
    b. Fiber. Provide 10 feet of slack at the MDF/IDFand at the station outlet end.
4. Termination of wiring at the station outlet:

a. All data and voice station cable shall be terminated at the individual receptacle modules in accordance with EIA/TIA-568-B, assignment T568B.

b. Termination of wiring at existing station outlets:
   1) Install in data and voice inserts in place of existing blank insert in existing faceplate.
   2) Install new labels and label holders.

5. Termination of station wiring at the IDF/HC

   a. For the installation/layout of station cable within the IDF/HC rooms, see detail on drawings.

   b. All Category 6A station cables entering the IDF/HC room will be terminated on a Category 6A RJ45 jack mounted in a Patch Panel as specified in Section 27 11 19 – Communications Termination Blocks and Patch Panels.

   c. Fiber station cabling will similarly be terminated on rack mounted patch panels.

   d. Termination shall begin at the upper left corner of the path panel and proceed to the right continuing down, left to right until all cables are terminated.

   e. All 4 port stations are to be terminated in the patch panel first, followed by the 2 port stations, then single port phones. Verify layout prior to termination with UCB Representative.

END OF SECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this section.

B. The work covered by this section is to be coordinated with related work as specified elsewhere in the specifications. Requirements of the following sections apply:

1. 26 00 00 Electrical

2. 26 05 00 Common Work Results for Electrical

C. The system and all associated operations shall be in accordance with the following:

1. California Building Code, 2019 Edition

2. California Electrical Code, 2019 Edition

3. Local Jurisdictional Adopted Codes and Standards

4. ADA Accessibility Guidelines

1.2 SUMMARY

A. The Command Center is to be located at a central control point on the first floor or as determined by local Authority Having Jurisdiction. RATH® Command Center Call Boxes are to be located on all floors above the first floor, in the elevator landing on each floor.

B. The Command Center must include visual indicators to allow rescue personnel to know which Call Box needs assistance. The Command Center must allow rescue personnel to speak to each Call Box individually. The Command Center must include both a handset and speakerphone to communicate back to the Call Boxes.

C. The emergency communication hardware shall comply with the Americans with Disabilities Act (ADA). The Call Boxes shall have the ability to be programmed with up to 2 emergency phone numbers (either both off-site or Base Station and one off-site). Upon activation of the emergency push button, a call will be automatically placed to the Command Center. If no one answers at the Command Center, the Call Box must dial a secondary location outside the building to activate two-way off-site person to person voice communications via landline, cellular device (part # 2100-LTEGSM4/2100-LTEVER4), or IP (part # 2100-VOIP2CS).

1.3 DEFINITIONS

A. ADA: Americans with Disabilities Act

B. AHJ: Authority Having Jurisdiction

1.4 SUBMITTALS

A. General: Submit the following according to Conditions of Contract and Division 1 Specification Sections.

1. Submit product data sheets. Include operation manuals.

2. Wiring or shop diagrams detailing wiring schematics, cabling.

PART 2 – PRODUCTS

2.1 ACCEPTABLE EQUIPMENT

A. The Command Center (2500 series) shall include both the Base Station and Distribution Module. The Base Station must have a powder coated steel housing (surface or flush mount) or be desk mounted, include a black handset with coil cord and be powered from the Distribution Module.

B. Distribution Module must be a surface mount enclosure, include connections for the Call Boxes and power both the Base Station and 2400 series Call Boxes. The Distribution Module shall be powered from 120vac power with a battery backup that provides power for a minimum of 4 hours (part # RP7700104, 2500-PWRUPS, or RP7701500).

C. The Call Boxes (2400 series) must be in full compliance with ADA requirements. Call Boxes require a hands-free speakerphone with an LED to indicate status of call.

D. The Call Boxes must allow the programming of a specific location message of the unit. This allows rescue personnel to know the location of the activated Call Box.

E. The Call Boxes are to be located no higher than 48” front reach, or 54” side reach to the center of the button above ground level to ensure conformance with the ADA requirements.

F. The Call Boxes must have a Braille face plate to ensure conformance with the ADA requirements.

G. The Command Center must provide an audible and visual indicator that a Call Box has been activated.

H. The 120vac Power Supply RATH® part # RP7700104, 2500-PWRUPS, or RP7701500 must be capable of supplying power to the Distribution Module.

I. The Command Center is to be mounted on a flat wall surface or a desktop.

J. The Call Boxes are to be wall, surface or flush mounted.

PART 3 – EXECUTION

3.1 ELECTRICAL

A. The Command Center and Call Boxes (2400 series) are to be powered by the Distribution Module (Note: 2100 series require separate power).

B. Distribution Module shall be powered by the RATH® part # RP7700104, 2500-PWRUPS, or RP7701500 Power Supply. It shall require 120vac power and provide battery backup capable of providing a minimum of 4 hours of electrical backup in case of building power failure.

C. The Base Station shall connect to the Distribution Module with single wire pair.

D. Each Call Box shall connect to the Distribution Module with a single wire pair. Wire pairs shall be shielded if near any power runs, otherwise standard pair is acceptable. Wiring shall be RATH® Custom Communication Cable (part # RP7500094). If CI 2 hour fire-rated cable is required, use RATH® Communication Cable (part # RP6600300M). For a UL Listed option use part # RPP66010002.

E. System shall be in compliance with all state and local electrical codes.

F. The system shall be monitored by the building fire alarm system per NFPA 72 using RATH® Supervisor Board 2500-XXSPVSR.

3.2 CABLING

A. Cabling for two-way communication system shall meet the applicable requirements for pathway survivability. Cabling installation shall consist of one or more of the following:

B. 2 hour fire-rated circuit integrity (CI) cable – RATH® part # RP6600300M (for a UL Listed option use part # RPP66010002).

C. 2 hour fire-rated cable system.

D. 2 hour fire-rated enclosure or protected area.

3.3 COMMUNICATIONS

A. The Call Boxes shall be an ADA compliant and vandal resistant speakerphone.

B. The Call Boxes shall be hands-free and be a push-button-once to talk system. Once the button has been pushed, the Call Box will call the Base Station. If no answer at the Base Station, it will automatically call a pre-programmed emergency number. The Call Box must be capable of being programmed with up to 2 emergency numbers (either both off-site or Base Station and one off-site).

C. The Call Box shall have location message capability. Call Box must have a minimum 18 second recordable message capability, programmable to play 1 or 2 times. Call Box shall notify called party of the location of the call upon being received at the emergency dispatch center.

D. The Call Box shall be capable of allowing the called party to replay the location message if necessary to ensure an understanding of the caller location.

E. If system is not attended to 24 hours a day, the Call Box must dial a secondary location outside the building to activate two-way off-site person to person voice communications.

F. Once a call has been made (button pushed), the call can only be terminated by the called party.

G. The Call Box must have a red LED that will light up upon push of the button. The light shall be a solid color when the Call Box is activated and will flash when call has been answered.

H. The Call Box must be capable of being programmed and re-programmed on-site.

I. Standard Call Box features:

1. Two number programming (either both off-site or Base Station and one off-site).

2. Operating temperature of between -40˚F to +150˚F (-40˚ to + 65˚ C).

3. On-site programmable.

4. EEPROM memory to protect programming

3.4 SIGNAGE

A. System shall consist of a minimum of one 120/277vac edge light sign (part # 7050 or 7050E), a “location” and “instruction” sign (part # 7049SS) to clearly indicate location of designated area. A tactile sign (part # 7043/7044 or 7087) with raised letter and Braille shall be located at entrance to area.

3.5 GRAPHICS

A. Command Center must include wording identifying the location of each Call Box and light an LED when a particular Call Box has been activated.

B. The Call Box wording must include “Emergency Phone”, International Phone Symbol and raised Braille lettering.

3.6 WARRANTY

A. The Command Center and Call Boxes shall be warranted for a period of three years.

3.7 MANUFACTURER

The manufacturer shall be:
RATH® Communications
N56 W24720 North Corporate Circle
Sussex, WI 53089
800-451-1460
Website: www.rathcommunications.com

PART 1 - GENERAL

1.1 SPECIFICATIONS SHOW INFORMATION FOR BOTH BASE BID AND FOR ADDITIVE BID ALTERNATE #2:

a. BASE BID: FURNISH AND INSTALL ALL AUDIOVISUAL BACKBOXES, PATHWAY, PULLSTRING, SUPPORTS/INFRASTRUCTURE AND CERTAIN AUDIOVISUAL DEVICES WHERE EXPLICITLY INDICATED ON PLANS AND SPECIFICATIONS.

b. ADDITIVE BID ALTERNATE 2 : FURNISH, INSTALL AND COMMISSION ALL AUDIOVISUAL DEVICES AND CABLING.

1.2 SECTION INCLUDES

A. Provide all labor, materials, transportation and equipment to complete the furnishing, installation, assembly, set up, and testing of the Sound and Audiovisual System work indicated on the drawings and specified herein. **Notwithstanding any detailed information in this Section, including Bid/Bid Alternate Scope separation as described in 1.1, above, provide complete, working systems.**

B. Design, engineer and provide complete, all means of support, suspension, attachment, fastening, bracing, and restraint (hereinafter "support") of the Work of this Section. Provide engineering of such support by parties licensed to perform work of this type in the Project jurisdiction.

1.3 SYSTEM FUNCTIONS

A. Provide the following, in addition to work shown on the drawings and specified in Parts 2 and 3 below:

B. Loudspeaker/Audio Processing, general

1. Program audio and speech content to output through overhead loudspeakers.

C. Racking compartment, general

1. Provide blank plates at all unused openings.

2. Provide fans as required to keep the interior of each equipment rack at a temperature of at least 5-10 degrees cooler than equipment manufacturer's recommended operating temperature.

a. Fans to not emit more noise than 30 dB.

D. Controls Systems, general

1. Review all push button and touchpanel button nomenclature with College's Representative prior to system programming.

2. Provide graphic indication of program volume level on control touchpanel when volume control is selected.

3. Provide Main menu selection button on all touchpanel screens to route user back to main touchpanel menu.

E. Control Functions

1. Control: Confirm all control functions and layouts with College's Representative prior to system programming.

2. Wall Control:

a. General: Functions to operate by scene/mode, not by device.
   1) End user selection of a single A/V input source (push buttons) automates:
      a) Projection screens lower
      b) Projectors turn on
      c) Presets recalled
      d) Sets audio chain to loudspeakers
   2) End user selection on an Audio Only input automates:
      a) Sets audio chain
   3) Control Push Button Selections
      a) Audio Mute
      b) Video Mute
      c) Program Volume
      d) Power Off
   4) Touchpanel Menus
      a) Startup Page: “Press here to begin”
      b) Home Page:
      c) “Select Source”: Provides sub-menus of source selections:
         1. PC, where occurs
         2. Laptop HDMI
         3. AUX HDMI, where occurs
         4. Mini Stereo audio only
      d) “Controls”: Provide sub-menu of:
         1. Screen up/down control
         2. Individual projector on/off control
      e) “Power Off”: Provides sub-menu selection of “Do you want to power off the system?” with “Yes” and “No” selections. Upon selection of “Yes”, menu reads “Please wait, shutting down system”
      f) All menus, except Home Page, to include “Home” button to revert back to the Home Page.

1.4 REFERENCE STANDARDS

A. Conform to the applicable portions of the current standards published by these organizations:
   1. SMPTE Society of Motion Picture and Television Engineers.
   2. NAB National Association of Broadcasters.

3. EIA Electrical Industries Association of America.
4. UL Underwriters Laboratories.
5. AES Audio Engineering Society.
6. NEC National Electrical Code.
7. UBC Uniform Building Code.
8. NFPA National Fire Protection Association.
9. EIAJ Electrical Industries Association of Japan.
10. IEC International Electrotechnical Commission.
11. FCC Federal Communications Commission.
12. NTC Network Transmission Committee of the Video Transmission Engineering Advisory Committee.
13. NCTA National Cable Television Association.
14. BTSC Broadcast Television Stereo Committee.
15. TASO Television Allocation Study Organization.

B. Conform additionally to the following specific standards:

1. American National Standards Institute (ANSI)
   a. ANSI S1.4-1983 (R2001) American National Standard Specification for Sound Level Meters
   b. ANSI S1.11-1986 (R2001) American National Standard Specification for Octave-Band and Fractional Octave-Band Analog and Digital Filters
   c. ANSI S1.42-1986 (R2001) American National Standard Design Response of Weighting Networks for Acoustical Measurements
   d. ANSI IT 7.214-89 Audio-visual Systems - Front Projection Screens (Tripod/Free-Standing) - Methods for Testing and Reporting Performance Characteristics.

2. Audio Engineering Society Incorporated (AES)
   a. AES2-1984 (r1997) AES recommended Practice Specification of Loudspeaker Components Used in Professional Audio and Sound Reinforcement
   b. AES5-1998 (Revision of AES5-1984) AES recommended practice for professional digital audio – Preferred sampling frequencies for applications employing pulse-code modulation
   c. AES14-1992 (r1998) AES standard for professional audio equipment – Application of connectors, part 1, XLR-type polarity and gender
   d. AES20-1996 AES recommended practice for professional audio – Subjective evaluation of loudspeakers
   e. AES26-2001 Revision of AES26-1995 AES recommended practice for professional audio interconnections – Conservation of the polarity of audio signals
   f. AES-R2-1998 AES Project Report for articles on professional audio and for equipment specifications – Notations for expressing levels

3. Electronic Industries Association of America (EIA)
   a. EIA-160 Sound Systems
   b. EIA-310-E Racks, Panels and Associated Equipment
   c. EIA-101-A Amplifiers for Sound Equipment
   d. SE-103 Speakers for Sound Equipment
   e. SE-104 Engineering Specifications for Amplifiers for Sound Equipment

4. International Electrotechnical Commission (IEC)
   a. IEC 268-3 (1988) Sound system equipment – Part 3: Amplifiers
   b. IEC 268-5 (1989) Sound system equipment – Part 5: Loudspeakers
   c. IEC 268-12 (1987) Sound system equipment – Part 12: Application of Connectors for Broadcast and Similar Use
   d. IEC 651 (1979) Sound level meters

5. International Organization for Standardization (ISO)
   a. ISO 1996-1 Acoustics – Description and measurement of environmental noise – Part 1: Basic quantities and – Composite Analog Video Signal – NTSC for Studio Applications

6. Federal Specifications (FS)
   a. GG-S-00172D Screen, Projection. Federal Supply Classification (FSC) 670.

7. Federal Standards (Fed-Std)
   a. 191A Textile Test Methods.
      1) 5760 Mildew Resistance of Textile Materials; Mixed Culture Method.
      2) 5903.1 Flame Resistance of Cloth; Vertical.

8. NFPA
   a. 255 Method of Testing Surface Burning Characteristics of Building Materials.
   b. 701 Methods of Fire Tests for Flame-Resistant Textiles and Films.

9. Society of Motion Picture Engineers (SMPTE).
   a. SMPTE 196M-86 Motion Picture - Screen Luminance and Viewing Conditions - Indoor Theater Projection Guide.
   b. SMPTE 202M-1998 Motion Pictures – B Chain Electroacoustic Response – Dubbing Theaters, Review Rooms and Indoor Theaters
   c. SMPTE RP167-1995 Alignment of NTSC Color Picture Monitors
   d. SMPTE EG1-1990 Alignment Color Bar Test Signal for Television Picture Monitors
   e. SMPTE EG27-1994 Supplemental Information for ANSI/SMPTE 170M and Background on the Development of NTSC Color Standards (R1999)
   f. RP 94 Recommended Practice for Gain Determination of Front Projection Screens.
   g. SMPTE RP 95 Recommended Practice for Installation of Gain Screens.
   h. SMPTE RP 98 Recommended Practice for Measurement of Screen Luminance in Theatres.

10. Underwriters Laboratories Incorporated (UL)
    a. UL 813 Commercial Audio Equipment 1996
    b. UL 1419 Professional Video and Audio Equipment 1997
    c. UL 1492 Audio-Video products and Accessories 1996
    d. UL 6500 Audio/Video and Musical Instrument Apparatus for Household, Commercial and Similar General Use 1999

1.5 RELATED WORK IN OTHER SECTIONS

A. Division 26 – Power for all equipment
B. Section 27 05 00 – Common Work Results for Communications Systems
C. Section 27 05 26 – Grounding and Bonding for Communications Systems

D. Section 27 05 29 – Hangers and Supports for Communications Systems

O. Section 27 14 00 – Communications Outside Plant Backbone Cabling
P. Section 27 15 00 – Communications Horizontal Cabling

1.6 QUALITY ASSURANCE

A. Test Equipment. Provide in conformance with the applicable requirements of Section 27 05 00 – Common Work Results for Audiovisual Systems. Test systems using at least one (1) each of the following test measurement devices or their functional equivalents:

1. Sound Systems:
   a. Wide band oscilloscope, 50 MHz analog. (Example: NTI Audio Minilyzer ML1).
   b. True RMS audio digital volt-ohm-millimeter (Example: Fluke 8060A).
   c. Integrated audio test set (Example: Audio Precision or NTI Audio Minilyzer ML1).
   d. Acoustic polarity tester (Example: NTI Audio Minilyzer ML1).
   e. Pink Noise generator (Example: NTI Audio Digital Audio Signal Generator, Extron VTG 300R).
   f. Calibrated microphone and pre-amplifier assembly (Example: 1/2” ANSI Type 1 ACCO, Larson Davis, Bruel & Kjaer free field incidence capsule, preamplifier/power supply).
   g. Real time audio spectrum analyzer, one-third octave (Example: NTI Audio Acoustilyzer AL1 or Minilyzer ML1, Ivie IE-30A or Rational Acoustics Smaart system).
   h. Frequency/time audio analyzer (Example: Goldline TEF system or Rational Acoustics Smaart system).

2. Baseband Video Systems:
   a. Wide band oscilloscope, 50 MHz, analog. (Example: Tektronix TDS3000C).
   b. Analog composite test generator (Example: Tektronix SPG300).
   c. Analog composite waveform/vector monitor (Example: Tektronix WFM series.)

3. RGBHV Wideband Component Analog Video Systems:
   a. Wide band oscilloscope, 500 MHz, analog. (Example: Tektronix TDS3000C).
   b. RGBHV test generator (Dot clock 200 MHz, Pixel clock accuracy 100 ppm, Horizontal frequency range 15 kHz to 131 kHz, Vertical frequency range 20 Hz to 120 Hz. (Example: Extron VTG 400D).

4. HD/SDI Video Systems

a. Pattern & Test Signal Generator (Example: Extron VTG 400D, Tektronix SPG300).
b. Portable Waveform Monitor/Rasterizer (Examples: Tektronix WFM series, Leader LV5750 with HD/SDI Options)

5. HDMI Video Systems
   a. HDMI EDID Diagnostic (Example: Kramer VA-2H).

6. Projection Systems:
   a. Luminance meter. (Example: Tektronix J17/J18 with J1803 8 degree luminance head.).
   b. Grey scale chart.
   c. Precision optical comparator. (Example: Phillips or Tektronix J17/J18 with J1810/J1820 chromaticity head.).

7. Structured Cabling used for Audiovisual Systems
   a. Level III field testers as defined in ANSI/TIA-1152 - Fluke, Agilent Or approved equal.
      1) The tester including the appropriate interface adapter must meet the specified accuracy requirements. The accuracy requirements for the permanent link test configuration (baseline accuracy plus adapter contribution) are specified in Table 4 of ANSI/TIA-1152
      2) The RJ45 test plug shall fall within the values specified in ANSI/TIA-568-C Annex C for NEXT, FEXT and Return Loss.
      3) The tester interface adapters must be of high quality and the cable shall not show any twisting or kinking resulting from coiling and storing of the tester interface adapters. In order to deliver optimum accuracy, preference is given to a permanent link interface adapter for the tester that can be calibrated to extend the reference plane of the Return Loss measurement to the permanent link interface. The Contractor shall provide proof that the interface has been calibrated within the period recommended by the vendor. To ensure that normal handling on the job does not cause measurable Return Loss change, the adapter cord cable shall not be of twisted-pair construction.
   b. Tone Test Sets.

8. Any other items of equipment or materials required to demonstrate conformance with the Contract Documents.

1.7 SUBMITTALS

A. Conform with Section 27 05 00 - Common Work Results for Communications Systems

1.8 CONFLICTS

A. Present any conflicts between codes, regulations, specifications and/or requirements at least thirty (30) calendar days prior to the commencement of the scheduled work.

1.9 SYSTEM PERFORMANCE REQUIREMENTS, AUDIO-VISUAL SYSTEM

A. Using the listed test equipment, document that the installed systems meet or exceed the performance standards below.
   1. Audio Playback and Sound Reinforcement Systems:
      a. Electrical Performance; Source Input to Power Amplifier Output:
         1) Frequency Response (Equalizer flat): +0.5 dB 30 Hz to 15 kHz.
         2) Total Harmonic Distortion (THD): Less than 0.5%, 30 Hz to 15 kHz, +4 dBm line level.
         3) Signal to Noise: At least 70 dB, 30 Hz to 15 kHz, referenced to input of +4 dBm.
         4) Crosstalk: At least -60 dB, 30 Hz to 15 kHz.
      b. Electro/Acoustic Performance:
         1) Standard Classrooms, Coaching Spaces and Conference Rooms
            a) Uniformity of Coverage:
               (a) Consistent with installed device, location in room and geometric dispersion of sound level.
            b) Minimum Sound Pressure Level, Pink Noise Input measured on axis to device under test, center of room, at 4 feet above the floor using a freestanding Type 1, microphone:
               (b) Program Audio 80 dB flat weighting, in each octave from 125 Hz to 8 kHz, without clipping.
      c. Equipment: Specified individually.
      d. Audio Signal Path: Shall not degrade performance of connected equipment.
   2. Video Systems
      a. Digital performance concurrent with SMPTE 292M HDTV requirements at 1.5 Gigabits.
      b. Analog Composite Video Frequency Response: 100 KHz to 20 MHz within 0.5 dB
      c. Analog Component/RGBHV Video Frequency Response: 100 KHz to 350 MHz within 3.0 dB
      d. Analog NTSC Video Signal to Noise Ratio: at least 65 dB.
      e. Analog RGBHV Video Signal to Noise Ratio: at least 58 dB.
      f. Analog Video Differential Phase and Gain: no more than 0.5 degrees and 0.5 percent, respectively.
      g. Analog and Digital Video Signal to Crosstalk Ratio: at least 50 dB.
      h. Analog Video Timing; no more than .25 degrees variation at 3.58 MHz between any two parallel lines to the same location.
   3. Projection Systems:
      a. Consistent with performance of specified projectors and screens.
      b. Brightness, convergence per ANSI standard procedures for device.

B. System Gain/Levels
   1. Maintain consistent signal levels throughout the Project for each type of signal carried. Patch points shall be unity gain, "flat" equalization, unless specifically noted otherwise herein or on the drawings. The reference signal levels shall be;
      a. Analog Video; 1.0 Volt peak to peak composite signal, sync tip to peak white, defined as "100 IRE", or "100% signal".
      b. TV RF; 1000 microVolts, defined as "0 dBmV"
      c. Digital Audio, Line Level; -20 dbfs, defined as "0 VU"
      d. Analog Audio, Line Level; +4 dBu, defined as "0 VU"

e. Analog Audio, Microphone Level; -50 dBm, 150 ohms
f. Analog Audio, Speaker Level; Greater than +20 dBm
g. Data and Control; As defined by the specification for the signal carried, e.g., RS-232, RS-422 or any other such appropriate standard

C. Masking
1. Masking sound level, following Contractor's level and signal equalization

2.

1/3 Octave Band	Sound Pressure Level and maximum permitted variance (dB) below ceiling tile
50 Hz:	47.0 (+4/-6) dB
63 Hz:	47.0 (+4/-5) dB
80 Hz:	47.0 (± 4) dB
100 Hz:	47.0 (± 3) dB
125 Hz:	47.0 (± 3) dB
160 Hz:	46.0 (± 3) dB
200 Hz:	45.0 (± 2) dB
250 Hz:	44.0 (± 2) dB
315 Hz:	42.7 (± 2) dB
400 Hz:	41.3 (± 2) dB
500 Hz:	40.0 (± 2) dB
630 Hz:	38.3 (± 2) dB
800 Hz:	36.7 (± 2) dB
1000 Hz:	35.0 (± 2) dB
1250 Hz:	33.3 (± 2) dB
1600 Hz:	31.7 (± 2) dB
2000 Hz:	30.0 (± 2) dB
2500 Hz:	28.3 (± 2) dB
3150 Hz:	26.7 (± 2) dB
4000 Hz:	25.0 (± 2) dB
5000 Hz:	22.3 (± 2) dB
6300 Hz:	19.7 (± 3) dB
8000 Hz:	17.0 (± 4) dB
10,000 Hz:	12.0 (+4/-6) dB

D. Measurements

1. Contractor to submit quantitative test reports substantiating conformance with the technical performance standards outlined herein above for each cable run, component, subsystem and overall system installed under the work of this Section, concurrent with or prior to identifying to the College's Representative that the work is Substantially Complete.

2. Conform with the requirements of Section 27 05 00 – Common Work Results for Audiovisual Systems as to means and method of submittal.

1.10 TRAINING

A. Conduct training on completed system at reasonable convenience of the College during normal business hours.

1. Operator Training: 8 hours, including classroom format and hands-on training. Document training using the systems installed under the work of this project. Transmit a copy of the training recordings to the College on DVD for subsequent retraining and reference by College staff.

2. Initial Use Support: Provide standby trainer/system engineer during one (2) system uses, not to exceed 8 hours of supplemental support training.

1.11 DEFINITIONS

A. Definitions of Terms: The following definitions and conditions apply to each of the respective parameters and the measurements of those parameters, unless specifically stated otherwise:

1. Frequency Response: The minimum acceptable frequency band over which the amplitude response is within 3 dB (or any specified range), or the specified limits of the response relative to the reference frequency (1 kHz for audio, 1.0 MHz for video) under design load conditions, at any operating level up to and including the specified maximum output while fully in compliance with all other performance specifications.

2. Maximum Output Level: The minimum acceptable maximum signal output level (voltage, current or power) attained under design load conditions attained while fully in compliance with all other performance specifications.

3. Harmonic Distortion: The maximum acceptable harmonic distortion measured at any operating level, up to and including the specified maximum output, with an applied sine wave signal of any frequency in the range of the specified frequency response.

4. Audio Intermodulation Distortion: The maximum acceptable intermodulation distortion resulting from the introduction of 60 Hz and 7 kHz signals in a ratio of 4:1 under design load conditions at any operating level up to and including the specified maximum output level.

5. Signal to Noise Ratio: The minimum acceptable ratio of signal to noise levels derived from broadband measurements under design load at maximum output over the entire range of the specified frequency response.

6. Clipping Level: The minimum acceptable maximum level of signal applied to the device under design load conditions while fully in compliance with all other performance specifications.

7. Sensitivity: The maximum acceptable level of input signal applied to the device that is necessary to provide the maximum output under design load conditions.

8. Design Load: The load (in ohms) specified by usage of the particular device input or output.

9. Composite Triple Beat Ratio: The ratio of visual carrier level to composite third order distortion products.

10. Cross Modulation Ratio: The ratio of visual carrier level to coherent spurious signal level (i.e. intermodulation products).

11. Carrier to Noise Ratio: The ratio of visual carrier to noise levels derived from broadband measurements under design load at maximum output over the entire range of the specified frequency response.

B. Signal Levels: The following voltage levels shall be considered the standard operating levels for the particular circuitry, unless specifically noted otherwise (0.775 Volt = 0 dBu = 0 dbm for a 600 ohms terminated circuit):

1. Microphone Circuits: -30 dBu or less.

2. Audio Line Level Circuits: -30 dBu to +24 dBu; equivalent to -30 dBm to +24 dBm for a 600 ohms terminated circuit.

3. Loudspeaker Level Circuits: More than +24 dBu.

4. Video Line Level Circuits: 1.0 Volt, peak to peak composite signal.

5. Radio Frequency (RF), Television (MATV) Circuits: +6 to +72 dBmV (0 dBmV = 1,000 microvolts).

C. Characteristic Impedances: The following operating impedances shall be considered to be the standard operating impedances for the particular circuitry, unless specifically noted otherwise:

1. Microphone Circuits: 50-250 ohms source, 150-1500 ohms terminating, electrostatically and electromagnetically balanced to ground.

2. Audio Line Level Circuits: 600 ohms maximum source, 600 ohms minimum terminating, line to line, electrostatically and electromagnetically balanced to ground.

3. Video Line Level Circuits: 75 ohms maximum source, 75 ohms minimum terminating to shield and signal ground, with Vertical Standing Wave Ratio (VSWR) not to exceed 1.2.

4. Radio Frequency (RF) Television Circuits: 75 ohms nominal to shield and signal ground, with Vertical Standing Wave Ratio (VSWR) not to exceed 1.2.

1.12 SOFTWARE LICENSING

A. Provide licensing for Project-specific software programming at programmable devices.

B. Provide licensing and original software copies for each device provided under Work of this Section that uses software for operation, configuration or control.

1. Provide licensing for required workstation operating systems, and required third party software.

2. For the Control System, provide a complete copy of the source code, including the device interface driver code modules.

C. Upgrade each software package to the release in effect at the end of the Warranty Period.

PART 2 - PRODUCTS

2.1 LOUDSPEAKER ASSEMBLIES AND RELATED **(BASE BID)**

A. Compact Package Full-Range Loudspeakers Speakers, Wall-mount
1. Drawing Reference: SR
2. Manufacturers:
a. Extron SM-3 (District Standard, no substitution)

B. Compact Full-Range 70v Loudspeaker, Ceiling
1. Drawing Reference: SA
2. Manufacturer:
a. Extron CS-3T w/ Speedmount Enclosure where required for installation in suspended ceilings. (District Standard, no substitution)

C. Full-Range 70v Loudspeaker, Pendant
1. Drawing Reference: SP
2. Manufacturer:
a. Extron Soundfield 3” Full-Range Pendant Speaker, White (District Standard, no substitution)

2.2 GENERAL POWER AMPLIFIERS AND RELATED

A. Power Amplifiers, General

1. Drawing Symbol: PA[number].

2. Provide the following functions and/or features

a. Employ solid state devices (integrated circuits and/or transistors) throughout and employ positive protection of circuit components.

b. With amplifier input driven 10 dB beyond input level required to produce full rated output, amplifier shall withstand for at least 15 seconds any of the following load conditions without instability or operation of main over current protection (i.e. no blown fuses or circuit breakers).
1) "Short" circuit of 0.1 ohm.
2) Open circuit (no load).

3) Standard Reactive Load: 5.4 ohms in series with the parallel combination of 12.5 microhenrys; 800 microfarads and 18.3 ohms resistive.

c. Peak voltage of turn-on and/or turn-off transients not greater than 20 dB below maximum rated amplifier output.
1) Time duration of transients not to exceed 3 seconds.

d. Input level controls for each output channel to be calibrated, stepped attenuators with at least 50 dB range.
1) For 0 to 34 dB of attenuation, steps not to be greater than 2.0 dB.
2) Attenuators to track calibration within 0.5 dB.
3) Stepped attenuators are not required at Power Amplifiers where the connected driving source device includes a precision attenuator under digital control with precision not less than that specified herein.

e. Input Connectors: XLR connector or tip sleeve (standard) phone jack or barrier strip.

f. Output Connectors: Standard 0.75 inch spacing "5-way" binding posts, or barrier strip.

g. Where integral cooling fans are provided, such fans shall have a minimum life rating of 50,000 hours at 25 degree Centigrade ambient temperature.

h. Where indicated, provide balanced input, differential or transformer. Provide matching accessory to implement if not a standard feature of the product provided.

i. Listed by a Nationally Recognized Testing Laboratory.

3. Minimum performance requirements with all channels driven

a. Power Output Per Channel: As scheduled on Drawings as Minimum Amplifier (Min Amp) and specified below; continuous average sine wave power into 70 Volt line over a bandwidth of 40 Hz to 20 kHz.
1) Frequency Response: plus 0 dB, minus 0.5 dB, 40 Hz to 20 kHz at rated output.
2) Total Harmonic Distortion: Less than 0.25 percent at rated output, 40 Hz to 20 kHz.
3) Intermodulation Distortion: Less than 0.04 percent at rated output using frequencies of 60 Hz and 7 kHz, mixed in a ratio of 4:1.
4) Input Impedance: 15,000 ohms minimum; unbalanced, or balanced as shown on drawings.
5) Hum & Noise: At least 94 dB signal-to-noise ratio.
6) Channel Separation: At least 75 dB at 1 kHz.
7) Phase Shift: Less than plus20 degrees from 20 Hz to 20 kHz.
8) D.C. Offset: Less than 10 millivolts.

B. Power Amplifiers, Mono, 70 Volt **(BASE BID)**

1. Drawing Symbol
a. PA70-200
2. Manufacturer

a. Extron XPA 2001-70V (District Standard, no substitution)

C. Power Amplifiers, 2 Channel, Low Impedance **(BASE BID)**
1. Drawing Symbols: PA30
2. Comply with Power Amplifiers, General, in this Section.
3. Power Output Per Channel, continuous average sine wave power into 8 ohm voice coil impedance, not less than 30 Watts
4. Manufacturer, PA30
   a. Extron MPA 152 Plus (District Standard, no substitution)

D. Sound Bar Speaker **(ADDITIVE BID ALT. #2)**

1. Drawing Reference: SBS
2. Construction:
   a. System Configuration 2-channel 2-way full-range for music / speech
   b. Components & Loading (2) 3.5 ” long-throw woofers and (1) 0.75“ tweeter per channel
   c. Recommended High-Pass Filter On-board 1st order @ 120 Hz; no outboard HP needed
   d. Enclosure Type Low profile sealed enclosure
   e. Enclosure Material Extruded ABS plastic with steel baffle insert
   f. Finish: Black
   g. Connectors Dual binding-head screws
   h. Suspension Hardware Universal mounting kit for direct attachment to display
   i. Grille Integral fabric wrap
3. Minimum Features/Function/Performance:
   a. Frequency Response: 120 – 20,000 Hz, +/- 3 dB
   b. Sensitivity 90 dB @ 2.83 volts / 1M
   c. Impedance 8 ohm
   d. Power Handling 90 W long term (AES-2) (per channel)
   e. Maximum Output 103 dB long term; 109 dB peak
   f. Nominal Coverage Angles 100□ H x 120□ V
   g. Nominal Dimensions
      1) height: 4.13 “
      2) width: match display wall
      3) depth: 2.06 ”
   h. Net Weight 15 lbs
4. Manufacturers:
   a. Innovox FS-H2
   b. Cambridge Sound

c. Or equal.

E. Paging Horn - 70V Coupled, Wall Mount, Weather Resistant **(BASE BID)**

1. Drawing Reference: SHC4
2. Complete Assembly to consist of:
   a. Constant directivity horn consisting of a 1.5” voice coil.
   b. Seventy volt tap transformer; 30 W minimum tap.
   c. Frequency Range (+/- 5dB): 400 Hz – 6.5 kHz.
   d. Sensitivity: 107 dB @ 1W/1m.
   e. Coverage: 60 degrees horizontal, 40 degrees vertical
   f. Weather resistant enclosure.
   g. Nominal Dimensions: 9”H x 12”W x 14”D.
   h. Tilting wall mount bracket.
   i. Finish: Per Architect.
3. Manufacturer
   a. ElectroVoice PA430T
   b. Community
   c. Atlas Sound
   d. Or equal

2.3 ASSISTIVE LISTENING SYSTEM (ALS):

A. General
1. Provide Radio Frequency Type, Frequency Modulated
2. 72 MHz Assistive Listening band.
3. Quantity of Devices: refer to ALS schedule on TA-001.

B. ALS Transmitter **(ADDITIVE BID ALT. #2)**
1. Drawing Symbol: ALS TX
2. Manufacturer
   a. Listen Technologies LT-700-072 (District Standard, no substitutions)

C. Receivers and Accessories **(ADDITIVE BID ALT. #2)**
1. Receiver
   a. Battery powered, rechargeable.
   b. Volume control.
   c. Receptacle for earphone/accessory.
   d. Rechargeable battery.
   e. Tunable to channel in use by the user.
   f. Quantity: As Scheduled on the plans
2. Earphone

a. Ear hung, not inserted in the ear canal.
b. Hearing-Aid Compatible - For hearing-aid compatible receivers:
c. Wireless neck loop compatible with “T” coil hearing aids.
d. Built-in antenna
e. Operates with provided receivers

3. Manufacturer
   a. Listen Technologies LR-500-072-0-M-C, LA-164 earphones, and LA-166 neck loops (Compatible with District Standard ALS Transmitter, no substitutions)

D. Battery Charger/Storage/Carry Case
1. Features
   a. Store and charge up to 16 Receivers and related accessories.
   b. Cover, latches and carrying handles.
   c. Removable lid.
2. Quantity: To simultaneously recharge each receiver as scheduled on the plans
3. Manufacturer
   a. Listen Technologies LA-325 (Compatible with District Standard ALS Transmitter, no substitutions)

2.4 CONTROL SYSTEM, SWITCHING AND RELATED

A. General

1. Products provide under this Section shall be made by manufacturers regularly engaged in the production of programmable commercial audio-visual control systems. Such manufacturers shall have at least 5 years prior production experience in the manufacture of such goods.

2. Provide control system to perform functions scheduled on drawings and herein.

   a. System to be field programmable.

   b. Provide programming allowance to implement system as required to provide the functionality indicated herein and as defined by the College during design and construction phase meetings, including closely matching the user interface of the existing control panels used elsewhere at the College in style, color and organization to the extent directed by the College’s Representative.

3. In addition to providing programming to meet the requirements outlined in part one of this specification section and as outlined by the College during the preconstruction programming meetings, Contractor to provide an allowance of up to $2000 to implement new functions in the audiovisual systems programming identified by the College after the substantial completion of this project. Allowance may not be expended by the Contractor in completing the base bid scope of work including Warranty defect items.

B. Control Processor **(ADDITIVE BID ALT. #2)**
1. Drawing References: CONTROL (Conference/Group Study)
2. Manufacturers:
   a. Extron IPCP Pro 250 (compatible with District Standard, no substitution)

C. Control Panels, Touch, 7" Diagonal **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: CTP (table-top), CTW (wall)
   2. Manufacturers
      a. Extron TLP Pro 725M & XTP PI 100 (District Standard, no substitution)

D. 100 Base-T Control LAN Ethernet Switch **(ADDITIVE BID ALT. #2)**
   1. Drawing References: NSW/NSW24
   2. Port Count:
      a. As Required plus at least 3 spare
   3. Features/Functions/Performance:
      a. RJ-45 10/100Base-TX ports (IEEE 802.3 Type 10Base-T; 802.3u Type 100Base-TX) ports.
      b. Each port can automatically provide 10 or 100 MBps Ethernet Layer 2 switching.
      c. Each port can automatically sense maximum connection speed of attached device (10 or 100 MBps) and its ability to support full or half duplex connectivity and respond (auto-sensing). .
      d. Performance - at least:
         1) throughput: 1 million pps (64-byte packets)
         2) address table size: 2,000 entries
      e. Communications - provides full support for the following standards:
         1) IEEE 802.1p Priority;
         2) IEEE 802.1D Spanning Tree;
         3) IEEE 802.1Q VLANs;
         4) IEEE 802.3x Flow Control
      f. Management - Provide at least:
         1) SNMPv1/v2c
      g. Environmental - can operate normally within at the following range of conditions:
         1) operating temperature: 0 degrees C to 55 degrees C (32 degrees F to 131 degrees F)
         2) relative humidity: 15 to 95% @ 40 degrees C (104 degrees F), non-condensing
      h. Provides port filtering by MAC address.
      i. Automatic shutdown of ports detecting jabber
      j. Status lights indicating at least port activity on each port.
   4. Construction.
      a. 1 Rack Unit maximum per 12 ports provided.
      b. Provide accessories as required to rack mount.
   5. Manufacturers:
      a. Netgear
      b. DLink
      c. Hewlett Packard
      d. Cisco Systems
      e. Or approved equal.

E. Modular Control Panel **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: CBP
   2. Manufacturer:

a. Extron MLC Plus 200 (District Standard, no substitutions)

2.5 VIDEO PROCESSING

A. Digital Presentation Switcher (Classroom)
1. Drawing Reference: AVSW1 **(ADDITIVE BID ALT. #2)**
2. Manufacturer:
a. Extron IN1808 (District Standard, no substitution)

B. Digital Presentation Switcher (Conference/Group Study)
1. Drawing Reference: AVSW2 **(ADDITIVE BID ALT. #2)**
2. Manufacturer:
a. Extron 1N1604 DTP (compatible with District Standard, no substitution)

2.6 NOTIFICATION SYSTEM

A. 2-WAY NOTIFICATION SYSTEM LOUDSPEAKER **(ADDITIVE BID ALT. #2)**
1. Drawing Reference: NS
2. Features/Functions:
a. IP flush mount loudspeaker w/ powder-coated metal grille.
b. 12”W x 12”H x 4”D
c. 8” High efficiency PA speaker
d. Built-in Sound Masking
e. Built-in Microphone for 2-way communication
f. Manufacturer’s back-box included
3. Manufacturer:
a. Advanced Network Systems IPSWS-FM
b. Or equal.

B. PUSH-TO-TALK 2-WAY NOTIFICATION SYSTEM **(ADDITIVE BID ALT. #2)**
1. Drawing Reference: PTT
2. Features/Functions:
a. Faceplate dimensions 4.5”H x 2.75” W for installation with any standard single-gang junction box.
b. Includes call button, faceplate (16 ga. Polished stainless steel), vandal resistant screws and peripheral interface adaptor board.
3. Manufacturer:
a. Advanced Network Systems AND-BTN-KIT-1.
b. Or equal.

2.7 SOURCE DEVICES

A. USB Pan-Tilt-Zoom Camera (Communications Lab) **(ADDITIVE BID ALT. #2)**

1. Drawing Reference: PTZ
2. Manufacturer:
a. Huddly IQ
b. Or equal

B. Wireless Connection Gateway **(ADDITIVE BID ALT. #2)**

1. Drawing Reference: WCG

2. Features/Functions:
   a. Number/signal type/connectors
      1) 1 HDMI digital video
      2) 1 female HDMI type A
   b. Horizontal frequency 15 kHz to 100 kHz
   c. Vertical frequency 24 Hz to 75 Hz
   d. Resolution range (Window mode) 640x480 @ 60 Hz to 1920x1200 @ 60 Hz (includes 480p, 576p, 720p, 1080p)
   e. Resolution range (Pass-through mode) 640x480 @ 60 Hz to 4096x2160 @ 60 Hz (includes 480i, 480p, 576i, 576p, 720i, 720p, 1080i, 1080p, 2K, 4K)
   f. Standards DVI 1.0, HDMI 2.0, HDCP 2.3
3. Manufacturer:
   a. Extron Sharelink Pro 500
   b. Or equal

C. Conference Camera/Microphone/Soundbar Speaker Hub **(ADDITIVE BID ALT. #2)**

1. Drawing Reference: HUB
2. Features/Functions:
   a. 20MP 1-inch CMOS Camera
      1) 60fps max
      2) 133-degree field of view
   b. Microphone Array
      1) Built-in 8 MEMS
      2) Beamforming and Noise-suppression
      3) Full-duplex
      4) Echo-cancellation
   c. Speaker
   d. Build-in 5W Loudspeaker
3. Connectivity
   a. USB, 1x USB 3.0, 1x USB 2.0
   b. Audio 1x 3.5mm audio line in
4. Power: DC 48V/0.7A
5. Manufacturer:
   a. Yealink UVC40
   b. Crestron
   c. Or equal

D. Multi-Port USB Hub (Communications Lab) **(ADDITIVE BID ALT. #2)**
1. Drawing Reference: USB-HUB
2. Manufacturer:
   a. Netlink
   b. Lenovo
   c. Or equal

E. Handheld Wireless USB Microphone (Communications Lab) **(ADDITIVE BID ALT. #2)**
1. Drawing Reference: HMR
2. Manufacturer:
   a. Samson Stage XPD2 Handheld Digital Wireless System

b. Shure
c. Or equal.

F. Ceiling Microphone System and Processor **(ADDITIVE BID ALT. #2)**
1. Drawing Reference: CMIC, CM, CMIC-PROC
2. Features:
   a. Dante interface with (2) RJ-45 sockets
   b. Audio Analog Out, 3-pin Phoenix Connector
   c. PoE via RJ-45 Socket
   d. Configuration via software or media control system
3. Manufacturer:
   a. Sennheiser Team Connect 2 w/ ceiling mounting frame for lay-in ceilings or ceiling suspension set for open/hard ceiling conditions
   b. Or equal

G. Radio Frequency Receiver/Wireless Microphone System: **(ADDITIVE BID ALT. #2)**
1. Drawing Reference(s): W, WMIC, WMIC REC
2. Provide quantity of complete systems to match quantity indicated on functional diagrams.
   a. Coordinate operating frequency with other UHF local sources, including but not limited to current television operating frequencies and DTV frequency allocations and/or local public safety operating frequencies to eliminate any interference from outside RF sources.
   b. Provide Receiver unit configured for diversity reception.
   c. Allows the expansion of wireless microphone systems by splitting one pair of antennas to multiple receivers. It also amplifies RF signals to compensate for insertion loss that results from splitting signal power to multiple outputs. A single system can support up to four wireless receivers.
3. Function/Features/Performance:
   a. WMIC
      1) Operating Range Under Typical Conditions: 100m (300 ft.) Note: actual range depends on RF signal absorption, reflection, and interference.
      2) Audio Frequency Response (+/– 2 dB): Minimum: 45 Hz; Maximum: 15 kHz
      3) Total Harmonic Distortion (ref. +/– 38 kHz deviation, 1 kHz tone): 0.5%, typical
      4) Dynamic Range: >100 dB A-weighted
      5) Operating Temperature Range: –18°C (0°F) to +57°C (+135°F) Note: battery characteristics may limit this range
      6) Transmitter Audio Polarity: Positive pressure on microphone diaphragm (or positive voltage applied to tip of WA302 phone plug) produces positive voltage on pin 2 (with respect to pin 3 of low impedance output) and the tip of the high impedance 1/4-inch output.
4. Manufacturer, WMIC System:
   a. Shure QLXD24/SM58 Digital Wireless Handheld System w/ SM58 Cartridge, Shure QLXD14 Bodypack System, and Shure WCE6T Omnidirectional Condenser Rigid Earset Microphone, tan.
   b. Or approved equal.

H. HDMI/DisplayPort w/ Audio Embedding Input Wall Plate **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: MP1
   2. Manufacturer:
      a. Extron DTP T DWP 4k 232 D (District Standard, no substitution)

I. Audio Input Wall Plate **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: MP2
   2. Features:
      a. 1-gang receptacle plate with (2) XLR-F balanced audio jacks
      b. Lockable, weatherproof receptacle cover
   3. Manufacturer:
      a. ProCo
      b. Whirlwind
      c. Or equal

J. Video Extender Set, Transmitter **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: DMTX
   2. Manufacturer
      a. Extron DTP T HWP 4k 231 D (District Standard, no substitution)

K. Multimedia Receiver w/ Scaler **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: DMRX
   2. Manufacturers
      a. Extron DTP HDMI 4K 230 RX (District Standard, no substitution)

L. Multimedia Receiver w/ Scaler w/ audio de-embedding **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: DMRX2
   2. Manufacturers
      a. Extron DTP3 R 201 4K/60 HDMI RX 60-1869-53 (compatible with District Standard, no substitution)

M. USB Extender Set **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: USB-X
   2. Manufacturer:
      a. Extron Extender Plus T (transmitter) 60-1471-12 and R (receiver) 60-1471-13 (compatible with District Standard, no substitution)

N. Document Camera **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: DOCCAM, DCAM
   2. Manufacturer
      a. Elmo TT-12iD (District Standard, no substitution)

2.8 PROJECTION SCREENS

A. Projection Screen, Motorized Retractable, Wall-Mount, **(BASE BID)**
   1. Drawing Reference(s): Projection screen, indicated
   2. Features/Functions:
      a. 137” diagonal
      b. 16:10 Aspect Ratio

3. Manufacturer
   a. Da-lite Tensioned Contour Electrol (District Standard, no substitution)

2.9 VIDEO TERMINAL EQUIPMENT

A. LCD, 55" Diagonal **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: LCD55
   2. Features/Functions:
      a. Panel Type: LCD, LED Backlighting
      b. Professional/commercial grade display warrantied by the manufacturer for continuous operation for not less than two years.
      c. Minimum Viewable Panel Size: 55" diagonal, 16:9 aspect ratio
      d. Maximum Pixel Pitch: 0.923 x 0.923 mm
      e. Native Resolution: 1920 x 1080
      f. Viewing Angle (H/V): 176°/176°
      g. Brightness: 450 cd/m^2
      h. Maximum Response Time: 6 ms
      i. Contrast Ratio: 5000:1
      j. Inputs
         1) VGA (D-sub 15 pin)
         2) HDMI
         3) Stereo Mini Jack
      k. Control:
         1) RS-232C
         2) RJ45
         3) IR, included IR Remote
      l. Power Consumption: In accordance with California Code of Regulations, Title 20: Division 2, Chapter 4, Article 4, Sections 1601-1608: Appliance Efficiency Regulations
      m. Weight: 70 lbs. Maximum
      n. Operating Temperature: 5-40 degrees C
      o. Operating Humidity: 20-80%
      p. Dimensions: Less than 2" deep.
   3. Manufacturer
      a. Samsung ME55B
      b. Sharp
      c. NEC
      d. Or approved equal

B. LCD, 60" Diagonal **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: LCD60
   2. Manufacturer
      a. Samsung UN60KS800DFXZA (District Standard, no substitution)

C. LCD, 70" Diagonal **(ADDITIVE BID ALT. #2)**
   1. Drawing Reference: LCD70
   2. Features/Functions:
      a. Panel Type: LCD, LED Backlighting
      b. Professional/commercial grade display warrantied by the manufacturer for continuous operation for not less than two years.

c. Minimum Viewable Panel Size: 70” diagonal, 16:9 aspect ratio
d. Maximum Pixel Pitch: 0.923 x 0.923 mm
e. Native Resolution: 1920 x 1080
f. Viewing Angle (H/V): 176°/176°
g. Brightness: 450 cd/m^2
h. Maximum Response Time: 6 ms
i. Contrast Ratio: 5000:1
j. Inputs
   1) VGA (D-sub 15 pin)
   2) HDMI
   3) Stereo Mini Jack
k. Control:
   1) RS-232C
   2) RJ45
   3) IR, included IR Remote
l. Power Consumption: In accordance with California Code of Regulations, Title 20: Division 2, Chapter 4, Article 4, Sections 1601-1608: Appliance Efficiency Regulations
m. Weight: 70 lbs. Maximum
n. Operating Temperature: 5-40 degrees C
o. Operating Humidity: 20-80%
p. Dimensions: Less than 2” deep.

3. Manufacturer
   a. Sharp PNR-703
   b. Sharp
   c. NEC
   d. Or approved equal

D. LCD, 80” Diagonal **(ADDITIVE BID ALT. #2)**
1. Drawing Reference: LCD80
2. Features/Functions:
   a. Panel Type: LCD, LED Backlighting
   b. Professional/commercial grade display warrantied by the manufacturer for continuous operation for not less than two years.
   c. Minimum Viewable Panel Size: 80” diagonal, 16:9 aspect ratio
   d. Maximum Pixel Pitch: 0.923 x 0.923 mm
   e. Native Resolution: 1920 x 1080
   f. Viewing Angle (H/V): 176°/176°
   g. Brightness: 450 cd/m^2
   h. Maximum Response Time: 6 ms
   i. Contrast Ratio: 5000:1
   j. Inputs
      1) VGA (D-sub 15 pin)
      2) HDMI
      3) Stereo Mini Jack
   k. Control:
      1) RS-232C
      2) RJ45
      3) IR, included IR Remote

l. Power Consumption: In accordance with California Code of Regulations, Title 20: Division 2, Chapter 4, Article 4, Sections 1601-1608: Appliance Efficiency Regulations
m. Weight: 70 lbs. Maximum
n. Operating Temperature: 5-40 degrees C
o. Operating Humidity: 20-80%
p. Dimensions: Less than 2" deep.

3. Manufacturer
   a. Sharp PNR-803
   b. Sharp
   c. NEC
   d. Or approved equal

E. Video Projector **(ADDITIVE BID ALT. #2)**
1. Drawing Reference: VPROJ
2. Manufacturers, Projectors:
   a. Panasonic PT-RZ570 with lens for installed throw-distance (District Standard, no substitution)

F. Projector Drop Ceiling Mount with Adjustable Pole **(BASE BID)**
1. Construction
   a. Compatible with suspended ceiling systems using 2'x2' or 2'x4' tiles
   b. Up to 50 lbs (22.7 kg) maximum load capacity
   c. Single-space and double-space J-box openings.
   d. Baseplate and pipe: aluminum
   e. Tie wire: steel, 14 AWG, 70,000 psi tensile strength
   f. Dimensions
      1) Base plate 1.2" H x 26.4" W x 8.0" D
      2) (2.9 cm H x 67.0 cm W x 20.3 cm D)
      3) Pipe 25" length, 1.5"-11.5 NPT
   g. Adjustment ranges 1.5" - 23.0" drop, 21.5" adjustability in 0.5" steps
2. Manufacturer
   a. Chief CMA-450, White
   b. Or equal.

2.10 SOUND CABLES AND RELATED

A. General

1. Provide cable with electrical conductors of soft drawn annealed copper, bare or tinned, solid or concentric stranded as applies, conductivity not less than 98 percent of pure copper.

2. Comply with applicable Code for insulation, jacket, marking and listing for applicable use.

   a. Refer to California Electrical Code, Table 725-61. Cable Uses and Permitted Substitutions.

3. Manufacturer part number specified is for a Listed Type CM construction to indicate intended cable construction and quality.

a. Code requirements take precedence.

b. Provide type required by Code at no additional cost to the College.

B. Cable, Microphone and Line Level, General Purpose

1. Drawing Symbol(s): SP, 2A.

2. Description: Shielded, single twisted pair, with #20 AWG color coded stranded conductors and foil shield with drain wire.

3. Performance/Construction

a. Conductors AWG #20.

b. Conductors Stranding: 7 by 28.

c. D.C. Resistance Per 1000 feet 15 ohms maximum.

d. Shield: Aluminum polyester foil with #20 AWG stranded tinned copper drain wire.

e. Diameter 0.24 inch maximum.

4. Where 2A indicated, provide 2 each SP

5. Manufacturer

a. Belden 8762

b. West Penn.

c. Or approved equal.

C. Cable, Microphone and Line Level, Miniature

1. Drawing Symbol: SP, 2A

2. Restriction: For use within fixed equipment racks only.

3. Description: Shielded, single twisted pair, with #22 AWG color coded stranded conductors and foil shield with drain wire.

4. Performance/Construction:

a. Conductors AWG #22.

b. Conductors Stranding: 7 by 30.

c. D.C. Resistance Per 1000 feet: 20 ohms maximum.

d. Shield: Aluminum polyester foil with #24 stranded tinned copper drain wire.

e. Diameter 0.15 inch maximum.

5. Where 2A indicated, provide 2 each SP

6. Manufacturer

a. Belden 8451, 9451, 1266A.

b. Alpha.

c. West Penn.

d. Or approved equal.

D. Cable, Antenna, Assistive Listening System

1. Description

a. Nominal 50 ohms (actual 51 or 52 ohms) coaxial cable.

2. Minimum 97 percent shield coverage.

3. Joint Army Navy (JAN) or Military (MIL) Construction

a. RG-8/U to JAN-C-17A

b. RG-8 A/U to MIL-C-17D

c. RG-9/U to JAN-C-17A.

4. Manufacturer

a. Belden 8237, 9251 or 8242.

b. CommScope.

c. Or approved equal.

E. Cable, Loudspeaker and D.C. Power

1. Drawing Symbol(s)

a. #18TP

b. #16TP

c. #14TP

d. #12TP

2. Description

a. Twisted pair, jacketed, unshielded cables, #12, #14, #16, or #18, as shown on Drawings.

3. Plenum rated where installed in open plenum return voids.

4. Performance/Construction

a. Conductor, AWG: #12, #14, #16, and #18, as noted.

b. Maximum diameter
1) 0.384 inch (#12)
2) 0.332 inch (#14)
3) 0.256 inch (#16)
4) 0.224 inch (#18).

5. Manufacturer

a. Belden.
   1) #12TP, Belden 8477
   2) #14TP, Belden 8473
   3) #16TP, Belden 8471
   4) #18TP, Belden 9740
   5) West Penn.
   6) Or approved equal.

F. Audio & Control Cabling, Underground, in ducts

1. As specified for the applications above with waterblocking construction consisting of two ply tape designed to swell on exposure to water.
2. Jacket is sunlight and moisture resistant
3. NEC CM or CL3 listed or better. Transition to listed cabling type within 50 feet of entering building.
4. Manufacturer listed for underground application subject to extended exposure to standing water.
5. Manufacturer:
   a. West Penn (aquaseal)
   b. Alpha
   c. Belden
   d. Commscope/Isotec
   e. Or approved equal.

2.11 VIDEO CABLES, COPPER COAX AND RELATED

A. General

1. Provide cable with electrical conductors of soft drawn annealed copper, bare or tinned, solid or concentric stranded as applies, conductivity not less than 98 percent of pure copper.
2. Comply with applicable Code for insulation, jacket, marking and listing for applicable use.
   a. Refer to California Electrical Code, Table 725-61. Cable Uses and Permitted Substitutions.
   b. Manufacturer part number specified is for a Listed Type CM construction to indicate intended cable construction and quality.
3. Code requirements take precedence.
   a. Provide type required by Code at no additional cost to the College.

B. Cable, Precision Video

1. Drawing Symbol(s): P-VID, V.

2. Description: 100 percent sweep tested from 0.01 to 100 MHz, double braided shield solid center conductor 75 ohms coaxial precision video cable.

3. Performance

   a. Cable Type: Coaxial precision video.

   b. Center Conductor AWG: Twenty (20) bare copper.

   c. Insulation: Polyethylene.

   d. Shield: Tinned copper double braid, minimum 98 percent coverage.

   e. Nominal Impedance: 75 ohms.

   f. Velocity of Propagation: 66 percent.

   g. Attenuation Per 100 feet:
      1) 1.0 MHz: 0.25 dB
      2) 4.5 MHz: 0.45 dB
      3) 10.0 MHz: 0.78 dB.

   h. Jacket: Polyethylene.

   i. Diameter: 0.305 inch maximum.

4. Manufacturer

   a. Belden 8281A or 8281B.

   b. Canare

   c. Gepco

   d. Or approved equal.

C. Cable, Miniature Precision Video

1. Drawing Symbol: Miniature Precision Video.

2. Description: 100 percent sweep tested from 0.01 to 100 MHz, braided shield plus foil shield, stranded center conductor 75 ohms coaxial miniature precision video cable.

3. Performance

   a. Cable Type: Coaxial precision video.

   b. Center Conductor AWG: 22 or 23 bare copper.

   c. Center Conductor Stranding: 7 by 30 or 7 by 32.

   d. D.C. Resistance Per 1000 feet: 15 ohms maximum.

   e. Insulation: Cellular Polyethylene.

   f. Shield: 100 percent foil plus trimmed copper braid, 95 percent coverage.

   g. Nominal Impedance: 75 ohms.

   h. Velocity of Propagation: 66 percent.

   i. Attenuation Per 100 feet:

1) 1.0 MHz: 0.15 dB
2) 10.0 MHz: 1.3 dB
3) 100 MHz: 5.0 dB.

j. Jacket: Polyethylene.

k. Diameter: 0.240 inch maximum.

4. Manufacturer

a. Belden 9209A.

b. Canare LV-61S.

c. Or approved equal.

D. Cable Set, Audio Video, Manufactured

1. Provide signal type as indicated on Drawings.

2. Manufacturer

a. Liberty Wire & Cable Interflex Z-200 and Z-300 Series

b. Markertek

c. Or approved equal.

E. Cable, Data Monitor Precision Video

1. Plan Reference(s):

a. D5

b. 5DVideo

2. Construction

a. 5 miniature high resolution coax cables in an overall shielded overall jacket to transmit analog component video based on the Red-Green-Blue-Horizontal Sync-Vertical Sync (RGBHV) transmission method.

b. Sub cables are color coded Red, Green, Blue, Black, Grey; or approved alternate color coding scheme.

c. Jacket: Code approved equal for application.

d. Overall five sub cable assembly diameter: 0.56" maximum in raceway applications.

e. Center Conductor AWG: Twenty two (22) ga Silver Plated Copper.

f. Insulation: Foamed Teflon.

g. Shield:
1) Each subcable is double shielded
2) Overall cable has 100% tape shield.

3. Approval/Rating:

a. UL: Recognized Type CL2P (Article 725 of NEC) for plenum application, riser rated elsewhere.

4. Performance - each sub-cable:
   a. Resistance: 0.0162 ohms/ft nominal @ 20C
   b. Impedance: 75 ohm nominal
   c. Capacitance: 17.5 pf/ft nominal
   d. Velocity of Propagation: 80% nominal
   e. Time Delay: 1.19ns/ft nominal
   f. Maximum Attenuation Per 100':
      1) 10 MHz: 0.8 dB/100 ft.
      2) 50 MHz: 2.5 dB/100 ft.
      3) 100 MHz: 3.5 dB/100 ft.
      4) 200 MHz: 4.6 dB/100 ft.
      5) 300 MHz: 5.0 dB/100 ft.
      6) 400 MHz: 7.2 dB/100 ft.
      7) 1000 MHz: 14.6 dB/100 ft.
5. Manufacturers:
   a. Altinex CB5100PL in plenum spaces, riser rated elsewhere.
   b. Extron
   c. Belden
   d. Gepco.
   e. Or approved equal.

F. DVI Cabling
1. Drawing Reference: DVI
2. Features/Functions
   a. Supports single link DVI-D signals up to 1920 x 1200 @ 60 Hz and 1080p/60:
   b. Data rates to 4.95 Gbps
   c. Color depth to 24 bits - 8 bits per color
   d. For cable lengths up to 12 feet: 24 AWG copper wire construction
   e. For cable lengths 25 feet and longer: 22 AWG copper wire construction
   f. NEC CM rated
3. Manufacturers, copper cabling and extenders:
   a. Extron
   b. Or approved equal.

G. HDMI Extender

1. Drawing Reference: HDMI Extend, HDMI XTD

2. Minimum Features/Functions/Construction/Performance

   a. Select to suit application and distance.

   b. Video
      1) Maximum data rate 6.75 Gbps (2.25 Gbps per color)
      2) Maximum pixel clock 165 MHz
      3) Resolution range Up to 1920x1200 or 1080p @ 60 Hz; 8, 10, or 12 bit color depth
      4) Formats RGB and YCbCr digital video
      5) Standards DVI 1.0, HDMI, HDCP 1.1, CEA-861E

   c. Video input — transmitter
      1) Number/signal type 1 single link HDMI (or DVI-D*)
      2) Connectors 1 female HDMI type A

   d. Interconnection between transmitter and receiver
      1) Connectors 1 female RJ-45 per unit
      2) Termination standard ANSI/TIA T568B
      3) Signal transmission distance Up to 330' (100 m) using manufacturer's recommended cabling assembly.

   e. Video output — receiver
      1) Number/signal type 1 single link HDMI (or DVI-D*)
      2) Connectors 1 female HDMI type A

3. Manufacturer, provide with with manufacturer's mounting kits and recommended cabling assemblies:

   a. Liberty Wire & Cabling

   b. Or approved equal.

H. VGA Extender

1. Drawing Reference: VGA XTD or as required

2. Provide as required to maintain signal integrity over required cable length

3. Manufacturers:

   a. Any as specified for HDMI extenders above.

2.12 CONTROL AND CONTROL MEDIA CABLING

A. General

1. Provide cable with electrical conductors of soft drawn annealed copper, bare or tinned, solid or concentric stranded as applies, conductivity not less than 98 percent of pure copper.

2. Comply with applicable Code for insulation, jacket, marking and listing for applicable use.

a. Refer to California Electrical Code, Table 725-61. Cable Uses and Permitted Substitutions.

b. Manufacturer part number specified is for a Listed Type CM construction to indicate intended cable construction and quality.

3. Code requirements take precedence.

a. Provide type required by Code at no additional cost to the College.

B. High Speed, TIA/TIA Category Cabling

1. Drawing Reference:** UTP6-4, where ** denotes cable count

2. Construction:

a. Provide horizontal copper cable in accordance with:
1) EIA ANSI/TIA/EIA-568-B.2
2) UL 444,
3) NEMA WC 66 (Performance Standard for Category 6 and Category 7 100 Ohm Shielded and Unshielded Twisted Pair)
4) ICEA S-90-661

b. UTP (unshielded twisted pair),

c. 100 ohm impedance

d. Four each individually twisted pair, 22 or 24 AWG conductors,
1) Color code
a) Pair 1 White/Blue Blue
b) Pair 2 White/Orange Orange
c) Pair 3 White/Green Green
d) Pair 4 White/Brown Brown

e. No shield in the sheath.

f. Jacket
1) Thermoplastic jacket
2) Color: Blue unless otherwise indicated.
3) Cable imprinted with manufacturers name or identifier, flammability rating, gauge of conductor, transmission performance rating (category designation) at regular intervals not to exceed 2 feet.
4) The word "FEET" or the abbreviation "FT" shall appear after each length marking.
5) Provide communications general purpose (CM or CMG), communications plenum (CMP) or communications riser (CMR) rated cabling in accordance with NFPA 70.
6) Type CMP and CMR may be substituted for type CM or CMG and type CMP may be substituted for type CMR in accordance with NFPA 70.

3. Certification

a. Warrantied by the manufacturer to provide Category 6 performance when installed in accordance with applicable EIA/TIA standards and when terminated with the jacks supplied by the Contractor for this Project.

4. Performance

    a. Assembly electrically meets or exceeds EIA ANSI/TIA/EIA-568-B.2 Category 6 performance standards

5. Manufacturers:

    a. Berk-Tek LANmark-6

    b. Belden/CDT

    c. Berk-Tek

    d. Commscope/Systimax

    e. Commscope/Uniprise

    f. General Cable

    g. Mohawk/CDT

    h. Superior/Essex

    i. Or approved equal

2.13 CONTROL MEDIA CABLING

A. General

1. Provide cable with electrical conductors of soft drawn annealed copper, bare or tinned, solid or concentric stranded as applies, conductivity not less than 98 percent of pure copper.

2. Comply with applicable Code for insulation, jacket, marking and listing for applicable use.

    a. Refer to National Electrical Code, Table 725-61. Cable Uses and Permitted Substitutions.

    b. Manufacturer part number specified is for a Listed Type CM construction to indicate intended cable construction and quality.

3. Code requirements take precedence.

    a. Provide type required by 2016 CEC at no additional cost to the College.

B. Low Speed Audiovisual Cabling

1. Drawing Reference: AVNet

2. 1 cable equivalent to a 1 pair, 18 gauge cable suitable for RS-485 (A/V Net) signaling and remote device powering.

3. Manufacturers:

    a. Crestron

    b. Liberty Wire & Cabling

    c. AMX

d. Extron

e. Or approved equal.

C. Shielded High Definition Category Media Cabling

1. Drawing Reference(s):

a. HCAT MEDIA

2. Features/Functions:

a. Proprietary 4 twisted-pair cable in overall shield designed to transmit manufacturer's proprietary implementation of HDBaseT

3. Manufacturers:

a. Crestron DigitalMedia 8G Cable

b. Liberty Wire & Cabling

c. AMX

d. Extron

e. Or approved equal.

2.14 MISCELLANEOUS PRODUCTS

A. Cable Termination Devices and Related:

1. Screw-type or Tubular Clamp Barrier Blocks:

a. Buchanan 125, 0625 Series.

b. Electrovert

c. TRW-Cinch 140, 141, 142 Series.

d. Weidmuller .

e. Pass & Seymour/Legrand.

f. Phoenix

g. Or approved equal.

2. Tubular Clamp Barrier Blocks, High Density, Switch Block Section

a. Drawing Reference: TB15.

b. Features/Functions
1) Paired screw terminals on opposite sides of insulating base.
2) TB15 Base mounts to DIN rail, providing space beneath TB15 to dress field and source cabling.
3) Terminates range of wire gauges used by Project – at least 30 gage to 10 gage.
4) High density:
a) At least 33 pairs of connections per foot for 12 and smaller gage terminations,

b) At least 16 pairs of connections per foot for 10 gage terminations.

5) Switch Block Section permits load, such as field devices, to be separated from monitoring panel for testing independent of source then restored without disturbing field wiring terminations.

6) Rated at least fifteen (15) amperes at 300V AC/DC

c. Approvals
1) UL

d. Manufacturers:
1) Allen Bradley Isolation Switch Blocks,
a) 1492-H7 for 30 to 12 gage
b) 1492-CE9 for 10 gage.
2) Tyco Buchanan 0135 Series.
3) WECO Electrical Connectors
4) Altech
5) Curtis Industries
6) Electrovert
7) Weidmuller
8) Pass & Seymour/Legrand
9) Phoenix
10) Or approved equal.

3. Low Level Audio Cable Termination, Insulation Displacement Products

a. Coordinate with wire size, type and insulation

b. Manufacturer
1) ADC "Dense Patch".
2) Siemon Model S66M450 with D10 Designation Strip.
3) Any meeting 110TB under Section 17119 – Communications Termination Blocks and Patch Panels of the Base Building Project
4) Or approved equal.

B. Audio and Control Connectors and Related:

1. Circular Audio Connector, Cord, 3 through 5 contacts, gold plated contacts, captive cable clamp strain relief, matte black chrome finish over nickel metal shell

a. Neutrik C-Series, X-Series.

b. Switchcraft.

c. Or approved equal.

2. Circular Audio Connector, Panel mount, male and female devices to fit same panel cutout including fasteners, 3 through 5 contacts, gold plated contacts, matte black chrome finish over nickel metal shell, female receptacles locking type:

a. Neutrik D Series Version L.

b. Switchcraft

c. Or approved equal.

3. Loudspeaker Connector, Panel mount, female devices to fit same panel cutout including fasteners as other panel mount receptacles, 4 contacts, matte black finish Polyamid/graphite shell, female receptacles locking type. UL Component Recognized:
    a. Neutrik NL4MP.
    b. Switchcraft
    c. Or approved equal.

C. Video Connectors and Related

1. Video Connector, BNC type, 75 ohms, Panel, recessed, flush with panel face, insulated from panel, double female
    a. Manufacturer
        1) Canare BCJ-JRU.
        2) Tec Nec
        3) Liberty Wire & Cable/Panelcraft
        4) Or approved equal.
2. Video Connector, BNC type, 75 ohms, Panel, recessed, flush with panel face, insulated from panel, single female to solder pin
    a. Manufacturer
        1) Canare BCJ-RU.
        2) Tec Nec
        3) Liberty Wire & Cable/Panelcraft
        4) Or approved equal.
3. Video connector, BNC type, 75 ohms, cord, crimp applied. Coordinate with cable.
    a. Manufacturer
        1) Amp.
        2) Amphenol.
        3) Augat/LRC Products
        4) Canare.
        5) Kings.
        6) Liberty Wire & Cable/Panelcraft
        7) RFI/Celltronics.
        8) Trompeter.
        9) Or approved equal.
4. Video Precision 75 ohms Terminator, BNC:
    a. Manufacturer
        1) Canare BCP-TA
        2) Trompeter TNAI-1-75.
        3) Or approved equal.
5. XGA Connectors, DB15
    a. Drawing Reference HD15

b. Manufacturer
   1) Amp.
   2) Amphenol.
   3) Canare.
   4) Kings.
   5) Liberty Wire & Cable/Panelcraft
   6) RFI/Celltronics.
   7) Or approved equal.

D. Custom Facility Panels and Rackmount Auxiliary Panels

1. Drawing Reference(s):
   a. MP* - Media Panels, where * is a number indicating the panel type.
   b. FP* - Facility Panels, where * is a number indicating the panel type.
   c. Aux Panel
2. Provide connector types and plate finish as shown. If none shown, provide:
   a. Rack mount panels:
      1) 16 gauge minimum, cold rolled steel or 1/8" minimum aluminum, finish to match rack finish.
      2) At Contractor's option, fabricate using rack mount panels with Decora/Decorator openings and steel plates with specified connectors. Match insert color to panel color provided. Refer to Rack Panel with Decora Openings below.
   b. Wall Panels: 16 gauge minimum cold rolled steel, finish to match surrounding electrical and other low voltage panels.
3. Manufacturers, Rack Mount Panels
   a. BGW Systems Inc.
   b. Conquest
   c. Middle Atlantic Products Universal Connector Panel
   d. Middle Atlantic Products Universal Connector Panel, Modular Custom Connector Panel Systems
   e. ProCo Sound, Inc.
   f. Ultimate Plates and Panels
   g. Or approved equal.
4. Manufacturers, Wall Panels
   a. PanelCrafters Division of Liberty Wire & Cable, Classic Series
   b. FSR
   c. RCI Systems
   d. Middle Atlantic

e. Ultimate Plates and Panels

f. Whirlwind

g. Or approved equal.

5. Manufacturers, Decora/Decorator connector inserts:

a. Connector Plates by Radio Design Labs. Provide specified connectors rear mounted in D-Blank insert for connector combinations not available from RDL.

b. Grey by Pathway Connectivity Solutions. Provide specified connectors rear mounted in 5100 insert for connector combinations not available from Pathway Connectivity Solutions.

6. Manufacturers, Rack Mount Decora Panel Openings

a. Lowell Manufacturing LD8-RMP with Lowell DBB-4 blank Decora plates at openings not fitted with equipment.

b. Middle Atlantic DECP Series

c. Or approved equal.

2.15 POWER DISTRIBUTION EQUIPMENT:

A. Comply with applicable Codes. Provide UL Listed devices suitable for commercial use. Provide all junction boxes, raceway, fittings, wire, supports and fastenings as required for complete installation. Contractor to coordinate plug end of selected strip with rack power receptacles installed under the work of Division 16. Unless otherwise noted, provide receptacles of NEMA 5-15R configuration.

B. Power Sequencer System

1. Drawing References: PWR-SEQ

a. Power Sequencer

b. Fire Alarm Interface – provide where required to shunt system operation on receipt of closure from Fire Alarm system.

c. Sold State Relay (SSR) SSR1 through SSR7

2. Features

a. Power sequencing system.

b. Solid state switching, zero crossing.

c. Sequencing on power up and power down.

d. Front panel button and external closure activation.

e. Alarm terminal to sequence the system down when tripped.

f. UL Listed.

3. Manufacturer

a. FSR Inc. Power Products Group SPC-20 Power Sequencer and SPC-20X Solid State Relay

b. Furman

c. Or approved equal.

C. UPS, Rack Mounted, 1400 VA

1. Drawing Reference: UPS10

2. Features/Functions/Performance:

a. Provide continuous, no-break power with sine wave output.

b. Size to carry connected load at least 10 minutes following loss of power, after at least two hours of charge time.

c. Provide Transient Over-Voltage (TOV) Surge Suppression; comply with ANSI/IEEE C62.41-1980, Category A and Category B.

d. Provide complete isolation from Line.

e. Provide output voltage regulation to ANSI C84.1 for computing equipment.

f. SNMP manageable and status reporting to College's Management console. Provide output KVA, switch-mode power supply rated, not less than 150% of connected load indicated.

g. Rack Mounted

3. Manufacturer:

a. SmartUPS 1400 RM series by American Power Conversion (APC)

b. Trip-Lite

c. Or approved equal.

D. Power Supplies and Related:

1. Drawing Reference: PS24.

2. Relay and Lamp Power Supply:

3. 24 VDC, regulated within 5%. Ripple not greater than 1.5%. Output current rating at least 150% of maximum possible load. Circuit breaker or intrinsic over current protection. UL Recognized or UL Listed.

E. Full Height Receptacle Strip, One (1) Circuit, 15A

1. Features/Construction:

a. Not less than 60" Long

b. Not less than eleven (11) 15A receptacles

c. Integral circuit breaker

d. NEMA 5-15P plug on 6' cord.

e. UL Listed Assembly

f. Provide mounting hardware as necessary to attach to rack interior.

2. Manufacturers.

a. Wiremold Series 7011ULBC.

b. Lowell ACS 1524

c. Geist NSVB200-101S15

d. Hubbell PR206

e. Leviton

f. Middle Atlantic

g. Chatsworth 12848-701

h. Or approved equal.

F. Full Height Receptacle Strip, One (1) Circuit, 20A

1. Features/Construction:

a. Not less than 70" Long

b. Not less than eleven (11) 15A receptacles

c. Integral circuit breaker

d. NEMA 5-20P plug on 6' cord.

e. UL Listed Assembly

f. Provide mounting hardware as necessary to attach to rack interior.

2. Manufacturers. Contractor to coordinate selected strip with rack power receptacles installed under the work of Division 26.

a. Geist NSVB200-102S20

b. Hubbell PR20820DRTL

c. Leviton P104x series

d. Lowell ACS-2024

e. Midde Atlantic PD-1020C-NS

f. Wiremold Series 7011ULBC20.

g. Chatsworth 12848-705

h. Or approved equal.

G. Rackmount Power Panel, Horizontal Mount, User Aux device use:

1. Drawing Reference: POWER.

2. Functions/Features:

a. Front face of panel shall provide two electrical power outlets and a switch. An indicator lamp shall show the presence of AC power when on. The front face of panel shall have a black finish. The rear face shall provide a minimum of at least four receptacles. The panel shall be racked mounted in a maximum of two rack units. The panel shall be Code approved and UL rated for this application.

3. Manufacturers:
   a. Hubbell MCCPSS19TS
   b. Leviton 4515
   c. Geist SP124-1020
   d. Or approved equal.

PART 3 - EXECUTION

3.1 GENERAL

A. Perform the Work of this Section in accordance with acknowledged industry and professional standards and practices, and the procedures specified herein.

B. Furnish and install (herein, "provide") all materials, devices, components, and equipment required for complete, operational systems.

3.2 PRECONSTRUCTION PROGRAMMING MEETING

A. Not less than 30 calendar days prior to the scheduled completion of the project, Contractor to initiate a request of the College's Representative to schedule an Audiovisual Systems programming meeting.

1. The College's Representative will schedule the meeting at the reasonable mutual convenience of the Contractor and the College's technical systems representatives.
2. The purpose of the meeting is for the College's Representative to indicate to the Contractor how the programmable interfaces of the audiovisual systems are to be implemented, including:
   a. Button assignments and labels for physical button panels
   b. Touchscreen menu hierarchy, scene arrangement, button and background colors, text size, logos
   c. Whether authorization codes or passwords will be required to access special functions/menus.
3. Contractor to document the information received from the College's Representatives at this meeting.

4. Contractor to submit the documentation of the requirements meeting, along with their proposed response to the College's programming requirements in the form of screen shots and system menu flow diagrams as required under Section 27 05 00 – Common Work Results for Communications Audiovisual Systems, 1.4 Submittals.

3.3 WIRING CLASSIFICATION AND RELATED

A. Audio Signal Wiring Classification:

1. Type A-l: Microphone level wiring less than -30 dBμ, 20 Hz to 20 kHz.
2. Type A-2: Line level wiring -30 dBμ to +24 dBμ, 20 Hz to 20 kHz.
3. Type A-3: Loudspeaker level or circuit wiring greater than +24 dBμ, from 20 Hz to 20 kHz.

B. Video and Related Signal Wiring Classification:

1. Type V-1: Baseband and composite video wiring 1 volt peak-to-peak into 75 ohms, 0 to 10.0 MHz.
2. Type V-2: Synchronization and switching pulse wiring 4 volts peak-to-peak into 75 ohms, 15.62 to 15.75 kHz.
3. Type V-3: Color subcarrier wiring 0 to 4 volts peak-to-peak into 75 ohms, 3.57 to 4.43 MHz.
4. Type V-4: MATV system wiring 0.1 to 1000 uV peak-to-peak into 50 or 75 ohms, 47 to 890 MHz.

C. Control Signal Wiring Classifications:

1. Type C-1: DC control wiring 0 to 50 volts.
2. Type C-2: Synchronous control or data wiring 0 to 40 volts, peak-to-peak.
3. Type C-3: AC control wiring 0 to 48 volts, 60 Hz.

D. Additional Wiring Classifications:

1. Type M-1: DC power wiring 0 to 48 volts.
2. Type M-2: AC power wiring greater than 50 volts, 60 Hz.

E. Wiring Combinations:

1. Except as indicated herein, conduit, wireways and cable bundles shall contain only wiring of a single classification. The following combinations are acceptable in conduit, or cable harnesses. Additional acceptable combinations may be indicated on the Contract Drawings.
    a. Types A-1, C-1, and M-1.
    b. Types A-2, C-l, C-2, and M-l, runs less than twenty (20) feet.
    c. Types A-2, C-1, and M-1.

d. Types A-3, C-1, C-2, and M-1.

e. Types A-2, V-1, and V-3.

f. Types V-1, V-2, V-3, and C-1.

g. Types M-2 and C-3.

3.4 WIRE AND CABLE INSTALLATION

A. Provide permanent identification of run destination at all raceway terminations.

B. All wire and cable shall be continuous and splice-free for the entire length of run between designated connections or terminations.

C. All shielded cables shall be insulated. Do not permit shields to contact conduit, raceway, boxes, panels or equipment enclosures.

D. Within buildings, make splices only in designated terminal cabinets and/or on designated equipment backboards. Outside buildings, make splices only in designated manholes and/or handholes. Protect splices outside of buildings with splicing kits equivalent to Scotchcast Re-enterable. Make splices only with connectors or terminal devices specified herein. Document all splices on Record Drawings.

E. Verify that all raceway has been de-burred and properly joined, coupled, and terminated prior to installation of cables. Verify that all raceway is clear of foreign matter and substances prior to installation of wire or cable.

F. Inspect all conduit bends to verify proper radius. Comply with Code for minimum permissible radius and maximum permissible deformation.

G. Apply a chemically inert lubricant to all wire and cable prior to pulling in conduit. Do not subject wire and cable to tension greater than that recommended by the manufacturer. Use multi-spool rollers where cable is pulled in place around bends. Do not pull reverse bends.

H. Provide a box loop for all wire and cable routed through junction boxes or distribution panels. Provide tool formed thermal expansion loops at cable at manholes, handholes and at both sides of all fixed mounted equipment. Cable loops and bends shall not be bent at a radius greater than that recommended by the manufacturer.

I. Secure all wire and cable run vertically for continuous distances greater than thirty (30) feet. Secure robust non-coaxial cables with screw-flange nylon cable ties or similar devices appropriate to weight of cable. For all other cables, provide symmetrical conforming nonmetallic bushings or woven cable grips appropriate to weight of cable.

3.5 SIGNAL POLARITY CONVENTION

A. Maintain consistent absolute signal polarity at all connectors, patch points and connection points accessible in the system. Comply with AES26-2001.Where applicable, a positive polarity electrical signal shall yield positive acoustic pressure from the loudspeakers.

B. Audio signal connector convention: Comply with AES 14-1992 (r1998)

Signal	Connector	Wire
Signal Phase	Pin 2	Red or White
Signal Anti-Phase	Pin 3	Black
Signal Ground	Pin 1	Drain Wire

C. Video and RF/MATV Connector Convention:

Signal	Connector	Wire
Signal Phase	Center Pin	Center conductor
Signal Anti-Phase	Shell	Shield
Signal Ground	Shell	Shield

3.6 WIRING PRACTICE

A. Land all non-coaxial field wiring entering each equipment rack at specified terminal devices prior to connection to any equipment or devices within racks. At Contractor's option, such terminals may be located in the equipment racks or in the terminal cabinets provided. Coordinate such selection with Project construction sequence and test procedures specified herein.

B. Identify all wire and cable clearly with permanent labels wrapped about the full circumference within one (1) inch of each connection. Indicate the number designated on the associated field or shop drawing or run sheet, as applies. Assign wire or cable designations consistently throughout a given system. Each wire or cable shall carry the same labeled designation over its entire run, regardless of intermediate terminations. Conform with the requirements of Section 27 05 00.

C. Apply all crimp connectors only with manufacturer's recommended ratchet type tooling and correct crimp dies for connector and wire size. Plier type crimp tooling shall not be acceptable.

D. Coordinate insulation displacement (quick connect) terminal devices with wire size and type. Comply with manufacturer's recommendations. Make connections with automatic impact type tooling set to recommended force.

E. Make all connections to screw-type barrier blocks with insulated crimp-type spade lugs. Lugs are not required at captive compression terminal type blocks. Provide permanent designation strips designed for use with the terminal blocks provided. Make neat, intelligible markings with indelible markers equivalent to "Sharpie".

F. Tin terminated shield drain wires and insulate with heat shrinkable tubing.

G. Use only rosin core 60/40 tin/lead solder for all solder connections.

H. Dress, lace or harness all wire and cable to prevent mechanical stress on electrical connections. No wire or cable shall be supported by a connection point. Provide service loops where harnesses of different classes cross, or where hinged panels are to be interconnected.

I. Termination and buildout resistors and related circuit correction components shall be visible. Do not install in connector shells or internally modify equipment. Show locations on Record Drawings.

J. Correct any and all of the following unacceptable wiring conditions:

1. Deformed, brittle or cracked insulation.
2. Insulation shrunken or stripped further than 1/8" away from the actual point of connection within a connector, or on a punch block.
3. Cold solder joints.
4. Flux joints.
5. Solder splatter.
6. Ungrommeted, unbushed, or uninsulated wire or cable entries.
7. Deformation or improper radius of wire or cable.

3.7 FINISHES

A. Finishes and materials for Contractor fabricated assemblies such as racks, custom control panels, brackets, blank panels, equipment mounting in furniture or casework, speaker baffles, speaker grille material and in general any item or component herein which is visible shall adhere to the following:

1. Finish shall be as directed by the College's Representative.
2. In the event that the College's Representative provides no direction as to finish, finish shall match exactly the surrounding and adjacent surfaces.
3. Wooden speaker back boxes and baffles shall be painted flat black if not otherwise finished or stained.

3.8 EQUIPMENT ENCLOSURE (RACK) AND EQUIPMENT FABRICATION

A. Combustible material, other than incidental trim of indicated equipment, is prohibited within equipment racks.

B. Within each equipment enclosure, provide a full-height multi-circuit ground outlet strip with branch circuit count as shown on drawings; locate on the left side of the equipment enclosure, as viewed from the rear. In each enclosure provide number of receptacles required by present and future equipment indicated on drawings, plus at least two spare receptacles. Provide flexible steel raceway and junction box for connection of power service. Bond internal raceway to rack frame.

C. Provide a permanent label on the front of each equipment rack including the rack designation, and the circuit breaker number and associated electrical distribution panel designation servicing same.

D. Maintain separation of wiring classifications as specified herein. Separately dress, route and land microphone and line level cables and related on the right side of the equipment enclosure, as viewed from the rear; dress, route, and land loudspeaker level and control cables on the left side of the equipment enclosure, as viewed from the rear.

E. Access shall not require demounting or de-energizing of equipment. Install access covers, hinged panels, or pull-out drawers to insure complete access to terminals and interior components.

F. Fasten removable covers containing any wired component with a continuous hinge along one side, with associated wiring secured and dressed to provide an adequate service loop. Provide an appropriate stop locks to hold all hinged panels and drawers in a serviceable position.

G. Provide permanent labels for all equipment and devices. Where possible, fasten such labels to the rack frame or to blank or vent panels which will remain in place when active equipment is removed for possible service.

H. At jackfields, provide service loop to permit removal of jackfields from rack sufficient to conveniently access all jack contacts for routine cleaning and maintenance. Organize the service loop and harness such that reasonable reconnection of jacks and jack normals is possible without cutting apart the harness.

I. Coordinate the design and execution of wire harnessing of multi-bay rack ensembles with conditions of delivery to installation locations at Project Site, and with the requirement herein for test of the completely wired system in the shop prior to delivery to the Project Site. Organize the wiring harnesses such that they will fold within one shippable unit without risk of damage, or provide polarized multipin connectors and related interconnect systems as specified elsewhere herein.

J. At each equipment backboard, provide UL Listed surge suppressing multi-outlet assembly with at least six (6) receptacles.

3.9 EQUIPMENT RACK AND EQUIPMENT TESTING AND ADJUSTING PROCEDURES

A. Conduct procedures in fabrication shop. Verify safe and proper operation of all components, devices, or equipment, establish nominal signal levels within the systems and verify the absence of extraneous or degrading signals. Make all preliminary adjustments and document the setting of all controls, parameters of all corrective networks, voltages at key system interconnection points, gains and losses, as applicable. Submit test report. Request and coordinate verification of submitted test data by the College's Representative. Correct all non-conforming conditions prior to shipment to Project Site. Perform at least the following procedures:

B. Preliminary: Verify:

1. Grounding of devices and equipment. Integrity of signal and electrical system ground connections.
2. Proper provision of power to devices and equipment.
3. Integrity of all insulation, shield terminations and connections.
4. Integrity of soldered connections. Absence of solder splatter, solder bridges.
5. Absence of debris of any kind, tools, etc.
6. Routing and dressing of wire and cable.
7. All wiring, including polarity and continuity, including conformance with wire designations on running sheets, field and shop drawings.
8. Mechanical integrity of all support provisions.

C. Rig temporary power and grounding. Comply with all applicable Codes, regulations and ordinances.

D. Determine the proper sequence of energizing systems to minimize the risk of damage. Energize. Burn in for at least 168 hours.

E. Sound Systems:

1. Gain control settings: Establish tentative normal settings for all gain controls. Set all equalizers flat. Set all automatic gain control devices to bypass. Terminate power amplifier outputs with power load resistors with resistance value within 10% the nominal output impedance of the respective amplifier. Adjust all gain controls on equipment for optimum signal-to-noise ratio and signal balance and, unless they are sub-panel mounted, cap them to prevent tampering. Unless specified or directed otherwise, adjust gains such that in a given system the "front end" operates at unity gain and maintains 10 dB of clip margin referenced to the first onset of clipping of the associated power amplifier(s). Measure and document system gains at 1 kHz. Settings may require further adjustment by the Contractor, a result of testing by the College's Representative.
2. Freedom from parasitic oscillation and radio frequency pickup: Maintain previous setup. Set up for each mode of operation specified in the functional requirements; verify that all systems are free from spurious oscillation and radio-frequency pickup using broadband oscilloscope. Correct any such defects.
3. Hum and noise level/signal to noise level/signal to crosstalk level: Maintain previous setup. Terminate microphone and line-level inputs with shielded resistors of 150 and 600 ohms, respectively. Set available variable gain controls such that full power amplifier output would be achieved with -40 dBm input level at a microphone input and +12 dBm at a line-level input. Measure and document the specified parameters of the system overall for each microphone input channel and line-level input channel. Compare with nominal signal level.
4. Total Harmonic Distortion: Maintain previous setup. Measure at reference operating level at least at 63 Hz, 125 Hz, 1 kHz, 10 kHz.

F. Baseband Video Systems:

1. Picture Monitors:
   a. Apply crosshatch. Verify linearity.
   b. Apply red field. Adjust purity.
   c. Apply SMPTE bars and PLUGE. Adjust to standards.
2. Video Path Test: Use manufacturer's procedures. Use full field or line signals.

G. Data/Graphics Systems:

1. Projector:
   a. Apply crosshatch. Converge at design distance. Verify linearity.
   b. Apply red, green and blue field. Adjust purity.
2. Wideband Component Analog Video Path Test: Use manufacturer's procedures.

H. Control System:

1. Demonstrate complete operation.

3.10 PROJECTION SCREEN INSTALLATION

A. Inspection

1. General: Examine surfaces and rough framing to determine suitability to install screen and mount. Do not start work until unsatisfactory conditions are corrected.

B. Installation

1. Install screen and projector mount horizontal and plumb for proper operation per manufacturer's recommendations. Securely anchor to supporting structure to withstand all loading conditions and strain of service.

C. Adjustment

1. Adjust units as required for smooth operation and alignment as required.
2. Just prior to final acceptance of project, clean the screen surface according to the manufacturer's instructions.
3. Protect completed work from damage until acceptance by the College's Representative.

3.11 LOUDSPEAKER ASSEMBLY INSTALLATION

A. Loudspeakers:

1. Verify proper installation of loudspeaker enclosures and related support.

2. Verify that no loudspeaker assembly is subjected to stresses or loading effects in any way contributing to possible extraordinary failure.

3.12 VIDEO PROJECTOR ASSEMBLY INSTALLATION

A. Design, engineer and provide complete, all means of support, suspension, attachment, fastening, bracing, and restraint (hereinafter "support") of such equipment. Provide engineering of such support by parties licensed to perform work of this type in the Project jurisdiction. Submit in timely manner.

B. Comply with applicable Code and the requirements of the Authorities having jurisdiction.

C. Provide safety factor greater than six (6) or as required by Code, whichever is greater.

D. Mountings shall:

1. Permit projector lens to align with top of projection screen.

2. Permit Video Projector to be re-oriented at least plus or minus 3o from angles shown on the Contract Drawings for optimum picture.

3. Maintain precise location and orientation of Video Projector after such adjustment when subject to normal building motion and Code defined seismic induced building motion.

E. Do not apply any load to building structure without first obtaining written approval of the College's Representative. Obtain per Project procedures.

F. During Acceptance Testing, adjust orientation of Video Projector as directed to achieve optimum picture. Provide workers and ladders as required. Perform such adjustment with no claim for additional cost or time.

3.13 PERMANENTLY INSTALLED MICROPHONES

A. General

1. Orient generally as shown in the plans with respect to area of intended pickup.

B. Ceiling Mount Microphones

1. Review indicated mounting location in the field prior to installation. Verify that location is not associated with excessive levels of vibration or background noise (due to HVAC, Projector fans and loudspeakers installed under the work of this or other projects, audible occupancy sensors. Report such conditions to the College's Representative and obtain direction prior to proceeding.

2. Coordinate installation location of boundary microphones with final floor plan for maximum uniformity of coverage, and maintainance of unobstructed line-of-site between the projector(s) and the screen(s).

3.14 PERMANENTLY INSTALLED PROGRAM AUDIO SPEAKERS

A. At projection screen conditions,

1. Coordinate the installation location with the projector screen to maintain symmetry.

2. Place speakers indicated for mounting at underside of ceiling oriented to place their long dimension parallel to the ceiling plane.

B. Provide resilient mounting vibration isolation at all wall and roof deck supported loudspeakers to minimize coupling of program audio sound into other building spaces. This requirement does not apply to ceiling supported distributed ceiling speakers.

C. Dress cabling neatly and out of side of audience.

D. Orient on adjustable speaker mounts for maximum uniformity of coverage for audience area and maximum gain before feedback at presenter microphones.

3.15 SYSTEMS PERFORMANCE TESTING AND ADJUSTING PROCEDURES

A. Upon completion of the installation of all equipment in an area, perform the following tests and record results. Verify safe and proper operation of all components, devices, or equipment, establish nominal signal levels within the systems and verify the absence of extraneous or degrading signals. Make all preliminary adjustments and document the setting of all controls, parameters of all corrective networks, voltages at key system interconnection points, gains and losses, as applicable. Submit test report. Correct all non-conforming conditions prior to requesting Acceptance Review and Testing. Perform at least the following procedures:

1. Mechanical: Verify:

   a. Integrity of all support provisions.

   b. Absence of debris of any kind, tools, etc.

2. Power and Isolated Ground: Verify:

   a. Isolation of Isolated Ground system from raceway and related ground.

   b. Grounding of devices and equipment. Integrity of signal and technical power system ground connections.

   c. Proper provision of power to devices and equipment.

3. Signal Wiring: Verify:

   a. Integrity of all insulation, shield terminations and connections.

   b. Integrity of soldered connections. Absence of solder splatter, solder bridges.

   c. Routing and dressing of wire and cable.

   d. Continuity, including conformance with wire designations on running sheets, field and shop drawings.

   e. Absence of ground faults.

   f. Polarity.

4. Use the proper sequence of energizing systems to minimize the risk of damage. Energize.
5. Sound Systems, Electronic Tests; confirm:
    a. Gain at 1 kHz.
    b. Maximum output.
    c. Input clipping level.
    d. Frequency response.
    e. Total harmonic distortion.
    f. Signal to noise ration.
    g. Signal to crosstalk ratio.
6. Electro/Acoustic Tests:
    a. Uniformity of coverage.
    b. Electronic and acoustic frequency response/one-third octave equalization. Measure at ear level. Comply with applicable portions of ANSI (SMPTE) PH22.202M-1984, "B chain electro-acoustic response - control rooms and indoor theaters." Adjust to "curve X of B chain characteristic". College's Representative will direct final adjustment.
    c. Maximum continuous sound pressure level (in the reverberant field). Drive systems with broadband pink noise. Sustain for at least five (5) minutes with no system damage. Measure for "A" and "C" weightings at ear level on loudspeaker axis. Turn off noise.
    d. Acoustic signal-to-noise ratio referenced to the specified maximum continuous sound pressure level in the reverberant field. Measure for "A" and "C" weightings at ear level on loudspeaker axis with mechanical systems operating. Present comparison with previous measurement.
7. Video Systems:
    a. Picture Monitors:
        1) Apply crosshatch. Verify linearity.
        2) Apply red field. Adjust purity.
        3) Apply SMPTE bars and PLUGE. Adjust to standards.
    b. Video Path Test: Use NTC Report No. 7 procedures. Use full field or line signals.
        1) Insertion Gain.
        2) Gain/Frequency Distortion.
8. Control System: Demonstrate complete operation.

3.16 LABELING

A. Conform with the requirements of Section 27 41 07 – Identification for Audiovisual Systems.

B. Provide permanent "wedge" type labels on all controls, as applies, to indicate correct settings after systems performance testing and adjustment procedures have been successfully completed.

END OF SECTION

PART 1 - GENERAL

1.1 DESCRIPTION

A. The Contractor shall furnish and install all equipment including, but not limited to, outlet boxes, wiring, speakers, and all other necessary equipment to provide a complete operating system as indicated with the contract documents. Provide all necessary wall plates, specialty boxes, etc., not provided by others.

B. Under this specification, system shall provide a complete Communication System for the Administrative, Common and Classroom areas.

C. The Communication System shall provide distribution of overhead paging and emergency paging.

1.2 RESPONSIBILITIES

A. Contract documents are detailed only to the extent required to show design intent. It shall be understood and agreed upon by the Contractor that all work described herein shall be complete in every detail.

B. Furnish additional items not mentioned herein to meet requirements as specified without claim for additional payments. Items, may include hardware, rack panels, 66Blocks etc., and other devices that are required for installation.

C. Labor furnished shall be trained and experienced in telecommunication systems.

D. All equipment unless otherwise specified, shall be new, free from defects, and best craftsmanship in its class.

E. All manufactured equipment shall be installed as recommended by the manufacturers, or as indicated in their published installation manual.

F. Furnish and install necessary equipment, back boxes, supports and enclosures.

G. Furnish and install all necessary wire.

H. Furnish shop drawings.

I. Perform initial programming of system and audio level adjustments.

J. Perform final programming of system and audio level adjustments.

K. Provide system documentation including equipment manuals and drawings.

L. Guarantee all equipment and components for their specified period from date of acceptance.

M. Provide information on system requirements to any Contractor responsible for supplying related materials for this system.

N. FCC registration and U.L. listed numbers shall be available.

1.3 SUBMITTALS

A. Submit layout drawings of the communication system and all components.

B. Submit drawings of control equipment showing all major components.

C. Provide block diagrams showing components and relative connections.

D. Submit a certificate showing a completion of installation, programming, and service training from the system manufacture.

E. Submit data sheets on equipment provided.

1.4 QUALIFICATIONS

A. The Contractor shall be from an established and local company providing solutions to the school market for a minimum of 3 (three) years with Telecom/Data Experience.

B. The Contractor shall maintain an adequate parts inventory to perform necessary service and upgrades.

1.5 MAINTENANCE

A. The Contractor shall provide a 12 (twelve)-month guarantee of the installed system against defects in material and workmanship. All warranty material shall be provided at no expense to the Owner. Guarantee period shall begin on the date of acceptance by the Owner or Engineers.

1.6 PLEDGE OF QUALITY

A. The Contractor shall be an authorized dealer of the supplied equipment with full warranty privileges.

B. The Contractor shall inventory the necessary parts in order to maintain and service the equipment being supplied. This equipment inventory shall be in direct relation to total systems installed as recommended by the manufacture.

C. The Contractor shall provide complete drawings detailing all interconnections, panel wiring diagrams, and specification sheets.

1.7 IN-SERVICE TRAINING

A. The Contractor shall furnish in-service training with the system. The sessions shall facilitate the training of personnel in operating classroom equipment, administrative equipment, program distribution, and user programming functions. Manuals and user guides shall be provided at the time of training.

1.8 WIRING

A. Wiring shall be in accordance with the Manufacturer's specifications. Wiring shall meet all local and state codes. All wiring shall be ground and short tested.

1.9. COMMUNICATION SYSTEM

The Communication System shall be a Valcom V-2006A Six Zone One Way Analog Paging system and be expandable to the following functions and features with additional components from the same manufacturer:

A. System shall interface with any telephone system, thus allowing the school(s) to upgrade or replace their intercom/paging system without purchasing a new telephone system to get the features as described herein. Any system that does not allow these features or functions and is proprietary to one or only a few telephone systems shall not be acceptable.

B. Direct dialing, handsfree, and two-way communication from administrative telephones to any location equipped with a talkback speaker.

C. Automatic gain control on intercom speech to assure constant talkback speech level.

D. Distribute an emergency announcement from a telephone to all areas furnished with a loudspeaker. This emergency announcement shall have the highest priority over all system functions.

E. Microprocessor based system capable of handling up to 6 (six) zones.

F. Distribution of general announcements from administrative telephone. This announcement shall be capable of all-call, group call or multiple group calls.

G. Provide announcements from a desktop microphone.

H. Common area speakers shall be hardware assigned to one of the six paging groups.

L. All levels shall be on a priority basis. Incoming intercom calls will be displayed in the order of these levels with Emergency as top priority.

M. Manually distribute an emergency alert tone via pushbutton or interfaced contact closure.

N. Programmable features shall be stored in an E²PROM memory and not be lost due to power failures.

O. Facilities to annunciate incoming intercom calls at multiple administrative phones simultaneously. Calls may be answered from any of the administrative telephones by simply lifting handset or pressing a button on telephone. Once answered the call will automatically be cancelled from other administrative phones.

PART 2 – PRODUCTS

2.0 INTERCOM CONTROL UNIT AND SPEAKERS

A. Shall be a Valcom V-2006A unit capable of six zones.

B. Pre-alert tone for intercom calls.

C. Ability to produce integral tone signals for time tones or emergency tones..

D. One way speakers shall be Valcom V1020-C speaker.

E. One-Way speakers in the common areas (hallways, office areas, etc), shall be Valcom V1020-C speaker with built in volume control.

F. Outside paging horns shall be Valcom V1030-C Horn to be waterproof, UV resistant, and have integrated volume control.

G. System speakers shall use plenum rated 18/4 or 16/4.

H. Provide one unrestricted audio path for communication of hands-free/normal paging, emergency paging only and program material.

I. Provide call confirmation tone at speaker when an intercom call is placed. This verifies that the call has been placed in queue.

2.1 WIRING

A. All wiring shall be listed for the intended purpose. Use Plenum rated 18/4 or 16/4 U.L. listed cable.

B. All interior wiring shall be in accordance with new construction guidelines suggested by the Manufacture; including the speaker and the call-in switch.

2.2 INSTALLATION

A. Complete system shall be installed in accordance with Manufacturer's recommendations.

B. All wiring shall be installed in raceways or plenum rated cable where routed in plenum ceiling areas.

2.3 PROTECTION

A. The contractor shall provide all necessary protection on the AC power feed and on all station lines leaving/entering the building.

B. Provide drawings of protection devices and all relative information.

END OF SECTION 27 51 16

SECTION 27 53 13 – WIRELESS CLOCK SYSTEM

PART 1 GENERAL

1.1 GENERAL REQUIREMENTS & SCOPE

The system is specified as described.

A. Furnish and install a complete new Wireless Clock System using the Primex 72MHz OneVue™ Sync Wireless Clock System.

B. Furnish and install all system equipment, devices, accessories, and material in accordance with these specifications and drawing to provide a complete and operating system.

C. All bids shall be based on the equipment as specified herein. The model designations are that of Primex, Inc. The specifying authority must approve any alternate system

D. System shall include the System Devices
Transmitter (master)
Repeater Transmitter (secondary)
GPS Receiver
Analog Clocks

1.2 RELATED SECTIONS

A. Division 26 “Electrical”

B. Division 26 Section “Common Work Results for Electrical”

1.3 REFERENCES

System devices specified shall meet or exceed the requirements of the following.

A. National Fire Protection Association (NFPA): 1. NFPA 70 - National Electrical Code (NEC).

B. Manufacturer Installation and User Guides and online help system.

1.4 DEFINITIONS

This section provides commonly used terms within this specification.

A. GPS: Global Positioning System, a worldwide system that employs a constellation of satellites in an integrated network to determine geographic location anywhere in the world, and which employs and transmits Universal Coordinated Time, the world's most accurate and reliable time.

B. NTP: Network Time Protocol, used for synchronizing the clocks on computer networks and devices from either a public server or a separate server on a private local area network.

C. UTC: Universal Coordinated Time

1.5 SYSTEM DESCRIPTION

A. System shall operate on a 72MHz frequency. The 72MHz frequency efficiently transmits its signal through common building materials and across longer distances with less interference - ensuring all system devices receive system data updates.

B. System transmitter shall require a FCC license for operation, resulting in a safe and interference free operation.

C. Manufacturer shall offer system transmitters with a variety of power output levels to provide coverage for a single building or an entire campus.

D. System shall wirelessly synchronize clocks and/or timers, and shall be capable of clock readouts in multiple time zones where desired.

E. System shall provide a master time source that is transmitted wirelessly from the system master transmitter to secondary system devices. The master time source can either from a system supplied GPS Receiver or from an OWNER defined internal or external NTP server that the master transmitter can access via the OWNER'S Local Area Network (LAN). Up to three designated NTP Servers may be specified to ensure continuity of time synchronization. The master time will be synchronized to UTC.

F. Hard wiring of system clocks for data communication shall not be required.

G. System clocks shall automatically adjust for Daylight Saving Time in locations where DST is observed.

H. Each system clock and other components shall use both precise time and synchronized time.

I. Digital clocks shall be synchronized to within 10 milliseconds every 10 minutes and the system shall have an internal oscillator that maintains plus or minus four seconds per day between synchronization, so that clock accuracy shall not exceed plus or minus 0.2 seconds.

J. Analog Clocks shall be synchronized to within 10 milliseconds 6 times per day when operating clock strikes 2:01 AM, 6:01 AM, 10:01 AM, 2:01 PM, 6:01 PM, and 10:01 PM, and the system shall have an internal oscillator that maintains plus or minus one second per day between synchronization, so that clock accuracy shall not exceed plus or minus 0.2 seconds.

K. System shall include an internal clock reference so that failure to detect the master time source shall not result in the system clocks failing to indicate time. Additionally, system transmitters shall have an internal battery backup of up to eight hours in the event of a power failure so that settings and the correct master time will be instantly recalled upon restoration of power.

L. System shall incorporate a “fail-safe” design so that failure of any component shall not cause failure of the system. Upon restoration of power or repair of failed component, the system shall resume normal operation without the need to reset the system or any component thereof.

M. If a system transmitter stops transmitting valid time signals due to power failure, the system analog clocks will continue to function as accurate quartz clocks until a valid time signal is decoded. If signal transmission is not restored for three consecutive days, a clock's second hand will “two-step” as a visual indicator that the signal has been lost. A system digital clock/timer that has not decoded a valid time signal for a three consecutive days will display a visual indicator by flashing its colons continuously until a valid time signal is received. Should clocks lose both power and signal, the clocks will not function.

N. Clock locations shall be as indicated and clocks shall be fully portable, capable of being relocated at any time.

O. System shall provide a mobile configurator app (available for both iOS and Android) that allows OWNER to on-board a new transmitter and manage transmitter settings.

P. System transmitters shall be equipped with Bluetooth® low energy wireless technology that allows the devices to send and receive communication to and from the system mobile configurator app.

Q. System shall include access to the Manufacturer system cloud-based software that allows OWNER to manage and monitor system transmitters and receive remote support services. Optionally, the system transmitters can be set to stand-alone mode, which does not allow for remote support services. A system that requires stand-alone computer-based system software or server hardware for system management or monitoring does not meet the requirements for this specification.

R. U.S. only: System must operate in accordance with a “Radio Station Authorization”, Form FCC 601 – LM, granted by the Federal Communications Commission (FCC). This license will be issued to and held by the end user.

S. CANADA only: The system must operate in accordance with a “Technical Acceptance Certificate” issued under the authority of Industry Canada and the Ministry of Industry. This license will be granted to and held by the end user.

1.6 REGULATORY REQUIREMENTS

A. Equipment and components furnished shall be of Manufacturer latest model.

B. System shall be installed in compliance with local and state authorities having jurisdiction.

C. U.S. only: The end user will hold a license, known as a “Radio Station Authorization” granted by the FCC. This license grants the end user protected use for wireless transmission at the designated frequency. This license will designate a unique “call sign” for each end user.

D. U.S. only: Transmitter and receiver shall comply with Part 90 of FCC rules as follows: This device may not cause harmful interference. This device must accept interference received, including interference that may cause undesired operation. Transmitter frequency shall be governed by FCC Part 90.35. Transmitter output power shall be governed by FCC Part 90 257 (b).

E. CANADA only: The end user will hold a license, known as a “Non Complex Fixed Station” Radio License granted by Industry Canada and the Ministry of Industry. This license grants the end user protected use for wireless transmission at the designated frequency.

F. CANADA only: IC-2365: Application for “License to Install and Operate a Radio Station in Canada” must be completed and signed by end user prior to license issuance. The end user will grant permission for Primex to apply for the license on their behalf. Primex will provide all documents and technical information to Industry Canada for approval. This license will designate a unique “call sign” for each end user.

G. CANADA only: Transmitter and receiver shall comply with RSS 119 of Issue 6 of Industry Canada specifications as follows: This device may not cause harmful interference, and this device must accept interference received, including interference that may cause undesired operation. Transmitter frequency shall be governed by IC: RSS119 Issue Transmitter output power shall be governed by IC: RSS119 Issue 6.

1.7 SUBMITTALS

A. Product Data: Submit complete catalog data for each component, describing physical characteristics and method of installation. Submit brochure showing available colors, styles, sizes, and finishes of clocks.

B. Samples: Submit one specified system device model(s) for approval. Approved sample(s) shall be tagged and shall be installed in the work at location directed.

C. Manufacturer Instructions: Submit complete installation, set-up and maintenance instructions.

D. Floor plans indicating the location of system transmitter(s), approved by Manufacturer, will be submitted to Owner prior to installation.

E. U.S. only: Operating License: Submit evidence of application for FCC Radio Station Authorization prior to installing equipment. Furnish the license or a copy of the application for the license, to the Owner/End User prior to operating the equipment. The original license must be delivered to the Owner/End User.

F. CANADA only: Submit IC Technical Acceptance Certificate prior to installing equipment. Furnish the license or a copy of the application for the license, to the Owner/End User prior to operating the equipment. The original license must be delivered to the Owner/End User.

1.8 SUBSTITUTIONS

A. Proposed substitutions, to be considered, shall be manufactured of equivalent materials that meet or exceed specified requirements of this Section.

B. Proposed substitutions shall be identified not less than 10 days prior to bid date.

C. Other systems requiring wiring and/or conduit between master and clocks and/or timers will not be accepted.

D. Other systems using wireless technology in an unlicensed frequency range will not be accepted.

E. Other systems using wireless technology where the license is held by any party other than the end user will not be accepted.

1.9 QUALITY ASSURANCE

A. U.S. only: Permits: Operating license for the transmitter from the FCC.

B. CANADA only: IC-2365: Application for “License to Install and Operate a Radio Station in Canada” must be completed and signed by end user prior to license issuance.

C. Qualifications Manufacturer: Company specializing in manufacturing commercial time system products with a minimum of 30 continuous years of documented experience including 10 or more years of experience producing GPS wireless time systems.

D. Installer: Company with documented experience in the installation of commercial time systems.

E. Prior to installation a site survey must be performed to determine proper transmitter placement.

1.10 DELIVERY STORAGE AND HANDLING

A. Deliver all components to the site in the Manufacturer original packaging.

B. Packaging shall contain Manufacturer name and address, product identification number, and other related information.

C. Store equipment in finished building and in unopened packaging until ready for installation.

1.11 PROJECT SITE CONDITIONS

A. Clocks and/or Timers shall not be installed until painting and other finish work in each room is complete.

B. Mobile configurator app: installed on a mobile device meeting the app install requirements.

C. Transmitter with an external antenna: Coordinate installation of system antenna for access to the roof to comply with safety standards detailed in Manufacturer instructions and per local codes.

D. GPS Receiver time source: Coordinate installation of device for access to the roof or exterior side wall per Manufacturer installation instructions.

1.12 SYSTEM STARTUP

A. At completion of installation and prior to final acceptance, turn on the equipment; ensure that all equipment is operating properly, and that all system devices and components are functioning.

1.13 WARRANTY

A. Manufacturer shall provide a 5 year limited warranty on system transmitters, clocks, digital timers, timer control switch, and GPS Receiver.

B. All other system components shall have a 1 year limited warranty, including external antennas and components and universal power supply (UPS).

PART 2 PRODUCTS

2.1 SECTION INCLUDES

A. The system and equipment is specified as described in this section.

B. All bids shall be based on the equipment as specified herein. The model designations are that of Primex. The specifying authority must approve an alternate system.

2.2 Manufacturer

A. System shall be manufactured by:
Primex, Inc. 965 Wells St, Lake Geneva, WI 53147 | Phone: (855) 557-0337 | info@primexinc.com | www.primexinc.com

2.3 SYSTEM OPERATION

The system shall perform in the sequence of operation as described below.

A. Install system transmitters and components, including internal or external antenna and optional GPS Receiver, detailed in Manufacturer installation instructions.

B. Configure system transmitter settings through mobile configurator app detailed in Manufacturer instructions.

C. Configure and install system clock devices per model specifications detailed in Manufacturer installation instructions.

Master transmitter operation

A. When power is first applied, it looks for a master time source (first GPS and then NTP). If a master time source is not found, it uses its onboard real time clock (RTC) and continues to search for its master time source. If time source is not found, transmitter is set to a warning state with a time sync failure status, its caution LED status indicator is illuminated, and transmits its state to the system software at its scheduled check-in time (default set to every 5 minutes). If it fails to get time from either source consecutively for 30 minutes (default), it enters an alarm state and its error LED indicator is illuminated. If the RTC clock is off significantly, the transmitter will report a critical error to OneVue. This will occur only after the first 30 minutes of operation if the RTC continues to be significantly off.

B. GPS Time Source: With the transmitter in GPS mode, it powers to a connected GPS receiver mounted with a clear view of the sky. Upon power, the GPS receiver seeks the GPS satellites in orbit to determine position and UTC time. Once the transmitter acknowledges receivable GPS data, it downloads time data and synchronizes its internal master clock to GPS time. The transmitter then starts to transmit its internal time once

every second. The transmitter updates its internal clock every time it receives valid time data from the GPS.

C. NTP Time Source: Transmitter connects over the OWNER'S Ethernet to the IP address of the NTP server. This IP address is programmed into the transmitter as part of its setting configuration. Once the connection to the NTP server is acknowledged, it downloads time data and synchronizes its internal master clock to received NTP time. The transmitter then starts to transmit its internal time once every second. The transmitter updates its internal clock in this mode once every 5 minutes by system default (end-user setting). Transmitter configuration allows up to three NTP servers for fail-over purposes.

Clock operation

A. After initial setup, the clock and/or timer shuts off its receiver. Six times each day an analog clock microprocessor activates its receiver and starting with the stored channel it search for a valid time signal. Every 10 minutes a digital clock/timer activates its receiver and starting with the stored channel search for a valid time signal. If necessary, the clocks will resynchronize to the correct time.

B. If an analog clock has not decoded a valid time signal for three consecutive days, it enters step mode. Low battery voltage is a common cause of the clock to not properly decode a time signal. If a clock goes into step mode, replace its batteries first and then determine if the clock synchronizes to master time source before attempting other troubleshooting methods.

C. If a digital clock/timer has not decoded a valid time signal for three consecutive days, its display colon indicator flashes continuously until a valid time signal is received.

2.4 EQUIPMENT

The system shall include all equipment as specified.

Supply following transmitter model(s)

- 1 Watt Transmitter with internal antenna, Ethernet Port (with GPS)
- 1 Watt Transmitter with external antenna, NTP and GPS Input
- 1 Watt Transmitter with internal antenna, NTP or Repeater capability
- 5 Watt Transmitter with external antenna, NTP and GPS input
- 30 Watt Transmitter with external antenna, NTP and GPS input

Transmitter general specifications

A. User-defined settings (mobile app): Time Zone, Daylight Saving Time bypass option, up to three NTP time sources, Power-on Transmit Schedule, Normal Transmit Schedule, Firmware, and Repeater Channel for a secondary (repeater) transmitter.

B. User-defined settings (system software): Legacy Clock Time Zone, Alarm Delay, Firmware, Unresponsive Timeout, and Check-in Interval.

C. Front panel: four LED status indicators (Power, Transmit, Caution, Error) and Bluetooth labeled push-button to pair transmitter with the system mobile configurator app.

D. Rear panel: Network LAN port (RJ-45 Ethernet, 100/10 Mbps, 802.3 Ethernet), GPS In port (MiniDIN 7-Pin), External Antenna connector (coaxial, n-male), Baseboard Monitor port (MiniDIN 9-Pin, for use with 5 or 30 Watt Transmitter only), dry contact closure relay panel (for use with specified Primex products), and pin port to allow end-user connection initiation (check-in) to system software.

E. An onboard real time clock (RTC) such that failure to receive time from master time source will not disable the operation of the system clocks.

F. Time zone adjustment for all time zones in the world and includes Eastern, Central, Mountain, Pacific, Alaska, and Hawaii.

G. Manufacturer or authorized certified installer shall configure the transmitter FCC call sign and RF channel number. These settings are to be predetermined during the FCC licensing process based on system installation location and existing wireless services operating in the area. The OWNER will be required to contact Manufacturer or authorized certified installer if, for any reason, a different broadcast channel is required, since the request would require a modification of the license, requiring approval by the US: FCC or CANADA: by Industry Canada. The system OWNER is the sole proprietor of the FCC License and manufacturer or certified installer are acting as agents. Changes to channel or other FCC regulated configuration settings following the installation by the manufacturer or certified installer are the sole responsibility of the OWNER, and should only be done in accordance with FCC regulations.

1 Watt Transmitter specifications

Transmitter shall meet the specifications below:

A. 1-Watt maximum transmission (at transmitter)

B. 72MHz frequency range

C. 49 channels available (pre-programmed prior to shipment)

D. Dimensions: 17.0”L x 12.0”W x 1.7”D (43.2cm x 30.5cm x 4.32cm)

E. Weight: 9 lb.. (4 kg)

F. Power Supply: Input: 120 VAC, 50/60 Hz, 0.6 Amp | Output: 9 VDC, 2.78 Amp, 6 ft. (1.8 m) cord

G. Operating Range: 32° to 122°F (0° to 50°C)

Internal antenna specifications (1 Watt Transmitter)

Transmitter shall include an internal antenna that is fastened to the top of the unit.

A. Antenna: 46.0 in. L (116.8 cm)

B. Weight: 7.75 lb. (3.5k g)

5 and 30 Watt Transmitter specifications

Transmitter shall meet the specifications below.

A. Operating Frequency Range: 72MHz

B. Enclosure Dimensions: 22”W x 17”H x 22”D (55.88cm x 43.18cm 55.88cm)

C. Approx. Weight: 55 lb. (24.9 kg)

D. Power Supply: 120 VAC, 50/60 Hz, 6.0A Max

E. Oversized heat sink provides adequate cooling

F. Amplifier Output Bandwidth: >20 MHz maximum

External antenna specifications

Transmitter shall include an external antenna that meets the below specifications

A. Antenna connects to the transmitter via a 100 ft. (30.5m) 50-ohm coaxial cable.

B. **5 and 30 Watt models**: External Antenna must be installed by Primex or a certified Primex installer.

C. Cabling: Maximum 100 ft. (30.48 m) between transmitter and antenna

D. FCC Part 90 Accepted

E. IC RSS-119 Accepted

F. Weight: 9 lb. (4.1 kg)

G. Shall include an Outdoor Ground Plane Antenna that meets the specification below:

   Dimensions: 29.4”H x 41.5”W (74.7cm x 105.41cm)
   Lightning Protection: Direct Ground
   Cabling: 100 ft. (30.48 m) between transmitter and antenna provided
   FCC Part 90 Accepted

IC RSS-119 Accepted
Weight: 8.25 lb. (3.75 kg)

GPS Receiver specifications

A. **External Antenna model:** GPS roof mounted with 16 ft. (5 m) cable attached. GPS Receiver shall be a complete GPS receiver including antenna in a waterproof case, designed for roof or outdoor mounting. Provide mounting bracket for attachment to roof structure.

B. **Internal Antenna model:** GPS roof mounted, with 10 ft. cable (3 m) attached.

C. An GPS extension cable is available from the Manufacturer, 50 ft. (15.25 m), 100 ft. (30.5 m), or 200 ft. (61 m). Use with an external antenna: total GPS cable length cannot exceed 100 ft. (30.5 m).

D. GPS Receiver cable must be plenum rated where required by local code.

E. GPS connection to main Transmitter requires ferrite bead connector (supplied with transmitter).

Repeater Transmitter

A. Shall receive signal from master Transmitter and transmit the signal to the system devices in its vicinity, which are out of range from the master transmitter.

Analog Clocks

Clocks shall meet the following specifications:

A. Analog clocks shall be wall mounted.

B. Face shall be white. Hour and minute hands shall be black.

C. Additional colors, finishes, and dial faces are available from Manufacturer.

D. Clock faces can be customized by Manufacturer to display organization name or logo as specified.

E. Clock frames and lenses are of durable thermoplastic.

F. Clocks shall have a tamper proof/theft resistant clock-lock mounting slots.

G. Analog clocks shall be capable of automatically adjusting for Daylight Saving Time. An on-off switch located on the transmitter shall disable this function if desired.

H. Clock shall have either a battery-power or a 120 VAC power supply built into the clock assembly.

I. If power is interrupted, the clock will stop until power resumes. Upon resumption of power, the clock will self correct to the current time.

J. Electric (AC) models will include a two prong plug. The power cord can be cut to length and sliced as needed for hard wired installation.

K. Battery-operated analog clocks shall have up to a 5-year battery life. Battery life is based on common operating conditions and may very due to installed site conditions.

L. Installer will furnish clock batteries in accordance with Manufacturer instructions.

M. Time shall be automatically updated from the transmitter 6 times per day.

N. If the transmitter stops transmitting valid time signals due to power failure, the clocks will continue to function as accurate quartz clocks until a valid time signal is decoded. If signal transmission is not restored after 96 hours, the second hand will “two -step” as a visual indicator that the signal has been lost. Should the clocks lose both power and signal, the clocks will not function.

O. Analog clock receivers shall be as follows: Receiver sensitivity: >-110 dBm, Receiver power: Dual Alkaline batteries or AC-powered, Antenna type: internal, Antenna gain: -7 dBd

P. SUPPLY MODELS - Traditional Series Analog Clocks
(Power Source) Description
(Battery) 9” (22.86cm) Black
(Battery) 12.5” (31.75cm) Black
(Battery) 12.5" (31.75cm) White

16” (40.64cm) Clear Oak Arabic
16” (40.64cm) Clear Oak Roman
16” (40.64cm) Walnut Arabic
16” (40.64cm) Walnut Roman

Digital Clocks

Clocks shall meet the following specifications.

A. Digital Clock must be able to receive synchronized time signal from the master or satellite transmitter.

B. Digital Clock display must include a 12 or 24-hour time display, a PM indicator light, and an alternating time and date display option.

C. Surface-mount models are available from the Manufacturer.

D. Flush-mount models are available from the Manufacturer.

E. Dual-mount models are available from the Manufacturer; dual mount kit.

F. Digital Clock shall be capable of automatically adjusting for Daylight Saving Time.

G. Digital Clock shall have either a 120 VAC or 24 VAC power supply built into the clock assembly.

H. 120 VAC Digital Timer will include a power cord with a two prong plug. Power cord can be trimmed to length and spliced as needed for hard wired installation.

I. 24 VAC Digital timer will include a power cord with pigtail to be hard wired to building 24VAC power grid.

J. Digital Clock must be viewable from 150 ft. (45.7 m).

K. Digital Clock must have highly visible 7-segment LED digits.

L. Digital Clock shall have three display dimmer options, 75%, 50%, and 25%.

M. Digital Clock LED colors, sizes, digit layouts, and mount options are available from the Manufacturer.

N. SUPPLY MODELS - Digital Clocks

Digital Clocks (Levo Series)

Surface-Mount with 2.5" Digits

Description
120VAC, 4° Slope Bracket, 10’ (3.0m) cord with plug
120VAC, 18° Slope Bracket, 10’ (3.0m) cord with plug
24VAC, 4° Slope Bracket, 12” (30.48cm) cord with pigtail
24VAC, 18° Slope Bracket, 12” (30.48cm) cord with pigtail

Surface Mount with 4" Digits

Description
120VAC, 4° Slope Bracket, 10’ (3.0m) cord with plug
24VAC, 4° Slope Bracket, 12” (30.48cm) cord with pigtail

Accessories

A. System shall be available from the same equipment manufacturer.

Analog Clock - Dual Clock Kit
Description
Black - Fits 12.5" Traditional Series or Educational Series Analog Clock
White - Fits 12.5" Traditional Series or Educational Series Analog Clock

Slim Metal Series Clock - Dual Clock Kit
Description
Fits 12.5” (31.75cm) Slim Model Clock
Fits 16” (40.6cm) Slim Model Clock

Digital Clock - Dual Clock Bracket Kit
Ceiling mount: [2", 4-Digit] [2", 6-Digit] [4", 4-Digit] [4", 6-Digit]
Wall mount: [2", 4-Digit] [2", 6-Digit] [4", 4-Digit]

Digital Clock Polycarbonate Clock Guards
Description
2.5" (6.35cm) Guard: 16.0" L x 7.0" H x 5.5"D (40.64cm L x 17.78cm H x 13.97 cm D)
4" (10.16cm) Guard: 25.0" L x 9.8" H x 4.4" D (63.5cm L x 24.9cm H x 11.2 cm D)

Analog Clock Wire Clock Guard
Description
16" Clocks (40.64cm): 18" square x 3"D (45.72cm square x 7.6cm D)

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine conditions with the Installer present for compliance with requirements and other conditions affecting the performance of the system and the system devices.

B. Do not proceed until unsatisfactory conditions have been corrected.

C. Verify that construction is complete in spaces to receive equipment and that rooms are clean and dry.

D. Verify that 120 VAC electrical outlet is located within 5 ft. (1.5 m) of device and the outlet is operational and properly grounded.

3.2 INSTALLATION

A. General: Install system devices in accordance with applicable codes.

B. Install system devices in accordance with Manufacturer written instructions.

C. Provide all system equipment necessary for a complete and operable system.

D. Comply with requirements of Division 27 Sections "Common Work Results for Communications" and "Communications Horizontal Cabling."

E. Cables: Install cables in raceways and cable trays except within consoles, cabinets, and desks [and except in accessible ceiling spaces and framed partitions where exposed wiring is allowed by Owner]. Install plenum cable where required. Conceal cable installation where possible.

GPS Unit (INTERNAL Antenna Transmitter Model only):

A. Install GPS unit on roof in location indicated, in clear view of the sky.

B. Install unit in location free from standing water and above accumulations of leaves or debris.

C. Seal cable connection to GPS with cable connection sealant.

D. Any added cable lengths must be protected from outside elements.

GPS Unit (EXTERNAL Antenna Transmitter Model only):

A. Locate transmitter in a penthouse, electrical closet or telecommunications room in a central location in the building.

B. Clearance around all side of the transmitter to comply with local building codes.

If GPS Unit will be used as master time source:

A. Attach GPS receiver cable to transmitter back panel.

B. Set GPS/LAN DIP switch to GPS.

If NTP will be used as master time source:

A. Connect CAT5/CAT5e/CAT6 EIA/TIA standard Ethernet cable from transmitter back panel LAN port to available network drop.

Transmitter (EXTERNAL Antenna only)

A. Transmitter is connected to external antenna via a 50 ohm coaxial cable. Typical length is 100 ft. (30.5 m)

B. Cable routing should comply with ANSI EIA/TIA-569 and local building codes.

C. If cable is routed through conduit, the conduit should be a minimum of 2 in. (50.8 mm) diameter.

D. Transmitter enclosure must be bonded to an earth ground per ANSI EIA/TIA 607, NEC Article 250, and local building codes.

E. Antenna should be mounted to a mast on the roof of the building connecting to the transmitter via a 50-ohm coaxial cable.

F. Consult manufacturer instruction manual for specific clearances and mounting instructions.

G. Antenna must be bonded to an earth ground per ANSI EIA/TIA 607, NEC Article 250, and local building codes.

Transmitter (INTERNAL Antenna only)

A. Locate transmitter where indicated, a minimum of 2 to 3 ft. (.6 to 1 m) above the floor, away from large metal objects such as filing cabinets, lockers or metal framed walls.

B. Transmitter(s) will be placed at locations indicated within specifications and drawings.

C. Connect antenna to transmitter, using care not to strip threads

D. Connect power supply to the transmitter.

E. Plug power supply into electrical outlet.

Analog Clocks

A. Furnish all equipment necessary for a complete and operational system.

B. Perform the following operations with each clock:

1. Configure and set clock to correct time in accordance with manufacturer instructions.
2. Observe clock until valid signals are received and clock adjusts itself to correct time.
3. Install each clock per its model mounting specifications per manufacturer instructions and mounting instructions at the indicated location

Digital Clocks

A. Cable routing must comply with ANSI EIA/TIA- 569-A and local building codes.

B. Furnish all equipment necessary for a complete and operational system.

C. Perform the following operations with each clock:

1. Configure and set clock to correct time in accordance with manufacturer instructions.
2. Observe clock until valid signals are received and clock adjusts itself to correct time.
3. Install each clock per its model mounting specifications per manufacturer instructions and mounting instructions at the indicated location.

Digital Timers

A. Cable routing must comply with ANSI EIA/TIA- 569-A and local building codes.

B. Furnish all equipment necessary for a complete and operational system.

C. Perform the following operations with each clock:

1. Mount timer per model mounting specifications.
2. Apply power per timer model power specifications.
3. Connect timer to switch control unit with manufacturer provided cable or approved extension cable.
4. Fasten timer to mounting bracket.
5. Set time zone, time date option, and brightness level in accordance with manufacturer instructions and per owner requirements.
6. Observe timer until valid time signal is received and timer displays correct time.

3.3 FIELD INSPECTION

A. Inspection: Make observations to verify that system devices and components are properly labeled.

B. Prior to final acceptance, inspect each system device and component, adjust as required, and replace parts which are found defective.

C. At completion of system device installation and prior to final acceptance, turn on the equipment; ensure that all equipment is operating properly, and that the system and all system devices and components are functioning.

3.4 MANUFACTURER SERVICES

A. System software and device manuals shall be assessable through Manufacturer online knowledge base

B. Provide Manufacturer system commissioning in accordance with Manufacturer written recommendations. Perform operational testing to verify compliance with requirements. Adjust as required.

C. Manufacturer to provide a specified level of system commissioning services.

1. Phone commissioning: system deployment training, including system set up, validation of device configuration, and system functionality by way of a remote web conference.
2. On-site commissioning: system deployment training, including system set up, validation of device configuration, system functionality, verification of device network connections, and device install training.
3. Installation and full on-site commissioning: system training, software configuration, validation of device configuration, training on system functionality, verification of network use, device install training, and device installation.

3.5 CLEANING

A. Prior to final acceptance, clean exposed surfaces of devices, using cleaning methods recommended by Manufacturer.

B. Remove temporary labels from clock faces. Do not remove labels from backs of clocks.

3.6 DEMONSTRATION

A. Provide training to OWNER'S representative on setting, adjusting and configuring device and routine maintenance.

B. Provide training to OWNER'S representative on how to install or access the system provided software, adjusting and programming the transmitter, setting and adjusting system devices and routine maintenance

3.7 PROTECTION

A. Protect finished installation until final acceptance of the project.

3.8 TESTING

A. All devices must be tested at their operational location under normal operational conditions to ensure reception of signal.

END OF SECTION 27 53 13

PART 1 - GENERAL

1.1 SUMMARY

A. This specification describes technical and performance criteria for deploying an Emergenct responder Radio Coverage Antenna System (ERRCS) capable of supporting Public Safety Networks (PSN). The ERRCS components specified in this document include: Donor Antennas, Coverage Antennas, Coax Cable, Coax Connectors, Splitters, Combiners, Couplers, Fiber-Optic Cable, Fiber-Optic Connectors, and Fiber-Optic Jumpers, Bi-Directional Amplifiers (BDA), Fiber-Optic Master Unit and Fiber-Optic Remote Units.

1.2 RELATED SECTIONS

A. 27 05 00 COMMON WORK RESULTS FOR COMMUNICATIONS

B. 27 05 26 GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

C. 27 05 29 HANGERS AND SUPPORTS FOR COMMUNICATIONS SYSTEMS

D. 27 05 33 CONDUITS AND BACKBOXES FOR COMMUNICATIONS SYSTEMS

E. 27 05 36 CABLE TRAYS FOR COMMUNICATIONS SYSTEMS

F. 27 05 53 IDENTIFICATION FOR COMMUNICATIONS SYSTEMS

G. 27 11 16 COMMUNICATIONS CABINETS, RACKS, FRAMES, AND ENCLOSURES

H. 27 11 19 COMMUNICATIONS TERMINATION BLOCKS AND PATCH PANELS

I. 27 11 23 COMMUNICATIONS CABLE MANAGEMENT AND LADDER RACK

J. 27 11 26 COMMUNICATIONS RACK MOUNTED POWER PROTECTION AND POWER STRIPS

K. 27 13 00 COMMUNICATIONS BACKBONE CABLING

L. 27 13 43 COMMUNICATIONS SERVICES CABLING

M. 27 15 00 COMMUNICATIONS HORIZONTAL CABLING

N. 27 41 33 MASTER ANTENNA TELEVISION SYSTEMS

O. 27 51 16 PUBLIC ADDRESS SYSTEMS

P. 27 52 13 PATIENT MONITORING AND TELEMETRY SYSTEMS

Q. 27 52 23 NURSE CALL/CODE BLUE SYSTEMS

R. 27 53 13 CLOCK SYSTEMS

1.3 SYSTEM DESCRIPTION

A. Services: Upon commissioning, the ERRCS shall provide coverage for the PSNs listed below on all frequencies currently being used by the designated PSN in the given market.

1. NOTE: Below list should be customized for specific project
    a. 700 MHz Public Service
    b. 800 MHz Public Service

B. Expansion: Without replacing the Passive DAS Infrastructure, the DAS shall have expansion capabilities to support the following PSN frequencies deployed in a SISO antenna environment. Any additional Components required for system expansion shall comply with all specifications of this Section.

Service	Uplink	Downlink
700/800 Public Safety	793-805, 806-824	763-775, 851-869

C. PSN Approval: The Contractor shall propose and deploy a DAS system capable of receiving approval of the PSN Authority Having Jurisdiction (AHJ).

D. Network Management:

1. NMS: The DAS shall have a Network Management System (NMS) capable of alarm, monitor, configuration and control of all Active Components.
2. SNMP Integration: The DAS NMS shall be capable of integration with 3rd party SNMP based NMS products for alarm purposes and provide alarming information.

1.4 ALTERNATIVES

A. No alternative component(s) shall be accepted as equal to the components and manufacturers specified in this document unless the Contractor proves the alternative component(s) are of equal or superior specifications and quality, and that they have been used in similar projects of size and complexity for no less than 3 years. The following information shall be required for each alternative component with submittal of the bid response:

1. Passive Components:
    a. Product samples
    b. Detailed product specifications
    c. Independent test results verifying the product specifications
    d. Written documentation from the manufacturer guaranteeing the alternative component(s) shall remain available for new purchase for a period of 7 years from the date of system acceptance.
2. Active Components:
    a. Hardware and software manuals
    b. Detailed product specifications
    c. Mean Time Between Failure (MTBF) data for each Active Component
    d. Independent test results verifying the product specifications

e. Written documentation from the manufacturer guaranteeing the alternative component(s) shall be supported for a period of 7 years from the date of system acceptance.

f. For Active Components serving the PSN, written documentation from the AHJ that the alternative component(s) are approved for use within the PSN and that system acceptance of the DAS to the PSN will not be withheld due to the alternative component being used in the DAS.

1.5 CODES, STANDARDS AND CERTIFICATIONS

A. All work, including but not limited to: cabling, pathways, support structures, wiring, equipment, installation, workmanship, maintenance and testing shall comply with the latest editions of the National Electrical Code, National Electrical Safety Code, all applicable local rules and regulations, equipment manufacturer's instructions, and the National Electrical Contractors Association (NECA) Standard of Installation. In case of discrepancy or disagreement between the documents noted above, the contractor shall satisfy the most stringent requirements.

B. Requirements set forth by first-responder code, ordinance, or the PSN AHJ shall supersede the requirements described herein and shall be met in their entirety. It is the Contractor’s responsibility to ensure that the ERRCS complies with local code, ordinances or requirements established by the PSN AHJ.

1.6 ABBREVIATIONS AND ACRONYMS

A. AHJ: Authority Having Jurisdiction

B. ATP: Acceptance Test Plan

C. BDA: Bi-Direction Amplifier

D. BOM: Bill-of-Material

E. DAS: Distributed Antenna System

F. DAQ: Delivered Audio Quality

G. ESMR: Enhanced Specialized Mobile Radio

H. FCC: Federal Communications Commission

I. LMR: Land Mobile Radio

J. MTBF: Mean Time Between Failure

K. NFPA: National Fire Protection Association

L. NMS: Network Management System

M. PSN: Public Safety Network

N. RoF: Radio-over-Fiber

O. RoHS: Restriction of Hazardous Substances

P. RSL: Received Signal Level

Q. SISO: Single-Input, Single-Output

R. SMR: Specialized Mobile Radio

S. SNMP: Simple Network Management Protocol

T. SOW: Statement of Work

U. VSWR: Voltage Standing Wave Ratio

1.7 DEFINITIONS

A. Acceptance: Expressed approval by the customer

B. Active: ERRCS components that require AC/DC power for operation

C. Channel: A path for an RF transmission between two points

D. Component: A main system element of the ERRCS

E. Contractor: The prime contractor bidding the project

F. Delivered Audio Quality (DAQ): A measure of audio quality over a transmission medium used to quantify the quality of audio heard over a radio system. DAQ levels are defined by the following scale:

1. DAQ 1: Unusable. Speech present but not understandable.
2. DAQ 2: Speech understandable with considerable effort. Requires frequent repetition due to noise or distortion.
3. DAQ 3: Speech understandable with slight effort. Requires occasional repetition due to noise or distortion.
4. DAQ 3.4: Speech understandable without repetition. Some noise or distortion present.
5. DAQ 4: Speech easily understandable. Little noise or distortion.
6. DAQ 5: Perfect. No distortion or noise discernible.

G. ERRCS Sub-contractor: A qualified and experienced ERRCS integrator performing the ERRCS deployment for the Contractor.

H. Head-End Equipment: The equipment that accepts the RF Source, and then typically attenuates, combines, filters and converts the various RF Source signals before transmitting the RF signals to the Remote Units.

I. Passive: ERRCS components that do not require AC/DC power for operation

J. Remote Unit: The equipment that receives the RF signals from the Head-End Equipment, and then typically filters, converts and often amplifies the RF signal before transmitting it to the coverage antenna.

1.8 PERFORMANCE REQUIREMENTS

A. Optical Fiber Infrastructure:

1. General: Optical fiber cabling shall be tested and certified after installation as described below and as required for cable manufacturer's warranty.

2. Fiber testing shall be performed on all optical fibers in completed end-to-end system. Testing shall consist of a bi-directional end-to-end Optical Time Domain Reflectometer (OTDR) trace performed by EIA/TIA-455-61 or a unidirectional end to end power meter test performed by EIA/TIA-455-53A with Single Direction OTDR Trace

3. The system loss measurements shall be provided at 1310 and 1550 nanometers for singlemode optical fibers and 850 and 1300 nanometers for multimode fibers.

4. Optical return loss measurements shall be completed for each fiber at either 1310 or 1550 nm for singlemode. OTDR traces that demonstrate minimum connector and splice performance or a composite ORL test may be used to satisfy this requirement.

5. For spans greater than 90 meters, each tested span must test to a value less than or equal to value determined by calculating a link loss budget. For horizontal spans less than or equal to 90 meters, each tested span must be less than or equal to 2.0 dB.

6. The insertion loss for each mated optical fiber connector pair shall not exceed 0.5 dB. Optical return loss shall be < -65 dB @ 1310 and 1550 nm for singlemode fiber.

7. Optical splices shall have an average splice loss of < 0.05 dB with a maximum of 0.10 dB at both 1300 nm and 1550 nm for single mode fiber. Mechanical splices shall have a ORL of -65 dB for singlemode fiber.

8. Pre-installation testing: Test all optical fiber cable for all optical fibers prior to installation of cable.

9. Attenuation testing: Attenuation testing shall be performed with a stable launch condition using two-meter jumpers to attach test equipment to cable plant. The light source shall be left in place after calibration and power meter moved to far end to take measurements.

10. Loss budget: Fiber links shall have a maximum loss of:

B. (Allowable cable loss by kilometer) × (kilometers of optical fiber in link) + (0.2 decibels) × (number of connectors) + (0.15 dB) X (number of splices) = maximum allowable loss

1. Link loss: A mated connector to connector interface shall be considered a single connector. Loss numbers for installed link shall be calculated by taking sum of bi-directional measurements and dividing that sum by two. All links not meeting requirements of standard shall be brought into compliance by Contractor, at no additional cost to Owner.

2. Documentation: Following final documentation shall be submitted to Owner's Representative prior to commissioning data system and final contract payment according to Submittals in this section:

a. End-to-end loss data

b. Individual splice loss data (where applicable)

c. As installed diagrams

C. PSN DAS:

1. The PSN DAS shall comply with NFPA-1221 current edition as adopted by the AHJ.

2. Where the in-building coverage requirements include 700 - 800 MHz public safety system and commercial wireless in-building coverage, the two systems shall operate over a separate passive cable and coverage Antenna Infrastructure.
3. Contractors shall state the assumed channel count for the PSN Frequency Bands identified above in Section 1.3A. with submittal of bid response. Prior to installation, contractors shall confirm the channel count and frequencies with the AHJ and shall guarantee coverage for these channels per the criteria stated above.
4. The ERRCS shall be capable of upgrade to allow for changes to system frequencies within the deployed frequency band in order to maintain radio system coverage as originally designed.
5. The contractor shall explain the method used to avoid downlink and uplink interference.

1.9 ADDITIONAL REQUIREMENETS

A. PSN Approval: When approval of the ERRCS deployment is required by code or ordinance, the Contractor shall be responsible for facilitating the AHJ approval(s) per the requirements of the code or ordinance.

1.10 SUBMITTALS

A. Submittal Requirements with Bid Response:
   1. Product Data: Submit manufacturer datasheets for the following components:
      a. Donor and Coverage Antennas or Access Points
      b. Coaxial Cable and Connectors (if used)
      c. Splitters, Combiners and Couplers (if used)
      d. Bi-Directional Amplifiers (BDA) (if used)
      e. All active components included in the DAS
   2. Shop Drawings: Submit the following items:
      a. RF link budget
      b. Overlay of system Components on floor plans
      c. Drawings for Donor Antenna and grounding
      d. Bill-of-Material (BOM)
   3. Statement of Work (SOW): Submit sample SOW
   4. Acceptance Test Plan (ATP): Submit sample ATP
   5. Recommended Spares
   6. Warranty Documents:
      a. Submit for all manufactured Components specified in this Section.
      b. Submit Contractor’s System Warranty.
      c. Submit Manufacturer’s Extended Warranty.

B. Submittal Requirements Prior to Start of Construction
   1. Final RF link budget
   2. Overlay of system Components on floor plans

3. Drawings for Donor Antenna and grounding (if used)
4. RF propagation modeling
5. Bill-of-Material (BOM)
6. Maintenance Service Contract
7. Statement of Work (SOW): The contractor shall submit a SOW that has been accepted by the customer or customer's designated representative.
8. Acceptance Test Plan (ATP): The contractor shall submit an ATP that has been accepted by the customer or customer's designated representative.

C. Submittal Requirements at Close Out

1. Drawings: Submit as-built drawings indicating:
   a. Donor antenna, grounding and lighting protection details (if used)
   b. Cable routing, splitters, couplers and coverage antenna locations
   c. Active component locations, layout and configuration
2. Test Reports
   a. PSN: Submit Accepted ATP reports confirming the requirements of Section 1.8D have been met.
3. Field Reports: Submit sweep-testing results for all cable runs.
4. Field Reports: Submit OTDR or End-to-End Power Measurement test results for all fiber runs.
5. Operation and Maintenance Data: Submit hardware and software manuals for all Active Components.
6. Warranty Documents:
   a. Submit for all manufactured components specified in this Section.
   b. Submit Contractor's System Warranty.
   c. Submit Manufacturer's Extended Warranty

1.11 QUALITY ASSURANCE

A. Qualifications and Requirements

1. Contractor or ERRCS Sub-contractor shall have a minimum of 4-years full-time experience executing ERRCS work of similar scope and complexity.
2. Contractor or ERRCS Sub-contractor shall have deployed a minimum of 10 ERRCS systems.
3. Contractor or ERRCS Sub-contractor shall have the ability to remotely monitor ERRCS systems.
4. Contractor or ERRCS Sub-contractor shall provide an onsite construction foreman to oversee the installation.
5. Contractor or ERRCS Sub-contractor shall provide a project manager to oversee the ERRCS deployment.

B. Certifications

1. The manufacturer(s) of the ERRCS active components shall maintain a formal authorized and certified value-added reseller program, which consists of routine quality audits of the

participating value-added resellers. The list of authorized value-added resellers shall be published, and the Contractor or ERRCS Sub-contractor shall be listed in the Manufacturer's publication of value-added resellers.

2. Contractor or ERRCS Sub-contractor(s) shall provide manufacturer certification that their personnel have been trained on the passive and active components being installed.

3. Contractor or ERRCS Sub-contractor shall be an authorized and certified value-added reseller for the proposed ERRCS manufacturer of passive and active ERRCS components.

C. Contractor(s) meeting the above certifications, requirements and qualifications include:

1. A valid FCC-issued general radio operators license.

2. Certification of in-building system training issued by a nationally recognized organization, school or a certificate issued by the manufacturer of the equipment.

1.12 WARRANTY

A. Manufacturer Warranty:

1. Splitters, Couplers and Coverage Antennas: 5-year limited warranty from date of system acceptance.

2. Coaxial Cable and Connectors: 10-year limited warranty from date of system acceptance.

3. Fiber-Optic Cable: 25-year limited warranty from date of system acceptance.

4. Active Components: The earliest of 1-year limited warranty from date of system installation or 15 months from date of shipment.

B. Contractor Warranty: Contractor shall warrant the system performance as specified in Section 1.8 for 1-year.

1.13 MAINTENANCE

A. The Contractor shall provide an optional annual maintenance service contract to include:

1. 24x7x365 Remote Monitoring

2. Remote Diagnostics & Repair

3. 24x7x365 Technician Dispatch (On-site within 24 hours)

4. Annual Preventive Maintenance

5. Service Provider Coordination

6. Equipment Warranty Management

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Specified Manufacturers for 50 Ohm passive DAS components: Commscope, RFS, Westell, Microlabs, Comba

B. Specified Manufacturers for DAS Active components: Corning MobileAccess

C. Specified Manufacturers for BDA Active components: Comba, Westell, Bird Technologies, Fiplex

D. Specified Manufacturers for Optical fiber components: Corning Cable Systems, Commscope

E. Acceptable Manufacturers: As permitted in Section 1.4

2.2 COMPONENTS

A. Omni-Directional Coverage: Omni-Directional Coverage antennas shall feature a multi-band design, accommodating multiple frequency bands in a single small antenna. *(If UHF services are required as specified in Section 1.3A, the specifications for the Omni-Directional Coverage antenna shall be MARS MA-CQ26-1X or functional equivalent.)*

1. Electrical Band 1:
    a. Frequency Band: 698 – 800 MHz
    b. VSWR: ≤ 1.8:1
    c. Gain: ≥ 1.5 dBi
    d. Maximum input power:
    e. Impedance: 50 Ω
    f. Beamwidth, Horizontal: 360° omnidirectional
    g. Beamwidth, Vertical: 80° nominal
    h. Return Loss: 10.9 dB
2. Electrical Band 2:
    a. Frequency Band: 1710 – 2700 MHz and 800 – 960 MHz
    b. VSWR: ≤ 1.5:1
    c. Gain: ≥ 1.5 dBi @ 800–960 MHz and ≥ 5.0 dBi @ 1710 – 2700 MHz
    d. Maximum input power:
    e. Impedance: 50 Ω
    f. Beamwidth, Horizontal: 360° omnidirectional
    g. Beamwidth, Vertical: 65° nominal
    h. Return Loss: ≤ 13.9 dB
3. Mechanical:
    a. Connector: 50 Ω N Type
    b. Mounting: Thru-hole ceiling mount
    c. Radome material: ABS, UV resistant
    d. Pigtail cable: Plenum rated
4. Environmental:
    a. Application: Indoor
    b. Operating Temperature: 40 °C to +60 °C (40 °F to +140 °F)
    c. Relative Humidity: Up to 100%
5. Regulatory Compliance/Certifications: RoHS 2002/95/EC

B. Directional Coverage Antennas: Directional coverage antennas shall feature a multi-band design, accommodating multiple frequency bands in a single small antenna. *(If UHF services are required as specified in Section 1.3A, the specifications for the Omni-Directional Coverage antenna shall be MARS MA-WA46-1X or functional equivalent.)*

1. Electrical Band 1:
    a. Frequency Band: 698 – 800 MHz
    b. VSWR: ≤ 1.8:1
    c. Gain: ≥ 5.0 dBi @ 698 – 800 MHz
    d. Maximum input power: 50W
    e. Impedance: 50 Ω
    f. Beamwidth, Horizontal: 110° nominal
    g. Polarization: Vertical
    h. Return Loss: ≤ 10.9 dB
2. Electrical Band 2:
    a. Frequency Band: 1710 – 2700 MHz and 800 – 960 MHz
    b. VSWR: ≤ 1.5:1
    c. Gain: ≥ 5.0 dBi @ 800 – 960 MHz and ≥ 6.0 dBi @ 2170 – 2700 MHz and ≥ 8.0 dBi @ 1710 – 2170 MHz
    d. Maximum input power:
    e. Impedance: 50 Ω
    f. Beamwidth, Horizontal: 90° nominal
    g. Return Loss: ≤ 13.9 dB
3. Mechanical:
    a. Connector: 50 Ω N Type Female
    b. Mounting: 4-hole wall mounting plate
    c. Radome material: ABS, UV resistant
    d. Pigtail cable: RG58, plenum rated
4. Environmental:
    a. Application: Indoor
    b. Operating Temperature: 40 °C to +60 °C (40 °F to +140 °F)
    c. Relative Humidity: Up to 100%
5. Regulatory Compliance/Certifications: RoHS 2002/95/EC

C. Air Dielectric, Plenum Rated Cable:

1. Material Characteristics:
    a. Jacket: Halogenated, Fire-Retardant
    b. Outer Conductor Material: Corrugated Aluminum or Corrugated Copper
    c. Inner Conductor Material: Copper-Clad Aluminum Wire
2. Electrical Characteristics:
    a. Impedance: 50 ± 2.0 Ω

b. Frequency Band: 1 - 8800 MHz

c. Peak Power Rating: ≥ 40.0 kW

3. Mechanical Characteristics:

a. Diameter Over Jacket: ≤ .62 in

b. Minimum Bending Radius: 5 in

c. One Time Minimum Bending Radius: 2.5 in

4. Attenuation Characteristics:

Frequency (MHz)	Attenuation (dB/100ft)
150	≤ 0.86
450	≤ 1.565
800	≤ 2.166
2000	≤ 3.716

Standard Conditions: VSWR 1.0, ambient temperature 20 °C (68 °F)

5. Approved Manufacturer: Commscope AL4RPV-50 or equivalent, in accordance with Section 1.4.

D. Foam Dielectric Cable:

1. Material Characteristics:

a. Jacket: Non-halogenated, Fire-Retardant Ployolefin

b. Outer Conductor Material: Corrugated Copper

c. Inner Conductor Material: Copper-Clad Aluminum Wire or Copper Tube

2. Electrical Characteristics:

a. Impedance: 50 ± 1.0 Ω

b. Frequency Band: 1/2” Nominal: 1 - 8800 MHz, 7/8” Nominal: 1 - 5000 MHz

c. Peak Power Rating: ≥ 40.0 kW

3. Mechanical Characteristics:

a. Diameter Over Jacket: 1/2” Nominal: ≤ .63 in, 7/8” Nominal: ≤ 1.1 in

b. Minimum Bending Radius: 1/2” Nominal: ≤ 5 in, 7/8” Nominal: ≤ 10 in

c. One Time Minimum Bending Radius: 1/2” Nominal: ≤ 2 in, 7/8” Nominal: ≤ 5 in

4. Attenuation Characteristics: 1/2” Nominal

Frequency (MHz)	Attenuation (dB/100ft)
150	≤ 0.815
450	≤ 1.447
800	≤ 1.968
2000	≤ 3.251

Standard Conditions: VSWR 1.0, ambient temperature 20 °C (68 °F)

5. Attenuation Characteristics: 7/8” Nominal:

Frequency (MHz)	Attenuation (dB/100ft)
150	≤ 0.417
450	≤ .744
800	≤ 1.014
2000	≤ 1.683

Standard Conditions: VSWR 1.0, ambient temperature 20 °C (68 °F)

E. Splitters, Combiners, Couplers, and Coax Jumpers:

1. Approved Manufacturer: Comba, Commscope, Westell or equivalent, in accordance with Section 1.4.

F. BDA: The BDA shall use digital filtering to mitigate interference and accommodate multiple services for PSNs.

1. Characteristics

a. Operating Temperature Range: -33 °C to +50 °C

b. Filtering: Digital for Public Safety Bands

c. FCC Part 90.219 Type Classification: Class A narrowband for LMR/SMR/ESMR frequency bands

d. Alarming: Shall support both SNMP and SMS using wireless modem

2. Compliance:

a. NFPA: For Public Safety bands, the BDA shall comply with NFPA 1221 In-Building Public Safety Radio Enhancement Systems.

b. FCC: Shall be FCC type certified.

3. Approved Manufacturers: Comba, Westell, Bird Technologies, Fiplex or equivalent, in accordance with Section 1.4.

G. Fiber-Optic Master Unit: When installation requirements dictate an Active fiber ERRCS, the Fiber-Optic Master Unit shall convert radio over coax to Radio-Over-Fiber (RoF) for distribution to Fiber-Optic Remote Units. Master unit shall be capable of utilizing either Multimode or Single Mode fiber. The Master unit shall also support simultaneous deployment of multiple remote power options (low, medium, and high).

1. Approved Manufacturers: SOLiD, Commscope, Corning or equivalent, in accordance with Section 1.4.

H. Fiber-Optic Remote Units: The Fiber-Optic Remote Unit converts the RoF signal back to radio over coax, as well as provides filtering so that multiple frequency bands can reside over the same passive cable and antenna infrastructure. Fiber-Optic remote unit shall be compatible with the Fiber-Optic Master Unit listed above. Remote unit shall be capable of utilizing either Multimode or Single Mode fiber.

1. Approved Manufacturers: SOLiD, Commscope, Corning or equivalent, in accordance with Section 1.4.

I. Fiber-Optic Cable and Connectors:

1. General Specifications:

a. Cables shall be six-fiber or greater, designed for point-to-point applications as well as mid-span access, and shall provide a high-level of protection for optical fiber installed in interior building environments.

b. All cables shall be home run from each remote location to each Fiber Master rack without passing through any intermediate cross-connects. Intermediate splice/aggregation points are allowed.

2. Single Mode Fiber General

a. All fibers in the cable must be usable and meet required specifications.

b. Each optical fiber shall be sufficiently free of surface imperfections and inclusions to meet the optical, mechanical, and environmental requirements of this specification.

c. Each optical fiber shall consist of a Germania-doped silica core surrounded by a concentric glass cladding.

d. Each optical fiber shall be proof tested by the fiber manufacturer at a minimum of 100 kpsi (0.7 GN/m2).

e. The fiber shall be coated with a dual layer acrylate protective coating. The coating shall be in physical contact with the cladding surface.

f. The attenuation specification shall be a maximum value for each cabled fiber at 23±5 ºC on the original shipping reel.

3. Single-Mode (Dispersion Un-shifted)

a. The single-mode fiber utilized in the optical fiber cable shall meet ITU G.652 (Tables A, B, C & D), IEC Specification 60793-2-50 Type B1.3, TIA/EIA 492-CAAB and Telcordia Generic Requirements GR-20-CORE.

4. Single-Mode (Dispersion Un-shifted) Bend Improved Loss Optical Fiber

a. The single-mode fiber utilized in the optical fiber cable shall meet ITU G.652 (Table D), ITU G.657 (Table A1), IEC Specification 60793-2-50 Type B1.3 and Telcordia Generic Requirements GR-20-CORE.

5. Single-Mode (Dispersion Un-shifted) Bend-Tolerant Optical Fiber

a. The single-mode bend-improved optical fiber utilized in the optical fiber cable shall meet ITU-T G.652, Table D, ITU-T G.657, Table A2 and B2, IEC Specification 60793-2-50 Type B1.3 and B6_b, and Telcordia Generic Requirements GR-20-CORE.

6. Single-Mode (Dispersion Un-shifted) Bend Insensitive Optical Fiber

a. The single-mode bend insensitive fiber utilized in the optical fiber cable shall meet ITU G.652 (Table D) and ITU G.657 (Table B3).

7. Multimode Fiber General

a. All fibers in the cable must be usable and meet required specifications.

b. Each optical fiber shall be sufficiently free of surface imperfections and inclusions to meet the optical, mechanical, and environmental requirements of this specification.

c. Each optical fiber shall consist of a germania-doped silica core surrounded by a concentric glass cladding. The fiber shall be a matched clad design, manufactured by the Outside Vapor Deposition (OVD) process.

d. Each optical fiber shall be proof tested by the fiber manufacturer at a minimum of 100 kpsi (0.7 GN/m2).

e. The fiber shall be coated with a dual layer acrylate protective coating. The coating shall be in physical contact with the cladding surface.

f. The attenuation specification shall be a maximum value for each cabled fiber at 23 ± 5 °C on the original shipping reel.

8. Standard 62.5/125 µm Fiber (OM1)

a. The fiber shall meet the following specifications:

1) EIA/TIA-492AAAA-A-1997, “Detail Specification for 62.5-µm Core Diameter/125-µm Cladding Diameter Class Ia Graded-Index Multimode Optical Fibers."

2) IEC 60793-2-10, “Product specifications – Sectional specification for category A1 multimode fibres”, Type A1b 62,5/125 µm graded index fiber.

9. Standard 50/125 µm Fiber – 150 (OM2)

a. The fiber shall meet the following specifications:

1) EIA/TIA-492AAAB, "Detail Specification for 50-µm Core Diameter/125-µm Cladding Diameter Class Ia Graded-Index Multimode Optical Fibers."

2) IEC 60793-2-10, “Product specifications – Sectional specification for category A1 multimode fibres”, Type A1a.1 50/125 µm graded index fiber.

10. Laser-optimized 50/125 µm Fiber – 300 (OM3)

a. The fiber shall meet the following specifications:

1) EIA/TIA-492AAAC, "Detail Specification for 850-nm Laser-Optimized, 50-µm Core Diameter/125-µm Cladding Diameter Class Ia Graded-Index Multimode Optical Fibers."

2) IEC 60793-2-10, “Product specifications – Sectional specification for category A1 multimode fibres”, Type A1a.2 850 nm laser-optimized 50/125 µm graded index fibre.

3) Approved Manufacturer: Corning or equivalent, in accordance with Section 1.4.

J. Fiber-Optic Apparatus:

1. General specifications:

a. Panel shelves and wall mount housing shall be used for combination of splicing pigtails, direct connectorization, or PnP cabling. Shelf shall be designed for use as termination shelf only (direct connector termination) or as splice and termination shelf.

b. Building cabling shall not terminate directly to equipment and patch panels shall be installed at both the head end and remote locations. Panels shall be sized to match fiber count of cable being installed as well as allow for future expansion.

c. Solution shall be able to handle the internal termination of Composite copper DC power and optical fiber cable without the use of 3rd party components. Head end components shall be capable of inclusion of power limiting components that meet NEC requirements.

1) Approved Manufacturer: Corning Cable Systems or equivalent, in accordance with Section 1.4.

K. Fiber-Optic Patchcords:

1. General Specifications:

a. To maintain channel integrity, optical fiber patch cords and pigtails shall be fabricated to meet the performance parameters corresponding to the optical fiber cable approved product type specified below. Patch cord and pigtail plug connectors shall be equipped with boots and shall have same colors as related optical fiber backbone cables, unless specified or indicated otherwise. Optical fiber patch cords shall be available with the following options as specified or indicated:

1) Termination types: SC-APC, LC-APC

2) Connector/cable configuration: Duplex

3) Fire ratings: Riser, plenum and/or LSZH

4) Patch cord outside diameters: 2.0, 2.9 or 3.0 millimeters

5) Lengths: As specified or indicated

6) Approved Manufacturer: Corning Cable Systems or equivalent, in accordance with Section 1.4.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The contractor and/or ERRCS Sub-contractor shall design, install, commission and test the ERRCS in accordance with the manufacturer's instructions and recommendations.

B. The contractor and/or ERRCS Sub-contractor shall install the ERRCS in accordance with the accepted SOW.

C. The contractor and/or ERRCS Sub-contractor shall adhere to all work and safety requirements while working at the job site.

D. The contractor and/or ERRCS Sub-contractor shall have DAS project foreman on site overseeing the installation.

E. The contractor and/or ERRCS Sub-contractor shall have at a minimum one Project Manager on staff overseeing the project. The Project Manager will be responsible for the following:

1. Developing and maintaining a project plan consistent with the overall milestones of the project.
2. Overseeing and coordinating the activities of the ERRCS project, including initiating and holding weekly project conference calls, as well as maintaining and distributing meeting minutes.
3. Act as the point-of-contact interface for all ERRCS project activities.
4. Provide weekly status updates regarding work performed, worked scheduled, open items, problems/issues and resolutions.

F. The contractor and ERRCS Sub-contractor shall be prepared to deploy the ERRCS in a phased approached as dictated by the building construction and/or work of other trades.

G. The contractor and ERRCS Sub-contractor shall facilitate PSN Approval and connection to their respective macro networks.

H. The contractor and ERRCS Sub-contractor shall be prepared to connect to the PSN network(s) in a phased approached as dictated by the PSN and schedules.

3.2 ACCEPTANCE TESTING

A. Acceptance testing will be performed confirming the requirements of Section 1.8 have been met.

B. PSN Acceptance Testing

1. PSN Acceptance Testing shall comply with the following:
   a. The Acceptance Test shall ensure that two-way coverage on each floor of the building meets the minimum coverage requirements detailed in section 1.8.
   b. Tests shall be made using the frequencies listed in Section 1.3A.
   c. Testing shall be coordinated with the Customer and AHJ to ensure no undue interference to any public safety operations.
   d. All testing shall be done on frequencies authorized by the FCC.
2. Test Procedures
   a. The test plan shall ensure testing throughout the building. Testing shall be performed on a grid system. A spot located approximately in the center of a grid area will be selected for the test. Once the spot has been selected, prospecting for a better spot within the grid area will not be permitted. A grid is overlaid onto a floor area to provide 20 grid cells. Grid cells are provided with definite minimum and maximum dimensions. For most buildings, using a minimum grid dimension of 20 ft and a maximum grid dimension of 80 ft will suffice to encompass the entire floor area. A maximum of one area will be allowed to fail the test (95% coverage). Where a floor exceeds 128,000 sq ft, which is the floor area that can be covered by the maximum grid dimension of 80 ft, the floor be subdivided into 40 equal sectors, with each sector being tested individually. A maximum of two non-adjacent areas will be allowed to fail the test (95% coverage). In addition to the above requirement, all critical areas, which include; the emergency command center(s), the fire pump room(s), exit stairs, exit passageways, elevator lobbies, standpipe cabinets, sprinkler sectional valve locations, and other areas deemed critical by the AHJ, shall be provided with 99 percent floor area radio coverage. Signal strength measurements shall be performed using standardized parameters as specified below.
3. Measurement Parameters
   a. Signal levels shall be measured to ensure the system meets the criteria specified in the Technical Proposal. Downlink measurements shall be made with the following standardized parameters:
   b. Measurements shall be recorded using a calibrated spectrum analyzer or a calibrated automatic signal-level measurement recording system measuring RSSI in each band with a dipole antenna positioned approximately 4’ above the surface.
   c. If P25 Phase II TDMA signals are being measured, the system BER will be measured on a known P25 Phase II TDMA signal. The signal source for measuring the system BER will be provided by the AHJ. The downlink signal level will be measured and the BER will be determined. The DAS coverage will be considered acceptable if the measured BER is five percent (5%) or less.
   d. In addition, the AHJ may conduct portable radio test to show true system performance for P25 Phase I and Phase II TDMA and FDMA services being used on the DAS. These tests shall be conducted using the DAQ scale. A successful test shall include any score measuring DAQ 3.4 or greater.
   e. Measurements will be recorded for the test pattern as described above.
   f. The System uplink noise floor will be measured by connecting a spectrum analyzer to the uplink output of the donor BDA to verify that it agrees with levels predicted by the design link budgets detailed in the Contractor’s TF link budget submittals.
   g. System acceptance is achieved when 95% of the averaged data points meet or exceed the requirements specified here and in Section 1.8.

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. Section includes, but is not necessarily limited to:

1. Common standards and procedures for the Electronic Safety and Security Work
2. Design, engineer and provide complete, all means of electronic security systems pathway, as well as support, suspension, attachment, fastening, bracing, and restraint (hereinafter "support") of the Work of this Division. Provide engineering of such support by parties licensed to perform work of this type in the Project jurisdiction.

1.2 RELATED DOCUMENTS

B. Drawings and general provisions of the Contract, including Conditions and Division 1 Specification Sections, apply to this Section.

C. Provisions of this Section apply to Electronic Safety and Security Work, including the following Sections:

1. Section 28 05 13 – Conductors and Cables for Electronic Safety and Security
2. Section 28 05 26 – Grounding and Bonding For Electronic Safety And Security
3. Section 28 05 28 – Pathways for Electronic Safety and Security
4. Section 28 13 00 – Access Control and Alarm Systems
5. Section 28 23 00 – Visual Surveillance

1.3 RELATED WORK IN OTHER SECTIONS/DIVISIONS

D. Division 8

1. Provides the electronic door locking hardware, including electronic locks and power transfer hinges.

E. Division 27

1. Installs the structured cabling used to support the Project IP Cameras.

1.4 REFERENCES

F. Usage in accordance with Section 01 42 00 - References

G. Conform to the applicable portions of the following standards agencies:

1. American National Standards Institute (ANSI)
   a. ANSI C39.1 (1981; R 1992) Requirements for Electrical Analog Indicating Instruments

2. ASTM International (ASTM)
    a. ASTM A 123/A 123M (2002) Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products

12. LAN Local Area Network
13. MAX Maximum
14. NIC Not In Contract.
15. OD Outside Diameter
16. OFE Owner/College Furnished Equipment.
17. PSRH Project Standard Receptacle Height.
18. PSSH Project Standard Switch Height.
19. TYP Typical
20. UON Unless Otherwise Noted.

J. Definitions of Terms:

1. As defined in Section 28 13 00 – Access Control and Alarm Systems.

1.6 SYSTEM PERFORMANCE REQUIREMENTS

K. As defined in the individual Specification Sections of Division 28.

1.7 SUBMITTALS

L. Submit the following according to Conditions of the Construction Contract and Division 1 Specification Sections.

M. General Requirements

1. Submit all materials for review arranged in same order as Specifications, individually referenced to Specification Section, Paragraph and Contract Drawing number. Conform in every detail as applies to each referencing Section.

2. Submit 8 ½"x 11" items bound in volumes and drawings in edge bound sets. Submit all drawings on sheets of the same size.

3. Make each specified submittal as a coordinated package complete with all information specified herein. Incomplete or uncoordinated submittals will be returned with no review action.

N. Progress Schedule: Comply with Section 01 32 19 – Submittal Schedules, Daily Reports and Field Reports.

O. Manufacturer's Product Data:

1. Manufacturer's Product Data Sheets. Collate in sequence of List of Materials:

2. Data sheet for each item in each Electronic Security Section, including all accessories, clearly marked for proposed product required for the Project, to including but not limited to the following where required by the Project scope:

   a. Electronic Security Systems Pathway
      1) Raceway
      2) Raceway connectors
      3) Gutter
      4) Terminal Cans, Pull Boxes, Device Boxes
      5) Enclosures
      6) Means of support

   b. Access Control and Intrusion Device Field Devices provided under the work of the Base Construction Contract
      1) Door position sensors
      2) Request to exit devices

3. Material Safety Data Sheet, where applies.

4. List of Materials Schedule. For each item, include:

   a. Referencing Specification Section

   b. Referencing Paragraph

   c. Referencing Drawing, if specified only on plans

   d. Manufacturer.

   e. Model number.

   f. Listing, including name of Nationally Recognized Testing Laboratory.

   g. Precede each submittal book with a summary schedule, with columns for each item above and rows for each item submitted.
      1) Example:
      2)

Specification Section	Paragraph	Contract Drawing Reference	Manufacturer	Model No.	UL/CLA Listed
28 05 00	2.03C		XYZ	123	Y
28 05 26	2.07A1		AAA	34-56	Y
		TY2.01	ZZY	456	Y

P. Field (Installation) and Shop Drawings: Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Wiring diagrams shall identify circuit terminals and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Drawings shall indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Collate in sequence at least the following plans:

1. Drawing index/symbol sheet.
2. Floor plans. At scale of Contract Documents. Show:
    a. Device rough-in locations
    b. Mounting height.
    c. Conduit size.
    d. Rough-in.
3. Sections/Elevations: At scale of Contract Documents:
    a. Mounting location reference.
    b. Terminal cabinets.
    c. Electrical power receptacles required for the work of this Section.
    d. Clearances
4. System Conduit Riser Drawing. Submit drawings that clearly and completely indicate the function of each Electronic Safety and Security component. Indicate termination points of devices, and interconnections required for system operation. Indicate interconnection between modules and devices. Show:
    a. Terminal cabinets.
    b. Coordination with floor plans.
5. Mounting details:
    a. Identify each item requiring seismic restraint installation in accordance with CBC Chapter 16. Include floor mounted items weighing more than 400 pounds and wall mounted or suspended items weighing more than 20 pounds.
    b. Supports for such items shall be provided support, bracing, and anchorage, designed by the Contractor in accordance with the following criteria:
        1) Design to resist seismic forces in accordance with CBC Chapter 16.
        2) Minimum Design Parameters - As defined for the Project in Division 1 and/or on the Code Compliance sheet of the Architectural Plans, with respect to Occupancy Category, Site Classification, Seismic Design Category, Importance Factor, Spectral Acceleration and SDI.
    c. Specific details of restraints including anchor bolts submitted under the Section 27 05 29 – Hangers and Supports for Communications Systems for mounting and maximum loading at each location, showing compliance and

coordination with Code and the project Architectural, Structural and Mechanical Documents.

d. Stamped and signed by an Engineer licensed in the Project jurisdiction for work of this type.
   1) Submit an accompanying Engineering analysis stamped and signed by an Engineer licensed in California for work of this type, indicating that the Equipment Enclosure System will comply with California Building Code for the Project Seismic Zone when loaded with the weight of the equipment submitted.
   2) Show calculations on drawings or in bound volume for review by Authorities having jurisdiction.

e. Show loads, type and strength of connections, sizes, dimensions, materials, etc.

f. Provide details for:
   1) Equipment Rack anchorage.

6. Installation details

   a. Terminal cabinets: Draw elevations of terminal blocks corresponding to the Single Line Diagram.

   b. Firestopping,

   c. Details of flexible raceway connections to be made to vibrating equipment

   d. Details of J-Box and sealant application for the typical conditions listed in Section 27 05 48 – Noise and Vibration Controls for Communications Systems.

   e. California Access Compliance Manual and Americans with Disabilities Act (ADA) compliance.

7. Fabrication details

   a. Receptacles.

   b. Panels.

   c. Special mounting provisions

   d. Legends/engraving details. Half or full size:

8. Schedules of Application

   a. An itemized list of all items of equipment to be fitted with flexible electrical connections.

   b. Catalog cuts of the products to be applied as J-Box mastic and Acoustical Sealant, and a schedule of rooms to receive application of mastic and sealant at J-Boxes.

Q. Hazardous Materials Notification: In the event no product or material is available that does not contain asbestos, PCB or other hazardous materials as determined by the College's Representative, a "Material Safety Data Sheet" (MSDS) equivalent to OSHA Form 20 shall be submitted for that proposed product or material prior to installation.

1.8 QUALITY ASSURANCE

R. Procedures: In accordance with Section 01 40 00 - Quality Requirements.

S. Designated Supervisor: Provide a designated supervisor present and in responsible charge in the fabrication shop and on the Project Site during all phases of installation and testing of the Work of this Section. This supervisor shall be the same individual through the execution of the Work unless illness, loss of personnel, or other circumstances reasonably beyond the control of the Contractor intervene.

T. Reference Documents: At all times when the work is in progress, maintain at the workplace, fabrication shop or Project Site as applies.

1. A complete set of the latest stamped, actioned submittals of record.

2. A complete set of manufacturer's original operation, instruction and service manuals for each equipment item.

U. Standard Products

1. Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products shall have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period shall include applications of equipment and materials under similar circumstances and of similar size. The product shall have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items shall be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section. All components must be of new condition, used or reconditioned products will not be accepted.

a. Alternative Qualifications. Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

2. Material and Equipment Manufacturing Date

a. Products manufactured more than 3 years prior to date of delivery to site shall not be used, unless specified otherwise.

V. Manufacturer’s identification tags or marks are not acceptable on surfaces which will remain exposed to view after installation.

1. Evidence of “patching” after removal of tags or marks is not acceptable.

1.9 REGULATORY REQUIREMENTS

W. Regulations Applicable: Including but not limited to those defined in Section 01 42 00 - References.

1. Nothing in the Contract Documents shall be construed to permit Work not conforming to applicable laws, ordinances, rules, or regulations.

2. Safety Agency Listing: All devices provided under the Work of this Section which are connected to the Project electrical system shall be listed by a Nationally Recognized Testing Laboratory, and shall be so labeled.

3. In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the College's Representative. Equipment, materials, installation, and workmanship shall be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.10 DELIVERY, STORAGE AND HANDLING

X. Procedures:

1. In accordance with General Conditions and Division 1 Section "Product Requirements", as specified in the individual sections of Division 28 and the following.

a. General

1) Provide protection from weather, moisture, extreme heat and cold, dirt, dust, and other contaminants for cabling and equipment placed in storage.

1.11 ENVIRONMENTAL REQUIREMENTS

Y. Connecting hardware shall be rated for operation under ambient conditions of 32 to 140 degrees F and in the range of 0 to 95 percent relative humidity, non-condensing.

1.12 SEQUENCING

Z. Comply with Section 01 10 00 - Summary of Works and Section 01 32 16 – Construction Project Document.

1.13 OPERATING AND MAINTENANCE DATA

AA. Commercial off the shelf manuals shall be furnished for operation, installation, configuration, and maintenance of products provided as a part of the Electronic Safety and Security cabling and pathway system. Precede the manuals with a systems narrative specific to this Project, outlining the major systems functionality, the major systems components, and identifying which manuals document the performance of which subsystems.

1. Submit operations and maintenance data in accordance with Section 01 78 39 – Project Record Documents and as specified herein not later than 2 months prior to the date of beneficial occupancy.

BB. Spare Parts

1. In addition to the requirements of Section 01 77 00 – Closeout Procedures and Section 01 78 23 – Operation and Maintenance Data, provide a complete list of parts and supplies, with current unit prices and source of supply, and a list of spare parts recommended for stocking.

1.14 PROJECT RECORD DOCUMENTS

CC. Comply with 01 78 00 - Closeout Submittals, and the following.

1. Record Drawings

a. Content
   1) Provide a least as required for the Shop and Installation Drawings defined elsewhere in this Section.
   2) Contractor shall be responsible for updating building and Electronic Safety and Security plans to reflect as-built conditions.
   3) Indicate actual work on Drawings; indicate actual products used, replace vendor neutral nomenclature used in bid set with makes and models of actual installed devices.

b. CAD.
   1) Use a computer aided drafting (CAD) system in the preparation of record drawings for this Project. CAD system shall produce files in AutoCAD® .DWG format, latest release at time of Project bid closure. Campus Standard, no substitution permitted.
   2) Except where prohibited by Contract, College's Representative will furnish CAD backgrounds in AutoCAD® .DWG format, for use by the Contractor in preparing Record Drawings.
   3) Disk copy of Record Drawings: Provide 2 separate disc copies of each drawing file in the format noted above. Submit on College Representative's directed media format.

c. Reproduceables: As specified in Division 1.

1.15 WARRANTY SERVICE

DD. In addition to provisions of General Conditions and Division 1 Section "Product Requirements", provide the following.

1. Response Time:

a. Provide an access control manufacturer qualified technician familiar with the work at the Project Site within 24 hours after receipt of a notice of non-emergency malfunction.

b. Provide an access control manufacturer qualified technician familiar with the work at the Project Site within 4 hours after receipt of a notice of an emergency malfunction. An emergency malfunction is defined as one causing gate or door openings to be either inaccessible or unsecured.

c. Provide the College's Representative with telephone number attended 8 hours a day, 7 days a week, to be called in the event of a malfunction.

EE. Provide all additional Warranties as defined in each Electronic Safety and Security Systems Section.

1.16 CLOSEOUT

FF. Punch List: Perform any and all remedial work, at no claim for additional cost or time. Where required, retest and submit Test Report. Notify the College's Representative of completion of Punch List.

GG. Portable Equipment: Furnish all portable equipment and spares to the College's Representative, along with complete documentation of the materials presented. Where applicable, furnish portable equipment in the original manufacturer's packing.

HH. Operating and Maintenance Data: Install framed operating and maintenance instructions. Submit Manuals.

II. Project Record Documents: Submit print and digital copies. Digital files shall be in AutoCAD .dwg format, latest release at time of Project bidding..

JJ. Keys: If applicable, replace construction locks with permanent locks. Provide 5 sets of keys to the College's Representative.

KK. Instruction: Conduct specified instruction.

LL. Warranty: Submit Warranty dated to run from date of Substantial Completion of the Project.

PART 2 - PRODUCTS

2.1 GENERAL

A. Where a particular material, device, piece of equipment or system is specified directly, the current manufacturer's specification for the same shall be considered to be a part of these specifications, as if completely contained herein in every detail.

B. Each material, device or piece of equipment shall comply with all of the manufacturer's current published specifications for that item.

C. Products shall be made by manufacturers regularly engaged in the production of such products.

D. Provide quantity as shown on Contract Drawings, or as otherwise indicated.

E. Provide all auxiliary and incidental materials and equipment necessary for the operation and protection of the Work of this Section as if specified in full herein.

F. Unless recycled content is specified, provide new materials.

G. Provide the manufacturer's latest design/model, permanently labeled with the manufacturer's name, model number and serial number.

H. Where products are of similar type or use, provide products of the same manufacturer, unless otherwise indicated.

I. Components

1. UL or third party certified. Cabling and interconnecting hardware and components for Electronic Safety and Security systems shall be UL listed or third party independent testing laboratory certified, and shall comply with NFPA 70 and conform to the requirements specified herein.

2. Where equipment or materials are specified to conform to industry and technical society reference standards of the organizations, submit proof of such compliance.

a. The label or listing by the specified organization will be acceptable evidence of compliance.

b. In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the College's Representative.

c. The certificate shall state that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

J. Enclosures:

1. Provide steel frames and enclosures designed and wired to eliminate all induced currents.

2. Make bolted connections with self-locking devices.

3. All enclosures should be appropriate to environment of installation – refer to the requirements of Section 28 05 28 – Pathways for Electronic Safety and Security.

K. Finishes: Any item or component of the Work of this Section which is visible shall comply with the following.

1. Finishes noted or scheduled on the Contract Drawings take precedence.

2. Where design location requires that products, materials or equipment are visible to the public, no manufacturer's logos larger than 1/2 inch shall be visible. Unless otherwise noted or directed, neatly remove or permanently paint out such logos.

3. Where finishes are not noted or otherwise defined in the Contract Documents, submit manufacturer's standard finish samples for selection by the College's Representative.

2.2 LABELING

L. Shall meet the legibility, defacement, exposure and adhesion requirements of UL 969.

M. Unless otherwise indicated, provide black text on a white background.

N. Shall be preprinted or computer printed type. Hand written labels are not acceptable.

O. Manufacturers

1. Brother P-Touch
2. Brady
3. Or equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine existing conditions before starting work. Submit conflicts in a timely manner for resolution

3.2 GENERAL

A. Conform to UL 681, UL 1037, and UL 1076, the appropriate installation manual and the requirements of each specification section for each equipment type, whichever is most restrictive . Components within the system shall be configured with appropriate "service points" to pinpoint system trouble in less than 20 minutes.

3.3 PREPARATION

A. Prepare and sequence the work to minimize disruption to each room environment and any existing Electronic Safety and Security systems.

B. Protection: Cover all computers, electronic equipment, desks, chairs, furniture and other articles when working at ceiling level and/or performing dust producing tasks.

3.4 SWITCH INSTALLATION

A. Work of this project includes installation of door position switches, window switches, hatch switches and gate position switches that need to be incorporated with the work of the project in order to prevent rework of construction installed by the work the Project during subsequent installation of the Electronic Security Systems by the College and its contractors.

B. At each condition, switch to be fully installed concealed and integrated into the work of the project with leads extended from each switch to the nearest pullbox installed for aggregation of pathway from the electronic security system devices. As described in Section in 28 05 28 - Pathways for Electronic Safety and Security.

3.5 LABELING

A. Field devices: Each Electronic Security System initiating device and each annunciating device shall be labeled with the assigned ID matching the device ID used in the College's Access Control programming and set-up screens.

1. The ID shall incorporate the device abbreviation, the architectural door number and a sequential number assigned to each device of the same type occurring at

the door opening in the form Door Number - Device Abbreviation – Sequential Number - .

a. Example: One LA at door number 101A: 101A-LA-1.

b. Example: Two DO's at door 121: 121-DO-1, 121-DO-2.

2. Apply label to an unobtrusive spot on the device, cut to minimum practical size before applying.

B. Panels. Attach to the interior of each control a panel clear plastic holder in this holder place a laser printed list of the door and card reader relay points zone numbers and other signals that may be transmitted to the central station, the type of device, exactly what the alarm and restoral signals indicate. This list shall be typed on 8-½" x 11" paper. Provide a copy of these list(s) in Microsoft Word on electronic media format delivered to the College's Representative.

3.6 REPAIR AND RESTORATION

A. Where working in spaces occupied by the College, return to their original positions any furniture or articles relocated to perform the work.

3.7 CLEANING

A. Where working in spaces occupied by the College:

1. Immediately after completing work within each space, clean up and remove all materials, scrap and dust.

2. All scrap material in work area shall be picked up and removed from the building at the end of each day. See also Division 1 for additional requirements.

3. All dust resulting from work performed shall be vacuumed up daily.

4. All scrap material shall be removed from the site and disposed of in an authorized disposal site. Refer to Section 01 74 19 - Construction Waste Management and Disposal.

3.8 SYSTEMS PERFORMANCE TESTING AND ADJUSTING PROCEDURES

A. General Procedures

1. It shall be the responsibility of the Security Contractor to demonstrate to the College's Representative that the security system is complete and functional as per these specifications. For intrusion detection field devices test shall ensure that the requisite degree of intrusion detection is provided.

2. Acceptance testing shall be scheduled by the Security Contractor thorough established project channels

3. Furnish all necessary instruments and equipment required for conducting tests.

B. Device Level Tests

1. Initially, test each sensor and subsystem component individually.

2. Test all wire for shorts, open circuits, or grounding.

3. Immediately correct any defective work

C. Systems Tests.

1. When the function of each component within a particular subsystem such as each sensor within a particular zone is verified, certify that subsystem of the entire Electronic Safety and Security System is satisfactorily meeting required specifications. Test each subsystem similarly until each detection zone has been certified.

2. When subsystem certification is complete, test entire integrated system to ensure that subsystem elements are compatible and function as a complete system. Integrated system test shall be accomplished in linear fashion, end-to-end, and shall verify that each simulated intrusion performed within each detection zone produces an appropriate alarm or signal.

3. Integrated system test shall also verify that alarm is correctly annunciated at the terminal block associated with the field devices,

D. Contractor Testing

1. Provide for approval, not later than 30 days prior to formal inspection and test, a detailed operational test plan of how each component, subsystem, and entire Electronic Safety and Security System will be tested.

2. Submit a written test report from an authorized representative of the equipment manufacturer that the system has been 100% tested and approved. Submit prior to request for final payment.

3. Test each individual circuit and device for proper operation in the presence of telecommunications personnel. Correct all failures and retest at contractors expense to verify corrections. Correct as built drawings, O & M manuals, programming sheets and system programming to reflect the College's final occupancy room numbers.

4. Provide College's Acceptance Form with a check box associated with each card reader and input point. A check mark in the box will indicate that each point has been correctly installed and that communication between the controller and the server has been established. This form shall be completed prior to College acceptance of the system.

3.9 COMMISSIONING AND ACCEPTANCE

A. General:

1. Upon completion of the work, remove excess debris, materials, equipment, apparatus, tools and similar items. Leave the premises clean, neat and orderly.

B. Results Expected:

1. Electronic Security Systems shall be complete and ready for use.

2. Testing, start-up and cleaning work shall be complete.

3. Maintenance Materials: Special tools for proper operation and maintenance of the equipment provided under this Specification shall be delivered to the College.

C. Inspections

1. There shall be three phases of commissioning inspections:

   a. Rough-in inspection

   b. Above-ceiling inspection (after cables are placed)

   c. Final inspection and testing

2. The Contractor shall verify that the installation and materials used have been inspected before they are enclosed within building features, or otherwise hidden from view. The Contractor shall bear costs associated with uncovering or exposing installations or features that have not been inspected and approved.

D. Rough-in inspection. Once electrical rough-in and pathways have been installed, but prior to walls and ceilings being installed, the Contractor shall request of the College's Representative, in writing, for the official rough-in inspection to take place. The College's Representative will then schedule a time to be on-site to conduct this inspection.

1. At a minimum, the College's Representative will evaluate the following items:

   a. Accurate location and height above finished floor for all outlet boxes.

   b. Accurate dimensions (particularly depth) of all outlet boxes and diameter of in-wall conduit serving outlet boxes.

   c. Gutter size, location and clearance.

   d. Location and size of all other electronic security systems conduits or pathways.

   e. Location, spacing and clearance of and around electronic security systems racks and wall-mounted equipment.

   f. That electronic security systems hard wired power and power receptacles, where installed under the work of this project, meet the design requirements.

2. The College's Representative is then to issue a written report to the Contractor identifying all items which currently do not meet the construction document requirements. All items are to be resolved prior to walls and ceilings being closed up. This report is not necessarily all-inclusive; should issues be discovered later in the project, the Contractor is still responsible for corrections/repairs.

E. Above-ceiling inspection

1. Once all electronic security systems cabling has been installed and properly supported and walls have been painted, but prior to the installation of ceiling tiles/material, contractor shall request of the design team, in writing, for the official above-ceiling inspection. The College's Representative will then schedule a time

to be on-site to conduct this inspection

2. At a minimum, the College's Representative will evaluate the following items:
   a. That all items from the previous inspection have been corrected.
   b. That electronic security systems cabling is routed correctly and adequately supported.
   c. That electronic security systems cabling is not painted or over-sprayed.
   d. That the installed electronic security systems cabling matches what was specified/submitted.
   e. That there are no kinks, splices, or other damage to the installed electronic security systems cabling.
   f. That all field devices are properly supported, oriented and labeled.
   g. That all penetrations through fire-rated walls are properly firestopped, including fire blocking materials installed in the annular spaces; and that the firestops are properly labeled.
3. The College's Representative is then to issue a written report to the Contractor identifying all items which currently do not meet the construction document requirements. This report is not necessarily all- inclusive; should issues be discovered later in the project, the appropriate communications subcontractor is still responsible for corrections/repairs.

F. Acceptance Review and Testing Procedures

1. The College's Representative will witness formal Acceptance Tests after receipt of written certification that all prior Punch List work is complete and that Contractor's functionality tests have been completed and that system is ready for final inspection. This request shall be made 3 weeks before substantial completion. The College's Representative will then schedule a time to be on-site to conduct this inspection.
2. The Contractor shall provide the following for the acceptance testing.
   a. Personnel: Provide services of the designated supervisor. Provide quantity of technicians as required to comply with Project Schedule.
   b. All tools appropriate for performance of adjustment of and corrections to this Work. Include spare wire and connectors and specified tooling for application.
   c. Ladders, scaffolding and/or lifts as required to access high devices.
   d. All test equipment.
   e. Complete set of latest stamped, actioned submittals of record for reference.
   f. Complete set of Test Reports.
   g. Complete set of manufacturer's original operation, instruction and service manuals for each equipment item for reference.

3. The Contractor shall execute the test plan required in Submittals section and as approved and/or modified by the College's Representative. The testing must demonstrate complete operation of all systems and equipment, including any portable equipment.

4. These procedures may be performed at any hour of the day or night as required by the College's Representative to comply with the Project Schedule and avoid conflict with College staff activities. Provide all specified personnel and equipment at any time without claim for additional cost or time.

5. At a minimum, the College's Representative will check the following items:

   a. Mechanical/Physical Installation.
      1) That all items from the previous inspections have been corrected.
      2) That all electronic security systems equipment and cabling terminal rooms is installed per the contract documents, including all required terminal blocks, pull boxes, termination resistors and electronic security systems grounding.
      3) All other items necessary to guarantee contract documents are met and complete and functioning communications systems are installed.
      4) All cables and electronic security systems field devices and pathway are properly labeled.
      5) All penetrations through fire-rated walls are properly fire-stopped, including fire blocking materials installed in the annular spaces; and that the firestops are properly labeled.

   b. Functionality Demonstration
      1) Demonstrate functionality of each installed device is consistent with the read range, sensitivity and immunity to false alarms as specified by the device manufacturer.
      2) Functional demonstration to also include, but not limited to the following active components and all related items installed under the work of the project:
         a) Door position sensors

6. Door Position, Window and Hatch Switches

   a. Demonstrate functionality of each device. Demonstrate that operation of each monitored door by 1/2" or less from the fully closed position causes the position switch to change state.

G. Adjust: As directed by the College's Representative.

3.10 POST ACCEPTANCE TEST REMEDIATION

A. Temporary Equipment: Provide and operate, without claim for additional cost or time, temporary equipment and/or systems to provide reasonably equivalent function, as determined by the College's Representative, in place of the Work of this Section which is incomplete or found not in conformance with the Contract Documents as of seven (7) days prior to the scheduled completion date. Provide such temporary equipment until Acceptance of the Work of this Section. Thereafter, remove such temporary equipment.

B. Correct:

1. In timely manner, correct identified Work of this Section which is incomplete or found not in conformance with the Contract Documents to comply with the Contract Documents, as reasonably determined by the College's Representative.

2. Conduct additional tests to in the presence of the College's representative to demonstrate that system conforms to the Contract Documents.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes wiring standards for work of Electronic Safety and Security Systems.

B. Related Work Under Other Sections

1. Section 27 10 00 – Structured Cabling, Basic Materials & Methods

a. Defines standards and methods for termination of IP-based cabling used for IP cameras and IP work area outlets necessary to support access control systems installed under the work of Division 28.

2. Section 27 15 00 – Communications Horizontal Cabling

a. Defines materials and execution standards for installation of TIA/ANSI standard category media installed under the work of Division 27 to provide work area outlets for final connection by the work of Division 28 to cameras and IP alarm system panels.

3. Section 28 05 00 – Common Work Results for Electronic Safety and Security.

4. Section 28 05 26 – Grounding and Bonding For Electronic Safety And Security

5. Section 28 05 28 – Pathways for Electronic Safety And Security

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions and Division 1 Specification Sections, apply to this Section.

1.3 SUBMITTALS

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

1.5 QUALITY ASSURANCE

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

1.6 DELIVERY, STORAGE AND HANDLING

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

1.7 WARRANTY

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

PART 2 - PRODUCTS

2.1 CABLING

A. General

1. Where not otherwise specified or indicated, conform to manufacturers most stringent recommendations with respect to pair count, gage, conductor construction and shielding for indicated run length.

2. Conform to Code requirements with respect to acceptable jacket construction for each application and condition. Provide NEC/CEC CMP listed cable construction at plenum at environmental air and underfloor applications.

B. Card Reader Cabling

1. Construction:

a. Conform to Code requirements with respect to acceptable jacket construction for each application and condition

b. 4 pair

c. 22 ga. minimum

d. Overall foil shield with drain wire.

e. Manufacturers:
1) Belden
2) Alpha
3) Commscope/Isotec
4) West Penn
5) or equal.

f. Manufacturers, Alternate Construction:
1) Category 6 cabling as specified in Section 27 15 00.

C. Release Button, Door Switch

1. 2 stranded conductors, 22-18 gauge minimum

2. Manufacturers:

a. Belden 8442, 8461, 5300UE, 5500UE, 6300UE, 6500UE

b. Alpha

c. Commscope/Isotec

d. West Penn

e. or equal.

D. Request to Exit, Motion Detector, Glass Break

1. 4 stranded conductors, 22-18 gauge minimum

2. Manufacturers:

a. Belden 5302UE, 5502UE, 6302UE, 6502UE

b. Alpha

c. Commscope/Isotec

d. West Penn

e. or equal.

E. Combination dual detector

1. 6 stranded conductors, 22-18 gauge minimum
2. Manufacturers:
    a. Belden 5304UE, 5504UE, 6304UE, 6504UE
    b. Alpha
    c. Commscope/Isotec
    d. West Penn
    e. or equal.

F. Lock Power and General Low Voltage Power, Indoor Applications

1. 2 stranded conductors, 16-18 gauge minimum. Size to exceed manufacturers minimum recommendations for voltage drop for required run lengths.
2. Manufacturers:
    a. Belden 5300UE, 5200UE, 6300UE, 6200UE
    b. Alpha
    c. Commscope/Isotec
    d. West Penn
    e. or equal.

G. RS-232 Cabling

1. At least 2-3 pairs, actual pair count as required by interface.
2. 22 gauge minimum, paired construction.
3. Overall foil shield with drain wire
4. Manufacturers:
    a. Belden 9855, 89855
    b. Alpha
    c. Commscope/Isotec
    d. West Penn
    e. or equal.

H. RS-485 Cabling

1. At least 2 pairs, or as required by interface.
2. 18 gauge minimum, paired construction.
3. Overall foil and braid shield with drain wire
4. Manufacturers:
    a. Belden 9842, 82842

b. Alpha

c. Commscope/Isotec

d. West Penn

e. or equal.

I. Control Cabling, Underground, in ducts

1. As specified for the applications above with waterblocking construction consisting of two ply tape designed to swell on exposure to water.

2. Jacket is sunlight and moisture resistant

3. NEC CM or CL3 listed or better. Transition to listed cabling type within 50 feet of entering building.

4. Manufacturer listed for underground application subject to extended exposure to standing water.

5. Manufacturer:

a. West Penn Aquaseal

b. Alpha

c. Belden

d. Commscope/Isotec

e. or equal.

2.2 ELECTRONIC SECURITY SYSTEMS CABLING LABELS, INTERIOR

A. Shall meet the legibility, defacement, exposure and adhesion requirements of UL 969.

B. Shall be preprinted or computer printed type. Hand written labels are not acceptable.

C. Provide vinyl substrate with a white printing area and black print. If cable jacket is white, provide cable label with printing area that is any other color than white, preferably orange or yellow – so that the labels are easily distinguishable.

D. Shall be flexible vinyl or other substrates to apply easy and flex as cables are bent.

E. Shall use aggressive adhesives that stay attached even to the most difficult to adhere to jacketing.

F. Manufacturers:

1. Brady

2. Brother

3. Panduit

4. Or equal.

2.3 ELECTRONIC SECURITY SYSTEMS CABLE LABELS, OUTSIDE PLANT

A. Cable Tags in Manholes, Handholes, and Vaults

1. Provide tags for communications cable or wire located in manholes, handholes, and vaults.
    a. The tags shall be polyethylene.
    b. Machine printed - Do not provide handwritten letters.
2. Polyethylene Cable Tags
    a. Provide tags of polyethylene that have an average tensile strength of 22.4 MPa (3250 pounds per square inch) 3250 pounds per square inch; and that are two millimeter (0.08 inch) 0.08 inch thick (minimum), non-corrosive non-conductive; resistive to acids, alkalis, organic solvents, and salt water; and distortion resistant to 77 degrees C 170 degrees F.
    b. Provide 1.3 mm (0.05 inch) 0.05 inch (minimum) thick black polyethylene tag holder.
    c. Provide a one-piece nylon, self-locking tie at each end of the cable tag.
    d. Ties shall have a minimum loop tensile strength of 778.75 N (175 pounds) 175 pounds. The cable tags shall have black block letters, numbers, and symbols 25 mm (one inch) one inch high on a yellow background.
    e. Letters, numbers, and symbols shall not fall off or change positions regardless of the cable tags' orientation.
3. Manufacturers:
    a. Panduit
    b. Brady
    c. or equal.

PART 3 - EXECUTION

3.1 WIRING CLASSIFICATION AND RELATED

A. Audio Signal Wiring Classification:

1. Type A-l: Microphone level wiring less than -30 dBu, 20 Hz to 20 kHz.
2. Type A-2: Line level wiring -30 dBu to +24 dBu, 20 Hz to 20 kHz.
3. Type A-3: Loudspeaker level or circuit wiring greater than +24 dBu, from 20 Hz to 20 kHz.

B. Video and Related Signal Wiring Classification:

1. Type V-1: Baseband and composite video wiring 1 volt peak-to-peak into 75 ohms, 0 to 10.0 MHz.

2. Type V-2: Synchronization and switching pulse wiring 4 volts peak-to-peak into 75 ohms, 15.62 to 15.75 kHz.

3. Type V-3: Color subcarrier wiring 0 to 4 volts peak-to-peak into 75 ohms, 3.57 to 4.43 MHz.

4. Type V-4: MATV system wiring 0.1 to 1000 microVolts peak-to-peak into 50 or 75 ohms, 47 to 890 MHz.

C. Control Signal Wiring Classifications:

1. Type C-1: DC control wiring 0 to 50 volts.

2. Type C-2: Synchronous control or data wiring 0 to 40 volts, peak-to-peak.

3. Type C-3: AC control wiring 0 to 48 volts, 60 Hz.

D. Additional Wiring Classifications:

1. Type M-1: DC power wiring 0 to 48 volts.

2. Type M-2: AC power wiring greater than 50 volts, 60 Hz.

3. Wiring Combinations:

E. Except as indicated herein, conduit, wireways and cable bundles shall contain only wiring of a single classification. The following combinations are acceptable in conduit, or cable harnesses. Additional acceptable combinations may be indicated on the Drawings.

1. Types A-1, C-1, and M-1.

2. Types A-2, C-l, C-2, and M-l, runs less than 20 feet.

3. Types A-2, C-1, and M-1.

4. Types A-3, C-1, C-2, and M-1.

5. Types A-2, V-1, and V-3.

6. Types V-1, V-2, V-3, and C-1.

7. Types M-2 and C-3.

3.2 WIRING PRACTICE

A. All wiring of Division 28 to be installed in raceway except above accessible ceilings.

1. Separate raceway systems, including backboxes and conduit, shall be provided for to electromagnetically isolate electric lock and door motor operators, local door alarms and other similarly powered sources of electro-magnetic noise from door position switches, card reader, door release buttons, duress alarms and similar low power, electromagnetic noise sensitive applications. Refer to Wiring Classification and Related above and comply.

2. Minimum conduit size for multiple conductor runs shall be ¾". In each control panel two empty ¾" conduits shall be installed for future use. These conduits shall be routed to an accessible area above the ceiling or to a location approved by College. Run circuits for AC separate from circuits using DC. Each supervisory/data loop shall be run separately from any other supervisory/data loops they shall not be permitted to share the same conduit. From security alarm control panel provide one ¾" conduit to nearest telephone backboard or panel location for tie-in to College furnished central station. Provide min 1" conduit to each card access or exterior door, unless otherwise shown or scheduled on the plans

3. Conduits including flexible metal and armored cable shall terminate in the sensor or device enclosure.

4. Ends of conduit shall be fitted with insulated bushings. Exposed conductors at ends of conduits external to sensors and devices are not acceptable.

5. Refer to additional requirements in Section 28 05 28 - Pathways For Electronic Safety And Security.

B. All field wiring shall run continuous from device to device no splices shall be permitted except at specified terminal blocks installed in lockable termination cabinets.

1. The use of wire nuts and crimp type connectors shall not be permitted.

2. Where shielded wire is used it shall be connected to an earth ground at the panel. Tin terminated shield drain wires and insulate with heat shrinkable tubing.

3. Dress, lace or harness all wire and cable to prevent mechanical stress on electrical connections. No wire or cable shall be supported by a connection point.

4. Provide service loops where harnesses of different classes cross, or where hinged panels are to be interconnected.

5. Security alarm conductor terminations in control panels, termination cabinets, junction boxes and annunciator panels to be made on specified terminal strips with a separate point for each conductor.

a. All such strips to be number identified as shown in wiring diagram attached to inside of door of control panel.

b. Connect wiring neatly to terminals strips.

c. Set up termination of cabling so that section of the system may be isolated or shorted out for servicing.

C. No control panel shall be mounted where is not readily accessible the highest connection point shall not be above 6'-6"' nor shall the bottom of the panel be below 30".

D. All necessary interconnections, services, and adjustments required for a complete and operable system shall be provided. All installation work must be done in accordance with the safety requirements set forth in the general requirements of ANSI C2 and NFPA 70.

E. Coordinate insulation displacement (quick connect) terminal devices with wire size and type. Comply with manufacturer's recommendations. Make connections with automatic impact type tooling set to recommended force.

3.3 LABELING

A. Label each end of each cable to indicate its terminal point.

1. For field devices, use the device label assigned per the requirements of Section 28 05 00 - Common Work Results for Electronic Safety and Security.

END OF SECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions and Division 1 Specification Sections, apply to this Section.

B. Related Work Under Other Sections

1. Section 26 05 26 – Grounding & Bonding for Electrical Systems
2. Section 27 05 26 – Grounding and Bonding For Communications Systems
3. Section 28 05 00 – Common Work Results for Electronic Safety and Security
4. Section 28 05 13 – Conductors and Cables for Electronic Safety and Security
5. Section 28 05 28 – Pathway for Electronic Safety and Security

1.2 SUMMARY

A. This section includes grounding and bonding of Electronic Safety and Security Work, including but not limited to:

1. Electronic Safety and Security Raceways
2. Cable Shields
3. Electronic Safety and Security Cabinets and Enclosures.

1.3 SYSTEM DESCRIPTION

A. Provide Electronic Safety and Security Grounding System as described herein and indicated on drawings.

B. Except as otherwise indicated, the complete Electronic Safety and Security installation including the racks, cabinets, panels, cable tray, runway, lightning protectors cable shields and splice cases provided under the work of this project shall be completely and effectively grounded in accordance with all Code and Standards requirements, whether or not such connections are specifically shown or specified.

C. Resistance:

1. Resistance from the farthest ground bus through the ground electrode to earth shall not exceed 5 Ohms or the requirements of ANSI/TIA/-606-B-2012, whichever is more restrictive.
2. Resistance from Electronic Safety and Security Rack Buss ground to Ufer ground must remain less than or equal to the electrical ground presented at A/C outlet for electronic equipment in the communications rack.

1.5 SUBMITTALS

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

1.6 QUALITY ASSURANCE

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

1.7 DELIVERY, STORAGE AND HANDLING

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

1.8 WARRANTY

A. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Equal products by the following manufacturers will be considered providing that all features of the specified product are provided:

1. Ground Bushings, Connectors, Jumpers and Bus:
   a. O-Z/Gedney.
   b. Thomas & Betts Corp.
   c. Or equal.
2. Compression Connector Lug
   a. Panduit
   b. Harger Lightning & Grounding
   c. Or equal.
3. Telecommunications Ground Bus Bar
   a. Panduit
   b. Harger Lightning & Grounding
   c. or equal.
4. Rack and Cabinet Grounding
   a. Panduit Structured Ground Kit
   b. Harger Lightning & Grounding
   c. or equal.

2.2 GROUND CONDUCTORS

A. General purpose insulated: UL listed and code sized copper conductor, with dual rated THHN/THWN insulation, color identified green.

B. Cable jacket marking:

1. Must be legible and shall contain the following information:
   a. Manufacturer’s name
   b. Copper conductor gauge
   c. UL listing
   d. Cable jacket shall be green with black lettering

C. Telecommunications Bonding Backbone Cable: 3/0 AWG THHN/THWN CU - Must be UL listed.

1. Manufacturer:

a. General Cable
b. Harger Lightning & Grounding
c. or equal.

D. Bonding pigtails: Insulated copper conductor, identified green, sized per code, and provided with termination screw or lug. Provide solid conductors for #10 AWG or smaller and stranded conductors for #8 AWG or larger.

E. Bonding Conductors sized at 2 kcmil per linear foot of conductor length up to a size of 3/0 AWG ground wire.

2.3 COMPRESSION CONNECTOR LUG

A. Compression connector lug

1. Description
   a. Long-barrel compression lugs shall be used on all ground wire.
   b. Copper alloy body.
   c. Provide lug size to match conductor being terminated.
   d. Provide 2 hole pattern lugs.
   e. Provide each lug with silicon bronze hardware, including 2 bolts, 2 split lock washers and 2 nuts.
2. Manufacturer:
   a. Panduit
   b. Harger Lightning & Grounding GECLBxxx (xxx depending on Cable Size)
   c. or equal.

2.4 INSULATED GROUNDING BUSHINGS

A. Plated malleable iron or steel body with 150 degree Centigrade molded plastic insulating throat and lay-in grounding lug.

2.5 CONNECTIONS TO STRUCTURAL STEEL, GROUND RODS, OR SPLICES

A. Where required by the Drawings or Specifications, grounding conductors shall be spliced together, connected to ground rods or connected to structural steel using exothermic welds or high pressure compression type connectors.

1. Exothermic welds shall be used for cable-to-cable and cable-to-ground rod and for cable to structural steel surfaces. Exothermic weld kits shall be as manufactured by Harger Lightning & Grounding, Cadweld, Thermoweld or equal. Each particular type of weld shall use a kit unique to that type of weld.
2. High-pressure compression type connectors shall be used for cable-to-cable and cable-to-ground rod connections. Connections shall be as manufactured by Thomas & Betts #53000 series, Burndy “Hy-Ground” or equal.

2.6 EXTRA FLEXIBLE, FLAT BONDING JUMPERS

A. Two Hole Tinned Flat Braided Copper Ground Straps, 6 Gauge equivalent, 12" long with crimped lugs on each end and ¼"-20 mounting hardware.

1. Manufacturer:

a. Harger GS12094122C3/8

b. or equal.

PART 3 - EXECUTION

3.1 GENERAL

A. Provide Grounding and Bonding according to the most restrictive requirements of:

1. ANSI-J-STD-607-B

2. California Electrical Code Article 250 and references therein.

3. California Electrical Code Article 800.

B. In the event of conflicting requirements, National Electrical Code requirements shall prevail.

C. Point of Connection

1. Under Work of this Section, ground to the building Telecommunications Grounding System as installed under the work of Division 27 at the TMGB

D. Ground And Bonding Conductor Installation

1. All lug connections to the ground bars and opposite end shall use Antioxidant Joint Compound.

2. Unless otherwise noted, all bonding and ground wires on telecom cable trays and runways shall be routed on the outer edge of the cable trays and runways.

E. Mechanical Connections

1. Make connections bare metal to bare metal.

2. Where required, remove paint to bare metal, make grounding or bonding connection, and touch up paint.

3. Torque threaded fasteners to manufacturer's recommended values.

F. Compression Connections

1. Make compression connections with the lug or fitting manufacturer's recommended tooling, with the tooling set to the recommended force and stroke.

G. Electronic Safety and Security Raceways and Sleeves

1. Bond metallic raceway and sleeves to the Telecommunications Ground Busbar at the Telecommunications Room that serves the related Electronic Safety and Security systems.

2. Where a metallic raceway connects 2 or more Telecommunications Rooms, bond to the Telecommunications Ground Busbar at each.

H. Cable Shields

1. Comply with California Electrical Code Article 800.

I. Protector Fields

1. Comply with California Electrical Code Article 800.

J. Electronic Safety and Security cabinets and enclosures

1. Bond to the Communications Ground Busbar at the Communications Room.

3.2 LABELING

A. Provide labeling according to the requirements of:

1. ANSI/TIA/EIA-606-A.

2. Section 28 05 00 – Common Work Results for Electronic Security and Safety.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

A. Electronic security systems pathway requirements are shown schematically on the plans. Work of the Project includes design and provision by the contractor of complete electronic security systems pathways as specified in this Section and as shown diagrammatically on the plans. Design and provide electronic security systems pathways to be in accordance with the California Electric Code, ANSI/TIA-569-C (2012) Telecommunications Pathways and Spaces, as specified in this Section and as shown on the plans, whichever is most restrictive. Provide system furniture pathways in accordance with UL 1286.

B. Contractor to design complete Electronic Safety and Security pathway system including provision of the following

1. Rigid steel conduit and fittings.
2. Intermediate metal conduit and fittings.
3. Electrical metallic tubing and fittings.
4. Non-metallic raceway and fittings.
5. Flexible metallic conduit and fittings.
6. Liquidtight flexible metallic conduit and fittings.
7. Miscellaneous conduit fittings and products.
8. Junction Boxes
9. Hinged cover enclosures.
10. Pullboxes and Terminal Cabinets.
11. Wireway
12. Strut supports
13. Beam clamps
14. Concrete Fasteners
15. Touch-Up Materials
16. Conduit supports.
17. Equipment supports.
18. Fastening hardware

C. Provide fire penetration sealant systems at all rated wall and floor/ceiling penetrations as required. Additionally, provide where indicated, which may be in excess of Code but required to meet College's operational and functional requirements.

D. At Hazardous Occupancies, installation conforms to the requirements of California Electric Code for Class and Division rating of spaces.

E. Fastening System Description

19. Provide devices specified in this Section and related Sections for support of electronic safety equipment specified for this Project.

20. Provide support systems that are adequate for the weight of equipment, conduit and wiring to be supported.

21. Seismic Design Requirements

a. Identify each item requiring seismic restraint installation in accordance with CBC Chapter 16. Include floor mounted items weighing more than 400 pounds and wall mounted or suspended items weighing more than 20 pounds.

b. Supports for such items, including racks, conduit, cable trays and similar shall be provided support, bracing, and anchorage, designed by the Contractor in accordance with the following criteria:
1) Design to resist seismic forces in accordance with CBC Chapter 16.
2) Minimum Design Parameters - As defined for the Building, with respect to Occupancy Category, Site Classification, Seismic Design Category, Importance Factor, Spectral Acceleration and SDI.

1.2 RELATED DOCUMENTS

F. Drawings and general provisions of the Contract, including Conditions and Division 1 Specification Sections, apply to this Section.

G. Related Work In Other Sections. Related work: Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete installation.

1. Section 01 73 00 – Execution Requirements
2. Section 01 73 29 – Cutting and Patching
3. Section 28 05 00 – Common Work Results for Electronic Safety and Security
4. Section 28 05 13 – Conductors and Cables for Electronic Safety and Security
5. Section 28 05 26 – Grounding and Bonding for Electronic Safety and Security

1.4 SUBMITTALS

I. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification, Section 28 05 00 - Common Work Results for Electronic Safety and Security and the following:

1. As part of the project submittals, the contractor to provide engineered shop drawings indicating the proposed design for mounting all work of this Division as defined under the Seismic Design Requirements and defined elsewhere in this Section, inclusive of mounting systems, equipment mounted at the exterior, inclusive of its effective wind load under the range of conditions expected.

a. Shop drawings to be accompanied by anchorage calculations indicating that it shall remain attached to the mounting surface after experiencing forces in conformance with California Code of Regulations, Title 24, California Building Code.

b. Structural Calculations shall be prepared and signed by a California Registered Structural Engineer. Specify proof loads for drilled-in anchors, if used.

1.5 QUALITY ASSURANCE

J. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

K. All materials, equipment and parts comprising the units specified herein shall be new and unused, and of current manufacturer.

L. Only products and applications listed in this Section may be used on the project unless otherwise submitted and approved by the College's Representative.

1.6 DELIVERY, STORAGE AND HANDLING

M. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

1.7 WARRANTY

N. Conform with the requirements of Conditions of Construction Contract, Division 1 Specification and Section 28 05 00 - Common Work Results for Electronic Safety and Security.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MATERIALS

A. Products of the manufacturers specified in this section establish the minimum functional, aesthetic and quality standards required for work of this section.

2.2 GENERAL

B. Provide the following types of conduit systems listed by their commonly used generic name.

2.3 RACEWAY

C. Manufacturers:

1. Raceway:
    a. Allied Tube and Conduit Co.
    b. Triangle PWC, Inc.
    c. Western Tube and Conduit Corp.
    d. Spring City Electrical Manufacturing Co.
    e. Occidental Coating Co. (OCAL).
    f. Alflex Corp.
    g. American Flexible Metal Conduit Co.
    h. Anaconda.
    i. Or equal.
2. Stainless Steel Raceway and Fittings
    a. Calbrite

b. Allied Tube and Conduit

c. Or equal.

3. Fittings:

a. Appleton Electric Co.

b. OZ/Gedney.

c. Thomas & Betts Corp.

d. Spring City Electrical Manufacturing Co.

e. Occidental Coating Co. (OCAL).

f. Carlon.

g. or equal.

D. Rigid Steel Conduit.

4. Drawing and Spec Reference: RSC.

5. Construction:

a. Conduit: Full weight, threaded, hot-dip galvanized steel, conforming to ANSI C80.1 and UL 6.

b. Compression type couplings, locknuts, bushings, and elbows: Only materials of steel or malleable iron are acceptable. Locknuts shall be bonding type with sharp edges for digging into the metal wall of an enclosure.

c. Three piece couplings: Electroplated, cast malleable iron.

d. Insulating bushings: Threaded polypropylene or thermosetting phenolic rated 150 degree C minimum.

e. Insulated grounding bushings: Threaded cast malleable iron body with insulated throat and steel "lay-in" ground lug with compression screw.

f. Insulated metallic bushings: Threaded cast malleable iron body with plastic insulated throat rated 150 degrees C.

g. All fittings and connectors shall be threaded.

E. Coated Rigid Steel Conduit:

6. Drawing and Spec Reference: CRSC.

7. Conduit: Full weight, threaded, hot-dip galvanized steel, conforming to ANSI C80.1 and NEMA RN-1 with nominal 40 mil thermoplastic vinyl coating, heat fused and bonded to the exterior of the conduit.

8. Fittings:

a. Conduit couplings and connectors shall be as specified for galvanized rigid steel conduit and shall be factory PVC coated with an insulating jacket equivalent to that of the coated material.

b. Fittings over-sleeve to extend 1 conduit diameter or 1-1/2" beyond fitting, whichever is less.

9. Performance:

a. Tensile Strength: 3500 psi.

10. Approvals:

a. NEMA RN1 (Type 40 - 40 mils thick)

b. CalTrans Type 2

11. Manufacturers:

a. Plastibond by RobRoy Industries.

b. Occal-40 by Occidental Coating Company.

c. KorKap by Plastic Applicators.

d. Ocal-Blue

e. or equal.

F. Intermediate Metal Conduit

12. Drawing Reference: IMC

13. Conduit: Hot dip galvanized steel meeting the requirements of CEC Article 345 and conforming to ANSI C80.6 and UL 1242.

14. Fittings: Compression type couplings, connector and bushing shall be as specified for galvanized rigid steel conduit. Integral retractable type IMC couplings are also acceptable.

G. Electrical Metallic Tubing.

15. Drawing and Spec Reference: EMT.

16. Conduit: Shall be formed of cold rolled strip steel, electrical resistance welded continuously along the longitudinal seam and hot dip galvanized after fabrication. Conduit shall conform to ANSI C80.3 specifications and shall meet UL classifications.

17. Raintight compression couplings: Electroplate steel or cast malleable iron; UL listed raintight and concrete tight, using gland and ring compression type construction.

18. Raintight compression connectors: Electroplated steel or cast malleable iron, UL listed raintight and concrete tight, with insulated throat, using gland and ring compression type construction.

19. Use of set-screw couplings and connectors is not permitted.

H. Flexible Conduit:

20. Drawing Reference: FLEX

21. Construction:
    a. Flexible steel, zinc coated on both inside and outside by hot-dipping process.
    b. Interlocking spirally wound continuous steel strip.
    c. 3/4" minimum size.
22. Fittings: Compression type connectors shall be of the single screw clamp variety with steel or cast malleable iron bodies and threaded male hubs with insulated throats. Exception: Pressure cast screw-in connectors shall be acceptable for fixture connection in suspended ceilings and cut-in outlet boxes within existing furred walls.
23. Approvals:
    a. UL 1

I. Liquidtight Flexible Metallic Conduit

24. Drawing Reference: Liquidtight
25. Conduit: Shall be fabricated in continuous lengths from galvanized steel strips, interlocking spirally wound, covered with extruded liquidtight jacket of polyvinyl chloride (PVC) and conforming to UL 360. Provide conduit with a continuous copper-bonding conductor wound spirally between the convolutions.
26. Fittings: Compression type connector body and gland nut shall be of cadmium plated steel or cast malleable iron, with tapered, male, threaded hub; insulated throat and neoprene "O" ring gasket recessed into the face of the stop nut. The clamping gland shall be of molded nylon with an integral brass push-in ferrule.

J. Conduit, Stainless Steel

27. Constructed of Type 316 Stainless Steel with either EMT, IMC type stainless steel fittings.
28. Approvals
    a. UL6A

K. PVC Conduit

29. Drawing and Spec Reference: PVC.
30. Construction:
    a. 4" trade diameter, unless otherwise noted.
    b. Poly-vinyl chloride.
    c. Schedule by Application
        1) Straight segments, Schedule 40.
        2) Flat elbows, Schedule 40.
        3) Vertical elbows sweep up to grade, Schedule 80.
        4) Above grade, Schedule 80.
    d. Elbows.

1) Where innerduct liner is scheduled – CRSC.
2) Elsewhere, Schedule 80.
3) 90° C rated.
4) Solvent welded joints, joints by pipe manufacturer.

e. Application.
1) Soil Backfill/Direct Burial
a) RUS Type II, Type C or Type DB
b) Schedule 40.
2) Concrete Encasement:
a) PVC Type DB-120,
b) RUS Type I, Type B or Type EB
c) Any meeting Soil Backfill/Direct Burial.
3) Boring
a) HDPE.
b) RUS Type Flexible Plastic.

f. Performance:
1) Tensile Strength: 7,000 psi at 73.4° F.
2) Flexural Strength: 11,000 psi.
3) Compressive Strength: 8,600 psi.

g. Approvals:
1) RUS Listed for Telephone Cable Installation 5-99 Edition, or latest release thereof.
2) NEMA TC-2, PVC Type EPC-40 and EPC-80.
3) NEMA TC-3.
4) NEMA TC14 Fiberglass Conduit.
5) UL 514 fittings.
6) UL 651.
7) ANSI C33.91.

h. Manufacturers:
1) RUS Listed:

Manufacturer	RUS Listed for	Manufacturer Part Number
Allwire, Inc.	Flexible plastic	ALLDUCT
American Pipe & Plastics	Plastic	Type B, C, and D
	Plastic	Type EB and DB
	Plastic	PVC Multi-Duct (2,3,4 and 6-way)
Americon International	Flexible plastic	HDPE Duct
	Plastic	PVC Type C
Apache Plastics, Inc.	Plastic	Type EB and Type DB
ARMCO	Plastic	Smooth-Cor Type B and Type C
Arnco	Flexible plastic	HDPE Conduit
Bay Plastics, Inc.	Plastic	Type B and Type C
Bristolpipe	Plastic	Type B, C, and D
	Plastic	Type EB and Type DB
Can-Tex	Plastic	Type EB and Type DB
	Plastic	Type B, C, and D

Carlon	Plastic	Type EB and Type DB
	Plastic	Type B, C, and D
	Plastic	Multi-Gard
Certain-Teed Products Corp.	Plastic	Type EB and Type DB
CIBA-GEIGY	Fiberglass	T & D Conduit
Condux International, Inc.	Concrete	Condux
	Plastic	Type EB and Type DB
CSR Polypipe	Flexible plastic	HDPE Duct
Dura-line	Flexible plastic	HDPE Duct
Eagle Pacific Industries, Inc.	Plastic	Type EB and Type DB
	Flexible plastic	HDPE Coiled Duct
Endot Industries	Flexible plastic	HDPE Duct
Freedom Plastics, Inc.	Plastic	Type C
Hercules, Inc.	Flexible plastic	Corflo plastic conduit
Hurlbut Plastic Pipe	Plastic	Type C
Ingomar Plastic Pipe	Plastic	Type B and Type C
J-M Manufacturing Company	Plastic	Types C, EB, and DB
Kyova	Plastic	Type EB and Type DB
LCP National Plastics, Inc.	Plastic	Type EB and Type DB
	Plastic	Type B and Type C
Northern Pipe Products	Plastic	Type B, C, and D
OMNI	Flexible plastic	HDPE Duct
Petroflex	Flexible plastic	HDPE Duct
	Flexible plastic	Corrugated HDPE Duct
Phillips Products Co., Inc.	Flexible plastic	Driscon 3200
Phone Ducs	Plastic	Multiple plastic conduit (4, 6, & 9 Way)
PLEXCO	Flexible plastic	PLEXCO Duct
PWPipe	Plastic	Type EB and Type DB
Pyramid Industries, Inc.	Plastic	Type EB and Type DM
	Flexible plastic	HDPE Conduit
Quail Plastics	Plastic	Type EB and Type DB
Queen City Plastics	Plastic	Type EB and Type DB
River City Plastics	Plastic	Type EB and Type DB
Sedco	Plastic	Type EB and Type DB
Southern Pipe, Inc.	Plastic	PVC Types EB, DB, and Sch. 40
Tamaqua Cable Products	Flexible plastic	HDPE Duct
Tridyn Industries	Plastic	Type EB and Type DB
Vassallo Industries	Plastic	Type B and Type C
Wesflex	Flexible plastic	Flex-Con

2) or equal

L. Fiberglass Conduit

31. Drawing Reference: Fiberglass

32. Construction:

a. Trade Standard Sizes

b. Meets NEMA TC 14

c. Complete system of joints and threaded steel conduit couplers

33. Manufacturers:

a. TVC Communication/Vikimatic Fiberglass Conduit

b. Champion Fiberglass

c. FRE Composite

d. or equal.

2.4 MISCELLANEOUS CONDUIT FITTINGS AND PRODUCTS

M. General

1. UL 514B.

2. Listed in UL Electrical Construction Materials List.

N. Conduit Fittings, Insulated Throat Grounding Bushings

3. Description

a. Threaded for Rigid Steel Conduit and Intermediate Metal Conduit.

b. UL Listed for use with copper conductors.

c. Thermoplastic insulated liner for 105 degrees Celsius.

d. Body of malleable iron, zinc plated; or die cast zinc.

4. Manufacturer

a. Thomas & Betts (Steel City) BG-801 Series

b. O-Z/Gedney

c. or equal.

O. Watertight conduit entrance seals: Steel or cast malleable iron bodies and pressure clamps with PVC sleeve, neoprene sealing grommets and PVC coated steel pressure rings. Fittings shall be supplied with neoprene sealing rings between the body and PVC sleeve.

P. Watertight cable sealing bushings: One piece, compression molded sealing ring with PVC coated steel pressure disks, stainless steel sealing screws and zinc plated cast malleable iron locking collar.

Q. Expansion fittings: Multi-piece unit comprised of a hot dip galvanized malleable iron or steel body and outside pressure bussing designed to allow a maximum of 4" conduit movement (2" in either direction). Furnish with external braid tinned copper bonding jumper. Unit shall be UL listed for wet or dry locations.

R. Expansion/deflection couplings: Multi-piece unit comprised of a neoprene sleeve with internal flexible tinned copper braid attached to bronze end couplings with stainless steel bands. Coupling shall accommodate .75-inch deflection, expansion, or contraction in any direction, and allow 30-degree angular deflections. Flexible, corrosion-resistant, watertight, moisture and heat resistant molded rubber jacket and stainless steel jacket clamps. Unit shall comply with UL467 and UL514.

5. Manufacturer:
    a. OZ/Gedney Type DX
    b. Steel City Type EDF
    c. or equal.

S. Fire rated penetration seals:

6. UL classified.

7. Conduit penetrations in fire rated separation shall be sealed with a UL classified assembly consisting of fill, void or cavity materials.

8. The fire rated sealant material shall be the product best suited for each type of penetration, and may be a caulk, putty, composite sheet or wrap/strip.

9. Penetrations of rated floors shall be sealed with an assembly having both F and T ratings at least equal to rating of the floor.

10. Penetrations of rated walls shall be sealed with an assembly having an F rating at least equal to the rating of the wall.

T. Standard products not herein specified:

11. Submit for review a listing of standard electrical conduit hardware and fittings not herein specified prior to use or installation, i.e. locknuts, bushings, etc.

12. Listing shall include manufacturers name, part numbers, and a written description of the item indicating type of material and construction.

13. Miscellaneous components shall be equal in quality, material, and construction to similar items herein specified.

U. Hazardous area fittings: UL listed for the application.

2.5 JUNCTION AND DEVICE BOXES

V. Junction and Device Boxes

1. Drawing References: As shown on Symbol Schedule
2. Construction:
   a. Concealed/Flush Mounted:
   b. One or two piece welded knockout boxes. Junction boxes with knockouts are not to be used for surface mounted locations or exposed locations.
   c. UL 514A, cadmium or zinc-coated 1.25 oz/sq. ft., if ferrous metal.
   d. Pressed sheet steel, for flush indoor locations.
   e. UL 514C approved if non-metallic.
   f. At hollow masonry, tile walls and plaster walls, provide with device rings as required.
   g. Surface mounted:
      1) Conform to the Junction and/or PullBox construction scheduled on the Plans. Where construction not otherwise scheduled or noted on the plans, conform to the following.:
         a) Cast iron with threaded hubs and mounting lugs.
         b) Gasketed cover with spring lid.
      2) Concrete floor embedded:
         a) Cast iron concrete pour boxes with screwed brass cover, unless otherwise noted.
         b) Cadmium plated screw cover attachment at least 6" on center.
   h. If size not otherwise noted, at least 4S (4" square) by 2-1/8" deep, or Code minimum size, whichever is larger.
      1) Wherever 4S is indicated, contractor may at their option substitute 4-11/16" or 5” (5S) square boxes while maintaining the minimum depth required by these specifications and the drawings.
      2) At recessed masonry wall installations, provide gangable masonry boxes.
   i. Provide complete with approved type of connectors and required accessories, including attachment lugs or hangers. Provide raised device covers as required to accept scheduled device.
3. Approvals.
   a. UL 514A
4. Manufacturers:
   a. Interior, flush:
      1) Steel City.
      2) Bowers
      3) Randl Industries, Inc. (5S Boxes).
      4) or equal.

b. Interior, flush 5S Boxes
   1) Randl, Inc. 5 Square Telecommunications Boxes
   2) or equal.

c. Surface mount or exterior, exposed with cover of same construction.
   1) Appleton
   2) Pyle-National
   3) or equal.

d. Other conditions:
   1) Any meeting approvals and requirements.

2.6 TERMINAL BOXES, PULL CANS AND ENCLOSURES

W. Terminal Cabinets:

1. Drawing Reference: As Scheduled.

2. Construction:

   a. General
      1) Interior dimensions not less than those scheduled.
      2) Door face to be not less than 95% of panel interior dimensions.
      3) Provide with 3/4" fire retardant treated ply backboard where device termination scheduled/required within enclosure

   b. Interior Application

   c. Zinc Coated Sheet Steel, code gauge with standard concentric knockouts for conduit terminations.

   d. Finish: Manufacturer's standard gray baked enamel finish.

   e. Flush mounted enclosure Covers: Trim fitted, continuous hinged steel door, flush catch - lockable and keyed to match. Screw fastened doors not acceptable.

   f. Surface mount cabinets shall be furnished with screw cover trim, flush hinged door and shall not be less than 6 inches deep.

   g. Exterior Applications
      1) Door and lock arrangement as required by manufacturer to maintain specified rating.

3. Mounting:

   a. Flush mount cabinets shall be furnished with concealed trim clamps and shall be not less than 4 inches deep or as scheduled, whichever is greater

4. Approvals

   a. Interior Applications:
      1) NEMA 250 Type 1, unless otherwise noted. Refer to plans and schedules.

   b. Exterior Applications:

1) NEMA 250 Type - As scheduled, not less than NEMA 3R. Provide NEMA 4 and 4X where scheduled or where required to match installation conditions.

5. Manufacturers, Metallic Enclosures:
   a. B-Line Electrical Enclosures
   b. Circle AW Products.
   c. Hammond
   d. Henessey.
   e. Hoffman.
   f. Myers Electric Products
   g. Rittal.
   h. or equal.
6. Manufacturers, Non-metallic Enclosures
   a. Stahlin Enclosures
   b. Cabletek
   c. RMS Electronics, Inc
   d. STI, Inc
   e. Vynckier Inc.
   f. Or equal.

2.7 WIREWAY

X. Lay-In Wireway

1. Drawing Reference: Gutter
2. Features/Functions/Construction
   a. NEMA Type 1, unless otherwise noted.
   b. ANSI 61 Gray polyester powder finish inside and outside.
   c. Screw fastened cover completely removable to provide complete access to interior.
   d. 6"x6" cross-section minimum, size for 30% fill maximum
3. Approvals
   a. UL 870
   b. NEMA Type 1
4. Manufacturers
   a. Hoffman Lay-In Type 1 Wireway

b. Square D

c. Circle AW

d. or equal

2.8 THROUGH PENETRATIONS SEALANT SYSTEMS

Y. At a minimum, follow all manufacturer instructions. In case of discrepancy between manufacturer and contractor requirements, the more stringent shall apply. In the case of conflicting instructions, report any discrepancy to the College's Representative in a timely fashion so as not to impact the construction timeline.

Z. Application: Through Penetration Sealant Assemblies, Renenterable

1. Zero-maintenance firestop assemblies shall be used at all penetrations of rated partitions when the pathway on one or both sides of the wall, ceiling or floor is open, such as J-hooks or cable tray.

2. Communications cable tray or ladder rack shall not be continued through a fire-rated wall. Stop the tray or ladder rack, install multiple zero- maintenance firestop assemblies as needed, and continue the tray or ladder rack on the other side. Ensure grounding of the cable tray is continuous through the wall.

3. Electronic security system conduit sleeves through a single fire-rated wall shall not be used. For these applications, a zero-maintenance firestop assembly is required.

AA. Application: Firestopping for Conduits and Other Closed Pathways

4. Firestopping is required for all fire-rated penetrations where a electronic security system conduit or other closed pathway penetrates one or more membranes of a fire-rated wall floor or ceiling

5. Required for all electronic security system outlets located on fire-rated walls. Systems shall be UL CLIV tested

BB. For all penetrations for electronic security system openings through fire-rated walls, floors and ceilings, install the same manufacturer's product for that type of penetration throughout the project.

CC. Coordinate with all other trades prior to installation:

6. To ensure that through penetration firestop systems are installed according to specified requirements.

7. To ensure that sizing of openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems is appropriate.

DD. All penetrations through fire-rated building structures (walls, ceilings and floors) shall be sealed with an appropriate firestop system that at least matches the fire rating of the structure. This requirement applies to through penetrations (complete penetration) and membrane penetrations (through one side of a hollow fire-rated structure).

8. Any penetrating item i.e., riser slots, cables, conduit, cable tray, and raceways, etc. shall be properly firestopped.

9. Through penetrations shall be sealed on both sides of the structure.

10. Electronic security system outlet back-boxes installed in fire-rated walls shall be completely enclosed in an appropriate firestopping assembly within the wall.

11. Conduit sleeves shall not be used for penetrating fire-rated floors, ceilings and walls. A zero-maintenance firestop assembly shall be used instead.

EE. Verify the locations of all fire-rated walls prior to installation.

FF. Firestopping assemblies must make a gas, smoke and water tight seal when activated in a fire.

GG. Multiple cable bundles planned to penetrate a fire-rated wall and entering the same space within 10 feet of each other shall be consolidated in to a single penetration, unless one or both penetrations are membrane penetrations.

HH. Ambient Conditions:

12. Do not install firestopping products when ambient or substrate temperatures are outside the limitations recommended by the manufacturer.

13. Do not install firestopping products when substrates are wet due to rain, frost, condensation, or other causes.

14. Maintain the minimum temperature before, during, and for a minimum 3 days after installation of materials.

II. Schedule installation of firestopping after completion of the penetrating item (e.g., conduit) installation but prior to the covering or concealing of openings.

JJ. Before beginning installation:

15. Examine and clean the affected surfaces, as they shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellants, and any other substances that may inhibit optimum adhesion.

16. Provide masking and temporary covering to protect adjacent surfaces.

17. Do not proceed until unsatisfactory conditions have been corrected.

KK. After installation:

18. Remove equipment, materials, and debris, leaving area in undamaged, clean condition.

19. Clean all surfaces adjacent to sealed openings to be free of excess firestopping materials and soiling as work progresses.

20. Do not cover installed firestopping assemblies until inspected by the College’s Representative.

LL. All firestop systems (including the cabling through them) and identification labels shall be installed prior to the College Representative's above-ceiling inspection.

MM. Labeling

21. At all firestop locations, install a permanent label near the firestop on each side of the wall, ceiling or floor. Labels shall be pre-printed and include:
    a. Manufacturer of the firestop.
    b. Name of product and UL System Number.
    c. Name of installer and company name
    d. Date of installation.
    e. Rating of the wall/system (F and T ratings).
22. One location may have multiple labels (e.g. for a firestop in the annular space around a conduit penetration and a firestop within the conduit around the cables).
23. Labels shall not be painted over or otherwise obscured or defaced.

2.9 SUPPORTING DEVICES

NN. General

1. Supports to be sized to suit load and selected to match mounting conditions

OO. Manufacturers

2. Equal products by the following manufacturers will be considered providing that all features of the specified product are provided:
    a. Concrete fasteners:
        1) Phillips "Red-Head".
        2) Remington.
        3) Ramset.
        4) Hilti
        5) Simpson Strong-Tie
        6) or equal.
    b. Concrete inserts and construction channel:
        1) Unistrut Corp.
        2) GS Metals "Globe Strut."
        3) Thomas & Betts "Kindorf" Corp.
        4) Or equal.
    c. Conduit straps:
        1) O-Z/Gedney.
        2) Erico "Caddy" Fastening Products.
        3) Thomas & Betts "Kindorf" Corp.
        4) Or equal.
    d. Beam Clamps

1) Cooper B-Line
2) SuperStrut
3) Unistrut
4) or equal

e. Aircraft Cable Sway Braces
1) Mason Industries
2) M.W. Sausse/Vibrex
3) Loos & Company, Inc.
4) or equal.

PP. Concrete Fasteners

3. Provide expansion-shield type concrete anchors.

4. Provide powder driven concrete fasteners with washers. Obtain approval by College's Representative prior to use.

QQ. Concrete Inserts

5. Provide pressed galvanized steel, concrete spot insert, with oval slot capable of accepting square or rectangular support nuts of ¼ inch to ½ inch diameter thread for rod support.

RR. Aircraft cable sway braces

6. Steel rope sized to meet load.

SS. Construction Channel:

7. Construction:

a. 1-5/8" square galvanized channel formed from U.S.S.G No. 12 or 0.109 inch cold formed steel with 17/32-inch diameter bolt holes, and 1-1/2 inch on center in the base of the channel.

b. 10 foot sections.

8. All supporting materials by same manufacturer.

TT. Beam Clamps

9. Malleable iron electro-galvanized steel beam clamps selected to match building structural steel members.

UU. Conduit Straps

10. One hole strap, steel or malleable iron, with malleable iron clamp-back spacer for surface mounted wall and ceiling applications.

a. Use malleable strap with spacers for exterior and wet locations.

b. Use steel strap without spacers for interior locations.

11. Steel channel conduit strap for support from construction channel.

12. Steel conduit hanger for pendant support with threaded rod

13. Steel wire conduit support strap for support from independent #12 gauge hanger wires.

VV. Threaded rods, couplings, screws and nuts:

14. Electrolytically coated with zinc, 2 oz. zinc per square foot of surface, ASTM A123 or A153.

WW. Miscellaneous Parts

15. Hot dipped galvanized after fabrication; after cutting, de-burring and hole drilling. Coated with zinc, 2 oz. zinc per square foot of surface, ASTM A123 or A153.

XX. Paint/Tape for Touch-up:

16. Zinc: CRC "Zinc-It", Glyptal, Enterprise Galvanizing “Galambra”, or equal.

PART 3 - EXECUTION

3.1 GENERAL

A. The College’s Representative reserves the right to request additional supports where in their sole opinion said supports are required. Any additional supports shall be installed at no additional cost to the College.

3.2 EXAMINATION

A. Thoroughly examine site conditions for acceptance of supporting device installation to verify conformance with manufacturer and specification tolerances. Do not commence with installation until all conditions are made satisfactory.

3.3 PREPARATION

A. Coordinate size, shape and location of concrete pads required for equipment installation with the work of the other trades

B. Lay out support devices to maintain headroom, neat mechanical appearance and to support the equipment loads.

C. Where shown on the Drawings or Specifications, install freestanding Electronic Safety and Security equipment on concrete pads.

3.4 CONDUIT APPLICATION

A. General: Install the following types of conduits and fittings in the locations listed, unless otherwise noted in the drawings:

1. Exterior, Exposed:
   a. Type RSC for applications up to 8 feet AFF or to first pull box, whichever is first, applications subject to physical abuse or for applications greater than 4" diameter.
   b. EMT acceptable in all other applications not noted above up to 4" diameter, where used in conjunction with specified Raintight (compression) couplers.
2. Interior, Exposed, Wet and Damp Locations:
   a. Type CRSC.
3. Interior, Hazardous Locations
   a. Type RSC
   b. Type IMC, where permitted by the CEC.
4. Interior, exposed or concealed, dry locations:
   a. RSC, if subject to physical abuse.
   b. EMT, if not subject to physical abuse.
5. Interior, concealed, damp locations, including in masonry walls.
   a. RSC
6. Embedded in Concrete
   a. RSC or rigid non-metallic conduit.
   b. PVC Type Schedule 40.
7. Transition from walls, floor boxes and monuments to open plan furniture systems:
   a. Liquidtight

3.5 GENERAL REQUIREMENTS

A. Refer to the manufacturer's instructions and conform thereto.

B. Distribution Pathway via EMT Raceway:

1. EMT conduit is to be installed meeting the NEC handbook Article 348 Installation Specifications.
2. Provide escutcheon plates for all through wall conduit stubs.
3. All ends of conduits shall be cut square, reamed and fitted with insulated bushing.

4. All conduit which passes through fire walls shall be sealed with fire stop putty after all station wire has been installed.

3.6 MOUNTING AND INSTALLATION – DEVICE BOXES

A. Conform to the more restrictive of NEMA OS 3-2002 and the following.

B. Provide backboxes at all Electronic Safety and Security systems devices. Installation of device plates directly to wall surface without use of a backbox, unless specifically directed on plans, is unacceptable.

C. The distance between pull boxes shall not exceed 150 feet or more than two 90 degree bends.

D. Align boxes plumb with floor and surrounding construction. At door frames, locate 4" from frame. Verify placement with College's Representative details to ensure that box clears all trim, etc.

E. Support and fasten boxes securely. At stud walls use rigid bar hangers, attached to hanger with stud and nut.

F. At existing locations, provide cutting, patching and finishing as required to maintain or restore finishes so that resulting installation is integrated into the Architectural decor of the particular location.

G. Mounting Height: the mounting height of a wall-mounted outlet box is defined as the height from the finished floor to the horizontal center line of the cover plate.

H. Mount outlet boxes with the long axis vertical. Three or more gang boxes shall be mounted with the long axis horizontal.

I. Install wiring jacks and outlet devices only in boxes which are clean; free from excess building materials, dirt, and debris.

J. Install wiring jacks and outlet devices after wiring work is complete.

3.7 TERMINAL CABINETS, JUNCTION BOXES AND PULL BOXES

A. General

1. Thoroughly examine site conditions for acceptance of cabinets and enclosures installation to verify conformance with manufacturer and specification tolerances. Do not commence with installation until all conditions are made satisfactory.

B. Set cabinets and enclosures plumb and symmetrical with building lines. Furnish and install all construction channel bolts, angles, etc. required to mount all equipment furnished under this Section of the Specifications.

C. Cabinets and enclosures shall be anchored and braced to withstand seismic forces calculated in accordance with standards referenced in Section 27 05 29 – Hangers and Supports for Electronic Safety and Security Systems.

D. "Train" interior wiring, bundle and clamp using specified plastic wire wraps. Separate power and signal wiring.

E. Replace doors or trim exhibiting dents, bends, warps or poor fit that may impede ready access, security or integrity.

F. Terminate conduit in cabinet with lock nut and grounding bushing.

G. Cleaning

1. Touch-up paint any marks, blemishes or other finish damage suffered during installation.

2. Vacuum clean cabinet on completion of installation.

3.8 SUPPORT

A. Provide supports for raceways as specified in this Section.

B. All raceways installed in exposed dry locations shall be grouped in a like arrangement and supported by means of conduit straps, wall brackets or trapeze hangers in accordance with Code and the requirements of this Section. Fasten all hangers from the building structural system.

C. Provide supports and mounting attachments per the most restrictive of Code and the following Install no more than one coupling or device between supports.

Raceway Size (inches)	No of cables in run	Location	Support Spacing (feet)	
			RSC	EMT
Horizontal Runs				
½, 3/4	1-2	Flat Ceiling Wall Runs	5	5
½, 3/4	1-2	Where Access Limited To Building Structure	7	7
½, 3/4	3≥	Any Location	7	7
1≥	1-2	Flat Ceiling Or Wall	6	6
1≥	1-2	Where Access Limited To Building Structure	10	10
1≥	3≥	Any Locations	10	10
ANY	ANY	Concealed	10	10
Vertical Runs				
½, 3/4	ANY	Exposed	7	7
1, 1-1/4	ANY	Exposed	8	8
1-1/2≥	ANY	Exposed	10	10

D. The College's Representative reserves the right to request additional supports where in their sole opinion said supports are required. Any additional supports shall be installed at no additional cost to the College.

3.9 RACEWAY INSTALLATION

A. General

1. Raceway runs are shown schematically – Contractor to provide design and implementation of complete pathway system. Install concealed unless specifically shown otherwise. Supports, pull boxes, junction boxes and similar generally not indicated. Provide where designated in addition to those required by the Contractor's design.

   a. All raceway in new construction shall be run concealed, unless exposed construction is called for on the plans. Bring to the College Representatives any field conditions requiring exposed electronic security systems pathway and receive direction prior to proceeding.
      1) Conduit entries to device backboxes shall be made from the rear or side where concealed by architectural finish materials and shall not be exposed to public view and/or tampering.

   b. Install exposed conduit and raceway parallel and perpendicular to nearby surfaces or exposed structural members, and follow the surface contours. Level and square conduit and raceway runs.

   c. Raceway runs shall be mechanically and electrically continuous between all each equipment rack and utility demarcation point, receptacle and/or surface raceway strip, as applies.

   d. Each conduit shall enter and be securely connected to a cabinet, junction box, pull box, or outlet by means of a locknut on the outside and a bushing on the inside or by means of a liquid-tight, threaded, self-locking, cold-weld type wedge adapter.

   e. Conduit connections to enclosures will not interfere with components inside enclosure such as batteries, circuit boards, locking mechanisms etc.

   f. Conduit to be connected to enclosures via knockouts from factory. Additional penetrations are not permitted.

   g. Bends
      1) All bends or elbows shall have a minimum radius as follows:

Conduit Size (Inches)	Min. Radius (Inches)
3/4	8
1	12
1-1/4	18
2	24
2-1/2	24
3	30
3-1/2	30
4	30
5	36

2) Use factory elbows or machine bends for conduit bends 1-1/4" and larger.

h. Make bends and offsets so the inside diameter is not effectively reduced. Make bends in parallel or banked runs from the same center line so that the bends are parallel.

i. Install at least one (1) 3/8", 200 pound strength nylon pull cord in all empty raceways.

j. Raceways crossing building expansion joints or in straight runs exceeding 100 feet shall be provided with UL listed expansion fittings.

k. Install conduit seals and drains to prevent accumulated moisture in conduits from entering Electronic Safety and Security Systems enclosures.

2. Do not install conduit in concrete slabs unless specifically directed by College's Representative. Embedded conduits in concrete slab walls, and columns shall be installed in center third between upper and lower layers of reinforcing steel as directed by the College's Representative. Space conduits 8" on center except at cabinet locations where slab thickness shall be increased as directed by the College's Representative.

3. All conduits to be kept 12" away from steam or hot water lines. Install horizontal conduit and raceway runs below water and steam piping.

4. Conduit dropping down to equipment shall be as straight as possible without any offsets, parallel or perpendicular to walls, ceilings and other building features.

5. Conduit installed on any equipment shall be run symmetrical with the equipment and in such a manner as to:

   a. not to be exposed to damage;

   b. not interfere with access to components of the equipment that will interfere with maintenance operation or;

   c. not to be in a manner that the College's Representative deems detrimental to its operation.

6. Whenever an installation such as that listed occurs, the Contractor shall make all necessary changes at no additional cost to the College.

7. All cut ends of conduit, scratches, tool marks, etc. on any metallic raceway installed in the ground or on the exterior of the building shall be treated with two coats of specified Touch Up Paint/Tape.

8. Exposed conduit and metallic surface raceway installed in finished spaces shall be painted to match surrounding surfaces using paint and methods directed by the College's Representative.

9. All raceways stubbing up into equipment or racks shall be sealed. Raceways with conductors shall be plugged with duct-seal. Spare raceways shall be capped. Prevent foreign matter from entering conduit and raceway; use temporary closure protection. Replace conduits containing concrete, varnish or other foreign material.

10. Complete installation of conduit and raceway runs before starting installation of cables/wires within conduit and raceway.

11. Use specified conduit and raceway fittings that are of types compatible with the associated conduit and raceway and suitable for the use and location. Join and terminate conduit and raceway with fittings designed and approved for the purpose of the conduit and raceway system and make up tight.

12. Where chase nipples are used, align the raceway and coupling square to the box and tighten the chase nipple so no threads are exposed.

13. Horizontal conduit or EMT runs, where required and permitted, shall be installed as close to ceiling or ceiling beams as practical.

14. Conduit and EMT connected to wall outlets shall be run in such a manner that they will not cross water, steam or waste pipes or radiator branches.

15. Conduit and EMT shall not be run through beams, purlins or columns except where permission is granted by College's Representative in writing.

16. Bond installed metallic raceway in accordance with the requirements of the CEC.

3.10 RACEWAY FOR ACCESS CONTROL AND INTRUSION DETECTION SYSTEMS

A. Refer to general requirements herein above.

B. Below accessible ceiling line, access control and intrusion detection systems shall be installed in entirely in raceway. Size pathway for 30% fill maximum, including:

1. Rough-in for the field devices as detailed and scheduled on the plans.

2. Surface mounted device boxes, where called for in retrofit conditions, including those intended to mount card readers, local alarm sounders and cameras, to be penetrated from the rear (through the backing construction assembly) to prevent exposing the device to tampering. Surface mount device boxes should be free of knockouts at the sides of the box exposed to public access/view.

3. Pull cabinets located at regular intervals in the building, sized to accommodate the access control and intrusion detection cabling. Locate pull cans outside of public view.

a. Size raceway between pull cabinets to accommodate fill of field devices.

b. Coordinate backbox size to ensure that pathway connections to enclosures shall not interfere with components installed inside enclosure including batteries, circuit boards, locking mechanisms, etc. Undersized enclosures exhibiting interference with installed components to be replaced by the Contractor at no expense to the College.

c. Pathway including flexible metal and armored cable shall terminate in the sensor or device enclosure.

d. Ends of conduit shall be fitted with insulated bushings. Provide continuous complete non-flexible pathways, from device, including pull boxes for all field

devices. Leaving exposed conductors at ends of conduits external to sensors and devices not acceptable except above accessible ceiling line.

4. Gutter at backboard indicated security electronics termination points sized for 30% fill maximum, to terminate the raceway arriving from the pull cabinets and directly from the field devices pathway systems.

5. Mounting field devices to the cover of surface mounted junction boxes is unacceptable and will be replaced at no cost to the College.

C. Steel wireway/gutter and terminal cabinets to be provided at backboards of indicated termination rooms to full enclose the electronic security systems access control and alarm systems wiring, terminal devices, TB15's and terminal blocks used to terminate the field wiring installed under the work of this contract as described elsewhere herein.

3.11 HAZARDOUS LOCATIONS

A. Use rigid steel conduit only.

B. Install UL listed sealing fittings that prevent passage of explosive vapors in accordance with the manufacturers written instructions. Locate fittings at suitable, accessible locations and fill them with UL-listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank coverplate having a finish similar to that of adjacent plates or surfaces.

C. Install raceway sealing fittings at the following points and elsewhere as indicated:

1. Where conduits enter or leave hazardous locations.

3.12 REUSE OF EXISTING CONDUIT

A. General

1. Existing conduit is to be used as a pathway only where so shown on the drawings.

2. Prior to beginning work involving the use of an existing conduit, the Contractor shall consult with the College’s Representative in order to establish whether or not the conduit contains active service.

3. If no active service exists within the conduit, all cable is to be removed, and work is to proceed.

4. If active service does exist within the conduit and it has been determined that service needs to be disrupted, then work on that conduit shall not proceed until a schedule of service outage has been established by College’s Representative. Once given direction to proceed, the Contractor shall within the time period of one (1) working day; remove the old cable, install, terminate and test the new cables, and notify the College’s Representative the work using the specific conduit has been completed. The College’s Representative shall be responsible for the disconnection and reconnecting of the active service cross-connects within the terminal closet(s).

B. Conduit preparation procedure:

1. Remove existing wires and cables (if any).
2. Run a mandrel ½" smaller than the inside diameter of the conduit through the conduit receiving new wires and cables.
3. If the specified size mandrel will not pass through the existing conduit, start with a smaller size mandrel and increase mandrel size until the specified sized mandrel will pass.
4. Run a wire brush and clean rag with an outside diameter 1/8" larger than the inside of the conduit through the conduit receiving new wires and cables.
5. Repeat above until conduit is clean and materials detrimental to the wire and cables to be installed no longer exit conduit with the clean rag.

3.13 WIREWAY INSTALLATION

A. Install complete wireway system at electronic security systems backboards, including track, cover plate, device boxes, inside and outside elbows, splice plates, T's, transitions and extension rings and end caps as required.

B. Any existing surface raceway and/or exposed cabling along the indicated pathway of the raceway to be installed shall be removed prior to the installation of the new raceway. If the existing cabling contains active service, then Contractor shall consult with the College's Representative as to how best maintain the existing service before proceeding with the work.

C. Provide and install the proper factory fabricated corners, support clips, end connectors, etc. as required.

D. Corners and joints are to be cut neatly and finished using connector components of specified system. Where components are not available using specified system, to meet requirements of drawings, provide cleanly mitered joints, EMT and/or surface backboxes specified elsewhere herein.

E. All installed surface raceway shall be inspected for marks, scratches, gaps between sections or improper fitting of connector parts. All such damage shall be repaired to the College's Representatives satisfaction, or the raceway shall be removed and replaced.

F. Remove sharp corners and edges prior to installation of cable.

G. Attachment of raceway to walls, floors, and partitions:

1. Attach raceway to the supporting surface with mechanical fasteners applied to building structure per the most restrictive of manufacturer's directions, Code, or these provisions.

2. All surface raceway shall be installed so that its edges are parallel to the vertical or horizontal edge of the surface on which they are mounted. All surface raceway, found not to be installed in this manner, shall be removed and re-installed correctly.

3. Surface raceway shall be secured at 2'-0" intervals (2 spaced screws for 2" and wider raceways) with wood screws into wooden framing or self drilling wall anchors (ITWBildex "Heavy Duty E-Z Toggle", no known equal) into sheetrock or plastic inserts with pre-assembled drive screw for concrete (ITT-HOLUB "HI-DRIVE" nail anchors, no known equal) Powder (explosive charge) driven anchors are not acceptable. The use of adhesives as the sole means for fastening to any surface is not allowed.

4. Screws used in fastening surface raceway shall be no less than 3/4" in length.

5. The proper support clips, as called for by the manufacturer, for securing surface raceway to walls or floors are to be used per the manufacturer's instructions.

3.14 PENETRATIONS

A. Gypsum Wall Board Penetrations: Provide circular penetrations maximum 1/8" inch larger than outer diameter of conduit being used. On both sides of the wall fill space between conduit and wall with joint compound, depth to match gypsum board thickness.

B. As specified elsewhere herein, install UL listed fire-stop system whenever a raceway penetrates a firewall in conformance with the manufacturer's directions, the published systems assembly requirements, CBC Section 709 and 710 and CEC 300-21, whichever is the most restrictive. At cable tray penetrations, provide pillow type removable fire stop per CBC Section 709 and 710, the published systems assembly requirements and the manufacturer's directions, whichever is the most restrictive.

C. All Electronic Safety and Security systems conduit openings in walls and floors are the responsibility of the Contractor. Install sleeves shown on the drawings when the concrete is poured. Any openings required after the concrete has set maybe core drilled.

3.15 THROUGH PENETRATIONS SEALANT SYSTEMS

A. At a minimum, follow all manufacturer instructions. In case of discrepancy between manufacturer and contractor requirements, the more stringent shall apply. In the case of conflicting instructions, report any discrepancy to the College's Representative in a timely fashion so as not to impact the construction timeline.

B. Application: Through Penetration Sealant Assemblies, Renenterable

1. Zero-maintenance firestop assemblies shall be used when the pathway on one or both sides of the wall, ceiling or floor is open, such as J-hooks or cable tray.

2. Communications cable tray or ladder rack shall not be continued through a fire-rated wall. Stop the tray or ladder rack, install multiple zero- maintenance firestop assemblies as needed, and continue the tray or ladder rack on the other side. Ensure grounding of the cable tray is continuous through the wall.

3. Electronic security system conduit sleeves through a single fire-rated wall shall not be used. For these applications, a zero-maintenance firestop assembly is required.

C. Application: Firestopping for Conduits and Other Closed Pathways

1. Firestopping is required for all fire-rated penetrations where a electronic security system conduit or other closed pathway penetrates one or more membranes of a fire-rated wall floor or ceiling

2. Required for all teleelectronic security system outlets located on fire-rated walls. Systems shall be UL CLIV tested

D. For all penetrations for electronic security system openings through fire-rated walls, floors and ceilings, install the same manufacturer's product for that type of penetration throughout the project.

E. Coordinate with all other trades prior to installation:

1. To ensure that through penetration firestop systems are installed according to specified requirements.

2. To ensure that sizing of openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems is appropriate.

F. All penetrations through fire-rated building structures (walls, ceilings and floors) shall be sealed with an appropriate firestop system that at least matches the fire rating of the structure. This requirement applies to through penetrations (complete penetration) and membrane penetrations (through one side of a hollow fire-rated structure).

1. Any penetrating item i.e., riser slots, cables, conduit, cable tray, and raceways, etc. shall be properly firestopped.

2. Through penetrations shall be sealed on both sides of the structure.

3. Electronic security system outlet back-boxes installed in fire-rated walls shall be completely enclosed in an appropriate firestopping assembly within the wall.

4. Conduit sleeves shall not be used for penetrating fire-rated floors, ceilings and walls. A zero-maintenance firestop assembly shall be used instead.

G. Verify the locations of all fire-rated walls prior to installation.

H. Firestopping assemblies must make a gas, smoke and water tight seal when activated in a fire.

I. Multiple cable bundles planned to penetrate a fire-rated wall and entering the same space within 10 feet of each other shall be consolidated in to a single penetration, unless one or both penetrations are membrane penetrations.

J. Ambient Conditions:

1. Do not install firestopping products when ambient or substrate temperatures are outside the limitations recommended by the manufacturer.

2. Do not install firestopping products when substrates are wet due to rain, frost, condensation, or other causes.

3. Maintain the minimum temperature before, during, and for a minimum 3 days after installation of materials.

K. Schedule installation of firestopping after completion of the penetrating item (e.g., conduit) installation but prior to the covering or concealing of openings.

L. Before beginning installation:

1. Examine and clean the affected surfaces, as they shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellants, and any other substances that may inhibit optimum adhesion.

2. Provide masking and temporary covering to protect adjacent surfaces.

3. Do not proceed until unsatisfactory conditions have been corrected.

M. After installation:

1. Remove equipment, materials, and debris, leaving area in undamaged, clean condition.

2. Clean all surfaces adjacent to sealed openings to be free of excess firestopping materials and soiling as work progresses.

3. Do not cover installed firestopping assemblies until inspected by the College's Representative.

N. All firestop systems (including the cabling through them) and identification labels shall be installed prior to the College Representative's above-ceiling inspection.

O. Labeling

1. At all firestop locations, install a permanent label near the firestop on each side of the wall, ceiling or floor. Labels shall be pre-printed and include:

a. Manufacturer of the firestop.

b. Name of product and UL System Number.

c. Name of installer and company name

d. Date of installation.

e. Rating of the wall/system (F and T ratings).

2. One location may have multiple labels (e.g. for a firestop in the annular space around a conduit penetration and a firestop within the conduit around the cables).

3. Labels shall not be painted over or otherwise obscured or defaced.

3.16 SUPPORT INSTALLATION

A. Furnish and install supporting devices as noted throughout the Electronic Safety and Security Systems work.

B. Electronic Safety and Security device and conduit supports shall be independent of all other system supports that are not structural elements of the building, unless otherwise noted.

C. Fasten hanger rods, conduit clamps, outlet and junction boxes to building structure using powder actuated tools, precast inserts, expansion anchors, preset inserts or beam clamps.

D. Use powder actuated tools, self-drilling anchors, expansion anchor, or preset inserts on concrete surfaces.

E. Use sheet metal screws in sheet metal studs and wood screws in wood construction.

F. Do not fasten supports to piping, ductwork, mechanical equipment, conduit, or acoustical ceiling suspension wires.

G. Do not drill structural steel members unless first approved in writing by the College's Representative.

H. Fabricate supports from structural steel or steel channel, rigidly welded or bolted to present a neat appearance. Use hexagon head bolts with spring lock washers under all nuts.

I. Install surface-mounted cabinets with minimum of four anchors. Provide additional support backing in stud walls prior to sheet rocking as required to adequately support cabinets and panels.

J. Bridge studs top and bottom with channels to support flush mounted cabinets and panelboards in stud walls.

3.17 ERECTION OF METAL SUPPORTS

A. Cut, fit, and place miscellaneous metal fabrications accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

B. Field Welding: Comply with AWS "Structural Welding Code."

3.18 WOOD SUPPORTS

A. Cut, fit, and place wood grounds, nailers, blocking, and anchorage accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

END OF SECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions and Division 1 Specification Sections, apply to this Section.

1.2 RELATED WORK IN OTHER SECTIONS:

1. Division 8 – Door Hardware
2. Division 14 - Elevators and Elevator Control.
3. Section 27 15 00 – Communications Horizontal Cabling
   a. Provides the structured cabling to the access control and intrusion detection panels, and biometric readers.
4. Section 28 05 00 – Common Work Results for Electronic Safety and Security
5. Section 28 05 13 – Conductors and Cables for Electronic Safety and Security
6. Section 28 05 28 – Pathways for Electronic Safety and Security
7. Section 28 23 00 – Video Surveillance

B. By the College

1. Ethernet Network switches connected to structured cabling installed at the Telecommunications Rooms by Division 27 under the work of this Project.
2. Microsoft Windows ActiveDirectory directory services for use in assigning access groups and users by the Contractor. Refer to the minimum functional directory services capabilities provided by the access control system provided under the work of this Section.

1.3 SCOPE

A. Work of Division 28 includes provision of a Unified Security Platform (USP), including fully integrated access control and video surveillance systems as described in Section 28 23 00 and this Section. Work of section 28 13 00 includes (but is not necessarily limited to) provision of the access control subsystem portion of the USP, including but not limited to:

1. Access Control System.
   a. Work of this Project provides a new enterprise grade access control system with headend server and storage located at the Telecom Rooms in building 1 and 2. The Access Control (ACS) shall include all intelligent field advanced processing controller, communication devices, card readers, combination card readers/keypads, access cards, I/O boards, power supplies, enclosures, mounting hardware, and all other equipment as specified herein. All material shall be the manufacturer's standard catalog products.

b. Monitoring

1) The ACS shall allow system administrators to separate the creation and viewing of objects into partitions. ACS operators shall be associated with partitions and this shall determine which objects operators have the ability to create and or view.

a) The ACS partitions shall include but not be limited to the following objects:

(1) Personnel
(2) Clearances
(3) Doors
(4) Controllers with all associated hardware (readers, inputs, outputs, etc).
(5) Video servers with all associated objects (cameras, tours, views, etc).
(6) Application layouts
(7) Events
(8) Dynamic views
(9) Maps
(10) Reports, forms, results
(11) Holidays
(12) Badge layouts
(13) Queries
(14) Images

b) Graphical User Interface (GUI)

(1) The ACAS shall employ a standard Windows graphical user interface (GUI). A mouse and keyboard shall be the primary operator interface with the system. Operator screens shall utilize all standard Windows-style functions such as drop-down menus, context menus, radio buttons, and lists, as appropriate. The interface shall utilize a 'tree structure' similar to Windows Explorer.

c) Administration Operator Interface

(1) The ACAS shall employ an Administration Operator Interface to control the following:
(2) Hardware (readers, inputs, outputs, door controls, other systems, future fully integrated video surveillance systems,).
(3) Configuration of personnel records, operators and operator privileges.
(4) Graphical Maps.
(5) Application Layouts.
(6) Dynamic Views.
(7) Queries.
(8) Import/Export of objects, including images.
(9) System Variables.
(10) Reports (either periodic or one-time).
(11) System functions (event command and control, actions, schedules).
(12) Display of a list of objects in a grid that can have their values modified and respond to real-time status changes.
(13) Scheduling of backups.
(14) Monitoring of system settings and performance.
(15) Designing of and printing of badges.
(16) The GUI shall be configurable by the system administrator to control the views and access of each Monitoring Station operator.

d) At the workstations, ACS system provides for real time monitoring of system status including graphical maps of the areas under the control of the system indicating alarm conditions correlated with camera call up of the cameras installed under the work of Section 28 23 00 for the cameras with views of the area of alarm as described elsewhere in this Section.
e) System views can be broken into up to 16 tiled focus areas within a single workstation's display to permit simultaneous display of multiple content (example: graphical map, event log, display of user record associated with event, and multiple camera views around event).

2) Workstation and web interface. System permits monitoring of full system feature set from web interface to permit monitoring from a remote sites if required by the College's operations.

c. Input and output points.
1) Work of this project installs new Card Readers at selected door openings as indicated on the plans.
2) Work of this project interfaces the ACS to field devices installed under the work of this Section:
a) Door position switches.
b) Local door alarms
c) Electric locks and electric strikes
d) Request to exit devices, including:
(1) Door hardware with integral REX button functionality.
3) Work of this project interfaces to devices installed under the work of other Sections:
a) Power Door Operators and their controls

2. Intrusion Detection System

a. If the provided ACS system is not listed as a UL Listed 1076 Proprietary Burglar Alarm Unit, provide a separate commercial burglar alarm system consisting of intrusion detection panel and field devices, connected to the surrounding ACS alarm interface using SDK based IP signalling.

1.4 SUBMITTALS

A. Refer to the requirements of Section 28 05 00 – Common Work Results for Electronic Safety and Security.

1.5 TRAINING

A. Train the College's Representatives in operation of the installed video management system. Provide a least three separate training tracks focused on the training needs of specific stakeholder groups within the College's operation and technical staff including at least Operator Staff, Administrators and Colleges Technical/Information Technology Support Staff.

1. For the Operator Staff provide at least eight hour classroom type training sessions, covering the basic theory and operation of the Access Control and Intrusion Detection system and provide up to 20 hours support for the initial systems operator during first use. Schedule the three different sessions at

different times of the day/days of the week to accommodate the different schedules of the College's staff.

2. For the Administrator Staff provide at least eight hours classroom type training in the theory and both basic and advanced operation and functions of the Access Control and Intrusion Detection system. Provide hands-on Training for the Command Center Administrator Staff, provide up to 8 hours hands-on support for in basic and advanced systems operations.

3. For the Colleges Technical/Information Technology Support Staff and third party integrators staff provide eight hours classroom and hands-on training in Access Control and Intrusion Detection system functionality, IP communications protocols used, device handshaking, record importing and overall data flow through the system. Review directory tree integration mechanisms and requirements for tree maintenance. Review methods for bare metal recovery of operations. Review Access Control and Intrusion Detection manufacturer's approved methods for software upgrades and hardware replacement, including failed disks in the storage array.

4. For each Training session, Document the training provided using a camera and video recorder and provide a copy of the recorded training to the College for future reference and use in training new staff.

1.6 QUALITY ASSURANCE

A. General:

1. Conform to Section 28 05 00 - Common Work Results For Electronic Safety and Security.

2. The manufacturers of all hardware and software components employed in the system shall be established vendors to the access control/security monitoring industry for no less than five (5) years.

3. The security system integrator shall have been regularly engaged in the installation and maintenance of integrated access control systems similar in size and scope to that outlined herein for a period of no less than five (5) years. The installing integrator shall be certified by the manufacturer to be able to install and configure the Enterprise version of the manufacturer's access control system.

4. The security system integrator shall supply information attesting to the fact that their firm is an authorized product dealer for the system proposed at the Project site.

5. The security system integrator shall supply information attesting to the fact that their installation and service technicians are competent factory trained personnel capable of maintaining the systems of this scale and of providing reasonable service time.

6. The security system integrator shall provide a minimum of three (3) references whose systems are of similar complexity and have been installed and maintained by the security system integrator in the last five (5) years.

7. There shall be a local representative and factory authorized local service organization that shall carry a complete stock of parts and provide maintenance

for these systems. Local shall be defined as an area in a 50 mile radius of installed location

B. Standards Agencies.

1. The ACS shall be tested and listed by Underwriters Laboratories (UL) for UL 294 for Access Control System Units.

2. Additionally, conform to the applicable portions of the following standards defined in 28 05 00 – Common Work Results for Electronic Safety and Security.

1.7 DEFINITIONS

A. ACS – Access Control System. The integrated system installed by the work of this Contract comprising the access control system, intrusion detection system and panic/duress alarms, including both central processing hardware and the remote field devices.

B. CSA – Client Software Application

C. DGP. Data Gathering Panel. Intelligent access control and alarm systems panel connected to the ACS network and to card readers, access control and intrusion detection field devices as specified elsewhere in this Section.

D. DGM – Dynamic Graphical Maps

E. ALPR – Automatic License Plate Recognition

F. SDK – Software Development Kit

G. SMA – Software Maintenance Agreement

H. SSM – Server Software Module

I. UI – User Interface

J. USP – Unified Security Platform

K. USW – Unified Web Client

L. VMS – Video Management System

1.8 DOOR SEQUENCE OF OPERATIONS.

A. The following outlines the minimum functionality that should be achieved at each opening equipped with card reader control.

B. Assumes doors are in armed condition.

1. Doors with Card Reader on One Side

a. Presentation of valid card at unsecure side:

1) Performs real-time lookup of card against current database to validate card status relative to door opening, day of week and time of day.

2) Provides positive success visual feedback - green light or similar - to card holder
3) Permits cardholder to operate door.
4) Logs entry in access database, including at minimum card number, door number and timestamp
5) Shunts alarm generation for door open status for College selected variable period (adjustable over a range of at least 10 seconds to 1 minute adjustable through ACAS software).
6) If double door opening, permits operation of second leaf during the College selected variable period without generating alarm.

b. Presentation of invalid or unreadable card at unsecure side of door:
1) performs real-time lookup of card against current database to validate card status relative to door opening, day of week and time of day.
2) provides positive failed visual feedback - red light or similar - to card holder and denies operation of door.
3) logs entry in access database, including at minimum card number (if readable), door number and timestamp

c. Approach to door opening from secure side
1) Doors equipped with Request to Exit: If occupant breaks approach beam from side farthest from door first, followed by beams closer to door, shunts generation of alarm on door operation for Construction Administrator selected variable period as for Card Readers above.
2) Doors equipped with Request to Exit equivalent in handle/crash bar: If occupant signals intent to exit from secure side by mechanically operating door hardware, shunts generation of alarm on door operation for College selected variable period as for Card Readers above.
3) Doors equipped with Release Button: On operating Release Button, shunts generation of alarm on door operation for College selected variable period as for Card Readers above.
4) If double door opening, permits operation of second leaf during the College selected variable period without generating alarm.

2. Doors with Card Readers on both sides, one side is secure, one side is unsecure.

a. Operation, General
1) Unless otherwise indicated, doors with dual card readers have an unsecure and secure side. A CR symbol appears on the unsecure side; a CRS symbol appears on the secure side. Neither magnetic locks nor delayed egress systems are to be installed. A valid card is necessary to operate the door from the unsecure side as for doors with single card readers
2) A valid card is necessary to shunt the door alarm when operating the door from the secure side. Failure to present a valid card does not prevent door from operating.

b. Presentation of valid card at unsecure side:
1) performs realtime lookup of card against current database to validate card status relative to door opening, day of week and time of day.
2) provides positive success visual feedback - green light or similar - to card holder
3) permits cardholder to operate door.

4) logs entry in access database, including at minimum card number, door number and timestamp
5) shunts alarm generation for door open status for College selected variable period (adjustable over a range of at least 10 seconds to 1 minute).
6) If double door opening, permits operation of second leaf during the College selected variable period without generating alarm.

c. Presentation of invalid or unreadable card at either side of door:
1) performs real-time lookup of card against current database to validate card status relative to door opening, day of week and time of day.
2) provides positive failed visual feedback - red light or similar - to card holder and, at unsecure side, denies operation of door
3) logs entry in access database, including at minimum card number (if readable), door number and timestamp

d. Presentation of valid card at secure side.
1) performs realtime lookup of card against current database to validate card status relative to door opening, day of week and time of day.
2) provides positive success visual feedback - green light or similar - to card holder
3) logs entry in access database, including at minimum card number, door number and timestamp
4) shunts alarm generation for door open status for College selected variable period (adjustable over a range of at least 10 seconds to 1 minute).
5) If double door opening, permits operation of second leaf during the College selected variable period without generating alarm.

3. Doors with Card Readers on both sides, both sides unsecure.

a. Operation, General
1) Where indicated by CR symbols on both sides of the door, the door opening to require a valid card to operate the door from either side.
2) Such door configurations shall not be installed where the door is part of an emergency egress path of travel.

b. Presentation of a valid card at either side:
1) performs realtime lookup of card against current database to validate card status relative to door opening, day of week and time of day.
2) provides positive success visual feedback - green light or similar - to card holder
3) permits cardholder to operate door.
4) logs entry in access database, including at minimum card number, door number and timestamp
5) shunts alarm generation for door open status for College selected variable period (adjustable over a range of at least 10 seconds to 1 minute).
6) If double door opening, permits operation of second leaf during the College selected variable period without generating alarm.

c. Presentation of invalid or unreadable card at either side of door:
1) performs real-time lookup of card against current database to validate card status relative to door opening, day of week and time of day.

2) provides positive failed visual feedback - red light or similar - to card holder and denies operation of door
3) logs entry in access database, including at minimum card number (if readable), door number and timestamp

4. Doors left open ("propped open") beyond the designated period generate an alarm at the central control panel indicating door and condition. If a local door alarm is shown in the vicinity of the door, causes the local door alarm to sound. Local alarms for door prop should provide an intermittent tone 30 seconds before going into alarm and triggering a solid tone upon alarm. Local door alarm can be cleared either from the access control system control screen or locally using designated key. Use of a key to silence the LA sounding, but shall not interrupt processing of other ACS events associated with event.

5. Doors operated while armed without presentation of a valid card, valid operation of a Request to Exit Device, operation of a release button or release by central control panel to generate an alarm at the central control panel indicating door and condition. If a local door alarm is shown in the vicinity of the door, causes the local door alarm to sound, Local door alarm can be cleared either from the access control system control screen or locally using designated key.

6. Doors provided with powered door operators to be configured to operate as follows:

a. Unsecure side
1) Depressing the door operator button without first presenting a valid card results and no action.
2) Depressing door operator button after presenting a valid card causes the DGP to signal the door operator to initiate door opening after the associated electric lock mechanism has been released.
a) In a double door, where the handle in an electric latch cannot be retracted remotely, this may include releasing an electric strike in the normally passive leaf of the opening.
b) College's Representative to provide direction as to the length of time for which the door operator button to remain operational following receipt of a valid card.

b. Secure side
1) Depressing door operator button causes the DGP to signal the door operator to initiate door opening after the associated electric lock mechanism has been released.
a) In a double door, where the handle in an electric latch cannot be retracted remotely, this may include releasing an electric strike in the normally passive leaf of the opening.

C. Gate Operation

1. Presentation of valid card or vehicle emitter at unsecure side:

a. performs real-time lookup of card against current database to validate card status relative to gate, day of week and time of day.

b. provides positive success visual feedback - green light or similar - to card holder.

c. signals gate controller to operate gate.

d. logs entry in access database, including at minimum card number, door number and timestamp

e. shunts alarm generation for gate open status for College's Representative selected variable period (adjustable over a range of at least 30 seconds to 2 minutes).

2. Presentation of invalid or unreadable card at unsecure side of gate:

a. performs real-time lookup of card against current database to validate card status relative to gate, day of week and time of day.

b. provides positive failed visual feedback - red light or similar - to card holder and denies operation of gate logs entry in access database, including at minimum card number (if readable), door number and timestamp

3. Approach to gate from secure side

a. detector loop or similar device detects presence of vehicle at exit point.

b. receives signal from gate operator on action to operate Gate.

c. shunts alarm generation for gate open status for College's Representative selected variable period (adjustable over a range of at least 30 seconds to 2 minutes).

4. Detects forced operation of gate/operation of gate without use of valid card, remote release by Controller or in response to inductive loop detector or its functional equivalent.

a. generates an alarm at the central control panel indicating gate location and condition

D. Tamper Monitoring

1. Tampering with the DGP (removing its cover panel) or of other monitored electronic security system pullbox covers to be reported to the central ACS monitoring station. Restoral events (replacement of cover) to similarly be reported to the central ACS monitoring station.

1.9 COORDINATION

A. Coordinate the work of this contract with the related work of at least the following parties:

1. College’s Physical Security Staff

2. College’s IT staff and the IT Integrators working for the College

PART 2 - PRODUCTS

2.1 ELECTRONIC ACCESS CONTROL SYSTEM

A. Authorized Manufacturer(s): Schlage (District Standard, No Substitution Allowed)

1. Software: Pure Access ™ Cloud

2. Hardware:

a. IP Reader Controller

b. IP Bridge

B. Description:

1. Provide a complete and operational access control system (ACS) as indicated in the drawings and plans, including but not limited to an ACS Cloud Service Host, IP based Reader-Controllers and/or IP-Bridges connected by a high-speed electronic data transmission network.

   a. The Cloud Service shall be host on Amazon Web Services and provide for a minimum of 99.95% uptime. The Manufacturer shall closely monitor all conditions related to the Cloud Service infrastructure.

   b. The network connecting the ACS Cloud Service Host, IP Bridge and IP based Reader-Controllers shall be a Local Area Network (LAN) or Wide Area Network (WAN) utilizing TCP/IP communications protocol.

   c. Functions- The systems primary functions shall include
      1) Regulating access through doors, gates, turnstiles, and other entrance portals
      2) Credential cards and readers
      3) Credential creation and credential holder database and management
      4) Monitoring of field-installed devices
      5) Reporting

   d. Third Party Devices- In addition to supporting the Manufacturer's own multi-card readers, the system shall support the following types of readers by utilization of an IP Bridge:
      1) Wiegand output devices including but not limited to:
         a) Biometric devices
         b) Long Range Readers such as Tagmaster
         c) Barcode scanners

2. System Software:

   a. The ACS Host application software shall provide the interface between the Client, IP-Bridges, IP based Reader-Controllers, report alarms, generate reports and provide all other system functions.

   b. The system shall provide a web based User Interface using standard browsers such as Chrome, Firefox and Microsoft Edge. Mobile devices such as tablets and smart phones will be able to log in via the same such browsers and have a User Interface optimized for mobile experience.

   c. The system software license shall be licensed as follows:
      1) ACS Cloud Service:
         a) License shall be provided for the desired number of access points and users.
         b) b. Shall be an annual fee paid to maintain the Cloud Service and provide regular updates.

   d. System Functions - The access control system software functions shall include the following:
      1) User/Credential Management

a) Number of users and credentials dependent upon license limitations.
b) User group functionality
c) Users configuration shall have the following attributes:

(1) First name, mddle initial, and last name.
(2) User Image
(3) Alert email address for the User to receive Alert emails
(4) Ten (10) customizable User Defined Fields
(5) Web Access with customizable User Roles to define what the User can view and edit in the Client. Passwords for Web Access shall be forced to use strong passwords.
(6) Can reside in an unlimited number of User Groups.
(7) Can be associated with Custom Rules

2) When deactivating a User, the system shall deactivate all associated credentials with that User. Any credential can be deactivated without deactivating the associated User.
3) Microsoft Point Programming and Management
   a) System shall allow for the integration to Microsoft Active Directory unless it is utilizing a Cloud Service license of under fifty (50) Access points. This Integration will synchronize Users from Active Directory to the ACS Host. The ACS Host will poll the Active Directory server regularly for changes and synchronize those changes to its database.
4) Access Point Programming and Management:
   a) Provide an easy to use wizard to add Access points to the software
   b) Wizard shall include a full test of all Access Point components
   c) Configurable door latch interval
   d) Input enable/disable and configuration
   e) Number of Access Point Groups - Unlimited
5) Weekly Schedules:
   a) Number of Weekly Schedules - Unlimited
   b) Interval assignments - Any day of the week
6) Weekly Rules configurable based on type of device being used
7) Alarm and Event Logging - provide for logging of all system alarms and events chronologically including time and date stamp. Specific alarm conditions monitored shall be included but not limited to:
   a) Door Unauthorized Open Alarm
   b) Door Extended Open Alarm
   c) Reader-Controller Tamper Alarm
   d) Device Offline Alert
8) System Scheduling - provide for scheduling of events including:
   a) Access Point or Access Point Group unlock for specified Schedule.
   b) Access Point or Access Point Group unlock with specified Badge(s), Access Point(s) shall remain locked until an authorized Credential is read.
9) System Dashboards- Monitoring Attributes
   a) Shall provide customizable Dashboards for Monitoring of the ACS. These Dashboards shall be fully customizable, able to filter on all

events, able to filter on all devices where applicable and include the following:

(1) Ability to display non-wireless single Access Point status with the following:

(2) Live update of door status including physical door status and all event history on devices connected in real-time.

C. IP Reader Controller

1. Features/Functions

a. The Schlage RC contains 125 kHz proximity, 13.56 MHz smart and 2.4 GHz Bluetooth circuitry enabling the ability to process multiple formats simultaneously.

b. Real time connectivity; local mode feature allows readers to function without a connection to the network results in faster user response times, less network traffic and reduced host system loading.

c. Tamper detection via accelerometer senses any type of altering and prevents a security breach with the reader.

d. Communication is secured using industry standard TLS 1.2 encryption

e. Commission via ENGAGE™ mobile app for easy configuration

f. Three configurable inputs; Door Position (DPS), Request to Exit (REX),

g. and Auxiliary (AUX)

h. Mullion, wall mount and wall mount with keypad form factors

i. Reader controllers support 125 kHZ proximity, 13.56 MHz smart technology, 2.4 GHz Bluetooth and Near Field Communication (NFC)

j. Credential parity standard with Schlage MTB mobile enabled multi-technology readers and Schlage mobile enabled wireless locks; ISONAS credential parity is a factory orderable option

k. Accommodates interior, exterior, metal and non-metal installation environments

2. Operations/Performance

a. Reader type IP reader controller

b. Mounting style Mullion and Single gang

c. Standards ISO 14443A, ISO 15693

d. Certifications
1) FCC Certification
2) IC Certification
3) UL294 V7 / cUL Listed
4) RED Directive
5) CE Mark
6) IP65
7) REACH
8) Bluetooth SIG
9) RoHS 3

e. Frequency
   1) 2.4 GHz
   2) 13.56 MHz
   3) 125 kHz

f. Intelligence capacity
   1) 64,000 credentials
   2) 5,000 events
   3) 32 time schedules
   4) 32 holidays

g. Network communications
   1) 10/100Mb, half or full duplex
   2) Ethernet, WebSockets, standard Cat5E or better cable
   3) Network host or client modes - DHCP addressing

h. Visual communications LED (red, amber, green)

i. Audible communications Audible indicator (on / off)

j. Software compatibility
   1) Works with open PACS systems including ISONAS Pure AccessTM Cloud.

k. FIPS 201 compliant No

l. Technology supported
   1) CSN1, Proximity,
   2) Smart,
   3) Mobile (NFC and Bluetooth)

3. Manufacturer

   a. Isonas/Schlage
      1) RC11 Mullion Mount
      2) RC15 Single Gang

2.2 ACS SERVER HARDWARE

A. Server Hardware

1. Spec References:

   a. Access Control Server

2. Minimum Features/Functions/Performance

   a. The ACS Server to be compatible and approved for use with and supplied with one of the ACS Manufacturers' Operating Systems supported by the ACS Manufacturer when used as a server device, and with memory, processor and disk space scaled according to the system application requirements of this Project

   b. The server shall be a rack mount standard manufactured product of a computer manufacturer regularly engaged in the production of business class servers and shall carry the manufacturer's standard product warranty, assigned to the College.

c. Server shall meet or exceed the ACS manufacturer's minimum performance and functional requirements for a ACS server at the time of beneficial occupancy.

d. Provide complete system including server, rack monitor, rack mount keyboard and mouse, or provide KVM and share peripherals with other similar rack mount devices installed under the work this Project.

3. Manufacturers:

a. Server
   1) Dell
   2) HP
   3) Intel
   4) or equal.

b. Manufacturer, Monitor:
   1) Samsung series
   2) Sharp
   3) or equal.

c. Rack Mount Monitor Enclosure
   1) Middle Atlantic RSH4A with backclamp.
   2) Raxxess.
   3) Custom by Contractor.
   4) or equal.

d. Combination Monitor with Integral Rackmount, subject to the video response rate requirements defined above.
   1) Tripplite
   2) Marshall Electronics
   3) Pelco
   4) ToteVision
   5) or equal.

2.3 ACCESS CONTROL SENSORS & FIELD DEVICES

A. General

1. Field devices to be selected to match condition of opening and/or space to be protected. The following specifications are minimum standards; Contractor to consult with listed manufacturers and select appropriate device and mounting means for unusual construction conditions.

B. Door Tamper Alarm Switch

1. Drawing Reference: DS

2. Construction and Features

a. UL Listed

b. Hermetically sealed magnetic reed switch. Dual biased high security switch assembly deters tampering. Reed shall be potted in the contact housing with a polyurethane based compound.

c. Magnet shall be made of Alnico V.

d. Steel Door Switches
   1) Contact and magnet housing shall snap-lock into a 1" dia. hole. Snap-lock insulation bushing for tight fit and maximum gap in steel.
   2) Housings shall be molded of flame retardant ABS plastic. Both contact and magnet plastic housings are constructed of one piece of thick-walled ABS plastic for maximum strength.
   3) Color of housings shall be off-white, grey or mahogany brown. Color to be selected by College's Representative.
   4) Designed for Use in Steel Doors
   5) Operates in steel door and frame at gap up to:
      a) 1" min., Steel Doors
      b) 2" Min, Wood Doors
   6) Under Door Threshold switches. At all glass door assemblies with base lock plate, mount DS under door threshold. Provide necessary blocking and shimming and/or secondary magnets at recessed doors to bring magnet within specified gap.

3. Manufacturer:
   a. Steel Doors, 1"
      1) Sentrol 1076W.
   b. Under threshold:
      1) Sentrol 1921 magnet and 1055 or 1075W Switch
      2) Or approved equal by Ademco.

C. Door Switch, RollUp Doors and Coiling Grills

1. Drawing Reference: DU
2. Function/Features:
   a. Protects openings where door or gate travels in vertical plane.
   b. Place door switches on slab at side of track or at top of frame at each end of rollup door or grill.
   c. Fasten magnet to traveling door.
   d. Switch connects to structure with armored cable connection.
3. Manufacturer:
   a. Sentrol 1982 Magnet and 2202A or 2205 switch with Manufacturer's Supplemental Mounting Brackets and Spacers as required. At panel/sectional doors Sentrol 2300 series.
   b. Ademco
   c. or equal.

D. Gate Switch

1. Drawing Reference: GS
2. Function/Features:
   a. Monitors status of gate protected openings.
   b. Fasten magnet to traveling/moving gate with tamperproof fasteners.

c. Switch connects to conduit and backbox infrastructure with armored cable connection.

3. Manufacturer:

a. Sentrol 1982 Magnet and 2202A or 2205 switch with Manufacturer's Supplemental Mounting Brackets and Spacers as required. At panel/sectional gates, provide Sentrol 2300 series.

b. Ademco

c. or equal.

E. Hatch Switch

1. Drawing Reference: HS

2. Monitors state of roof hatches

3. Fasten magnet to hatch door.

4. Switch connects to structure at hatch opening with armored cable connection to serving junction box

5. Manufacturer:

a. Sentrol 2500 series

b. Ademco.

c. or equal.

F. Local Door Alarm, Interior

1. Drawing Reference: LA

2. Functions/Features:

a. Provide door management alarms for local and remote monitoring and annunciation of the status of the doors (door prop/door held, door intrusion/door forced or secure)

b. The LA shall be capable of operating in a stand-alone configuration or with access control systems.

c. Local sounder (field selectable 96 or 103 dBA @ 3 feet) shall be used to indicate both door prop/door held and intrusion/door forced conditions after a user selectable quiet, or access, time (0 seconds - 90 minutes) has expired. Sounder shall be incorporated into the faceplate of the LA.

d. Form C (N/O or N/C) contacts shall be available for the following outputs:
1) Door Contact Status.
2) Door Prop Alarm.
3) Intrusion & Tamper Alarm.
4) Bypass/ Key Switch Status.
5) Dry Contact Remote Alarm Reset.

e. The alarm (intrusion) contact shall change state upon the recognition of an alarm or tamper condition to alert remote monitoring equipment.

f. The unit shall remain in alarm until reset by integral key switch, remotely through a dry contact or automatically through an onboard timer (settable from 0 seconds to 5 minutes or manual).

g. An integral key switch shall be available for alarm shunt or alarm reset and be incorporated into the faceplate of the LA.

h. A Bi-Color status L.E.D. shall be incorporated into the faceplate of the LA. A remote L.E.D. output shall be provided to control a Bi-Color L.E.D. that follows the actions of the faceplate mounted L.E.D.

i. Inputs shall include a N/C Dry Contact for the door, Voltage Sense (12-24 VAC/DC) to monitor electric lock voltages and a N/O or N/C passive Shunt Input.

j. The following timers shall be user settable:
   1) Auto-reset,
   2) Alarm delay
   3) Silent time
   4) Shunt Delay.

k. The LA shall be mounted in the wall adjacent to the monitored door at PSSH.

3. Manufacturers:

   a. Designed Security, Inc. Model ES4200-K4-T1 w/ Rim Cylinder Keylock K option and a tamper circuit.
      1) As exterior locations, provide with manufacturer's -007 component weatherization option.

G. Request to Exit

1. Drawing Reference: REX

2. Function:

   a. Closure disarms security when approaching door from inside. Omit where base building door hardware incorporates a release button.

   b. Passive infrared technology.

   c. Dual "C" shaped patterns adjustable to limit protection area to areas immediately in front of and to each side of means of approach to protected doors from interior.
      1) ± 14° vertically adjustable pattern.
      2) Dual C shaped patterns require activation from outside ring (lobby interior) prior to activation from inner ring (adjacent door) to prevent operation of door by sliding object under door from outside of building.

3. Select device and pattern based on mounting height and architectural geometry around door.

4. Finish to be selected by College's Representative.

5. Manufacturer:

   a. Detection Systems DS-150i

   b. or equal.

H. Tamper Alarm Switch

1. Select to suit application.
2. Manufacturer:
   a. Sentrol.
   b. Ademco.
   c. Or equal.

2.4 IP NETWORK COMPATIBLE VIDEO INTERCOM SYSTEM

A. Entry Video Intercom

1. Drawing Reference: VI, VM
2. Features/Operation
   a. Power Source: Power over Ethernet (802.3af).
   b. Network Interface: 10 BASE-T / 100 BASE-TX Ethernet (RJ-45).
   c. Network Protocols: IPv4, IPv6, TCP, UDP, SIP, HTTP, HTTPS, MJPEG, RTSP, RTP, RTCP, IGMP, MLD, SMTP, DHCP, NTP, DNS.
   d. Bandwidth Usage:
      1) G.711: 64Kbps x 2 per video call.
      2) 64Kbps per monitor.
      3) H.264: 24Kbps ~ 2,048Kbps.
   e. Communication: Hands-free (VOX), push-to-talk (simplex), or handset (full-duplex).
   f. Door Release: Programmable Form C dry contact, 24V AC/ DC, 500mA - use EL-12S (use RY-24L for larger contact rating, which requires 24V DC power supply) or use RY-IP44 with 4 multipurpose relays.
   g. Wire Type: CAT-5e or CAT-6.
   h. Distance:
      1) Door Station to Network Node: 330 feet (100 meters).
      2) Master Station to Network Node: 330 feet (100 meters).
   i. IP Addressable Video Master Station Model IX-MV:
      1) 3.5” LCD color monitor
      2) Handset for privacy or hands-free VOX / PTT communication
      3) Door release button
      4) 6 programmable speed dial buttons for calling stations or accessing paging zones
      5) Wall or desk mount
      6) Connects using CAT-5e/6 cable
      7) 802.3af PoE compliant
      8) IP Addressable Video Door Station Model IX-DV:
      9) SIP 2.0 compliant
      10) 1.23 megapixel fixed color video camera
      11) White LED for low light illumination
      12) ONVIF Profile S compliant
      13) Camera vertical adjustment +15º, 0º, or -8º (manual)

14) Slot for microSD card (not provided by Aiphone)
15) Weather and vandal resistant
16) 2 contact outputs
17) 6 trigger inputs
18) Anodized aluminum
19) 802.3af PoE compliant
20) RJ45 in/out with PoE pass through (802.3at Type 2 PoE+)

j. Manufacturer:
1) VM: Aiphone
a) Wall Mount: Model IX-MV7-W.
b) Desk Mount: IX-MV
2) VI: Aiphone Model IX-DV.

2.5 ACCESS CONTROL WIRING

A. As specified in Section 28 05 13 – Conductors and Cables for Electronic Safety and Security.

PART 3 - EXECUTION

3.1 GENERAL

A. The Contractor shall install all system components, including College furnished equipment, and appurtenances in accordance with the manufacturer's instructions, IEEE C2 and as shown and necessary to provide a fully functional system. The contractor shall furnish necessary interconnections, services, and adjustments required for a complete and operable system as specified and shown. Control signal, communications, and data transmission line grounding shall be installed as necessary to preclude ground loops, noise, and surges from adversely affecting system operation.

B. Provide mounting hardware as necessary to securely fasten ACS hardware to the supporting structure or racks.

C. Device Wiring and Communication Circuit Surge Protection

1. All inputs shall be protected against surges induced on device wiring. Outputs shall be protected against surges induced on control and device wiring installed outdoors and as shown. All communications equipment shall be protected against surges induced on any communications circuit. All cables and conductors, except fiber optics, which serve as communications circuits from security console to field equipment, and between field equipment, shall have surge protection circuits installed at each end.

D. Installation

1. The contractor shall install the system in accordance with the standards for safety, NFPA 70, UL 681, UL 1037 and UL 1076, and the appropriate installation manual for each equipment type. Components within the system shall be configured with appropriate service points to pinpoint system trouble in less than 20 minutes.

2. Flexible cords or cord connections shall not be used to supply power to any components of the system, except where specifically noted. All other electrical work shall be as specified in Division 26 and as shown.

3. All circuit boards are to be mounted on "Stand-Offs". Circuit boards may not be affixed with double sided tape.

4. No components of the security system are to be mounted on the interior door of the DGP enclosure. Where additional space is required, Contractor to place a supplemental NEMA enclosure adjacent to the DGP sized as required to accommodate the additional components.

5. Perimeter Wireway: Refer to the requirements of Section 28 05 28 - Pathway for Electronic safety and Security regarding the requirement to wrap the backboard at electronic security system installation locations with steel wireway/gutter and terminal cabinets as necessary to fully enclose wiring and components associated with electronic security systems installation.

6. Enclosure Penetrations

7. Enclosure penetrations shall be from the bottom unless the system design requires penetrations from other directions. Penetrations of interior enclosures involving transitions of conduit from interior to exterior, and penetrations on exterior enclosures shall be sealed with rubber silicone sealant to preclude the entry of water. The conduit riser shall terminate in a hot-dipped galvanized metal cable terminator. The terminator shall be filled with an approved sealant as recommended by the cable manufacturer, and in a manner that does not damage the cable. Locate penetrations to enclosures to ensure they will not interfere with components inside enclosure such as batteries, circuit boards, locking mechanisms etc.

8. Cold Galvanizing

9. Field welds and/or brazing on factory galvanized boxes, enclosures, conduits, etc., shall be coated with a cold galvanized paint containing at least 95 percent zinc by weight.

E. Card Readers

1. Contractor to coordinate detail construction work in vicinity of card readers with work of other trades to ensure that specified read range of card readers is not compromised by the presence of large metal objects in the immediate vicinity of reader

2. Securely fasten card reader to structure to prevent its movement during repeated usage.

3. Unless otherwise indicated, card readers to be mounted to the nearest side of the door housing the door handle.

4. Unless otherwise indicated, card readers should be mounted to flush mount backboxes. Mounting card readers on surface mounted boxes is unacceptable except where such installations are specifically called for in the plans.

5. Contractor to further ensure that power supplies used with the readers meet or exceed card reader manufacturer minimum requirements for current and voltage stability.

6. Exterior card reader installations must be equipped with the appropriate weather protection.

3.2 PROGRAMMING

A. Initial Systems Programming

1. Contractor to meet with College's Representative to confirm functional requirements for surveillance systems defined in Part 1 of this Section, including but not limited to the following:

a. Access Classification Tiers. Establish Tiers and Classes of Doors and the levels of protection to required at each including:
1) Monitoring to be provided at each Alarm point.
2) Always on (24 hour response).
3) On when the system is Master Armed.
4) Only on when the system is Perimeter Armed.
5) Displays / Does Not Display at the Access Control Panel when the point is activated.
6) Provides / Does Not Provide entry warning tone.
7) Sounds / Does Not Sound audible alarm indication.
8) Point is bypassable / not bypassable.
9) Alarm Verification with programmable verification time.
10) Summary Relay activation by Point.
11) Provides / Does Not Provide "watch point" capability.
12) Review with the College the means to be used to transition from one condition to another.
a) Example. During Pre-Game conditions, Audience entry doors are secured and alarmed. Operation from the interior or force entry from exterior to generator alarm. At the transition from Pre-Game to Game condition, Audience entry doors are released for free operation and alarming is suppressed until transition to Post Game.
13) Threat Level
a) Programming should incorporate altered conditions of operations at each opening for each Event Condition based on Threat Level established and selected by Command Center operators.

b. Calendar. System Operations as a function of day-of-the-week and hour-of-the-day and differential access permitted based on these changes, particularly for No Scheduled Event Condition.
1) Access limitations and device functions that are dependent on the time or access or the event.

c. Alarm System response to events
1) Normal access (validated).
2) System fault
3) Unauthorized access
4) Unauthorized access detected by multiple monitoring points.

d. Pass codes according to the authorities and functions defined by the College's Representative.

e. In addition to standard door operation arming and alarming as described in Part 1 of this Specification Section, initial system programming to include the following features and functions:
   1) Arming Zones – at least the following:
      a) Classrooms
      b) Training Offices
      c) OEM Offices
      d) EOC

f. Document the Initial Programming Requirements and Submit in accordance with Section 28 05 00 - Common Work Results For Electronic Safety and Security.

2. At minimum, include allowance of post-opening programming time in the following quantities.

   a. In addition to providing the programming necessary to meet the functional requirements defined in Part 1 of this Section, Contractor to provide systems customization programming time as defined below in the following quantities:
      1) 100 hours.

   b. Programming time is time spent by a trained systems programming developing the specific sequence of alarm events and response for this Project.

   c. Programming time does not include installation of or correcting deficient installation of system components, coordination with the contractors, training the programmer in the programming of the system software or meeting with the the College's Representative(s) to establish the functional requirements of the security system.

   d. Programming time not used in initial systems configuration shall be available to the College for supplemental post-opening programming. Contractor to provide such post opening programming in a minimum of 4 hour blocks.

   e. Contractor to provide College's Representative with daily timesheets of programming time spent in support of this Project on request"

   f. Implement System Programming as defined above.

3.3 WIRING PRACTICE

A. Comply with requirements of Sections 27 11 16 - Communications Cabinets, Racks, Frames and Enclosures and Section 28 05 13 – Conductors and Cables for Electronic Safety and Security

B. At electric strikes and electric locks and all other monitored lines requiring same, provide end-of-line resistors, diodes or MOV’s where device does not already include such components. Document where such devices have been added.

3.4 INTRUSION DETECTION FIELD DEVICE INSTALLATION

A. Motion Detectors

1. Orient device and place manufacturers device masking to eliminate potential sources of false motion or IR alarms including motion and/or vehicle headlights through windows, sunlight and sun reflections, HVAC diffusers, and heating/cooling appliances. Test and adjust as required over at least 2 weeks of operation following the latest of the following:

   a. occupancy by the College,

   b. commissioning of building systems,

   c. removal of construction barriers and/or

   d. installation of permanent window coverings.

B. Glass Break Detectors

1. Orient to maximize system sensitivity to glass breakage along indicated area for protection. Select variable spectral sensitivity of device to match construction of glass installed in area of protection. Adjust as necessary to eliminate false alarms.

C. Duress Alarms

1. General: Conform with UL 636.

2. Casework and Furniture Duress Alarms:

   a. Provide at points within the protected area as indicated.

   b. Alarms shall be capable of being secretly activated by the foot or hand of an average adult in both standing and seated positions.

   c. Alarms shall not be visible or audible from the sensor.

   d. Mock up proposed mounting location with for review by the College's Representative. Following acceptance by College's Representative, fasten securely in place with a mechanical, not adhesive, means.

   e. Protect and secure signal cable where it extends under surface of desktop using surface raceway mechanically fastened to underside of desk. Where the cable extends through furniture accessible to end users or the action of drawers or doors, protect with split loom tubing fastened mechanically to the surface of the furniture. Adhesive fastening in lieu of mechanical fastening will not be accepted.

   f. Route cable to grommeted cover plate at nearest accessible wall providing transition of cabling to concealed in-wall/raceway wire pathway.

D. Tamper Switches

1. Enclosures, cabinets, housings, boxes, raceways, and fittings with hinged doors or removable covers which contain circuits of the intrusion detection system and associated power supplies shall be provided with cover having corrosion-resistant tamper switches. Arrange tamper switches to initiate an alarm signal when the door or cover is moved as little as 6 mm 1/4 inch from the normally closed

position. Mechanically mount tamper switches to maximize defeat time when enclosure covers are opened or removed. Minimum amount of time required to depress or defeat the tamper switch after opening or removing the cover shall be one second. Enclosure and tamper switch shall prevent direct line of sight to internal components and prevent switch or circuit tampering. Conceal mounting hardware so switch cannot be observed from enclosure exterior. Covers of junction boxes provided to facilitate initial installation of the system need not be provided with tamper switches if covers contain no splices or connections. Tamper switches on doors which must be opened to make normal maintenance adjustments to the system and to service power supplies shall be the push/pull-set, automatic-reset type.

2. Tamper switches shall be:

   a. Inaccessible until switch is activated;

   b. Under electrical supervision at all times, irrespective of the protection mode in which the circuit is operating;

   c. Spring-loaded and held in the closed position by the door, or cover protected;

   d. Wired to break the circuit when the door or cover is disturbed;

3.5 SYSTEM STARTUP

A. Satisfaction of the requirements below does not relieve the Contractor of responsibility for incorrect installations, defective equipment items, or collateral damage as a result of Contractor work/equipment. The Contractor shall not apply power to the system until after:

1. System equipment items have been set up in accordance with manufacturer's instructions.

2. A visual inspection of the system has been conducted to ensure that defective equipment items have not been installed and that there are no loose connections.

3. System wiring has been tested and verified as correctly connected.

4. System grounding and transient protection systems have been verified as properly installed.

5. Power supplies to be connected to the system have been verified as the correct voltage, phasing, and frequency.

3.6 SYSTEMS PERFORMANCE DEMONSTRATION AND ADJUSTING PROCEDURES

A. Demonstrate functionality of each installed device. Refer to the requirements of Section 28 05 00 - Common Work Results for Electronic Safety and Security.

3.7 LABELING

A. Conform with the requirements of Section 27 05 53 – Identification for Communications Systems.

3.8 WARRANTY

A. Warranty

1. The ACS shall be warranted by the contractor for one (1) year from the date of Substantial Completion.

B. Maintenance and Service

1. The contractor shall provide all services required and equipment necessary to maintain the entire ACS in an operational state as specified for a period of one (1) year after formal written acceptance of the system, and shall provide all necessary material required for performing scheduled adjustments or other nonscheduled work.

C. Description of Work

1. The adjustment and repair of ACS includes computer equipment, contractor provided programming, software updates, signal transmission equipment, access control equipment, facility interfaces, and support equipment. Provide the manufacturers required adjustments, re-programming of deficient contractor programmed functions and other work as necessary.

D. Personnel

1. Service personnel shall be qualified to accomplish all work promptly and satisfactorily. Provide proof that Service personnel have successfully completed the enterprise level of both hardware and software training offered by the system manufacturer. The College's Representative shall be advised in writing of the name of the designated service representative and of any change in personnel.

E. Inspections

1. The contractor shall perform two inspections at six (6) month intervals or more often if required by the manufacturers. This work shall be performed during regular working hours, Monday through Friday, excluding Federal holidays. These inspections shall include:

2. Visual checks and operational tests of the central processor, local processors, monitors, keyboards, system printers, peripheral equipment, ACS equipment, power supplies, and electrical and mechanical controls.

3. Clean system equipment, including interior and exterior surfaces.

4. Perform diagnostics on all equipment.

5. Check and calibrate each ACS device.

6. Run system software and correct diagnosed problems.

7. Resolve previous outstanding problems.

F. Warranty Service

1. The College’s Representative shall initiate service calls when the ACS is not functioning properly. Qualified personnel shall be available to provide service to the complete ACS.

2. The College's Representative shall be furnished with the telephone number where the contractor's service supervisor can be reached at all times.
3. Service personnel shall be at the site within four (4) hours after receiving a request for service.
4. The ACS shall be restored to proper operating condition after one (1) calendar day.
5. Materials installed during warranty service to match or exceed specification of products originally installed for the specified function.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

A. SCOPE

1. Section includes (but is not necessarily limited to) provision of field devices for intrusion detection system, including but not limited to:
   a. Intrusion Detection. Installs field devices.
      1) Includes
         a) Door position switches
         b) Motion Detector

1.2 RELATED WORK IN OTHER SECTIONS

B. Section 27 05 33 - Conduits and Backboxes for Communications Systems

1. Rough-in for devices installed by the work of this Section.

PART 2 - PRODUCTS

2.1 GENERAL

A. Include full range of interior point protection sensors, volumetric (space) protection sensors, exterior fence sensors, and duress alarms. Select device to suit project conditions per manufacturers recommendations.

2.2 ALARM SENSORS & FIELD DEVICES

A. Door Position Switch

1. Drawing Reference: DS

2. Construction and Features
   a. UL Listed
   b. Double Pole, Double Throw (DPDT) electrical configuration.
   c. Hermetically sealed magnetic reed switch. Dual biased high security switch assembly deters tampering. Reed shall be potted in the contact housing with a polyurethane based compound.
   d. Magnet shall be made of Alnico V.
   e. Steel Door Switches
      1) Contact and magnet housing shall snap-lock into a 3/4" or 1" dia. hole. Snap-lock insulation bushing for tight fit and maximum gap in steel.
      2) Housings shall be molded of flame retardant ABS plastic. Both contact and magnet plastic housings are constructed of one piece of thick-walled ABS plastic for maximum strength.
      3) Color of housings shall be off-white, grey or mahogany brown. Color to be selected by Architect.
      4) Designed for Use in Steel Doors

5) Operates in steel door and frame at gap up to:
   a) 3/8" min. - 3/4" Doors
   b) ½" min. - 1" Doors
6) Under Door Threshold switches. At all glass door assemblies with base lock plate, mount DS under door threshold. Provide necessary blocking and shimming and/or secondary magnets at recessed doors to bring magnet within specified gap.

f. Leads:
   1) Black: Common
   2) White: Closed Loop
   3) Red: Open Loop

3. Manufacturer:
   a. Steel Doors, 3/4"
      1) GE/Sentrol 1076D switch with 1921C magnet.
      2) Or equal by Ademco.
   b. Steel Doors, 1"
      1) Sentrol 1076D switch with 1921C magnet.
      2) Or equal by Ademco.
   c. Under threshold:
      1) Sentrol 1921 magnet and 1055 or 1075WSwitch
      2) Or equal by Ademco.

B. Motion Detector

1. Drawing Reference(s): MD, MDC

2. Functions/Features/Construction:
   a. Dual detection device detects change in background heat levels associated with passage of an intruder through passive infrared technology (PIR) and microwave reflection. Both detectors need to activate to signal an alarm conditions.
   b. Immune to rodent motion.
   c. Pulse Count: Installer-selectable, 1- or 2-event
   d. Detectable Walk Rate: 2-4 steps within field-of-view
   e. Indicators: Red LED with enable/disable feature
   f. Alarm Relay: Form C
   g. Operating Temp: At least 32º to 120ºF
   h. Operating Humidity: At least up to 95% RH (max.), non-condensing
   i. Dimensions: Not larger than 5"x5"
   j. K-Band Microwave
   k. Where exterior device installation shown, devices to suitable for outdoor use under Project conditions
   l. Corridor and Aisles Conditions, MDC
      1) Select device and configure device lens(es) and masks to monitor area nominally 20 degrees wide from point that device is installed to architectural barrier opposite or cross-aisle opposite of the device, unless otherwise indicated.
   m. Ceiling Mount Applications

1) Ceiling Mount Design. 360° field-of-view, mounting height from 8' to 16', install as recessed mount, unless otherwise noted.

n. Coverage - At least 25' diameter
o. Listings/Approvals
1) UL Listed
2) FCC Certified

3. Manufacturers - coordinate selected device with ceiling height and manufacturers instructions:
a. MD, Ceiling Interior
1) Ademco DT 7360
2) Rokonet Lunar DT
3) Bosch
4) Sentrol
5) or equal
b. MDC, select and submit for each condition.
1) Rokonet iWISE DT with ACT
2) Ademco
3) Bosch
4) Sentrol
5) or equal
c. MD, Exterior Conditions
1) Rokonet iWiseDT QUAD with ACT and optional ceiling swivel
2) Ademco
3) Bosch
4) or equal

C. Glassbreak Detectors, Recessed

1. Manufacturer:
a. Rokonet Vitron Plus.
b. GE Sentrol
c. Bosch
d. Ademco
e. Or approved equal

D. Glassbreak Detectors, Surface

1. Manufacturer:
a. Rokonet Vitron Plus.
b. GE Sentrol
c. Bosch
d. Ademco
e. Or approved equal

2. Intrusion Alarm Sounder
a. Drawing Reference: IAS
b. Function:
1) Low profile, electronic piezo, compact multi-tone sounder

2) Selectable 32 different tones
3) White ABS housing
4) Operates on 9–28VDC
5) Produces 82-100 dBa @ 10' (92-110 dBa @ 1m) with 20 dBa of adjustment
6) IP54 enclosure (IP65 with optional deep base)
7) Panel or wall mount

c. Manufacturer:
1) Federal Signal LP4-09-028
2) Or equal

2.3 Power Supplies

A. Power Supply, Backboard Mounted

1. Drawing Reference(s): POWER SUPPLY

2. Backboard mounted equipment

3. Function:
a. Power supply with backup battery
b. Class 1 (115VAC Input)
c. Individually fused, Power Limited, Class 2 outputs - sized to meet worst case load and runtime while maintaining system operations.
d. Unless otherwise indicated support operations of field devices and doors for at least 10 minutes following loss of power.
e. Provide timer modules as required to supplement ACAS operations.
f. Battery is lead acid type of common commercial manufacture.
g. UL Listings: UL 294, UL603, UL 1069, UL1481 for application
h. Power supply and battery fully enclosed in steel NEMA enclosure with cam lock cover and conduit knockouts.
i. Thermal and short circuit protection with auto reset.

4. Manufacturers:
a. Altronix
b. Dynalock
c. Locknetics
d. RCI
e. Securitron
f. Security Door Controls
g. or equal

2.4 INTRUSION DETECTION SYSTEM

A. Intrusion Detection Panel/ Digital Alarm Communicator and Access Control System (DACS)

1. Drawing Reference: Intrusion Detection Panel, Burglar Panel

2. Features/Functions/Construction

a. 246 hardwired, addressable or wireless points with flexible configuration options.
b. Conettix IP-based communication options provide high-speed, secure alarm transport and control through connection of wired and/or cellular network interfaces.
c. Up to 32 programmable areas, each supporting perimeter and interior points with touch screen, ATM style, or LED keypads.
d. Compatibility with touch-screen color LCD, vacuum fluorescent, ATM style LCD or LED style Alarm Command Centers
e. Program all system functions local or remote using Remote Programming Software (RPS) or by using basic programming through the keypad.
f. Integrated real time clock, calendar, test timer and programmable scheduling capability for relay control and automatic execution of system functions based on a time / event.
g. Provide 1.4 amps of auxiliary power and 2 amps of alarm power, both rated at 12 VDC.
h. Supervision of up to 16 keypads (up to 32 unsupervised keypads can be used).
i. The system supports up to 1000 users, each can have a passcode, an access token and a wireless keyfob. User passcodes contain three to six digits. Passcodes can be assigned to one of 14 customized authority levels in each area, and can be restricted to operate only during certain times.

3. Manufacturer:
   a. Bosch Security Systems, Inc. D9412GV4 Control Panel with the following:
      1) D1255 Alpha Keypad. Provide quantity of Keypads shown on plans.
      2) D8103 Universal Enclosure
      3) Conettix B426 Ethernet Communication Module
      4) B208 Octo-input Module
      5) B308 Octo-output Module
      6) B520 Auxiliary Power Supply Module
      7) D8129 Octo-relay Module
      8) D9127 Series POPIT Modules
      9) D8125 POPEX Point Expander
      10) D8128D OctoPOPIT Eight-point Expander

PART 3 - EXECUTION

3.1 Manufacturer Instructions

A. Conform to manufacturer instructions and the requirements of this specification section, whichever is more restrictive.

B. Conform to UL 681, UL 1037, and UL 1076, and the appropriate installation manual for each equipment type. Components within the system shall be configured with appropriate "service points" to pinpoint system trouble in less than 20 minutes.

C. Wiring and device mounting, except for type DU, shall be fully concealed or flush in mounting surface. No devices shall be surface mounted unless specifically called for.

D. For devices requiring access and operation by building occupants, install in accordance with the U.S. Department of Justice, Americans with Disabilities Act (ADA) and the State of California Access Compliance Manual.

3.2 LABELING

A. Conform with the requirements of Section 27 05 53 – Identification for Communications Systems.

3.3 SYSTEMS PERFORMANCE TESTING AND ADJUSTING PROCEDURES

A. Demonstrate functionality of each installed device is consistent with the read range, sensitivity and immunity to false alarms as specified by the device manufacturer. In the absence of an intrusion detection panel installed by Others, demonstrate using a VOM applied at the TB15 terminal block in the presence of the Agency's Representative.

B. Test shall ensure that the requisite degree of intrusion detection is provided.

1. Initially, test each sensor and subsystem component individually.

2. When the function of each component within a particular subsystem such as each sensor within a particular zone is verified, certify that subsystem of the entire ACAS as satisfactorily meeting required specifications. Test each subsystem similarly until each detection zone has been certified.

3. When subsystem certification is complete, test entire integrated system to ensure that subsystem elements are compatible and function as a complete system. Integrated system test shall be accomplished in linear fashion, end-to-end, and shall verify that each simulated intrusion performed within each detection zone produces an appropriate alarm or signal.

4. Integrated system test shall also verify that alarm is correctly annunciated at the terminal block associated with the field devices,

5. Log the results obtained for each device, sign log and submit for review prior to request for Demonstration of Functionality.

6. Provide for approval, not later than 30 days prior to formal inspection and test, a detailed operational test plan of how each component, subsystem, and entire ACAS will be tested.

7. When tests are complete and corrections made, submit a signed and dated certificate with a request for formal inspection and tests.

3.4 DEMONSTRATION OF FUNCTIONALITY

A. The Agency's Representative will witness formal tests after receipt of written certification that preliminary tests have been completed and that system is ready for final inspection. Manufacturer's technical representatives shall be present for the final inspection and test. Repeat preliminary tests and functional and operational tests,

conducted as requested by the Agency's Representative. Correct defects and conduct additional tests to demonstrate that system conforms to contract specifications.

B. Motion Detection

1. Demonstrate that each device detects an intruder moving through the specified coverage pattern.

C. Window, Hatch and Door Position Switches

1. Demonstrate functionality of each device when door, hatch or window door, hatch or window operated and opened not more than 3/8".

3.5 WARRANTY, MAINTENANCE AND SERVICE

A. Warranty

1. The IDS sensors shall be warranted by the contractor for one (1) year from the date of final system acceptance.

2. Maintenance and Service
   a. The contractor shall provide all services required and equipment necessary to maintain the IDS remote sensors in an operational state as specified for a period of one (1) year after formal written acceptance of the system, and shall provide all necessary material required for performing scheduled adjustments or other nonscheduled work.

3. Description of Work
   a. The adjustment and repair of IDS remote sensors includes signal transmission equipment, facility interfaces, and support equipment. Responsibility shall be limited to contractor installed equipment. Provide the manufacturers required adjustments and other work as necessary.

B. Personnel

1. Service personnel shall be qualified to accomplish all work promptly and satisfactorily. Provide proof that Service personnel have successfully completed the appropriate level of hardware training offered by the system manufacturer. The Agency shall be advised in writing of the name of the designated service representative and of any change in personnel.

C. Inspections

1. The contractor shall perform two inspections at six (6) month intervals or more often if required by the manufacturers. This work shall be performed during regular working hours, Monday through Friday, excluding Federal holidays. These inspections shall include:

2. Visual checks and operational tests of the remote sensorts, power supplies, and electrical and mechanical controls.

3. Clean system equipment, including interior and exterior surfaces.

4. Perform diagnostics on all equipment.

5. Check and calibrate each IDS device.

6. Resolve previous outstanding problems.

D. Emergency Service

1. The Agency shall initiate service calls when the IDS sensors are not functioning properly. Qualified personnel shall be available to provide service to the complete IDS sensors. The Agency shall be furnished with the telephone number where the contractor's service supervisor can be reached at all times. Service personnel shall be at the site within four (4) hours after receiving a request for service. The IDS sensors shall be restored to proper operating condition after one (1) calendar day.

END OF SECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including Conditions and Division 1 Specification Sections, apply to this Section.

1.2 RELATED WORK IN OTHER SECTIONS:

A. Section 27 11 19 - Communications Termination Blocks and Patch Panels

1. Provides the patch panels, if not existing to support the cameras installed under the work of this project.

B. Section 27 15 00 - Communications Horizontal Cabling

1. Horizontal structured cabling to support the cameras installed under the work of this project.

C. Section 28 05 00 - Common Work Results for Electronic Safety and Security

1. Submittals required of the work of this section.

2. Miscellaneous parts and execution standards for the work of this Section.

D. Section 28 05 28

1. Provides raceway and backboxes for the work of this Section.

1.3 RELATED WORK BY OTHERS

A. The College supplies the POE enabled Ethernet Switches and related building Ethernet networking hardware used to transmit the packets generated by the cameras installed under the work of this Project.

1.4 SCOPE

A. Work of Division 28 includes provision of a Unified Security Platform (USP), including video surveillance systems as described in this Section. Work of Section 28 23 00 includes provision of the video surveillance portion of the USP, including but not limited to:

1. Video Surveillance System.

a. Single sensor type indoor, self-illuminated TCP/IP dome cameras.

b. 180 and 360 degree view high definition Multiview indoor and outdoor, self-illuminated TCP/IP cameras.

2. Video Management System (VMS) with:

a. Camera licensing for the quantity of cameras shown on the plans plus 10% spare licensing capacity.

3. Directory Server to be installed at the College Office.

4. Provide twenty (20) web client licenses for College's staff to use.

1.5 SUBMITTALS

A. Refer to the requirements of Section 28 05 00 – Common Work Results for Electronic Safety and Security.

1.6 SYSTEM PERFORMANCE REQUIREMENTS

A. Video Surveillance Systems:

1. Technical Performance:

a. TCP/IP: System demonstrates full conformance with alarming, video analytics functionality, including motion detection using ONVIF Software (Open Network Video Interface Forum) Protocol.

b. IP Cameras: Meet Manufacturers performance specification.

2. Functional Performance:

a. Monitor and Display
1) Remote monitoring and reviewing of recorded images by persons using:
a) College's Local and Wide Area Network.
b) Local Area Network using College furnished network switching, and cabling provided under the work of this Project.
2) Provide images suitable for making identification of persons under lighting conditions resulting from the work of this Project and the prevailing environmental conditions at the Project site.

3. Uninterrupted Power System: For systems deriving camera power from power supplies installed under the work of this Project, sustain system operation for 2 hours following loss of power.

1.7 COORDINATE

A. Coordinate intended camera locations with the work of the Other Trades and the work of Section 28 05 28 – Pathways for Electronic Safety and Security to ensure field conditions do not result in obscuring the intended camera view(s).

B. Refer to Division 27 specifications to ensure that station cabling required for the work of this section.

1.8 DEFINITIONS

A. Refer additionally to Section 28 05 00 - Common Work Results for Electronic Safety and Security.

B. Abbreviations used in this Section

1. ACS – Access Control System

2. AES: Advanced Encryption Standard
3. AGC: Automatic gain control
4. ALPR – Automated License Plate Recognition
5. API: Application Programming Interface
6. Aspect ratio: A ratio of width to height in images
7. Bit Rate: The number of bits/time unit sent over a network
8. Bonjour: Enables automatic discovery of computers, devices, and services on IP networks.
9. CSA – Client Software Application
10. DGM – Dynamic Graphical Maps
11. DHCP: Dynamic Host Configuration Protocol
12. DNS: Domain Name System
13. DVS – Digital Video Server
14. EIS: Electronic Image Stabilization
15. FPS: Frames per Second
16. FTP: File Transfer Protocol
17. H.264 (Video Compression Format)
18. IEEE 802.1x: Authentication framework for network devices
19. IP: Internet Protocol
20. IR light: Infrared light
21. ISO: International Standards Organization
22. JPEG: Joint Photographic Experts Group (image format)
23. LAN: Local Area Network
24. LED: Light Emitting Diode
25. LPR: License Plate Recognition
26. Lux: A standard unit of illumination measurement
27. MBR: Maximum Bit Rate
28. MPEG: Moving Picture Experts Group
29. Multicast: Communication between a single sender and multiple receivers on a network
30. NTP: Network Time Protocol

31. NTSC: National Television System Committee – a color encoding system based on 60Hz
32. ONVIF: Global standard for the interface of IP-based physical security products
33. PACS: Physical Access Control System
34. PAL: Phase Alternating Line – a color encoding system based on 50Hz
35. PTZ: Pan/Tilt/Zoom
36. PoE: Power over Ethernet (IEEE 802.3af/at) standard for providing power over network cable
37. PPF: Pixels per foot
38. Progressive scan: An image scanning technology which scans the entire picture
39. QoS: Quality of Service
40. RAID: Redundant Array of Independent Disks
41. SDK – Software Development Kit
42. SIP: Session Initiation Protocol
43. SMA – Software Maintenance Agreement
44. SMPTE: Society of Motion Picture and Television Engineers
45. SMTP: Simple Mail Transfer Protocol
46. SNMP: Simple Network Management Protocol
47. SSL: Secure Sockets Layer
48. SSM – Server Software Module
49. SaaS: Software as a Service
50. TCP: Transmission Control Protocol
51. TLS: Transport Layer Security
52. UI: User Interface
53. UPS: Uninterruptible Power Supply
54. UPnP: Universal Plug and Play
55. USP: Unified Security Platform
56. USW: Unified Web Client
57. Unicast: Communication between a single sender and single receiver on a network
58. VBR: Variable Bit Rate
59. VMS: Video Management System

60. WDR: Wide dynamic range

1.9 LABELING AND DOCUMENTATION

A. Label the finished installation. Label each cable at each end uniquely using a Brady or similar cable labeling system.

B. Document the camera locations on a floor plan using CAD. Indicate the head end rack location and the major wiring runs. Provide a single-line diagram of the installed system. Submit PDF copies of the as built drawing documentation. In addition submit electronic copies of the CAD files for the College's use. Submit electronic files on a media type determined by the College.

C. Prepare and provide a hard copy and an electronic copy of an O&M manual for for the completed installation. Hard copy to be provided in a three ring binder. The electronic copy to be submitted on a PDF on a media type determined by the College's Representative.

1.10 TRAINING

A. Train the College's Representatives in operation of the installed video management system. Provide a least two separate training tracks focused on the training needs of specific stakeholder groups within the College’s operation and technical staff and College’s Technical/Information Technology Support Staff.

1. For the Colleges Technical/Information Technology Support Staff and third party integrators staff provide eight hours classroom and hands-on training in VMS system functionality, IP communications protocols used and device handshaking. Review directory tree integration mechanisms and requirements for tree maintenance. Review methods for bare metal recovery of operations. Review VMS manufacturer’s approved methods for software upgrades and hardware replacement, including failed disks in the storage array.

2. For each Training session, Document the training provided using a camera and video recorder and provide a copy of the recorded training to the College for future reference and use in training new staff.

1.11 QUALITY ASSURANCE

A. Test Equipment - provide for the purposes of quality assurance as described in Section 28 05 00 - Common Work Results for Electronic Safety and Security.

1. Network Packet Analyzer: (Fluke, Wireshark)

2. Waveform/Vector Monitor.

3. Portable High Resolution Color Picture Monitor (Marshall Electronics, ToteVision or equal).

PART 2 - PRODUCTS

2.1 UNAUTHORIZED MATERIALS

A. Materials and products required for work of this section shall not contain asbestos, polychlorinated biphenyls (PCB) or other hazardous materials identified by the College.

2.2 ACCEPTABLE MATERIALS

A. Products of the manufacturers specified in this section establish the minimum functional, aesthetic and quality standards required for work of this section.

2.3 VIDEO SURVEILLANCE EQUIPMENT

A. General:

1. All equipment and materials used shall be standard components that are regularly manufactured and used in the manufacturer's Video Surveillance System.

2. All systems and components shall have been thoroughly tested and proven in production use for at least180 days prior to the installation of this system.

3. All Video Surveillance System active systems components shall be provided with the availability of a toll free, 24-hour technical assistance program from the manufacturer, which provides immediate technical assistance to the end user at no charge. Where supplied systems are only supported through dealer liaison with manufacturer, and the College's Representative needs to speak with the VMS manufacturer during Contractor troubleshooting of integration, Contractor to initiate call.

2.4 VIDEO MANAGEMENT SYSTEM

A. Video Management Software

1. Description: Video surveillance management software (referred to as "system" or "VMS") supporting an unrestricted number of users, devices, servers and sites, with options for high availability, intelligent video walls, central surveillance operations and mobile devices.

2. System Architecture: The VMS shall consist of:

a. Servers: One or more VMS servers.

1) Physical or virtualized Windows servers.

2) Virtualized Windows servers, using:

a) Microsoft Hyper-V.

b) VMWare.

3) UPS provided to physical servers, network infrastructure and devices such as cameras.

b. Server Software Components: One or more Milestone XProtect software components, or software components made by others as noted, per VMS server.

1) Management Server: Central service component of the VMS responsible for handling system configuration, distributing the configuration to other system components, such as Recording Server services, and for facilitating user authentication.

2) Management Server Failover: A second server shall take over the Management Server function if the first server fails.

a) Failover Management Server: Installation of the Management Server service in a Microsoft Windows Failover Cluster, or similar compatible third-party software.

b) XProtect Management Server Failover: Installation of add-on in the VMS: A second server shall take over the Management Server, Log Server, Event Server, and SQL Server functions.

3) Recording Server: Service responsible for communications, recording and event handling for all devices (cameras, video and audio encoders, I/O modules, metadata sources, etc.), including:

a) Retrieving video, audio, metadata and I/O event streams from devices.

b) Recording video, audio and metadata.

c) Providing access to live and recorded video, audio and metadata.

d) Transmit live audio from operator’s microphone to one or more camera speakers or supported IP speakers.

e) Providing access to device status.

f) Triggering system and video events on device failures, events, etc.

g) Writes video streams, audio streams and their metadata to a high-performance media database.

h) Performing motion detection and generate smart search metadata.

i) Communicating with other Milestone products when using the Milestone Interconnect technology.

4) *Failover Recording Server:* Implementation of Recording Server service designated to take over recording and other tasks should an active Recording Server fail.

a) Failover Recording Server shall operate in two modes: cold-standby for monitoring multiple Recording Server services and hot-standby for monitoring a single Recording Server.

b) Both cold- and hot-standby mechanisms shall offer fully automatic and user transparent failover in the event of hardware or system failure, with automatic synchronization of video, audio and metadata at system recovery.

5) *Event Server:* Service that handles various tasks related to events, alarms, maps and third-party integrations via the Milestone Integration Platform Software Development Kit (MIP SDK).

6) *Failover Event Server:* Implementation of Event Server service by installing Event Server in a Microsoft Windows Failover Cluster, to ensure that another server takes over should the first server fail.

7) *Log Server*: Service that writes all system, audit and rule-triggered log messages to database.

8) *Service Channel*: Service responsible for communicating the following:

   a) Service and configuration messages to XProtect Smart Client.

   b) Updates to a Smart Wall monitor layout.

   c) Communicating that a specific Failover Recording Server is active.

9) *XProtect Mobile Server:* Service responsible for hosting the XProtect Web Client and for providing access to the VMS for XProtect Web Client and XProtect Mobile client users.

10) *Milestone Open Network Bridge:* Optional server, including Milestone Open Network Bridge service, Milestone RTSP Bridge service, and the Milestone Open Network Bridge Manager, plus 64-bit plug-in for Management Client. This is to enable private-to-public video integration.

11) *DLNA Server*: Service to enable display of live video on any DLNA compliant TV or displays without the need for additional equipment.

12) *Microsoft SQL Server*: Microsoft database server service for the Management Server, Event Server and Log Server services.

13) *API Gateway:* Service that provides a front-end and common entry point for RESTful API services on other VMS server components. *Microsoft Active Directory (required for MFA):* Active Directory is not required for single-site systems but is recommended for cyber security purposes.

c. *PC or Laptop Workstations:* One or more PCs or laptops for Milestone XProtect client software applications intended to run on Windows-based PCs and laptops.

   1) *Management Client:* The administration interface for all parts of the VMS, designed to be run remotely from, for example, an administrator's computer.

   2) *XProtect Smart Client:* Designed for day-to-day use by dedicated operators, to be run remotely on the operator's computer. XProtect Smart Client provides dedicated task-oriented tabs for Live Video, Video Playback, Search, plus dockable tabs for System Monitor and Alarm Monitor. XProtect Smart Client supports definable keyboard and joystick button shortcuts for frequently used actions, including window or camera selection.

   3) *XProtect Web Client:* Browser-based application for the occasional or remote user that needs easy access to live video monitoring and audio listening with PTZ control including use of presets, and video and audio

playback and export, with defined exports available for later usage or download.

d. *Tablets or Smartphones:* One or more tablets or smartphones using XProtect Web Client (see above) or XProtect Mobile client.

1) *XProtect Mobile Client:* Native mobile app for smartphone or tablet users, for easy access to live and playback of cameras, and to activate system events and outputs. Additionally, for use as a remote recording device by using the mobile device's built-in camera, whereby video from the device's camera is streamed back to the VMS and recorded like a standard camera.

e. *Smart Walls:* Optionally one or more Smart Walls.

1) See Section 28 51 19.13 VIDEO WALL.

f. *Wide-Area Surveillance System:* Optionally one or more individual Milestone VMS products connected to gain central surveillance operation across geographically dispersed sites.

1) See paragraph 2.3 C Multi-System Architectures below.

g. Networks:

1) *Multiple Network Segments*: The VMS must support network segmentation into separate device, server and internet-connected networks.

2) *Device Network:* Local network whose capacity and configuration are suitable for the level of video, audio and metadata data transmission established by the system design and its intended usage.

3) *Server Network:* Local network whose capacity and configuration are suitable for the level of video data transmission, systems integration, and user operations established by the system design and its intended usage.

4) *Internet-Connected Network*: Internet-connected network providing connection to remote VMS sites and private-to-public connection via Milestone Open Network Bridge. This network is also used for remote user access via the XProtect Mobile Server.

5) Network Traversal:

a) Enable software clients to access Recording Server services from outside a NAT firewall, by the use of public addresses and port forwarding.

b) Provide Remote Connect Services that enable secure remote connections to devices across different types of private and public networks.

3. *Multi-System Architectures:* Provide three architecture options for multi-site deployments:

a. *Distributed Recording Server Services:* Intended for sites with stable network connections between the central site and any number of remote sites.

1) Management Server at central site is providing user authentication and authorization for all distributed Recording Server services.
2) Each site has at least one Recording Server.

b. *Milestone Federated Architecture:* Intended for sites with stable network connections between all sites, establishes central management of, and central surveillance operations for, geographically dispersed sites via one or more levels of parent/child system connections. The federated architecture shall:

1) Management Server at parent site is providing user authentication for the full federated system and each child site Management Server is providing authorization.
2) Each site is equipped with one Management Server and at least one Recording Server.
3) Parent systems must be XProtect Corporate systems.
4) Child systems may be any number of XProtect Corporate, XProtect Expert, Milestone Husky M series, Milestone Husky X series and Milestone Husky IVO series systems.
5) Child XProtect Corporate and XProtect Expert systems function as autonomous sites even upon loss of network connectivity.
6) Make site details, including name, address, administrators and additional information, defined in the federated system available in the site navigation.

c. *Interconnected Architecture:* Suitable for providing central surveillance operations capabilities for a centrally XProtect Corporate-managed distributed system where some or all network connections between the local systems are unstable or intermittent. Capabilities shall include:

1) Management Server at central site is providing user authentication and authorization for all interconnected cameras.
2) Remote site is providing authentication and authorization to its cameras on central system access.
3) Central site is equipped with one Management Server and at least one Recording Server.
4) Remote site is one of the following products and their later editions:
   a) XProtect Corporate 2013
   b) XProtect Expert 2013
   c) XProtect Enterprise 8.0
   d) XProtect Professional 8.0
   e) XProtect Professional+ 2017 R2
   f) XProtect Express 1.0
   g) XProtect Express+ 2017 R2

h) Milestone Husky M20 2016 R2

i) Milestone Husky M30 2013

j) Milestone Husky M50 2013

k) Milestone Husky M500 Advanced 2016

l) Milestone Husky M550 Advanced 2016

m) Milestone Husky X2 2018 R2

n) Milestone Husky X8 2018 R2

o) Milestone Husky IVO 150D

p) Milestone Husky IVO 350T

q) Milestone Husky IVO 350R

r) Milestone Husky IVO 700R

s) Milestone Husky IVO 1000R

t) Milestone Husky IVO 1800R

5) *Site Independence:* Remote sites using the interconnected systems functionality shall operate as a full and separate VMS and NVR systems.

6) *Different Network Domains:* All or some systems may run on different network domains.

7) Number of Remote Sites: Any number of remote sites, which may run any size and any number of separate supported VMS and NVR systems.

8) *Upload Management:* Provide for the transfer of recordings from remote sites to the central site. It shall be possible at the central site to automatically or manually request recordings from the remote site, which requests shall be queued for execution once the remote site is connected to the central site's network. Users may define time intervals and bandwidth caps for upload of video from a remote site.

9) *Mobile and On-Premise VMS Support:* Remote sites can be on-premise systems or mobile systems, for example busses, trains and ferries and should be resilient to intermittent connectivity to central site.

10) *Status Detection:* VMS proactive detection of errors and cost-efficient management of connected sites by propagation of system status events and embedded remote management of connected system.

11) *Remote Management:* VMS detection of system problems and remote management of interconnected sites.

12) *Device Driver:* Connect the high-end VMS with most other VMS and NVR versions made by the software manufacturer through a device driver-based interconnected systems functionality.

13) *Central Video View and Playback:* Live video and playback of video for cameras from the remote site shall be the same as for cameras connected directly to the central site.

14) *Remote Camera Licenses:* VMS shall require a dedicated camera license for each interconnected camera that is enabled on the central site.

B. System Design Criteria

1. *Scalability:* Provide component-based system architecture to support scaling of VMS from small systems (up to 100 devices) to very large systems (several thousand devices) for single-site or multi-site deployment, whereby:
   a. *For Small Systems:* All software components can be installed on the same server if the server is able to handle the combined load.
   b. *For Large Systems:* Software components can be installed on separate dedicated servers to scale and distribute the load.
2. *Availability and High Performance:* Provide the following capabilities to ensure high VMS availability and performance.
   a. *Failover Recording Server:* Provide hot and cold Failover Recording Server capabilities.
   b. *Management Server, Event Server, Log Server, API Gateway*: Support Windows Server Failover Clustering, or similar.
   c. Storage solution shall be configured with RAID10 for Live database and RAID5 or RAID6 for archive database.
3. *Operating Systems:* Provide server and client software applications that are native 64-bit Microsoft Windows applications.
4. *Network Addressing:* Support both IPv4 and IPv6 addressing.
5. *Video Standards:* Provide simultaneous digital multi-channel live streaming and recording of video from IP cameras and IP video encoders without any software limitations on the number of cameras per Recording Server, with support for the following codecs and options:
   a. Codecs:
      1) H.264 and H.265
      2) MPEG-4 and MPEG-4 ASP
      3) MJPEG
      4) MxPEG
   b. Options:
      1) Toggling between recording key frames only or full video stream for MPEG-4, H.264 and H.265 video.
      2) Adjustable GOP length for MPEG-4, H.264 and H.265 video.
      3) Toggle between recording full framerate from the camera and any lower FPS for MJPEG video.
6. *Video De-Interlacing:* Provide live video views with an adaptive de-interlacing option, to improve the quality of interlaced video, based on the actual video

content received, for example, to smooth area of an image where object lines would otherwise appear as jagged lines.

7. *Multi-Live Video Streaming:* Provide multiple streams for live viewing using any combination of supported standards, video resolutions and frame rates.
8. *Adaptive Streaming:* Depending on the requested resolution, provide automatic selection between the video streams configured for multi-live video streaming to these clients:
    a. XProtect Smart Client: Live video streams from the Recording Server to the XProtect Smart Client or XProtect Smart Wall.
    b. XProtect Web Client: Live video streams from the XProtect Mobile Server to the XProtect Web Client.
    c. XProtect Mobile Client: Live video streams from the XProtect Mobile Server to the XProtect Mobile Client.
9. *Direct Streaming:* Provide live video streams in these codecs directly from the Mobile Server to clients without transcoding:
    a. XProtect Web Client: Provide MJPEG and H.264 live video streams.
    b. XProtect Mobile Client: Provide H.264 and H.265 live video streams.
10. *Audio Standards*: Provide simultaneous digital two-way audio streaming and recording of audio from IP speaker and IP microphone devices without any software limitations on the number of devices per Recording Server, with support for the following codecs and options:
    a. Codecs:
        1) AAC
        2) G711
        3) G726
    b. Options:
        1) Playback of audio files on rule.
11. *DLNA Support:* Provide the ability to easily display live video from the installed cameras directly onto any modern consumer-grade TV supporting DLNA functionality.
12. *Hardware Acceleration XProtect Smart Client:* Provide the following hardware acceleration capabilities to offload Smart Client video processing from the computer CPU to dedicated hardware video processing capabilities:
    a. *NVIDIA GPU:* Automatically detect and use all available NVIDIA GPUs, for hardware accelerated decoding, color correction, and scaling.
    b. *Intel Quick Sync:* Automatically detect and use Intel Quick Sync Video GPU integrated into select Intel processors for hardware accelerated decoding, color correction, and scaling.
    c. Provide the ability to use both NVIDIA and Intel GPUs at the same time and automatically load balance the requests for optimal performance.

d. Provide the ability to show which GPU is used to decode which stream.

13. *Hardware Acceleration Recording Server:* Provide the following hardware acceleration capabilities to offload Recording Server video processing from the computer CPU to dedicated hardware video processing capabilities:

    a. *NVIDIA GPU:* Automatically detect and use all available NVIDIA GPUs, for hardware accelerated decoding to enable server-side motion detection.

    b. *Intel Quick Sync:* Automatically detect and use Intel Quick Sync Video GPU integrated into select Intel processors for hardware accelerated decoding to enable server-side motion detection.

    c. Provide the ability to use both NVIDIA and Intel GPUs at the same time and automatically load balance the requests for optimal performance.

14. *Hardware Acceleration Mobile Server:* Provide the following hardware acceleration capabilities to offload Mobile Server video processing from the computer CPU to dedicated hardware video processing capabilities:

    a. *NVIDIA GPU:* Automatically detect and use all available NVIDIA GPUs, for hardware accelerated decoding to enable adaptive transcoding.

    b. *Intel Quick Sync:* Automatically detect and use Intel Quick Sync Video GPU integrated into select Intel processors for hardware accelerated decoding to enable adaptive transcoding.

    c. Provide the ability to use both NVIDIA and Intel GPUs at the same time and automatically load balance the requests for optimal performance.

15. *Open Network Bridge Functionality:* Provide access to live and recorded video, and the ability to control pan-tilt-zoom cameras in compliance with the relevant ONVIF Profile G and Profiles S standards.

16. *Camera-Independent Motion Detection:* Provide real-time, camera-independent motion detection with:

    a. *Configurable Sensitivity:* Configurable and automatic motion-detection sensitivity per camera

    b. *Searchable Metadata:* Searchable motion detection metadata created during motion detection.

    c. *Exclusion Zones:* Multiple motion exclusion zones definable per camera to keep irrelevant motion from triggering recording.

17. PTZ Control Priorities:

    a. Provide 32,000 PTZ priority levels for control of rights between different operators and automatic scanning and patrolling schemes.

    b. PTZ Scans and Patrols shall pause for higher-priority manual or event-based camera control, and resume after manual session timeout and completion of event camera control period.

18. *Configurable Pre-Buffering:* Provide pre-buffering with variable buffer length, with the ability to place buffer on disk or in memory.

19. *Device Video Quality Optimization:* Provide video quality optimized per available bandwidth, device screen resolution, and camera view window sizes in these clients:
    a. XProtect Smart Client Optimization:
        1) Switch between all configured live video streams from the cameras to optimize bandwidth consumption and workstation performance.
        2) Optimize viewing performance for remote viewing according to the available bandwidth and view layouts, maximizing video stream quality per display capabilities of defined views.
    b. *XProtect Web Client and XProtect Mobile Client Optimization:* Optimize transcoding by capping video stream resolution and frame rate for transmission to XProtect Web Client and XProtect Mobile client.
20. *Multicasting:* Provide optimization of network load in systems with many users viewing the same camera live, by sending one video stream per camera to multiple XProtect Smart Client and XProtect Smart Wall instances.
21. *Multiple Language Support:* Provide support for multiple languages in these XProtect clients:
    a. *Management Client User Interface:* American English, Chinese (Simplified), Chinese (Traditional), Danish, French, German, Italian, Japanese, Korean, Portuguese (Brazilian), Russian, Spanish, Swedish and Turkish.
    b. *Management Client Built-In Help:* American English, Chinese (Simplified), French, German, Japanese, Korean and Portuguese (Brazil).
    c. *XProtect Smart Client, XProtect Web Client and XProtect Mobile Client User Interface:* American English, Arabic, Bulgarian, Chinese (Simplified), Chinese (Traditional), Croatian, Czech, Danish, Dutch, Farsi, Finnish, French, German, Hebrew, Hindi, Hungarian, Icelandic, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese (Brazilian), Russian, Serbian, Slovak, Spanish, Swedish, Thai, Turkish and Ukranian.
    d. *XProtect Smart Client Built-In Help:* American English, Arabic, Chinese (Simplified), Chinese (Traditional), Czech, Danish, Dutch, French, German, Italian, Japanese, Korean, Polish, Portuguese (Brazilian), Russian, Spanish, Swedish and Turkish.
    e. XProtect Web Client and XProtect Mobile Client Built-In Help: American English, Danish and Japanese.
22. *True Multi-Window Support:* Provide true multi-window support in XProtect Smart Client whereby secondary windows have full functionality and can be operated in independent mode or synchronized mode where they follow the control of the main window.
23. *SNMP Agent:* Provide VMS functionality to act as SNMP agent that can generate an SNMP trap upon rule activation.
24. *System Capacities:* Provide the following maximum capacities, constrained only by the physical performance capabilities of installed server hardware and network infrastructure:

a. Unrestricted devices.

b. Unrestricted client software users.

c. Unrestricted mobile devices.

d. Unrestricted client PCs or laptops.

e. Unrestricted servers.

f. Unrestricted Smart Walls, with an unrestricted number and combination of display monitors.

g. Unrestricted sites.

h. Unrestricted system rules.

i. Unrestricted time profiles.

j. Unrestricted software client profiles.

k. Unrestricted media storage.

l. Recording rates of at least 30 FPS per camera, limited only by hardware capabilities.

C. System Security

1. *Control and Information Security:* Provide the following data protection measures and user rights management capabilities in support of system confidentiality, integrity and availability:

a. *Data in Transit:* Encrypted communication between servers and clients using secure communication CA digital certificates.

1) HTTPS connections from Recording Server to devices that support HTTPS connections.

2) Encrypted communication between the Recording Server and services that retrieve streaming data using customer-provided CA digital certificates for connections to the Recording Server.

3) Encrypted communication between the Management Server and the Recording Server using customer-provided CA digital certificates.

4) HTTPS connections from VMS clients, SDK clients and services that support HTTPS connections to Recording Server.

b. *System Configuration Data*: Provide password protection of the system configuration backup.

c. *Media Data at Rest Integrity and Encryption*: Provide the ability to use password-based protection, including encryption and digital signature settings, per media storage container.

1) Two modes of video database encryption using 256-bit AES encryption:

a) *Light Encryption.* Encrypts only the first part of the MJPEG or MPEG-4/H.264 video, audio and metadata, to use less processing power for encrypting the video. Video cannot be decoded without the information contained in the encrypted header.

b) *Strong Encryption.* Encrypts all parts of the video, audio and metadata stored in the database.

2) Digitally signed media databases with SHA-2 algorithm to establish a means of detecting modification of stored video, audio and metadata.

d. *Off-Premises Live and Recorded Video in Transit*: HTTPS connections must use trusted CA certificates and support HTTPS connections from:

1) Mobile Server to browser-based XProtect Web Client and XProtect Mobile client app.

2) Open Network Bridge to remote public systems.

e. Data Integrity of Exported Video:

1) Export video in XProtect format that can only be viewed in the XProtect Smart Client — Player.

2) Per-export password protection for playback.

3) 256-bit AES encryption.

4) Digitally signed media exports with SHA-2 algorithm to establish a means of detecting modification of exported video.

5) Include any digital signatures applied in the media database.

6) XProtect Smart Client — Player's Verify Signatures function to validate authenticity of exported video recording.

7) Option to prevent re-export of exported video.

f. *Digital Certificates:* Use of customer-provided CA digital certificates for connections to the Mobile Server.

g. Data Access Control: Provide:

1) User profiles restricting device access and video viewing, playback and export, including by day and time-of-day.

2) Timestamped audit log of who logged in, viewed live or recorded video, or exported video.

2. User Authentication:

a. *Log-in Options:* Log-in authentication via:

1) Microsoft Active Directory.

2) Local Windows user accounts.

3) External IDP using Open ID Connect to facilitate single sign-on.

4) Basic user system account (username and password credentials).

a) Ability for basic user to change password during login.

b) Ability for system administrator to enforce password change during login.

c) Ability to enforce password complexity.

5) Dual authentication, a.k.a. two-person rule, requiring two verified persons to gain access.

b. *Auto-Log-In:* Use of last used credentials for authentication, with Auto-log-in and auto-restore of camera views.

c. *Kerberos Authentication:* Provide strong authentication via Kerberos support.

3. *User Rights Management:* Provide common and central detailed management of user rights across all user and programmatic (SDK) interfaces, using roles, users, and user groups:

a. *Tiered User Rights:* Assign partial management of permissions to system administrators using the Management Client.

b. *User Rights:* Define roles, add and delete users, manage permissions for roles, user groups and users, generate user rights management reports. Tiered user management rights shall enable differentiated administrator rights per administrator role.

c. *User Rights Inheritance:* Create sub-management domains where management of a specific set of devices can be assigned to a specific system administrator.

d. *Roles:* Defining roles establishes permissions (also called “rights”) that determine which system features may be accessed by users and groups. Provide the following security settings for roles:

1) Role Info:

a) *General:* Management Client profiles, Smart Client profiles, evidence lock profiles, dual authorization rights, system log-in time profile.

b) *Applications:* Login to XProtect Smart Client, XProtect Web Client and XProtect Mobile client.

c) *Anonymous PTZ Sessions*: Enabling anonymous user information for PTZ sessions.

2) *Users and Groups*: Users and groups can be assigned to multiple roles.

3) *Overall System Permissions:* Globally allow or deny permissions for servers, devices and functions (such as manage, read, edit and delete).

4) *Specific System Permissions:* Allow permissions for specific individual devices and functions:

a) *Cameras:* Visibility, live view (within time profile), playback (within time profile), search sequences, smart search, export, manual recording, bookmark functions, AUX commands, evidence lock functions.

b) *Microphones and Speakers:* Visibility, listen to live audio (within time profile), playback audio (within time profile), search sequences, export, manual recording, bookmark functions, evidence lock functions.

c) *Inputs and Outputs:* Visibility, activation.

d) *PTZ Control:* Manual control, activate PTZ presets, PTZ priority, manage PTZ presets and patrolling, reserve and release PTZ session.

e) *Speech:* Speak to speakers, speak priority.

f) *Remote Recordings:* Retrieve remote recordings.

g) *Smart Wall:* Visibility, edit, delete, operate, playback.

h) *External Events:* Visibility, edit, delete, trigger.

i) *View Groups*: Visibility, edit, delete, operate.

j) *Servers:* Professional server access and authentication details, Milestone Federated Architecture site permissions.

k) *Matrix*: Visibility.

l) *Alarms:* Manage, view, disable alarms, receive notifications.

m) *MIP:* Milestone Integration Platform plug-in permissions.

4. *Client Authentication:* Provide Management Server authentication and authorization of connecting clients (XProtect Smart Client, Management Client and MIP SDK clients) and use a session-limited access token for controlling access to the Recording Server.

5. *System Hardening:* System hardening guide that:

   a. Describes data security, network security and physical security measures and best practices for securing the installed VMS against cyber-attacks. This includes security considerations for the hardware and software of servers, clients and network device components of a video surveillance system.

   b. Incorporates standards-based and best-practice-based security and privacy controls and maps them to each hardening recommendation.

6. *GDPR:* The system must facilitate compliance to GDPR:

   a. *GDPR-Ready Certification*: The VMS must have a European Privacy Seal from GDPR ready certificate.

      1) The vendor shall provide comprehensive guides and templates to aid in configuring a GDPR compliant system.

      2) The vendor shall have a clear and concise privacy policy.

   b. The system shall provide warnings when use of the system is at risk of going outside GDPR compliance.

   c. *Privacy by default*: The VMS must have privacy settings set by default.

      1) The system shall have audio data processing disabled by default.

      2) The system shall have metadata, recording, transmission, and other processing disabled by default.

      3) The system shall have online map services disabled by default.

7. *FIPS 140-2 compliant mode*: The VMS has the ability to operate in a FIPS 140-2 compliant mode.

D. Logging

1. Provide logging of errors, warnings, system information, user activity, and logs about rules to a centralized database with time, date, and other related information. Logs provide multi-system support and configurable logging limits.
    a. *System Logs:* Log all system related errors, warnings and system information, to be used for troubleshooting.
    b. *Audit Logs:* Log user activity in client applications including, but not limited to, user system access, configuration changes and operator actions.
    c. *Rule-Triggered Logs:* Log rules in which the system administrator has specified the “Make new log entry” action.
    d. *Log Exporting:* Logs can be exported as comma-separated-values (.csv) files.
    e. *Log Filtering:* Logs can be filtered based on time frame, source name, source type, user, user location, rule name, etc.
    f. *Log-Related Options:* Settings can be changed about:
        1) Log retention time.
        2) Which levels (error, warning, and system information) are logged.
    g. Log security.

E. System Functionality

1. Configuration Management:
    a. *Real-Time Configuration Change Application:* Immediately apply authorized changes of system configuration data for all sites, including, but not limited to licenses, devices, rules, schedules, users, maps, alarms, recording, client views, including while recording is in operation.
    b. *Configuration Data Caching for Continued Operation:* Cached Recording Server configuration data shall ensure continuous operation of Recording Server during periods where the Management Server is inaccessible.
    c. *Backup and Restore:* Built-in backup and restore support for manual system backup of all configuration data, including but not limited to:
        1) All system configuration data.
        2) Full device configuration data.
        3) Maps.
        4) Alarm settings and definitions.
        5) Software client views.
        6) User-defined rules, events and dashboard customizations.
        7) Defined video bookmarks.
    d. *Configuration Reporting:* Provide complete or partial documentation of system configuration, including custom and site-specific free-text information, contractor’s notes and option for logo inclusion.

2. Customizable Built-in System Monitor:
    a. *System Dashboard:* Dashboard display containing detailed and up-to-date information about current servers and cameras. Dashboard displays include the following items:
        1) *Server Tiles*: Displays the status of individual or groups of servers via colored tiles.
        2) *Camera Tiles*: Displays the status of the cameras via colored tiles.
        3) Details on monitoring parameters are shown when a tile is selected.
        4) *Monitoring Parameters:* Customizable Normal, Warning and Critical system monitor and event triggers for:
            a) General Server Information:
            b) CPU usage.
            c) Memory available.
            d) Recording Server Information:
            e) CPU usage.
            f) Memory available.
            g) Free space.
            h) Retention time.
            i) Camera Information:
            j) Live FPS.
            k) Recording FPS.
            l) Used space.
    b. *System Details:* Detailed real-time display and reporting of system performance and conditions for:
        1) General Server Information:
            a) CPU and memory usage.
        2) Recording Server Information:
            a) CPU and memory usage.
            b) Pie-chart status information for the storage elements on each hard drive: video recordings and archives; other data, including video archives from other archive storage locations (such as network drives); free space, disk size.
            c) Network adaptor usage.
            d) Storage container usage.
            e) Camera information.
        3) *Camera Information*: A table containing:
            a) General status.

b) Recording status.

c) Camera name.

d) Storage container used.

e) Used space.

f) Live FPS.

g) Recording FPS.

h) Live video format.

i) Recording video format.

j) Media data received.

4) *Historical Reporting*: On-screen and PDF report of historical performance data going back 30 days.

c. *Monitoring Multiple Servers and Federated Systems*: Provide multiple dockable tabs in XProtect Smart Client with system performance and use information for different servers and federated systems.

3. Application Workspace Optimization:

a. Options for optimizing application workspaces in the Management Client software:

1) *Application Layout*: Rearranging layout via drag-and-drop.

2) Management Client Profiles:

a) Centralized management of application options for optimization application for different user categories and skill levels.

b) Ability to tailor the availability of main/sub functions for different user roles.

b. Options for optimizing application workspaces in the XProtect Smart Client software:

1) *General*: Control general look and feel and navigation properties, such as color mode, camera title bar, grid sizes.

2) *Personal or Centrally Enforced*: Optimization can either be made as individual personalization managed by each operator, or centrally enforced using Smart Client profiles.

3) *View Layouts:* Availability of specific view layouts enforced using Smart Client profiles.

4) *Themes:* User interface color schemes enabling user choice of dark or light themes.

5) *Control Panes Availability*: Control availability of control panes and functions in live and playback tabs, and in setup mode.

6) *Timeline Information*: Control information included in timeline in playback tab.

7) *Export Behavior*: Control behavior and availability of export function.

8) *Keyboard and Joystick Setup*: Setup of keyboard short cuts and joystick controls.

9) *Alarm and Access Control Notifications*: Control behavior of alarms and access control notifications.

10) *Application Language*: Control application language.

11) *Advanced Application Settings*: Control advanced application settings such as use of multicast, hardware acceleration, adaptive streaming, videos diagnostics overlay and time zone settings.

4. Device Discovery and Management:

   a. Add Hardware wizard to automatically discover and upon approval add devices to system using Universal Plug and Play (UPnP) discovery, IP network range scanning, or manual device detection. User ability to perform initial setup of credentials on devices without factory default credentials detected. Must be supported for Axis, Bosch, Hanwha Techwin, and for ONVIF profile Q conformant devices.

   b. Replace Hardware wizard for swift replacement of malfunctioning devices with preservation of configuration settings and recordings, including those for attached cameras, microphones, speakers, inputs, outputs and metadata devices.

   c. Move Hardware wizard for moving devices and related devices from one Recording Server to another during runtime with no loss of settings, recordings, rules, permissions etc.

   d. User ability to enable and disable devices for purposes of maintenance or temporary deactivation.

   e. User ability to change the password of one or multiple devices based on a pre-configured time interval. Must be supported for Axis, Bosch, Canon, Hanwha Techwin, Hikvision, Panasonic, Sony and ONVIF-compliant devices.

   f. User ability to see the firmware version of each device.

   g. User ability to update information about the firmware and features available for a device.

   h. User ability to upgrade the firmware of one or multiple devices, based on groups of devices. Must be supported for Axis, Bosh, Hanwha, Techwin and ONVIF.

   i. For ONVIF Profile T & Q compliant devices. User ability to manage a VMS user account that communicates with a device. Add a user, list an existing user, and delete a user.

   j. For ONVIF Profile T & Q compliant devices. User ability to manage network configuration. Change IP address, subnet mask, and default gateway.

5. *Camera Image and Video Stream Management:* Adjustment of per-camera and per-video stream settings, with each camera allowed one or more streams for live viewing and one stream for recording, including an optional per-camera or per-camera-group preview window:

   a. Per Camera:

1) *General Settings*: Change all camera specific general settings such as brightness, color level, compression, maximum bit rate, resolution and image rotation.

2) *Camera Video Stream Settings*: Define as many different streams as specific camera support. Change individual stream settings such as FPS, resolution, image quality, video encoding format and resolution.

b. Per Camera Group:

1) *General Settings*: Change all common camera specific general settings for the camera group such as brightness, color level, compression, maximum bit rate, resolution and image rotation.

2) *Camera Video Stream Settings*: Define as many different streams as specific camera support for the camera group. Change individual stream settings such as FPS, resolution, image quality, video encoding format and resolution.

3) One camera can be associated to multiple camera groups.

c. *Video Streams:* Define one camera video stream used for recording and multiple cameras video streams to be used for live viewing.

d. *Recording*: Manage recording functionality including:

1) Related device recording.

2) Manual recording timer.

3) Pre-buffer use.

4) Recording framerate.

5) Media storage assignment.

6) Automatic retrieval of edge recordings.

e. *Fisheye Lens Viewing:* Capability for fisheye lens camera views provided through utilization of the ImmerVision Enables panomorph lens technology. Other lenses than ImmerVision can be supported by using a generic dewarping lens profile or a third-party plug-in.

f. *Motion Detection*: Manage motion detection functionality including:

1) Motion sensitivity.

2) Processing all frames or keyframes only.

3) Generation of motion metadata for smart search.

4) Exclusion zones.

g. *Camera Events*: Define which camera events will be forwarded to the VMS.

1) *Client Settings*: Define client related functionality including:

2) Use multicast for live stream.

3) Related devices.

4) Keyboard shortcut.

h. *Privacy Masks:* Permanent and liftable system-defined camera image privacy masks hide certain areas in the camera image for live view, recording, and video export.

1) Permanent Masks: Allow a system admin to mask areas in cameras at all times and for all users. Permanently masked areas cannot be revealed once recorded.

2) *Liftable Masks:* Allows a system admin to establish default mask areas in cameras at all times and for all users, but with the option to sufficiently privileged operators to temporarily remove the masks for authorized users if needed – such as during investigation.

3) *Masking Level:* When establishing a privacy mask, system admins may select a mask level on a scale between 'light blur' to 'solid grey'.

6. *PTZ Camera Control:* Camera-based and system-based PTZ camera control including the following capabilities.

a. *Camera PTZ preset positions:* Camera-based PTZ presets may be imported from the camera and renamed for use in system-based manual and automatic PTZ control.

b. *Automated Use of PTZ Presets:* Scheduled and event-based rules capability to move PTZ cameras to pre-set positions.

c. *System-Based PTZ Preset Positions:* System-based PTZ presets are definable for use in system-based manual and automatic PTZ control.

d. *PTZ Patrolling:* Multiple per-camera PTZ patrolling schemes may be defined with the following options:

1) Adjustable wait times between preset position changes.

2) Disabling of motion detection to avoid false detection alarms.

e. Multiple patrolling schedules per camera per day, with different schedule for days, nights and weekends.

F. Event and Alarm Management

1. *Rules Engine:* Provide rules for automating of different aspects of the system, including camera control, system behavior and external devices, based on events or time profiles, or a combination of events and time profiles.

a. *Trigger Events:* Provide a Microsoft-Outlook-style configuration dialog where pre-defined and custom-defined events are used in rules to trigger actions.

1) *Event Categories:* Organize events into the following categories:

a) *Hardware:* Physical hardware devices connected to the system.

b) *Devices:* Certain functions and states of devices available via connected hardware devices.

c) *External:* Relating to VMS integrations.

d) *Recording Server: A*rchiving, failover and database functions.

e) *Analytics:* From integrated analytics applications and systems.

f) *User-Defined:* Custom-configured events enabling users to manually trigger actions and events in the system.

b. *Start Actions:* Triggering events may initiate a wide set of system actions, including, but not limited to:

1) Control start and stop of recording, including scheduled and event-based recording.

2) Change camera stream properties.

3) Change of Smart Wall content and layout.

4) PTZ camera preset positions and patrols.

5) Event-based notifications, including email notifications to single or multiple recipients with optional attachment of a camera still image or AVI video clip.

6) External system interactions.

7) Bookmark creation.

8) Play pre-recorded audio.

9) Retrieve video and audio from edge storage devices and video from interconnected systems.

10) Single rule allows for executing multiple system actions.

11) Rule actions shall be triggered by event, time interval or a combination of event and time.

12) Rules shall be optionally stopped by event or after a specified time.

13) Unrestricted number of rules.

2. *Time Profiles:* Provide the following time profile functionality for use with profiles, rules and triggers:

a. Dynamic day-length time profile that follows daylight changes over a year including Daylight Savings Time for a given location defined by a GPS position.

b. Time profiles contain one, or more, single or recurring periods of time.

c. Asingle time period may span one or more days, defined by a starting date and time and an ending date and time.

d. A recurring period of time is defined as a time range with recurrence pattern and range:

1) Time range is a starting and ending time within a day.

2) Recurrence pattern may be Daily, Weekly, Monthly or Yearly.

3) Recurrent range is a starting and ending date, or a starting date with a duration in days.

e. Unrestricted number of time profiles.

3. *Single-Point Event/Alarm Management:* Provide central management of all internal system alarms and external security alarms. Events are pre-defined or

user-specified incidents on the VMS that can be set up to trigger an alarm, including analytics events and manual control actions. Event and alarm management capabilities shall include but not be limited to:

a. Alarm Data Settings:
    1) Customizable alarm priorities, statuses and categories to enable alignment of the alarm handling workflow with existing workflows and security systems.
    2) Optional sound notifications for different alarm priorities for notification of new incoming alarms.
    3) Manage which alarm priorities trigger desktop notifications for alarms.
    4) Manage which alarm data are shown in the Alarm Manager, including but not limited to:
        a) ID.
        b) Image.
        c) Location.
        d) Message.
        e) Owner.
        f) Priority Level.
        g) Source.
        h) State Level.
        i) State Name.
        j) Time.
    5) Optional Reasons for Closing to be chosen when an alarm is closed.
    6) Add audio files in wav-format to be used as alarm notification sounds.
    7) Manage how long alarms instances are kept in the system before being automatically deleted.

b. Alarm Configuration:
    1) User-definable alarm descriptions and work instructions.
    2) Select triggering event and source.
    3) Alarm time profiles specifying that response actions must take place within the specified time profile.
    4) Select start and stop events specifying that response actions must take place within the specified event window.
    5) Select a user defined event to be triggered if an alarm is not acknowledged within a defined time limit.
    6) Association of alarms with one or more cameras, with automatic display of camera video in the alarm preview window, with a minimum of 15 cameras showing simultaneously in the alarm preview window.

7) Association of alarms to maps.
8) Association of initial alarm owner (individual user or group) and priority.
9) Association of alarm category.
10) Select user defined event to be triggered by the alarm.
11) Enable or disable desktop notifications for alarms.

c. Alarm Manager:
1) Alarm list with extensive sorting and filtering capabilities.
2) Instant preview of recorded video from primary and related cameras, at the time of the incident.
3) Thumbnail image from primary camera, at the time of the incident.
4) Alarm disabling option shall enable users to suppress alarms from a given device for a specified time period.
5) Common alarm list for all interconnected systems and cameras.
6) Common alarm list for all sites in a Federated Architecture.
7) Alarm handling reports providing information about alarm inflow and alarm handling performance.

d. Alarm Handling:
1) Instant preview live video of primary camera.
2) Instant preview of recorded video from primary and related cameras, at the time of the incident.
3) Option to select any related cameras to be displayed in the live and playback view items.
4) Present the alarm work instructions.
5) Change priority and status of the alarm.
6) Alarm escalation with option to forward alarms to operators with appropriate skills to handle specific types of alarms.
7) Present time logged alarm activities.
8) Add time logged comments to the alarm incident.
9) Desktop notifications shall allow immediate access to alarm handling.

e. Map Integration:
1) Present incident location automatically on the map allowing operators to view and acknowledge active alarms.
2) All other map functionality must be available when viewing maps in the Alarm Manager.

f. Smart Map integration:
1) Present incident location automatically on the smart map allowing operators to view and acknowledge active alarms.

g. Cameras with active alarms shall be visualized when viewing the geographic location of search results in the Centralized Search workspace. *XProtect Web Client*: Provide the following alarm list, alarm handling and investigation functionality:

1) Alarm List:

a) Alarm list with filtering capabilities:

b) All or personal alarms.

c) All or specific alarm states.

d) All or specific alarm priorities.

e) Thumbnail image from primary camera, at the time of the incident.

f) Click to handle alarm.

2) Alarm Handling:

a) Instant preview of recorded video from primary and related cameras, at the time of the incident. Available incoming audio for cameras that have related microphones.

b) Present the alarm work instructions.

c) Change priority and status of the alarm.

d) Alarm escalation with option to forward alarms to operators with appropriate skills to handle specific types of alarms.

h. *XProtect Mobile Client*: Provide the following alarm notification, alarm list, alarm handling and investigation functionality:

1) *Alarm Notification*: Receive alarm notifications using Push Notifications. Notifications include access to:

a) Video.

b) Alarm information.

c) Work instructions.

2) Alarm List:

a) Alarm list with filtering capabilities:

b) All or personal alarms.

c) All or specific alarm states.

d) All or specific alarm priorities.

e) Thumbnail image from primary camera, at the time of the incident.

f) Click to handle alarm.

3) Alarm Handling:

a) Instant preview of recorded video from primary and related cameras, at the time of the incident.

b) Present the alarm work instructions.

c) Change priority and status of the alarm.

i. Alarm escalation with option to forward alarms to operators with appropriate skills to handle specific types of alarms.

G. Video Processing and Viewing

1. *Multiple Monitor Support*: Support multiple monitors where each monitor shall show multiple floating or full-screen windows for display of views or individual view items.
2. *View Window Aspect Ratios:* Support multiple views optimized for 4:3 and 16:9 display settings in both landscape and portrait orientations.
3. *Private or Shared Views:* Private views can only be access by the user who created them. Views may be shared generally and available to all roles or restricted to specific roles. Viewing of a content item in a shared view is subject to the viewer's permissions relating to the content item.
4. *View Groups:* View groups facilitate view navigation and simplify searching across multiple views by narrowing search scope.
5. *View Layout Persistence*: Same view layout in both live and playback modes.
6. *View Arrange and Restore:* Support simple drag-and-drop re-arrangement of cameras in views for optimized monitoring of incidents, including replacement of individual cameras with different cameras, with single-click restore of original view layout.
7. *View Creation:* Views that display up to 100 view items including cameras, web pages, still images, text and interactive items. View capabilities include, but are not limited to:
    a. *Camera View Item:* Live and recorded camera video displayed in resizable view windows, utilized in several workspaces within the application. Each camera view item contains the following:
        1) *Video Status Indicator:* A round dot indicating one of four states:
            a) *Green:* A connection to the camera is established.
            b) *Red:* Video from the camera is being recorded.
            c) *Yellow:* Playing back recorded video.
            d) *Gray:* The video has not changed for more than two seconds.
        2) *Motion Indicator:* An icon of a moving person that appears only when motion is detected since it was last cleared.
        3) *Bounding-Box Display:* Display of metadata bounding boxes as provided by supported cameras and integrated analytics in live and playback views.
        4) *Update on motion only:* Optimizes CPU use by allowing motion detection to control whether the image should be decoded and displayed.
        5) *PTZ Camera View Item:* PTZ camera view item can be configured to provide virtual joystick camera control and PTZ navigation overlay buttons on the video image.

6) *Overlay Buttons:* Used to add manually controlled speakers, events, outputs, PTZ cameras and to start/stop recording.

b. *Carousel:* Allow a specific view item to automatically sequence rotate through pre-defined set of cameras that are not necessarily present in the view at the same time. Operators may select default or custom display times for each camera, and they are able to manually switch to the next or previous camera in the carousel list.

c. *Hotspot:* Global hotspot function shall allow users to work in detail with any camera selected from any view. Local hotspot function shall allow users to work in detail with a camera selected from the same view.

d. *HTML Page*: Show interactive HTML page.

e. *Image:* Show a still image.

f. *Matrix:* Shows live video from multiple cameras in any view layout with customizable rotation paths, remotely controlled by the computers sending matrix remote commands.

g. *Navigable Map Pages:* Static or active map pages may be used to provide a good overview of premises, and for switching between different views, such as map page displaying a floor plan.

h. *Smart Wall*: Display Smart Wall control providing the following functionality:

1) Show monitor layout of currently selected Smart Wall.

2) Drag-and-drop views to any monitor.

3) Drag-and-drop cameras to any view item location in any monitor.

4) Change Smart Wall via dropdown.

5) Activate Smart Wall preset via dropdown.

i. *Text*: Add text.

j. *3rd party plug-ins*: Add 3rd party plug-ins to extend the behavior of XProtect Smart Client.

8. *Live Video*: Views provide camera live viewing capabilities including, but not limited to:

a. *Live Viewing:* View live video of camera view items on the Live tab.

b. *Manual PTZ Control:* Manual PTZ control options:

1) Video overlaid PTZ control.

2) Joystick.

3) Virtual joystick function.

4) PTZ point-and-click control.

5) Reserve and release PTZ control.

6) PTZ preset positions.

7) Overlay buttons to activate PTZ preset positions.

8) PTZ zoom to a defined rectangle.

9) Start, stop, and pause patrolling.

10) View who have PTZ control and time to automatic release, including anonymous users.

c. *Stream Selection*: Change to any defined live video stream.

1) Manual selection of defined live video stream.

2) *Adaptive Streaming*: Automatic selection of defined live video streams with the best match to the requested resolution.

d. *Send Video to Destination*: Option to send current camera to the following destinations:

1) View item in an existing window.

2) New floating window.

3) View item in any defined Smart Wall.

e. *Digital Zoom:* Magnification of video to facilitate detail viewing.

f. *Bookmarks:* Create quick or detailed bookmarks, to facilitate incident review and documentation.

1) System generated headline for quick bookmark.

2) Optional headline and description information for detailed bookmark.

g. Independent Video Playback:

1) Playback of video in multiple camera view items, each on its own independent timeline.

2) Option to initiate playback mode and synchronizing playback timeline with current time in independent playback.

h. *Instant Change of Camera:* Drag-and-drop placement of a different camera in a camera view item, instantly changes the content to video from the new camera, according to the camera view item's current timeline position.

i. *Smart Map*: Enable quick navigation to smart map, showing the geographic location of the camera, even camera located on a specific level inside a multistory building.

j. *Centralized Search*: Initiate Centralized Search for the camera in a new window.

k. *Manual Recording*: Start and stop manual recording with automatic stop of recording after a configurable number of minutes.

9. *Video Playback:* Views provide additional camera playback capabilities including, but not limited to:

a. *Playback:* Time synchronized play back video of camera view items on the Playback tab.

b. *Navigation:* Advanced video navigation includes:

1) Forward and backwards playback at different speeds:

a) *Playback Speeds*: ¼x, ½x, 1x, 2x, 4x, 8x, 16x.

b) *Instant Realtime Speed*: Toggle 1x playback speed or selected playback speed.

2) Forward and backwards frame-by-frame.

3) Skip to next or previous recorded sequence.

4) Skip to beginning or end of recordings.

5) Jump to date/time.

c. *Timeline:* An overview of recorded sequences and bookmarks via integrated video timeline with time navigation and playback controls, including the following functionality:

1) *Timeline Video Playback:* Video from multiple camera view items integrated to a common video timeline, with common timeline control from any of the integrated camera view item.

2) *Single and Consolidated Timeline*: Two timelines with the first showing overview of selected camera view item and second showing a consolidated overview of all camera view items in the view.

3) *Timeline Period*: Select which period timeline covers.

a) 5, 10, 20 minutes.

b) 1, 2, 4, 8, 12, 16, 20 hours.

c) 1, 2, 4 days.

d) 1, 2, 4 weeks.

4) *Recorded Sequences Overview*: Recorded sequences of video and audio are shown in the timeline. The timeline displaying light-red to indicate recording, red for motion, light-green for incoming audio, and green for outgoing audio. If there are additional sources of data available, these are displayed as other colors.

5) *Bookmarks Overview*: Bookmarks are shown in the timeline with instant preview of the recorded video.

6) *Integrated Time Interval Selection*: Integrated function to select a time interval for export, evidence lock or video and audio retrieval from edge storage devices and interconnected systems.

a) Visual selection on timeline.

b) Select start and end date/time.

c) Loop selected period on playback.

7) *Multi-Window Timeline*: Ability to use one timeline to control playback of cameras in multiple view windows.

d. *Recording Search:* Search listing of camera sequences or bookmarks.

1) *Preview*: Search results may be previewed.

2) *Print*: Print of still image from the selected video clip may be initiated.

3) *Export:* Export of selected video clips may be initiated, reducing time needed to prepare forensic video material.

10. *Send View Item to Smart Wall*: Option to send current view item content to any defined Smart Wall.
    a. *Smart Map*: Send smart map to Smart Wall with the current geographic location, zoom level, and layers.
11. *Two-Way Audio:* Audio from cameras with built-in or attached microphones can be configured for listening. Camera built-in or attached speakers can be configured for use to talk to individuals near speakers. Additional capabilities include:
    a. *Broadcast:* Broad announcements can be made by selecting the All Speakers option when talking.
    b. *Lock to Selected Audio Devices:* Enables continued use of microphones and speakers from selected cameras, while viewing video from a different set of cameras. This enables, for example, informing an individual at risk about the safety status of nearby areas.
    c. *Level Meter:* Level meter indicates the volume of the speaking operator's voice, to indicate whether the operator is at a correct distance from the microphone.
12. *Centralized Search:* Shall enable users to apply multiple search categories and filters to find recording sequences, bookmarks, recordings with motion, alarms, events, vehicles, people, location and data from third-party systems. Logical operators shall enable users to match any or all the search categories. From the search results, users shall be able to preview video and perform various actions, e.g. by exporting the search results or sending the search results to PDF. The search results shall be presented instantly as thumbnail images:
    a. *Sequence Search:* Search in recording sequences on one or more cameras.
    b. *Motion Search:* Search for sequences with motion, or Smart Search for motion in selected areas on one or more cameras.
    c. *Bookmark Search:* Search for bookmark headlines or descriptions.
    d. *Alarms and Events Search:* Search for alarms and events, with the ability to apply filters to refine the search results.
    e. *Location Search:* Search for recording sequences recorded at specific geographic locations. Shall only be available for cameras that provide ONVIF compliant video streams containing metadata about location.
    f. *People Search*: Search for people, with the ability to apply filters to refine the search results, including age, face, gender and height. Shall only be available for cameras that provide ONVIF compliant video streams containing metadata about people.
    g. *Vehicle Search:* Search for vehicles, with the ability to apply filters to refine the search results, including license plate, country code, color, speed, and vehicle type Shall only be available for cameras that provide ONVIF compliant video streams containing metadata about vehicles.

h. *Third-party Systems Search:* Search for metadata from integrated third-party systems.

i. *Sorting By Relevance:* The ability to sort search results by relevance:

1) One or no search categories: The search result with the newest event time shall be displayed first.

2) Multiple search categories combined with logical operator OR: The search result with most matching search categories shall be displayed first.

3) Multiple search categories combined with logical operator AND: The search result with most event times shall be displayed first.

j. *Save Search:* The ability to save searches for reuse:

1) Save searches.

2) Search for and open saved searches.

3) Edit saved searches.

4) Delete saved searches.

k. *Navigation:* Ability to jump to search results through a clickable timeline, or the ability to scroll through the search results.

l. *Preview:* Selected sequence previews with auto play and direct export support.

13. *Video Export and Documentation:* Smart Client options for video export and documentation include, but are not limited to:

a. *Snapshot:* Produce instant visual documentation of a camera by saving the camera image to a file.

b. *Print:* Produce instant visual documentation of a camera by sending it directly to a printer.

c. *Storyboarding:* The storyboarding function makes it possible to include video sequences from different or overlapping time intervals from different cameras in the one and the same export.

d. *Export XProtect Format:* Export in XProtect format; including the standalone XProtect Smart Client — Player application for simple instant viewing by authorities.

e. *Export Preview:* Review video just prior to export, with looped playback option.

f. *Export Other Formats:* Create evidence material in media player format (AVI files), MKV format, or still image format (JPEG images).

g. *Re-Export:* Re-Export allows an authorized individual to export a digitally signed selection from the original video exported. Option to disable re-export, during initial export to XProtect format, prevents undesirable re-distribution of sensitive video recordings.

h. *Bulk Export:* In a single step, export in multiple formats to multiple destinations, including direct export to optical media, to ensure consistency

across exported video sequences in various formats, and reduce human error possibilities.

i. *Export of Comments:* Two video formats support inclusion of comments in exported video:

1) *XProtect Format:* Include general and/or camera-specific comments to a video export file.

2) *Media Player Format:* Include comments as pre/post slides.

j. *Video Incident Report Printing:* Utilize still images rather than clips to print incident reports including images, surveillance details and free-text user comments.

H. Maps

1. *Maps:* Provide multi-layered physical overview of surveillance video coverage, with interactive access to and control of the VMS and related devices, including the following elements:

a. *Map Images:* Illustrated maps or photographs. Supported image file formats are: BMP, GIF, JPEG, JPG, PNG, TIF, TIFF, and WMP.

b. *Camera Icons:* Indicate camera locations on the map. Fixed camera icons show camera view as colored angle radiating from the camera. PTZ camera icons show preset camera views as colored angles radiating from the camera.

1) *Live Preview:* Hover mouse pointer over camera icon to display a live preview in a resizable window.

2) *PTZ Preset Navigation:* Click on PTZ preset view zone moves camera to the preset position.

c. *Microphone Icons:* Microphone icons show microphone locations on the map.

1) *Live Listening:* Place mouse over microphone icon; press and hold left mouse button to listen to incoming audio from microphone.

d. *Speaker Icons:* Indicate speaker locations on the map.

e. *Live Speaking:* Place mouse over speaker icon; press and hold left mouse button to talk through speaker.

2. *Control Icons:* Icons to use for control of objects such as doors, gates, and lights.

3. *Hot Zones:* Hot zones to provide vertical navigation through a hierarchy of maps by clicking on a hot zone.

1. *Map Overview Window:* Navigable overview of map hierarchy set up in XProtect Smart Client.

2. *XProtect Smart Wall Integration:* Drag-and-drop integration of maps with Smart Wall.

3. *Map Image Updates:* When map images are replaced by an updated version of the map image of the same scale, map icons and other elements are kept in their original locations.
4. *Map Display Information:* Information display options include but are not limited to:
    a. Real-time status monitoring indication from all system components including cameras, I/O devices and system servers.
    b. Graphical visualization of the system status through color coding.
    c. Hierarchical propagation of status indications to higher ordered maps.
    d. Different levels of status indications available (alarm, warning and errors).
    e. System performance data for cameras and servers including camera resolution, FPS, network use and disk space.
    f. Ability to suppress status indications (such as alarms and operational status) for a given device.
    g. Editable device names in map and map-specific names and references assignable to devices in Map, subject to user permissions.

I. *Smart Map:* Provide a geographic information system to accurately reflect geography in the real world, enabling access to cameras, microphones, input devices and alarms at multiple locations around the world. Differentiate from Maps, which utilize a different map for each location, by providing the complete picture in a single view, with seamless drilldown across different map layers. Include the following capabilities:

1. *GIS Map Services:* Supported services shall include Milestone, Bing, Google and OpenStreetMap map services.
    a. *Offline OpenStreetMap Map Service*: Support the use of owner-provided OpenStreetMap server for offline use.
2. *Geo-referenced Map Elements:* Shapefiles, CAD drawings, such as DWG and DXF files, and buildings with multiple floor levels shall be supported.
3. *Default World Map:* Standard world geographic background containing geo-reference data but not containing geographic reference features such as county boundaries, and cities.
4. *Map Layers:* Map data layers whose display may be toggled on and off, including but not limited to: Camera name and field of view, quick links, street names, and building and business names.
5. *Camera Selection:* Capabilities include:
    a. Instant one-click camera preview in floating view of up to 25 cameras.
    b. Easy multi-camera selection within camera preview.
    c. Easy drag-and-drop and point-and-click definition of: cameras, camera field of view. Changing cameras placement, direction and field of view automatically update camera position information.

d. Selection of 10 different camera icons.

e. Depiction of camera field of view on map.

6. *Camera And Device Aggregation:* Aggregated cameras and other devices shall be grouped visually to preserve the overview when multiple cameras or other devices are closely located.

   a. Ability to view the number and types of devices inside the grouping.

   b. Ability to zoom to a zoom level that shows all the cameras and devices inside the grouping, including sub-groupings.

7. *Device Naming:* Administrators may name edit devices in a map and assign map-specific names and references to devices in a map.

8. *Navigation*: Easy drag-and-drop and point-and-click definition of:

   a. *Location Links*: Location links shall enable quick navigation across different sites and locations.

   b. *Quick Links*: Quick links shall enable drilldown to existing classic Smart Client maps.

   c. *Building Navigation*: Navigation between different floors in buildings with multiple levels, where only camera related to the specific floor level are presented.

J. Media Storage Management

1. *Archiving:* Recorded video data may be automatically moved from a container's live database storage to its archived storage. Archived data is still online and available to client software.

2. *Grooming*: Video data grooming possibility to enable reduction of video recording data size by reducing the frame rate of the video data when archiving.

3. *Maximum Recording Times:* Maximum recording times may be set for manual recordings, with VMS deleting older video to free up storage for newer video.

4. *Edge Video Storage:* Provide utilization of camera-based storage including the following capabilities:

   a. *Video and Audio Retrieval:* Retrieving video and audio recordings across low-bandwidth connections based on time profiles, events or manual requests.

   b. *Video and Audio Consolidation:* Consolidating video and audio from multiple storage mechanisms:

      1) Seamless merging of video and audio stored centrally in media database, and video and audio retrieved from associated camera edge storage, or from an interconnected system.

      2) Optionally consolidate pre-event images recorded locally in camera or video encoder.

   c. *Scalable Video Quality Recording (SVQR):* Capability to record high quality video using edge storage and record low quality video centrally, to minimize network bandwidth utilization, using the capabilities described above. High

quality video can be retrieved when needed, on an event-driven, scheduled or manual basis.

5. *Evidence Lock:* Provide capabilities for assuring the availability of recorded video selected for evidentiary use, including:
    a. *Extension of Video Retention:* Manual extension of video retention time for a selected set of cameras, and its related devices, in a given time interval, where the operator selects an extended retention time from a pre-defined set of retention time options.
    b. *Video Sequence Metadata:* Users may add headline and comments information to locked video sequences to enhance their manageability.
    c. *Management of Locked Video Sequences:* Search, filter and listing functions including editing comments, modifying extended retention time and removing an evidence lock.
    d. *Locked Video Export:* Locked video may be exported though a single step operation.

K. XProtect Mobile Server
1. *User Authentication:* Facilitate the following methods of user authentication:
    a. *Basic Authentication:* Basic user VMS account.
    b. *Windows Authentication:* Via Active Directory or local Windows user account. Possible to use current Windows user to facilitate single sign-on.
    c. *Two-Step Verification:* In addition to login capabilities, provide two-step authentication via a verification code transmitted to the user's registered email address, with a five-minute timeout for verification code expiration, and a user login block for exceeding the maximum number of failed code entry attempts, which defaults to three but may be adjusted.
2. *Direct Streaming:* Configure the use of client requested live video streams without server transcoding.
3. *Adaptive Streaming:* Configure the use of automatic live video streams selection depending on the resolution requested by the client.
4. *Dynamic Bandwidth Optimization:* Optimize camera video stream from server to client to make optimum use of bandwidth.
5. *Bookmarks:* Enable the use of bookmarks in live video and recorded video.
    a. *Smart Connect:* Easy configuration of internet access to the Mobile Server by automatic configuration of firewalls and internet routers via UPnP, with verification of configuration and operation of internet connection, with option to email connection details to XProtect Mobile client users. Includes automatic Mobile Server on LAN via UPnP.

L. Xprotect Web Client
1. Provide the following browser-based capabilities:
    a. User Authentication:
        1) Require only username and password.

2) Enable basic users to change password during login.

3) Support two-step verification.

4) User authentication and authorization is handled by XProtect Mobile Server.

b. *Inherit System Views:* Automatically obtain the user's private and shared views configuration from the system.

c. *All-Camera View:* Automatically generate a view for all cameras when no views are set up.

d. *Two-Way Audio:* Audio from cameras with built-in or attached microphones can be configured for listening. Camera built-in or attached speakers can be configured for use to talk to individuals near speakers. Audio playback shall be available for investigations, video exports and alarms. Additional capabilities include:

1) *Broadcast:* Broad announcements can be made by selecting a microphone icon on the view level when talking.

2) *Use the Push-to-talk (PTT) Feature:* Communicate via the VMS system, through a PC microphone and while watching live video from one camera, with people near a video camera with audio equipment. Push-to-talk (PTT) is also available in Actions.

e. *Live Video Monitoring:* View live video with PTZ control including use of presets, video playback, and triggering of camera-related outputs and events from within the camera's view.

f. *Search:* Search function to find cameras, types of camera, cameras with related microphones, cameras with related speakers and camera views.

g. *Video Export:* Provide video export, with the option to preview and store exported video on the server, and make it available for later usage or download, for example, when a higher-bandwidth connection is in use:

1) *AVI, MKV, XProtect Format files:* Ability to create AVI, MKV or XProtect format export files.

2) *Still Image Export:* Provide camera view JPEG image export.

3) *Audio:* Option to include audio in the export package.

4) *Export On Server:* Ability to export on the server to avoid moving large files.

5) *Exceed Retention Time:* Ability to store video recordings for a period that is longer than the retention time.

6) *Play Back Deleted Recordings:* Ability to play back the recordings even if the recordings have been deleted from the media database.

7) *Reduced Download:* Ability to download only needed files or save them for downloading when on a faster connection.

8) *Preview On Server:* Preview exports on the server without downloading them.

h. Data Integrity Of Exported Video:

1) *Encryption And Password Protection:* Option to encrypt and password protect any of the available export formats.

2) *256-bit AES Encryption*: Ability to encrypt exports using 256-bit AES algorithm.

3) *Digital Signature:* Digitally signed media exports with SHA-2 algorithm to establish a means of detecting modification of exported video.

i. *Bookmarks:* Bookmarks shall be applicable for live video and recorded video:

1) Ability to create quick or detailed bookmarks to facilitate incident review and documentation.

2) Ability to edit and delete bookmarks and to use filtering to find bookmarked video.

j. *Secure Connection:* Connect to XProtect Mobile Server through trusted CA certificates for HTTPS encryption.

k. Supported Browsers:

1) Microsoft Edge

2) Safari

3) Google Chrome

4) Mozilla Firefox

l. *Browser Plug-Ins or Extensions*: No plug-ins or extensions to be installed.

M. XProtect Mobile Client

1. Provide the following native-app mobile client capabilities:

a. User Authentication:

1) Require only user name and password.

2) Enable basic users to change password during login.

3) Support two-step verification.

4) User authentication and authorization is handled by XProtect Mobile Server.

b. *Multiple Server Profiles:* Select between multiple server profiles to facilitate easily switching between sites or different connection addresses.

c. Views and View Groups: Automatically obtain the user's private and shared views from the system to be used as camera lists.

1) *View Groups:* Views shall be organized in view group folders. View groups shall also have the capability of organizing subordinate view groups.

2) *All-Camera View:* Automatically generate a view for all cameras when no views are set up.

d. *Two-Way Audio:* Audio from cameras with built-in or attached microphones can be configured for listening. Camera built-in or attached speakers can be configured for use to talk to individuals near speakers. Audio playback shall be available for investigations and alarms. Additional capabilities include:

   1) *Use the Push-to-talk (PTT) Feature:* Communicate via the VMS system, through the microphone of the mobile device and while watching live video from one camera, with people near a video camera with audio equipment. Push-to-talk (PTT) is also available in access control.

e. *Full-Screen View:* Display cameras in full screen to take better advantage of the mobile device's screen, with camera view navigation in full screen by swiping left or right.

f. *Pinch-To-Zoom:* Digital pinch-to-zoom shall enable mobile users to enlarge a part of the image for closer review and conduct detailed investigation of video.

g. *Picture-In-Picture*: Provide the following functionality for Picture-In-Picture:

   1) Display a live picture-in-picture frame of the same camera when in playback mode.

   2) The picture-in-picture shall be movable by dragging.

   3) Double-tapping and will return to live view.

   4) Hide live picture-in-picture frame.

h. *Search:* Search function to find cameras, types of camera, cameras with related microphones, cameras with related speakers, and camera views.

i. *Navigation:* Ability to navigate recorded video using a time picker and to adjust the start time by dragging a timeline scroller.

j. *Bookmarks:* Bookmarks shall be applicable for live video and recorded video.

   1) Ability to create quick or detailed bookmarks to facilitate incident review and documentation.

   2) Ability to edit and delete bookmarks and to use filtering to find bookmarked video.

k. *Mobile Video Push:* Provide XProtect Mobile client capability for mobile device users to use their mobile device cameras as cameras in the VMS, including the following characteristics:

   1) *No Mobile Setup:* No mobile device setup shall be required for mobile video push. Provide central server-side configuration.

   2) *Metadata Support:* Mobile users shall be able to include metadata in the video submitted.

   3) *Audio*: Mobile users shall be able to include audio in the video submitted.

l. *Investigation*: Provide access to investigations created in the XProtect Web Client.

m. *Secure Connection:* Connect to XProtect Mobile server through trusted CA certificates for HTTPS encryption.

n. Supported Mobile Operating Systems:

1) Android

2) iOS

N. SDK-Based Integration

1. *Milestone Integration Platform Software Development Kit (MIP SDK)*: The VMS shall support a software development kit (*MIP SDK*) that allows integrating the video management system with third-party applications, for example access control and video analytics.

2. *Integration Types and Functionalities*: Integration of third-party applications and plug-ins shall be possible in three different ways:

a. Integration through network protocols shall allow for the possibility to choose coding platform. Protocol integration shall make it possible to:

1) Retrieve, save, and change the configuration of the VMS through a SOAP or RESTful API.

2) Retrieve live or recorded video, audio, and metadata.

3) Send control commands and events to the VMS.

4) Receive VMS status information, for example if a camera is down or a server is running out of space.

5) Implement protocols on Windows, Java® and Linux® systems.

b. Integration through the .NET libraries which shall allow for using software components to integrate with the VMS. .NET integration shall make it possible to:

1) Retrieve, save, and change the configuration of the VMS.

2) Retrieve live and recorded audio and metadata.

3) Display live and recorded video with optional overlay of graphics.

4) Issue control commands to the VMS or related device, for example a camera with PTZ and outputs.

5) Send and receive events to the VMS.

c. Integration through a plug-in embedded directly into the VMS environment that shall run as part of the VMS and client applications. Plug-in integration shall make it possible to:

1) Be integrated with the event server, enabling the event server to use plug-in functionality. This shall allow event-based functionality to be executed without the need for an open user interface.

2) Be integrated with XProtect Smart Client, enabling the application to use plug-in functionality.

3) Be integrated with XProtect Management Client, enabling the application to use plug-in functionality.

4) Plug-ins shall be able to run across all products and versions of the VMS.

5) Plug-ins shall be able to listen for events from other plug-ins.

6) It shall be possible to activate licenses for third party plug-ins in XProtect Management Client.

d. Integration with Intelligent Video Analytics - through a cloud native containerized microservice-based application - shall make it possible to:

1) Deploy video analytics applications on the NVIDIA EGX platform.

2) Register video analytics applications with the VMS through a GraphQL API.

3) Discover available cameras, microphones, and media streams managed by the VMS through a GraphQL API.

4) Access media streams from video analytics applications using standard protocols, such as RTSP and gRPC.

5) Allow for events, metadata and media streams to be sent back into the VMS from video analytics applications using Kafka, gRPC, or a RESTful API.

3. *Integration Capabilities*: Third party applications shall be able to integrate with the VMS to access a variety of functionalities:

a. Video, Audio, and Metadata Functionality:

1) Retrieve and play live and recorded video.

2) Retrieve and play live and recorded audio.

3) Retrieve and access live and recorded metadata.

4) Retrieve and display single images (JPEG).

5) Export video and audio in AVI, MKV and native database format.

6) Place overlay information on live and recorded video in component-based implementation and in plug-ins for XProtect Smart Client.

7) Create, find, and delete bookmarks.

b. Configuration:

1) Retrieve and change VMS configuration, including camera, user and alarm information.

2) Enable third party applications to save and retrieve their own configuration.

c. *Authentication and Authorization*. Logins and authorization of third-party plug-ins, applications and protocol integrations:

1) Manage user rights on plug-in functionality.

2) A framework for system access and security token handling.

d. Event and Alarms:

1) Trigger internal (system-related) and external (integrated) events and alarms.
2) A specific event can trigger start or stop recording.
3) Search for existing alarms and events.
4) Update and acknowledge alarms.

e. *Licensing*. Read licenses and add own plug-in license:
1) Licensing of third-party integrations
2) Integration with online registration

f. System status:
1) Receive all status messages from the VMS, including server disk, CPU usage, and triggered events.

g. *Control*. Trigger output, control PTZ, start/stop recordings:
1) Send PTZ commands to cameras.
2) Retrieve PTZ position from absolute PTZ cameras.
3) Send a start or stop recording event from a specific event.
4) Set bookmarks in recording.
5) Activate external output.
6) Control video wall application functionality.
7) Send camera to a video-sharing monitor.
8) Send commands to third party-developed plug-ins.
9) Playback time controller.
10) Support for displaying plug-in items on smart map in XProtect Smart Client.
11) Change XProtect Smart Client theme

h. *System and Audit logs*. Generate log entries and reads logs:
1) Write and read systems and audit logs.

4. Use cases:
a. Compatibility with XProtect Transact, which integrate video surveillance with automatic teller machines (ATM), point-of-sale (POS) and enterprise resource planning (ERP) systems for managing loss prevention and fraud.
b. Compatibility with XProtect LPR for automatic reading and tracking of vehicle license plates.
c. Event integration via a simple message-based socket communication interface enabling external applications to trigger events in the VMS.
d. Functionality for external applications to trigger user-defined events in the VMS.

O. Computer Equipment

1. *Computer Requirements:* Consult with VMS manufacturer to determine current computer requirements appropriate for system design, intended use and desired level of performance. Optimize server computer count, and server application distribution across servers, to account for likely system expansion. The following are minimum requirements.

    a. Computer Running XProtect VMS:

        1) *CPU:* Intel® Core™ i3 or better.

        2) *RAM:* 16 GB or more.

        3) *Network:* Ethernet 2 x 1 Gbit or better.

        4) *Graphics Adapter:* Onboard GFX, AGP or PCI-Express, minimum 1024×768, 16-bit color or better.

        5) *Hard Disk Space:* 50 GB free or more (depends on number of servers, devices, rules, and logging settings).

        6) Operating System:

            a) For Individual Servers:

            b) Microsoft Windows 8.1 Pro (64 bit).

            c) Microsoft Windows 8.1 Enterprise (64 bit).

            d) Microsoft Windows 10 Pro (64 bit).

            e) Microsoft Windows 10 Enterprise (64 bit).

            f) Microsoft Windows 10 Enterprise LTSB (Long-Term Servicing Branch) 2016 (version 1607 or later).

            g) Microsoft Windows 10 IoT Enterprise, version 1803 or later (64 bit), IoT Core.

            h) Microsoft Windows Server 2012 (64 bit): Standard and Datacenter.

            i) Microsoft Windows Server 2012 R2 (64 bit): Standard and Datacenter.

            j) Microsoft Windows Server 2016 (64 bit): Essentials, Standard and Datacenter.

            k) Microsoft Windows Server 2019 (64 bit): Essentials, Standard or Datacenter.

            l) To Run Clustering/Failover Management Server:

            m) Microsoft Windows Server 2012/2012 R2 (64 bit) Standard or Datacenter.

            n) Microsoft Windows Server 2016 (64 bit) Essentials, Standard or Datacenter.

            o) Microsoft Windows Server 2019 (64 bit) Essentials, Standard or Datacenter.

        7) Software:

a) Microsoft .NET 4.7.2 Framework.

b) Microsoft .NET Core 3.1.13.

c) DirextX 11 or newer.

P. Licensing

1. *License Activation:* VMS shall offer easy-to-use automatic or manual online activation via the Internet and alternatively, offline activation via email and web for closed surveillance networks.
2. Server Base License:
   a. Require one mandatory XProtect Corporate server base license for installing the product.
   b. Server base license shall permit the following deployments within the legal entity purchasing the base license:
      1) Unrestricted number of Management Server services.
      2) Unrestricted number of Recording Server services.
      3) Unrestricted number of XProtect Smart Client, XProtect Web Client and XProtect Mobile client applications.
3. XProtect Smart Wall License:
   a. XProtect Smart Wall license shall permit connection of an unrestricted number of XProtect Smart Wall instances (including physical displays) and camera feeds.
4. Hardware Device License:
   a. Require one license per hardware IP address to connect:
      1) Cameras.
      2) Audio devices.
      3) Video encoders.
      4) Other devices.
   b. Support an unlimited number of hardware device licenses.
5. Licensing of Milestone Interconnect:
   a. Require one Milestone Interconnect device license per camera in an interconnected site that is enabled in the central XProtect Corporate system.
   b. Interconnect license shall be tied to the parent XProtect Corporate system showing the interconnected devices.
6. Licensing of Milestone Federated Architecture:
   a. The use of Milestone Federated Architecture is free and not subject to licensing. This implies that unrestricted sites and licensed cameras can be included in the federated hierarchy, without the need for additional or special licenses.
7. *License Overview Information:* License overview shall include add-on products.

8. *License Administration:* Provide expanded license information for multi-site installations where both the total used licenses for the common base license is presented along with the license use in the specific site.
    a. *Changes Without Activation:* A “Changes without activation” function shall allow additions and replacements of limited number of devices without requiring license device activation or reactivation.

Q. Video Management Data Storage Server
1. EIA 19” Rack Mount chassis, including all necessary mounting rails and hardware to mount in DIN (square hole) 4 post racks as provided under the work of Section 27 11 16 – Communications Cabinets, Racks, Frames and Enclosures.
2. Each server not less than 2RU high.
3. The server shall have the minimum capacities as required by the VMS manufacturer including:
    a. CPU's: As required by the VMS Manufacturer.
    b. RAM: As required by the VMS Manufacturer.
    c. Operating System: As required by the VMS Manufacturer.
    d. USB or PS/2 style mouse port
    e. USB or PS/2 style keyboard port
    f. Dual 10/100/Gigabit/10Gigabit Ethernet Adapters
    g. Display Adapter (at least 1024 x 768 resolution @ 65,536 colors)
    h. If server cannot boot from iSCSI Raid Array, provide a boot disk hard drive, at least 1T SATA or SAS.
4. Quantity of servers: As required and recommended by the VMS manufacturer for the quantity equal to 1.3 times the number of cameras provided under the work of this Project.
5. Features/Functions/Performance - iSCSI Raid Arrays
    1) Total Capacity: As required to capture full-motion video at highest resolution of specified cameras stored without overwriting for at least 30 days continuous operation, assuming:
        1) 1.3 times the camera count initially provided with the Project.
        2) 3.5 megapixel recording resolution per camera or greater as required to match supplied cameras.
        3) H.264 compression
        4) 40% activity (motion present 40% of period)
            a) 15 frame per second motion recording
        5) Minimum RAID Architecture:
            a) As required by the VMS Manufacturer.
        6) Minimum Construction and Performance

a) As required by the VMS Manufacturer.

7) Rack mountable, EIA 19", including all necessary mounting rails and hardware to mount in square hole) 4 post racks with DIN (square) openings

8) Not larger than 6 RU.

R. Manufacturers, VMS System:

1. Milestone Systems, Inc XProtect Corporate (District Standard, No Substitution)

S. Manufacturers, Servers

1. As pre-qualified by the VMS Manufacturer.
2. BCDVIDEO
3. HP
4. Dell
5. Or equal.

T. Manufacturers, iSCSI Array: Quantity - As required to meet storage requirement.

1. As pre-qualified by the VMS Manufacturer.
2. NetApp Inc.
3. Isilon Systems
4. Dell
5. HP
6. pivot
7. Or equal.

U. Manufacturers, Hard Drives for iSCSI Array

1. Seagate
2. Western Digital
3. Or equal.

V. Rack Mount Monitor, Keyboard and 19” Display

1. Drawing Reference: 19RMMKVMK
2. Minimum Features, Functions, Performance, Construction
    a. Combines an 8-port KVM switch, 19” LCD screen, full keyboard and touchpad in a 1U rack-mountable drawer assembly.
    b. Mounts into 19”-wide rack, 26”-38” deep.
    c. Control up to 8 servers from a single, easily accessible console.
    d. Includes eight cables that support computers with either PS/2 or USB connections
    e. Flip-up/fold-down screen keeps the console from blocking access to rack equipment when not in use:

f. 19” monitor supports video resolutions up to 1280 x 1024

g. DDC emulation allows optimal output to the LCD

h. Multi-Level Password Security

i. Enhances security by limiting access to an administrator and up to 4 local users

j. Two-level log-out allows for manual log-out or automatic log-out after a user-defined period of time has passed.

3. Manufacturers:

a. Tripplite B020-U08-19-K

b. APC

c. Or equal.

2.5 CAMERAS AND RELATED

A. IP Surveillance Indoor and Outdoor Dome Camera, 5MP Dome network camera:

1. Drawing References:

a. Interior Cameras, Circle with 1 in center and one arrowhead, subscript CI

b. Exterior Cameras, Circle with 1 in center and one arrowhead, subscript CE

2. The dome network camera shall meet or exceed the following performance specifications:

a. Image sensor 1/2.7” progressive scan RGB CMOS

b. Lens
   1) Varifocal, 3–8 mm, F1.3
   2) Horizontal field of view: 104°–40°
   3) Vertical field of view: 74°–29°
   4) Remote zoom and focus, P-Iris control, IR corrected

c. Day and night Automatically removable infrared-cut filter

d. Minimum Illumination
   1) With Forensic WDR and Lightfinder 2.0:
      a) Color: 0.13 lux at 50 IRE, F1.3
      b) B/W: 0 lux at 50 IRE, F1.3

e. Shutter speed 1/33500 s to 1/5 s

f. Camera angle adjustment Pan ±180°, tilt ±75°, rotation ±175°

g. Video Compression
   1) H.264 (MPEG-4 Part 10/AVC) Baseline, Main and High Profiles
   2) H.265 (MPEG-H Part 2/HEVC) Main Profile
   3) Motion JPEG

h. Resolution 2592x1944 to 160x90

i. Frame rate 25/30 fps with power line frequency 50/60 Hz

j. Video streaming

1) Multiple, individually configurable streams in H.264, H.265, and
2) Motion JPEG
3) Axis Zipstream technology for H.264 and H.265
4) Controllable frame rate and bandwidth
5) VBR/ABR/MBR H.264/H.265

k. Multi-view Streaming
1) Up to 2 individually cropped out view areas in full frame rate

l. Image settings
1) Compression, color saturation, brightness, sharpness, contrast, local contrast, white balance, day/night threshold, tone mapping, exposure control (including automatic gain control), motion-adaptive exposure, exposure zones, defogging, Forensic WDR: up to 120 dB depending on scene, barrel distortion correction, fine tuning of low-light behavior, dynamic text and image overlay, privacy masks, mirroring, rotation: 0°, 90°, 180°,270°, including Corridor Format

m. Pan/Tilt/Zoom Digital PTZ, preset positions

n. Audio Streaming Full duplex

o. Audio Encoding
1) 24bit LPCM, AAC-LC 8/16/32/44.1/48 kHz, G.711 PCM 8 kHz, G.726 ADPCM 8 kHz, Opus 8/16/48 kHz
2) Configurable bit rate

p. Audio Input/Output
1) External microphone input, line input, digital input with ring power, line output, automatic gain control
2) Two-way audio connectivity via optional AXIS T61 Audio and I/O Interfaces with portcast technology

q. Security
1) Password protection, IP address filtering, HTTPSa encryption, IEEE 802.1X (EAP-TLS)a network access control, digest authentication, user access log, centralized certificate management, brute force delay protection, signed firmware, secure boot, Axis Edge Vault with Axis device ID

r. Supported Protocols
1) IPv4, IPv6 USGv6, HTTP, HTTP/2, HTTPS, SSL/TLS, QoS Layer 3 DiffServ, FTP, SFTP, CIFS/SMB, SMTP, Bonjour, UPnP®, SNMP v1/v2c/v3 (MIB-II), DNS, DynDNS, NTP, RTSP, RTP, SRTP, TCP, UDP, IGMP, RTCP, ICMP, DHCPv4/v6, ARP, SOCKS, SSH, SIP, LLDP, MQTT v3.1.1, Syslog

s. Application Programming Interface
1) Open API for software integration, including VAPIX® and AXIS Camera Application Platform; specifications at axis.com
2) AXIS Video Hosting System (AVHS) with One-Click Connection
3) ONVIF® Profile G, ONVIF® Profile S, and ONVIF® Profile T, specification at onvif.org
4) Support for Session Initiation Protocol (SIP) for integration with Voice over IP (VoIP) systems, peer to peer or integrated with SIP/PBX

t. Casing
   1) IP52-rated, IK10 impact-resistant polycarbonate casing with hard-coated dome and dehumidifying membrane
   2) Encapsulated electronics and captive screws
   3) Color: white NCS S 1002-B

u. Mounting
   1) Mounting bracket with holes for junction box (double-gang, single-gang, and 4" octagon) and for wall or ceiling mount ¼"-20 UNC tripod screw thread

v. Sustainability PVC free

w. Memory 1024 MB RAM, 512 MB Flash

x. Power
   1) Power over Ethernet (PoE) IEEE 802.3af/802.3at Type 1 Class 3
   2) Typical 6.5 W, max 10.5 W

y. Connectors
   1) RJ45 10BASE-T/100BASE-TX/1000BASE-T PoE
   2) I/O: 4–pin 2.5 mm (0.098 in) terminal block for 1 supervised digital input and 1 digital output (12 V DC output, max. load 25 mA)
   3) Audio: 4-pin 2.5 mm (0.098 in) terminal block for audio in and out
   4) Audio and I/O connectivity via AXIS T61 Audio and I/O Interfaces with portcast technology

z. IR illumination
   1) OptimizedIR with power-efficient, long-life 850 nm IR LEDs
   2) Range of reach 40 m (130 ft) or more depending on the scene

aa. Storage
   1) Support for microSD/microSDHC/microSDXC card
   2) Support for SD card encryption (AES-XTS-Plain64 256bit)
   3) Recording to network-attached storage (NAS)

bb. Operating Conditions
   1) 0 °C to 50 °C (32 °F to 122 °F)
   2) Humidity 10–85% RH (non-condensing)

3. Manufacturer:

   a. Interior Camera, Fixed
      1) Axis Communications P3247-LV (Design Basis)
         a) Provide the following mounts, as scheduled
            a. Axis T94K01D Pendant Kit including weather shield.
            b. Axis T91 Mounts

   b. Exterior Camera, Fixed
      1) Axis Communications P3247-LVE (Design Basis)
         a) Provide the following mounts, as scheduled
            a. Axis T94T01D Pendant Kit
            b. Axis T91 Mounts

B. IP Surveillance Interior/Exterior Dome Camera, Three Camera Sensors minimum, Fixed, 180° Combined Horizontal Angle:

1. Drawing References:
   a. Interior Cameras, Circle with 3 in center and three arrowheads, subscript CI
   b. Exterior Cameras, Circle with 3 in center and three arrowheads, subscript CE
2. The fixed dome multi-sensor network camera shall meet or exceed the following design specifications:
   a. Image sensor 4 x 5 MP 1/2.5” progressive scan RGB CMOS
   b. Lens
      1) Fixed 5.9 mm, F1.88
      2) Horizontal field of view: 180°
      3) Vertical field of view: 38°
   c. Day and night Automatically removable infrared-cut filter
   d. Minimum illumination
      1) With Forensic WDR and Lightfinder:
         a) Color: 0.16 lux, F2.0
         b) B/W: 0.06 lux, F2.0
   e. Shutter time 1/40000 to 1/25 s
   f. Camera angle adjustment
      1) Pan ± 135°
      2) Tilt 15° to 92°
      3) Roll ± 8°
   g. Video compression
      1) H.264 (MPEG-4 Part 10/AVC) Baseline, Main and High Profiles
      2) H.265 (MPEG-H Part 2/HEVC) Main Profile
      3) Motion JPEG
   h. Resolution 8192x1728 (14.2 MP) to 608x128
   i. Frame rate
      1) 14.2 MP @ 25/30 fps (50/60 Hz) WDR
   j. Video streaming
      1) One configurable stream in H.264, H.265 and Motion JPEG in full frame rate
      2) Multiple individually configurable streams in reduced frame rate
      3) Controllable frame rate and bandwidth
      4) VBR/ABR/MBR H.264/H.265
   k. Image settings
      1) Saturation, contrast, brightness, sharpness, Forensic WDR: up to120 dB depending on scene, white balance, day/night threshold, exposure mode, compression, dynamic text and image overlay, orientation aid, exposure control, noise reduction, fine tuning behavior at low light, polygon privacy masks
   l. Security
      1) Password protection, IP address filtering, HTTPS encryption, IEEE 802.1X (EAP-TLS)a network access control, digest authentication, user

access log, centralized certificate management, brute force delay protection, signed firmware, protection of cryptographic keys with FIPS 140-2 certified TPM 2.0 module, Axis Edge Vault with Axis device ID

m. Supported protocols
   1) IPv4, IPv6 USGv6, ICMPv4/ICMPv6, HTTP, HTTP/2, HTTPS, TLS QoS Layer 3 DiffServ, FTP, SFTP, CIFS/SMB, SMTP, mDNS (Bonjour), UPnP®, SNMP v1/v2c/v3 (MIB-II), DNS/DNSv6, DDNS, NTP, RTSP, RTP, TCP, UDP, IGMP, RTCP, ICMP, DHCPv4/v6, ARP, SOCKS, SSH, LLDP, CDP, MQTT, Syslog, Link-Local address (ZeroConf)

n. Application Programming Interface
   1) Open API for software integration
   2) ONVIF® Profile S and ONVIF® Profile G, specification at onvif.org

o. Analytics Included
   1) video motion detection, active tampering alarm
   2) Supported
   3) perimeter defender, motion guard, fence guard, loitering guard
   4) Support for installation of third-party applications.

p. Event triggers Analytics, edge storage events, shock detection

q. Event actions
   1) Day/night mode, overlay text, video recording to edge storage, pre- and post-alarm video buffering, send SNMP trap
   2) File upload: FTP, SFTP, HTTP, HTTPS network share, email
   3) Notification: email, HTTP, HTTPS TCP

r. Data streaming Event data

s. Built-in installation aids Pixel counter, Leveling guide

t. Casing
   1) IP66-/IP67- and NEMA 4X-rated, IK10-rated impact-resistant casing with polycarbonate hard coated clear dome, aluminum base and dehumidifying membrane
   2) Color: white NCS S 1002-B
   3) For repainting instructions of skin cover or casing and impact on warranty, contact your distributor partner.

u. Mounting
   1) Mounting bracket with junction box holes (double-gang, single-gang, 4” square, and 4” octagon)
   2) ¾” (M25) conduit side entries

v. Sustainability PVC free

w. Memory 1024 MB RAM, 512 MB Flash

x. Power
   1) Power over Ethernet (PoE) IEEE 802.3at Type 2 Class 4
   2) Typical 12 W, max 22.5 W

y. Connectors
   1) Shielded RJ45 1000BASE-T

2) Terminal block for two configurable supervised inputs/digital outputs (12 V DC output, max load 50 mA), 3.5 mm analog/digital mic/line in

z. Storage
1) Support for microSD/microSDHC/microSDXC card
2) Support for SD card encryption
3) Support for recording to network-attached storage (NAS)

aa. Operating conditions
1) -40 °C to 50 °C (-40 °F to 122 °F)
2) Humidity 10–100% RH (condensing)
3) Maximum temperature according to NEMA TS 2 (2.2.7): 74 °C (165 °F)
4) Start-up temperature: -40 °C

3. Manufacturer:

a. Axis Communications Q3819-PVE (Design Basis)
1) Provide the following mounts, as required:
(1) Axis T94A01D Pendant Kit
(2) Axis T91B61 Wall Mount
(3) Axis T91B51 Ceiling Mount
(4) Axis T94A02F Ceiling Bracket
(5) Axis T91A64 Corner Bracket
(6) Axis T91B50 Telescopic Ceiling Mount

b. Or equal.

C. IP Surveillance Interior/Exterior Dome Camera, Four Camera Sensors, Fixed, 360° Combined Horizontal Angle:

1. Drawing References:

a. Interior Cameras, Circle with 4 in center and four arrowheads, subscript CI

b. Exterior Cameras, Circle with 4 in center and four arrowheads, subscript CE

2. The panoramic network camera shall meet or exceed the following design specifications:

a. Image sensor 4 x 1/2.8” progressive scan RGB CMOS

b. Lens
1) Varifocal, 3–6 mm, F1.8–2.6
2) 4x1080p capture mode:
3) Horizontal field of view: 96°–49°
4) Vertical field of view: 53°–27°
5) Diagonal field of view: 113°–55°
6) Motorized focus, motorized zoom

c. Day and night Automatically removable infrared-cut filter

d. Minimum illumination
1) Color: 0.20 lux at 50 IRE F1.8
2) B/W: 0.04 lux at 50 IRE F1.8, 0 lux with IR illumination on

e. Shutter speed 1/66500 s to 1/5 s with 50/60 Hz

f. Camera angle adjustment Pan ±90°, tilt 5–65°, rotation 5–95°, twist ±20°

g. System on chip (SoC)
   1) Model S5
   2) Memory 2048 MB RAM, 512 MB Flash

h. Video compression
   1) H.264 (MPEG-4 Part 10/AVC) Baseline, Main and High Profiles
   2) H.265 (MPEG-H Part 2)

i. Resolution 4 x 2560x1440 (4 x QHD 1440p) to 80x60

j. Frame rate Up to 25/30 fps (50/60 Hz)

k. Video streaming
   1) Multiple, individually configurable streams in H.264 and H.265
   2) Axis Zipstream technology in H.264 and H.265
   3) Controllable frame rate and bandwidth
   4) VBR/ABR/MBR H.264

l. Image settings
   1) Saturation, contrast, brightness, sharpness, WDR, white balance, exposure control, rotation: 0°, 90°, 180°, 270° including Corridor Format, dynamic text and image overlay, polygon privacy mask, compression

m. IP address One IP address for all channels

n. Security
   1) Password protection, IP address filtering, HTTPSa encryption, IEEE 802.1X (EAP-TLS)a network access control, digest authentication, user access log, centralized certificate management, brute force delay protection, signed firmware

o. Supported protocols
   1) IPv4, IPv6 USGv6, ICMPv4/ICMPv6, HTTP, HTTP/2, HTTPS, TLS, QoS Layer 3 DiffServ, FTP, CIFS/SMB, SMTP, mDNS (Bonjour), UPnPTM, SNMP v1/v2c/v3 (MIB-II), DNS/DNSv6, DDNS, NTP, RTSP, RTP, SRTP, SFTP, TCP, UDP, IGMPv1/v2/v3, RTCP, ICMP, DHCPv4/v6, ARP, SOCKS, SSH, LLDP, CDP, MQTT v3.1.1, Syslog, Link-Local address (ZeroConf)

p. Application Programming Interface
   1) Open API for software integration, including VAPIX® and
   2) AXIS Camera Application Platform; specifications at axis.com
   3) One-click cloud connection
   4) ONVIF® Profile G, ONVIF® Profile S and ONVIF® Profile T, specification at onvif.org

q. Analytics Included
   1) AXIS Motion Guard, AXIS Fence Guard, AXIS Loitering Guard
   2) AXIS Video Motion Detection, active tampering alarm
   3) Support for AXIS Camera Application Platform enabling installation of third-party applications, see axis.com/acap.

r. Event triggers

1) Detectors, hardware, input signal, storage, system, time, analytics, edge storage events
2) MQTT subscribe

s. Event actions
1) Day/night vision mode, overlay text, record video, send images, send notification, send SNMP trap, send video clip, status LED
2) File upload: FTP, HTTP, HTTPS, network share, SFTP and email
3) Notification: email, HTTP, HTTPS, TCP and SNMP trap
4) MQTT publish

t. Data streaming Event data

u. Built-in installation aids Pixel counter, focus assistant, remote focus, remote zoom

v. Casing
1) IP66-, IP67-, NEMA 4X-rated, IK09 impact-resistant, aluminium and plastic casing with polycarbonate hard-coated dome, sunshield (PC/ASA)
2) Color: white NCS S 1002-B

w. Mounting
1) Mounting bracket with junction box holes (double gang box, single gang box, 4” octagon junction box and 4” square junction box)
2) ½” (M20) conduit side entry
3) ¾” (M25) conduit adapter included

x. Sustainability PVC free

y. Power
1) Power over Ethernet (PoE) IEEE 802.3at Type 2 Class 4
2) IR illumination on: class 4, typical 16.3 W, max 25.5 W
3) IR illumination off: class 3, typical 10.7 W, max 25.5 W

z. Connectors
1) Shielded RJ45 10BASE-T/100BASE-TX/1000BASE-T PoE
2) Audio and I/O connectivity via AXIS T61 Audio and I/O Interfaces with portcast technology

aa. IR illumination
1) Four individually controllable IR with power-efficient, long-life 850 nm IR LEDs
2) Range of reach 15 m (49.2 ft) or more depending on the scene

bb. Storage
1) Support for microSD/microSDHC/microSDXC card
2) Dual SD cards
3) Support for SD card encryption
4) Support for recording to network-attached storage (NAS)

cc. Operating conditions
1) -30 °C to 50°C (-22 °F to 122 °F)
2) Humidity 10–100% RH (condensing)
3) Maximum temperature according to NEMA TS 2 (2.2.7): 74 °C (165 °F)

3. Manufacturer:
    a. Axis Communications P3719-PLE (Design Basis)
        1) Provide the following mounts, as required:
        2) Axis T94M02D Pendant Kit
        3) Axis T91D61 Wall Mount
        4) Axis T91B51, T91B63 Ceiling Mount
        5) Axis T91B50 Telescopic Ceiling Mount
    b. Or equal.

2.6 POWER SUPPLIES

A. Computer Grade Uninterruptible Power System, UL Listed

1. Drawing Reference: 2 KVA UPS
2. Features/Functions/Performance:
    a. Provide continuous, no-break power with sine wave output.
    b. Size to carry connected load.
    c. Provide Transient Over-Voltage (TOV) Surge Suppression; comply with ANSI/IEEE C62.41-1980, Category A and Category B.
    d. Provide complete isolation from Line.
    e. Provide output voltage regulation to ANSI C84.1 for computing equipment.
    f. SNMP manageable and status reporting to College's Management console. Provide Ethernet network interface on UPS.
    g. Provide output KVA, switch-mode power supply rated, not less than 150% of connected load indicated.
    h. Rack Mounted - at full height racks, provide rack mounted equipment.
3. Acceptable:
    a. APC Smart-UPS X 2000VA Rack/Tower LCD 100-127V
    b. Equal by Tripp Lite.
    c. Or Equal.

PART 3 - EXECUTION

3.1 PROGRAMMING AND INSTALLATION

A. Initial Systems Programming

1. Meet with College’s Representative to establish functional requirements for surveillance systems, including but not limited to the following:
    a. Camera Views
        1) Define in conjunction with the College’s representatives the minimum field of view to be provided at each fixed cameras. Contractor to review

the target for each camera at the Initial Systems Programming Meeting with the College's Representative and adjust the target view areas, and where required, the mounting location to provide the view currently required by the College's Representative. Where the mounting location requires adjustment, Contractor to coordinate related changes required with College's Representative.

2. Document and submit in accordance with the requirements of Section 28 05 00.

3. Provide initial systems programming in accordance with the preceding.

B. Installation

1. General

a. Conform to the manufacturer's recommendations and instructions regarding:
   1) camera mounting and adjustment.
   2) power and video cable sizing for length of indicated run.

2. Camera Installation

a. Locate the cameras in accordance with the plans and as required to provide the target images noted on the plans, except where modified through the pre-construction meeting described above.

b. Do not place cameras where they will be subject to ready access or tampering from persons in public access areas of the sites.
   1) Bring to the College's Representative attention through an RFI any proposed location that does not require a ladder or similar means of access from the public space.
   2) Obtain College's Representative's resolution of the RFI prior to proceeding with the installation.

c. Secure cameras to structure so that they cannot be readily removed, including with use tools or by force.
   1) Cameras are to be mounted to flush mounted backboxes at fed through rear of camera body, except where surface mounting is explicitly called for.
   2) Where surface mounting is indicated, use knock-outs on side of camera housing to connect to conduit. Install backbox containing required structured cabling biscuit box at remote location hidden from view and secure cover with tamperproof fasteners.
   3) Select fastening means appropriate to the mounting surface and its underlying framing system and fasten securely to the structure and not to lightweight surface materials. Removal of cameras following successful fastening shall require use of tamper fastener tooling or application of destructive force. College's Representative reserves the right to request remounting of any camera not found to meet this standard at no additional cost.

d. Where mounting to pipe mount indicated/or required by field conditions, select materials to maintain stability of camera image under environmental conditions associated with installation location, including wind load and potential for impact.

e. At exterior cameras, seal openings as directed by the manufacturer's instructions.

f. Apply manufacturer's recommended anti-graffiti coating to camera housings and domes.

g. Provide cameras with lensing as required to cover area of coverage indicated on the plans.

h. Adjust auto-iris systems at night to gain maximum depth of field under low light conditions.

i. Using a precision display portable video monitor and/or laptop, adjust each camera's angle and field of view as directed by the College's Representative.

3.2 SYSTEM STARTUP

A. The Contractor shall not apply power to the CCTV system until the following items have been completed:

1. CCTV system equipment items have been set up in accordance with manufacturer's instructions.

2. A visual inspection of the CCTV system has been conducted to ensure that defective equipment items have not been installed and that there are no loose connections.

3. System wiring has been tested and verified as correctly connected as indicated.

4. All system grounding and transient protection systems have been verified as properly installed and connected as indicated.

5. Power supplies to be connected to the CCTV system have been verified as the correct voltage, phasing, and frequency as indicated.

B. Satisfaction of the above requirements shall not relieve the Contractor of responsibility for incorrect installation, defective equipment items, or collateral damage as a result of Contractor work/equipment.

3.3 SYSTEMS PERFORMANCE TESTING AND ADJUSTING PROCEDURES

A. The Contractor shall provide all personnel, equipment, instrumentation, and supplies necessary to perform all site testing. The College's Representative will witness all performance verification and endurance testing. Written permission shall be obtained from the College's Representative before proceeding with the next phase of testing. Original copies of all data produced during performance verification and endurance testing shall be turned over to the College's Representative at the conclusion of each phase of testing prior to College's Representative approval of the test.

B. Contractor's Field Testing.

1. The Contractor shall calibrate and test all equipment, verify system operation, place the integrated system in service, and test the integrated system. Ground rods installed by the Contractor shall be tested as specified in IEEE Std 142.

The Contractor shall deliver a report describing results of functional tests, diagnostics, and calibrations including written certification to the College's Representative that the installed complete system has been calibrated, tested, and is ready to begin performance verification testing. The report shall also include a copy of the approved performance verification test procedure. In addition, the Contractor shall make a master video tape recording to a USB stick showing typical day and night views of each camera in the system and shall deliver the USB stick with the report. Note any objects in the field of view that might produce highlights that could cause camera blinding. Note any objects in the field of view or anomalies in the terrain which may cause blind spots. Note if a camera cannot be aimed to cover the zone and exclude the rising or setting sun from the picture. Note night assessment capabilities and whether lights or vehicle headlights cause blooming or picture degradation. If any of the above conditions or other conditions exist that cause picture degradation or interfere with the camera field of view, the Contractor shall inform the College's Representative. The field testing shall as a minimum include:

a. Verification that the video transmission system and any signal or control cabling have been installed, tested, and approved as specified.

b. When the system includes remote control/monitoring stations or remote switch panels, verification that the remote devices are functional, communicate with the security center, and perform all functions as specified.

c. Verification that all cameras are aimed and focused properly. The Contractor shall conduct a walk test of the area covered by each camera to verify the field of view.

d. Verification that cameras facing the direction of rising or setting sun are aimed sufficiently below the horizon so that the camera does not view the sun directly.

e. When dome camera mounts are used in the system, verify that all preset positions are correct and that the dome also operates correctly in a manual control mode.

2. The Contractor shall deliver a report describing results of functional tests, diagnostics, and calibrations including written certification to the College's Representative that the installed complete system has been calibrated, tested, and is ready to begin performance verification testing. The report shall also include a copy of the approved performance verification test procedure.

C. Performance Verification Test

1. The Contractor shall demonstrate that the completed CCTV system complies with the contract requirements. Using approved test procedures, all physical and functional requirements of the project shall be demonstrated and shown. The performance verification test, as specified, shall not be started until receipt by the Contractor of written permission from the College's Representative, based on the Contractor's written report. This shall include certification of successful completion of Contractor Field Testing as specified in paragraph "Contractor's Field Testing," and upon successful completion of training as specified. If the CCTV system is being installed in conjunction with an ESS, the CCTV performance verification test shall be run simultaneously with the ESS

performance verification test. The College's Representative may terminate testing at any time when the system fails to perform as specified. Upon successful completion of the performance verification test, the Contractor shall deliver test reports and other documentation as specified to the College's Representative prior to commencing the endurance test.

2. Testing

   a. Picture Monitors:
      1) Using indicated video test source, verify linearity and adjust as required.

   b. Camera Operation: Demonstrate that each camera:
      1) Produces images in conformance with specifications and as defined in the initial systems programming requirements.
      2) Includes date/time/camera number identification.

   c. Uninterrupted Power Systems: Disconnect normal power service. Demonstrate that the system remains in full operation for the specified time.

3.4 LABELING

A. Conform with the requirements of Section 27 05 53 – Identification for Communications Systems and for field devices, use the device label assigned per the requirements of Section 28 05 00 - Common Work Results for Electronic Safety and Security.

3.5 WARRANTY

A. Warranty

1. The VMS shall be warranted by the contractor for one (1) year from the date of Substantial Completion.

B. Maintenance and Service

1. The contractor shall provide all services required and equipment necessary to maintain the entire VMS in an operational state as specified for a period of one (1) year after formal written acceptance of the system, and shall provide all necessary material required for performing scheduled adjustments or other nonscheduled work.

C. Description of Work

1. The adjustment and repair of VMS includes computer equipment, contractor provided programming, software updates, signal transmission equipment, access control equipment, facility interfaces, and support equipment. Provide the manufacturers required adjustments, re-programming of deficient contractor programmed functions and other work as necessary.

D. Personnel

1. Service personnel shall be qualified to accomplish all work promptly and satisfactorily. Provide proof that Service personnel have successfully completed the enterprise level of both hardware and software training offered by the system

manufacturer. The College's Representative shall be advised in writing of the name of the designated service representative and of any change in personnel.

E. Inspections

1. The contractor shall perform two inspections at six (6) month intervals or more often if required by the manufacturers. This work shall be performed during regular working hours, Monday through Friday, excluding Federal holidays. These inspections shall include:
2. Visual checks and operational tests of the central processor, local processors, monitors, keyboards, system printers, peripheral equipment, VMS equipment, power supplies, and electrical and mechanical controls.
3. Clean system equipment, including interior and exterior surfaces.
4. Perform diagnostics on all equipment.
5. Check and calibrate each VMS device.
6. Run system software and correct diagnosed problems.
7. Resolve previous outstanding problems.

F. Warranty Service

1. The College’s Representative shall initiate service calls when the VMS is not functioning properly. Qualified personnel shall be available to provide service to the complete VMS.
2. The College's Representative shall be furnished with the telephone number where the contractor’s service supervisor can be reached at all times.
3. Service personnel shall be at the site within four (4) hours after receiving a request for service.
4. The VMS shall be restored to proper operating condition after one (1) calendar day.
5. Materials installed during warranty service to match or exceed specification of products originally installed for the specified function.

END OF SECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this section.

B. The work covered by this section is to be coordinated with related work as specified elsewhere in the specifications. Requirements of the following sections apply:

1. 26 00 00 Electrical
2. 26 05 00 Common Work Results for Electrical
3. 21 00 00 Water-Based Fire-Suppression System
4. 23 00 00 Heating, Ventilating, and Air-Conditioning (HVAC)

C. The system and all associated operations shall be in accordance with the following:

1. Requirements of the following Building Code: CBC 2019 Edition
2. Requirements of the following Fire Code: CFC 2019 Edition
3. Requirements of the following Mechanical Code: CMC 2019 Edition
4. NFPA 72, National Fire Alarm Code, 2016 Edition
5. California Electrical Code, 2019 Edition
6. ANSI/ASME A17.1 / CSA B44, Safety Code for Elevators and Escalators, 2016 Edition
7. ICC/ANSI A117.1 Accessible and Useable Buildings and Facilities, 2009 Edition
8. Local Jurisdictional Adopted Codes and Standards
9. ADA Accessibility Guidelines

1.2 SUMMARY

A. This Section covers fire alarm systems, including initiating devices, notification appliances, controls, and supervisory devices.

B. Work covered by this section includes the furnishing of labor, equipment, and materials for installation of the fire alarm system as indicated on the drawings and specifications.

C. The Fire Alarm System shall consist of all necessary hardware equipment and software programming to perform the following functions:

1. Fire alarm system detection and notification operations.
2. Control and monitoring of elevators, door hold-open devices, fire suppression systems, and other equipment as indicated in the drawings and specifications.

1.3 DEFINITIONS

A. ADA: Americans with Disabilities Act

B. AHJ: Authority Having Jurisdiction

C. ANSI: American National Standards Institute

D. ASME: American Society of Mechanical Engineers

E. FACU: Fire Alarm Control Unit

F. FM: Factory Mutual

G. IBC: International Building Code

H. ICC: International Code Council

I. IDC: Initiating Device Circuit

J. IEEE: Institute of Electrical and Electronic Engineers

K. IFC: International Fire Code

L. IMC: International Mechanical Code

M. IRI: Industrial Risk Insurers

N. LED: Light-emitting diode.

O. NAC: Notification Appliance Circuit

P. NFPA: National Fire Protection Association

Q. NICET: National Institute for Certification in Engineering Technologies.

R. RAC: Releasing Appliance Circuit

S. SLC: Signaling Line Circuit

T. UL: Underwriters Laboratories

U. ULC: Underwriters Laboratories, Canada

1.4 SYSTEM DESCRIPTION

A. General: Provide a complete, non-coded addressable, microprocessor-based fire alarm system with initiating devices, notification appliances, and monitoring and control devices as indicated on the drawings and as specified herein.

B. Power Requirements

1. The control unit shall receive AC power via a dedicated fused disconnect circuit.

2. The system shall be provided with sufficient battery capacity to operate the entire system upon loss of normal AC power in a normal supervisory mode for a period 24 hours with 5 minutes of alarm operation at the end of this period. The system shall automatically transfer to battery standby upon power failure. All battery charging and recharging operations shall be automatic.

3. All circuits requiring system-operating power shall be 24 VDC nominal voltage and shall be individually fused at the control unit.

4. The incoming power to the system shall be supervised so that any power failure will be indicated at the control unit. A green "power on" LED shall be displayed continuously at the user interface while incoming power is present.
5. The system batteries shall be supervised so that a low battery or a depleted battery condition, or disconnection of the battery shall be indicated at the control unit and displayed for the specific fault type.
6. The system shall support NAC Lockout feature to prevent subsequent activation of Notification Appliance Circuits after a Depleted Battery condition occurs in order to make use of battery reserve for front panel annunciation and control.
7. The system shall support 100% of addressable initiating devices in alarm or operated at the same time, under both primary (AC) and secondary (battery) power conditions.
8. Loss of primary power shall sound a trouble signal at the FACU. FACU shall indicate when the system is operating on an alternate power supply.

C. Software: The fire alarm system shall allow for loading and editing instructions and operating sequences as necessary.

1. The system shall be capable of on-site programming to accommodate system expansion and facilitate changes in operation.
2. All software operations shall be stored in a non-volatile programmable memory within the fire alarm control unit. Loss of primary and secondary power shall not erase the instructions stored in memory.
3. Panels shall be capable of full system operation during new site specific configuration download, master exec downloads, and slave exec downloads.
4. Remote panel site-specific software and executive firmware downloads shall be capable of being performed over proprietary fire alarm network communications.
5. Panels shall automatically store all program changes to the panel’s non-volatile memory each time a new program is downloaded. Panels shall be capable of storing the active site-specific configuration program and no less than 9 previous revisions in reserve. A compare utility program shall also be available to authorized users to compare any two of the saved programs. The compare utility shall provide a deviation report highlighting the changes between the two compared programs.
6. Panels shall provide electronic file storage with a means to retrieve a record copy of the site-specific software and up to 9 previous revisions. Sufficient file storage shall be provided for other related system documentation such as record drawings, record of completion, owner’s manuals, testing and maintenance records, etc.
7. The media used to store the record copy of site-specific software and other related system documentation shall be electrically supervised. If the media is removed a trouble shall be reported on the fire alarm control unit.

D. History Logs: The system shall provide a means to recall alarms and trouble conditions in chronological order for the purpose of recreating an event history. A separate alarm and trouble log shall be provided.

E. Recording of Events: The system shall be capable of recording all alarm, supervisory, and trouble events by means of system printer. The printout shall include the type of signal (alarm, supervisory, or trouble) the device identification, date and time of the occurrence. The printout shall differentiate alarm signals from all other printed indications.

F. Wiring/Signal Transmission:

1. Transmission shall be hard-wired using separate individual circuits for each addressable signaling line circuit, dedicated to fire alarm service only.

2. System connections for initiating device circuits shall be Class B, signaling line circuits shall be Class B, and notification appliance circuits shall be Class B.

3. Circuit Supervision: Circuit faults shall be indicated by a trouble signal at the FACU. Provide a distinctive indicating audible tone and alphanumeric annunciation.

G. Required Functions: The following are required system functions and operating features:

1. Priority of Signals: Fire alarm events have highest priority. Subsequent alarm events are queued in the order received and do not affect existing alarm conditions. Priority Two, Supervisory and Trouble events have second-, third-, and fourth-level priority, respectively. Signals of a higher-level priority take precedence over signals of lower priority even though the lower-priority condition occurred first. Annunciate all events regardless of priority or order received.

2. Noninterfering: An event on one zone does not prevent the receipt of signals from any other zone. All zones are manually resettable from the FACU after the initiating device or devices are restored to normal. The activation of an addressable device does not prevent the receipt of signals from subsequent addressable device activations.

3. Transmission to an approved Supervising Station: Automatically route alarm, supervisory, and trouble signals to an approved supervising station service provider, under another contract.

4. Annunciation: Operation of alarm and supervisory initiating devices shall be annunciated at the FACU and the remote annunciator, indicating the type of device, the operational state of the device (i.e. alarm, trouble or supervisory) and shall display the custom label associated with the device.

5. Selective Alarm: A system alarm shall include:

a. Indication of alarm condition at the FACU and the annunciator(s).
b. Identification of the device that is the source of the alarm at the FACU and the annunciator(s).
c. Operation of audible and visible notification appliances until silenced at FACU.

d. Closing doors normally held open by magnetic door holders.
e. Shutting down supply and return fans building wide.
f. Closing smoke dampers on system building wide.
g. Transmission of signal to the supervising station.
h. Initiation of elevator Phase I functions (recall, shunt trip, illumination of indicator in cab, etc.) in accordance with ANSI/ASME A17.1 / CSA B44, Safety Code for Elevators and Escalators, when specified detectors or sensors are activated, as appropriate.

6. Supervisory Operations: Upon activation of a supervisory device such as a tamper switch, the system shall operate as follows:

    a. Activate the system supervisory service audible signal and illuminate the LED at the control unit and the remote annunciator.
    b. Pressing the Supervisory Acknowledge Key will silence the supervisory audible signal while maintaining the Supervisory LED "on" indicating off-normal condition.
    c. Record the event in the FACU historical log.
    d. Transmission of supervisory signal to the supervising station.
    e. Restoring the condition shall cause the Supervisory LED to clear and restore the system to normal.

7. Alarm Silencing: If the "Alarm Silence" button is pressed, all audible and visible alarm signals shall cease operation.

8. System Reset

    a. The "System Reset" button shall be used to return the system to its normal state. Display messages shall provide operator assurance of the sequential steps ("IN PROGRESS", "RESET COMPLETED") as they occur. The system shall verify all circuits or devices are restored prior to resetting the system to avoid the potential for re-alarming the system. The display message shall indicate "ALARM PRESENT, SYSTEM RESET ABORTED."
    b. Should an alarm condition continue, the system will remain in an alarmed state.

9. A manual evacuation (drill) switch shall be provided to operate the notification appliances without causing other control circuits to be activated.

10. WALKTEST: The system shall have the capacity of 8 programmable passcode protected one person testing groups, such that only a portion of the system need be disabled during testing. The actuation of the "enable one person test" program at the control unit shall activate the "One Person Testing" mode of the system as follows:

    a. The city circuit connection and any suppression release circuits shall be bypassed for the testing group.
    b. Control relay functions associated with one of the 8 testing groups shall be bypassed.
    c. The control unit shall indicate a trouble condition.
    d. The alarm activation of any initiating device in the testing group shall cause the audible notification appliances assigned only to that group

to sound a code to identify the device or zone.

e. The unit shall automatically reset itself after signaling is complete.

f. Any opening of an initiating device or notification appliance circuit wiring shall cause the audible signals to sound for 4 seconds indicating the trouble condition.

1) Any device which is activated during the time that Walktest is enabled, but is not within the group under test shall immediately cause a normal alarm sequence to commence as if the system was not under any testing sequence.

11. Install Mode: The system shall provide the capability to group all non-commissioned points and devices into a single "Install Mode" trouble condition allowing an operator to clearly identify event activations from commissioned points and devices in occupied areas.

a. It shall be possible to individually remove points from Install Mode as required for phased system commissioning.

b. It shall be possible to retrieve an Install Mode report listing that includes a list of all points assigned to the Install Mode. Panels not having an install mode shall be reprogrammed to remove any non-commissioned points and devices.

12. Module Distribution:

a. The fire alarm control unit shall be capable of allowing remote location of the following modules; interface of such modules shall be through a Style 7 (Class A) supervised serial communications channel (SLC):

1) Initiating Device Circuits
2) Notification Appliance Circuits
3) Auxiliary Control Circuits
4) Initiating Device Signaling Line Circuits
5) Notification Appliance Signaling Line Circuits
6) Power Supplies

H. Integrated Automation

1. Building Automation and Control Network (BACnet) Integration

a. The fire alarm control unit shall be capable of providing a one-way communications interface between the fire alarm control unit and an industry-standard Building Automation and Control Network (BACnet) using ASHRAE® BACnet® IP (internet protocol) compliant with ANSI/ASHRAE Standard 135.

b. The BACnet communications module shall be agency listed to UL Standard 864.

c. The fire alarm control unit shall be capable of communicating status changes of up to 1500 devices and system points to the building automation system. This shall include the capability to discretely identify and report the status of each notification appliance and initiating device.

d. Status of addressable initiating and notification devices shall be accomplished via multi-state BACnet objects, and each point shall

include detailed custom descriptions matching those provided in the fire alarm control panel site specific programming.

e. Programming of the BACnet interface shall be accomplished using the current version of the manufacturer's approved fire alarm panel programming software.

f. MS/TP Master and MS/TP Slave data link layer options communicating at baud rates up to 76,800 bps shall be supported.

g. The interface shall be capable of supporting ANSI X3.4, ISO 10656 (ICS-4), ISO 10656 (UCS-2), ISO 8859-1, or IBM/Microsoft DBCS character sets.

h. A standard RJ-45 Ethernet connection to the Building Automation System Ethernet network shall be provided at the fire alarm control unit as part of the contract.

i. Systems using relay interfaces shall not be accepted.

2. Refer to section: 25.00 Integrated Automation

I. Analog Smoke Sensors:

1. Monitoring: FACU shall individually monitor sensors for calibration, sensitivity, and alarm condition, and shall individually adjust for sensitivity. The control unit shall determine the condition of each sensor by comparing the sensor value to the stored values.

2. Environmental Compensation: The FACU shall maintain a moving average of the sensor's smoke chamber value to automatically compensate for dust, dirt, and other conditions that could affect detection operations.

3. Programmable Sensitivity: Photoelectric Smoke Sensors shall have 7 selectable sensitivity levels ranging from 0.2% to 3.7%, programmed and monitored from the FACU.

4. Sensitivity Testing Reports: The FACU shall provide sensor reports that meet NFPA 72 calibrated test method requirements.

a. Reports shall be capable of being printed for annual recording and logging of the calibration maintenance schedule.

b. Where required, reports shall be accessible remotely through:

1) A Fire Panel Internet Interface using Ethernet and TCP/IP communications protocol compatible with IEEE Standard 802.3. The Fire Panel Internet Interface shall be capable of automatically scheduling email reports to individual user accounts on a weekly, bi-weekly, or monthly schedule

5. The FACU shall automatically indicate when an individual sensor needs cleaning. The system shall provide a means to automatically indicate when a sensor requires cleaning. When a sensor's average value reaches a predetermined value, (3) progressive levels of reporting are provided. The first level shall indicate if a sensor is close to a trouble reporting condition and will be indicated on the FACU as "ALMOST DIRTY." This condition provides a means to alert maintenance staff of a sensor approaching dirty without creating a trouble in the system. If this indicator is ignored and the second level is reached, a "DIRTY SENSOR" condition shall be indicated at the

FACU and subsequently a system trouble is reported to the Supervising Station. The sensor base LED shall glow steady giving a visible indication at the sensor location. The "DIRTY SENSOR" condition shall not affect the sensitivity level required to alarm the sensor. If a "DIRTY SENSOR" is left unattended, and its average value increases to a third predetermined value, an "EXCESSIVELY DIRTY SENSOR" trouble condition shall be indicated at the control unit.

6. The FACU shall continuously perform an automatic self-test on each sensor that will check sensor electronics and ensure the accuracy of the values being transmitted. Any sensor that fails this test shall indicate a "SELF TEST ABNORMAL" trouble condition.

7. Multi-Sensors shall combine photoelectric smoke sensing and heat sensing technologies. An alarm shall be determined by either smoke detection, with selectable sensitivity from 0.2 to 3.7 %/ft obscuration; or heat detection, selectable as fixed temperature or fixed with selectable rate-of-rise; or based on an analysis of the combination of smoke and heat activity.

8. Programmable bases. It shall be possible to program relay and sounder bases to operate independently of their associated sensor.

9. Magnet test activation of smoke sensors shall be distinguished by its label and history log entry as being activated by a magnet.

J. Fire Suppression Monitoring:

1. Water flow: Activation of a water flow switch shall initiate general alarm operations.

2. Sprinkler valve tamper switch: The activation of any valve tamper switch shall activate system supervisory operations.

K. Audible Alarm Notification: By horns in areas as indicated on drawings.

L. Addressable Notification Appliances

1. Monitoring: The FACU shall monitor individual addressable notification appliances for status, condition, type of appliance, and configured appliance settings. A fault in any individual appliance shall automatically report a trouble condition on the FACU.

2. Individual Appliance Custom Label: Each addressable appliance shall have its own 40 character custom label to identify the location of the appliance and to aid in troubleshooting fault conditions.

3. Individual Appliance Information Display:

   a. The FACU shall be capable of calling up detailed information for each addressable appliance including the appliance location, status, condition, type of appliance, and configured appliance settings.
   b. Notification appliances that are not capable of communicating and reporting their individual location, status, condition, type of appliance, and configured appliance settings to the FACU shall not be accepted.

4. Programmable Appliance Settings:

a. The selectable operation of each addressable notification appliance shall be capable of being configured by the FACU without having to replace or remove the appliance from the wall or ceiling.
    1) Programmable appliance settings for applicable addressable notification appliances shall include:
        a) Operation:
            (1) General Evac
            (2) Alert
            (3) User Defined
        b) Style:
            (1) Indoor
            (2) UL Weatherproof
            (3) ULC Weatherproof
        c) Candela Selections:
            (1) Indoor: 15, 30, 75, 110, 135, or 185 cd (per UL1971)
            (2) UL Weatherproof: 15 or 75 cd (per UL1971), and 75 or 185 cd (per UL1638)
            (3) ULC Weatherproof: 20, 30 or 75 cd (per ULCS526)
        d) Horn Volume:
            (1) Hi
            (2) Low
        e) Horn Cadence:
            (1) Temporal 3
            (2) Temporal 4
            (3) March Time 20 bpm
            (4) March Time 60 bpm
            (5) March Time 120 bpm
            (6) Steady
        f) Horn Tone:
            (1) 520 HZ
            (2) Bell
            (3) Slow Whoop
            (4) Siren
            (5) Hi / Lo

b. Systems that require replacement or removal of the appliances from the wall or ceiling to change their applicable operation or settings shall not be accepted.

5. Programmable Notification Zones:

a. Changing the notification zone assigned to a notification appliance shall be configurable by the FACU and shall not require additional circuits or wiring.
b. Systems that require additional circuits and wiring to change the notification zone assigned to a notification appliance shall not be accepted.

6. Addressable Notification Appliance Automated Self-Test:

a. The fire alarm control unit shall be capable of performing an automated functional self-test of all self-test notification appliances and meet the requirements in NFPA 72, 14.2.8 Automated Testing and Table 14.4.3.2 testing requirements.
b. Test results for each self-test notification appliance shall be stored in non-volatile memory at the fire alarm control unit.
c. The fire alarm control unit shall be capable of running a functional automated test for all self-test notification appliances in a general alarm group or for all self-test appliances within a specific notification zone.
d. The duration required to complete the automated functional test for all self-test notification appliances shall be accomplished in 2 minutes or less.
e. The automated test results for all self-test notification appliances shall be available from the fire alarm control unit within 4 minutes from the start of the test.
f. If any notification appliance fails its automated functional self-test an audible and visual trouble signal shall be annunciated at the fire alarm control unit.
    1) The self-test trouble signal shall be a latching trouble signal which requires manual restoration to normal.

7. Addressable Notification Appliance Reports:
    a. The fire alarm control unit shall maintain configuration and test data for each self-test addressable notification appliance.
    b. The fire alarm control unit shall be capable of generating configuration, self-test, and deficiency reports, that can be viewed through the fire alarm control unit user interface or printed via the fire alarm control unit service port.
        1) At minimum, the configuration report shall include the following information applicable for each addressable notification appliance:
            a) Point ID
            b) Custom Label
            c) Device Type
            d) Candela Setting
        2) At minimum, the self-test report shall include the following information applicable for each self-test notification appliance:
            a) Point ID
            b) Custom Label
            c) Time and Date of last test
            d) Pass / Fail results of last visual test
            e) Pass / Fail results of last audible test
    c. The fire alarm control unit shall also be capable of providing a deficiency report that includes a list of all self-test notification appliances that have failed self-test.

8. Magnet test: When the control unit is in diagnostic mode, the appliances shall be capable of being tested with a magnet. The magnet diagnostics shall:

a. Pulse the appliance LED to indicate appliance address, and
b. briefly sound the individual horn to confirm the audible appliance operation, and
c. briefly flash the individual strobe to confirm visible appliance operation.

1.5 SUBMITTALS

A. General: Submit the following according to Conditions of Contract and Division 1 Specification Sections.

1. Product data sheets for system components highlighted to indicate the specific products, features, or functions required to meet this specification. Alternate or as-equal products submitted under this contract must provide a detailed line-by-line comparison of how the submitted product meets, exceeds, or does not comply with this specification.

2. Wiring diagrams from manufacturer.

3. Shop drawings showing system details including location of FACU, all devices, circuiting and details of graphic annunciator.

4. System power and battery charts with performance graphs and voltage drop calculations to assure that the system will operate in accordance with the prescribed backup time periods and under all voltage conditions per UL and NFPA standards.

5. System operation description including method of operation and supervision of each type of circuit and sequence of operations for all manually and automatically initiated system inputs and outputs. A list of all input and output points in the system shall be provided with a label indicating location or use of IDC, SLC, NAC, relay, sensor, and auxiliary control circuits.

6. Operating instructions for FACU.

7. Operation and maintenance data for inclusion in Operating and Maintenance Manual. Include data for each type product, including all features and operating sequences, both automatic and manual. Provide the names, addresses, and telephone numbers of service organizations.

8. Product certification signed by a certified representative of the manufacturer of the fire alarm system components certifying that their products comply with indicated requirements.

9. Record of field tests of system.

B. Submission to Authority Having Jurisdiction: In addition to routine submission of the above material, make an identical submission to the authority having jurisdiction. Include copies of shop drawings as required to depict component locations to facilitate review. Upon receipt of comments from the Authority, make resubmissions, if required, to make clarifications or revisions to obtain approval.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: A factory authorized installer is to perform the work of this section.

B. Each and every item of the Fire Alarm System shall be listed under the appropriate category by a Nationally Recognized Testing Laboratory and shall bear the respective "NRTL" label.

1.7 PROJECT CONDITIONS

A. Interruption of Existing Fire-Alarm Service: Do not interrupt fire-alarm service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary guard service according to requirements indicated:

1. Notify Architect no fewer than two days in advance of proposed interruption of fire-alarm service.

2. Do not proceed with interruption of fire-alarm service without Architect's written permission.

1.8 SOFTWARE SERVICE AGREEMENT

A. Comply with UL 864.

B. Technical Support: Beginning with Substantial Completion, provide software support for two years.

C. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade shall include new or revised licenses for use of software.

1. Provide 30 days' notice to Owner to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

1.9 MAINTENANCE SERVICE

A. Warranty Maintenance Service: Provide maintenance of fire alarm systems and equipment for a period of 12 months, using factory-authorized service representatives

B. Basic Services: Routine maintenance visits on an “as needed” basis at times scheduled with the Owner. Respond to service calls within 24 hours of notification of system trouble either by customer visit or other customer contact as necessary. Adjust and replace defective parts and components with original manufacturer's replacement parts, components, and supplies.

C. Additional Services: Perform services within the above 12-month period not classified as routine maintenance or as warranty work when authorized in writing. Compensation for additional services must be agreed upon in writing prior to performing services.

D. Maintenance Service Contract: No later than 60 days prior to the expiration of the warranty maintenance services, deliver to the Owner a proposal to provide contract maintenance and repair services for an additional one-year term. As an option with this proposal, deliver to the Owner a proposal to provide scheduled inspection and testing services for a one-year term. Owner will be under no obligation to accept maintenance service contract proposal or inspection and testing proposal.

1.10 EXTRA MATERIALS

A. General: Furnish extra materials, packaged with protective covering for storage, and identified with labels clearly describing contents as follows:

1. Break Rods for Manual Stations: Furnish quantity equal to 15 percent of the number of manual stations installed; minimum of 6 rods.
2. Notification Appliances: Furnish quantity equal to 10 percent of each type and number of units installed, but not less than one of each type.
3. Smoke Detectors or Sensors, Fire Detectors, and Flame Detectors: Furnish quantity equal to 10 percent of each type and number of units installed but not less than one of each type.
4. Detector or Sensor Bases: Furnish quantity equal to 2 percent of each type and number of units installed but not less than one of each type.
5. Printer Ribbons: Furnish 6 spare printer ribbons when a printer is provided.

PRODUCTS

1.1 ACCEPTABLE EQUIPMENT AND SERVICE PROVIDERS

A. Manufacturers: The equipment and service described in this specification are those supplied and supported by Johnson Controls and represent the base bid for the equipment.

1. Subject to compliance with the requirements of this specification, provide products by Simplex, a Johnson Controls Company.

B. Being listed as an acceptable Manufacturer in no way relieves obligation to provide all equipment and features in accordance with these specifications.

C. Alternate products must be submitted to the Engineer two weeks prior to bid for approval. Alternate or as-equal products submitted under this contract must provide a detailed line-by-line comparison of how the submitted product meets, exceeds, or does not comply with this specification.

D. The equipment and service provider shall be a nationally recognized company specializing in fire alarm and detection systems. This provider shall employ factory trained and NICET Level II, Level III and Level IV certified technicians, and shall maintain a service organization within 50 miles of this project location. The equipment and service provider shall have a minimum of 10 years experience in the fire protective signaling systems industry.

1.2 SYSTEMS OPERATIONAL DESCRIPTION

A. Fire-alarm signal initiation shall be by one or more of the following devices and systems:

1. Manual stations.
2. Heat detectors.
3. Flame detectors.
4. Smoke detectors.

5. Duct smoke detectors.
6. Verified automatic alarm operation of smoke detectors.
7. Automatic sprinkler system water flow.
8. Heat detectors in elevator shaft and pit.
9. Fire-extinguishing system operation.
10. Fire standpipe system.

B. Fire-alarm signal shall initiate the following actions as required:

1. Continuously operate alarm notification appliances.
2. Identify alarm at fire-alarm control unit and remote annunciators.
3. Transmit an alarm signal to the remote alarm receiving station.
4. Unlock electric door locks in designated egress paths.
5. Release fire and smoke doors held open by magnetic door holders.
6. Switch heating, ventilating, and air-conditioning equipment controls to fire-alarm mode.
7. Activate smoke-control system (smoke management) at firefighter smoke-control system panel.
8. Activate stairwell and elevator-shaft pressurization systems.
9. Close smoke dampers in air ducts of designated air-conditioning duct systems.
10. Recall elevators to primary or alternate recall floors.
11. Activate emergency lighting control.
12. Activate emergency shutoffs for gas and fuel supplies.
13. Record events in the system memory.
14. Record events by the system printer.

C. Supervisory signal initiation shall be by one or more of the following devices and actions:

1. Valve supervisory switch.
2. Low-air-pressure switch of a dry-pipe sprinkler system.
3. Elevator shunt-trip supervision.

D. System trouble signal initiation shall be by one or more of the following devices and actions:

1. Open circuits, shorts, and grounds in designated circuits.
2. Opening, tampering with, or removing alarm-initiating and supervisory signal-initiating devices.
3. Loss of primary power at fire-alarm control unit.
4. Ground or a single break in fire-alarm control unit internal circuits.

5. Abnormal AC voltage at fire-alarm control unit.
6. Break in standby battery circuitry.
7. Failure of battery charging.
8. Abnormal position of any switch at fire-alarm control unit or annunciator.
9. Fire-pump power failure, including a dead-phase or phase-reversal condition.

E. System Trouble and Supervisory Signal Actions: Initiate notification appliance and annunciate at fire-alarm control unit and remote annunciators. Record the event on system printer where provided.

1.3 FIRE ALARM CONTROL UNIT (FACU)

A. The following FACU hardware shall be provided:

1. Power Limited base panel with platinum cabinet and door, 120 VAC input power.
2. 3,000 point capacity where (1) point equals (1) monitor (input) or (1) control (output).
3. 2000 points of annunciation where one (1) point of annunciation equals:
    a. 1 LED driver output on a graphic driver or 1 switch input on a graphic switch input module.
    b. 1 LED on panel or 1 switch on panel.
4. 9.5 Amp Power Supply minimum with temperature compensated, dual-rate battery charger capable of charging up to 110 Ah batteries without a separate external battery charger. Battery charger voltage and amperage values shall be accessible on the FACU LCD display. Optional cooling fan shall be available to increase base power supply from 9.5 to 12.7 Amps. Optional expansion and back-up power supplies shall be available.
5. One Auxiliary electronically resettable fused 2A @24VDC Output, with programmable disconnect operation for 4-wire detector reset.
6. One Auxiliary Relay, SPDT 2A @32VDC, programmable as a trouble relay, either as normally energized or de-energized, or as an auxiliary control.
7. Three (3) circuit Class B Addressable Notification Appliance Signaling Line Circuits (SLCs) module.
    a. Each Addressable Notification Appliance SLC shall be rated at 3A and capable of supporting up to 127 Notification Appliances per channel.
    b. Wiring shall be 18 AWG to 12 AWG unshielded twisted pair wire. Systems that require shielded wire for Notification Appliances shall not be accepted.
    c. A constant voltage under both primary and secondary power conditions shall be maintained at the notification appliance field wiring terminal connections in the FACU to ensure the voltage drop on the circuit is consistent under both primary and secondary power conditions.
    d. For systems that do not provide a constant voltage source at the FACU notification appliance field wiring terminal connections, the fire alarm

contractor shall:

1) Provide separate point-to-point voltage drop calculations for all notification appliances under worst case secondary power specifications, and
2) Perform a complete functional test of all notification appliances under worst case secondary power conditions.

8. Four (4) form "C" Auxiliary Relay Circuits (Form C contacts rated 2A @ 24VDC, resistive), operation is programmable for trouble, alarm, supervisory or other fire response functions. Relays shall be capable of switching up to ½ A @ 120VAC, inductive.
9. The FACU shall support up to (5) RS-232-C ports and one service port. All (5) RS-232 Ports shall be capable of two-way communications.
10. Remote Unit Interface: supervised Class B (Style 4) or Class X (Style 7) serial communication channel for control and monitoring of remotely located annunciators and I/O panels.
11. Universal Communicator supporting POTS, Internet, and Cellular communications. Shall have multiple connectivity options and be configurable with a primary and secondary path. Paths can use any of the external connections; telephone line, cellular, or LAN Ethernet. Cellulat shall be minimum 3G with 2G fallback. Cellular antenna extension kits shall be available for poor reception areas. IP based transmission; cellular or Ethernet shall be based on ADEMCO Contact ID Alarm Communication Protocol.

B. Cabinet: Lockable steel enclosure. Arrange unit so all operations required for testing or for normal care and maintenance of the system are performed from the front of the enclosure. If more than a single unit is required to form a complete control unit, provide exactly matching modular unit enclosures.

C. Alphanumeric Display and System Controls: Panel shall include an 854 character, expanded content multi-line QVGA LCD display to indicate alarm, supervisory, and component status messages and shall include a keypad for use in entering and executing control commands.

1. The system shall have the capability to provide expanded content, multi-line, operator interface displays. The expanded content multi-line displays shall be Quarter-VGA (QVGA) or larger and be capable of supporting a minimum of 854 standard ASCII characters to minimize or eliminate the levels of navigation required for access to information when responding to critical emergencies and abnormal system conditions. The QVGA operator interface shall provide operator prompts and six context sensitive soft-keys for intuitive operation.

a. Expanded content, multi-line operator interfaces shall be capable of providing the following functions:

1) Dual language operation with Instant-Switch language selection during runtime.
2) Activity display choices for:
a) First 8 Events.
b) First 5 Events and Most Recent Event (with first and

most recent event time and date stamps).
c) First Event and Most Recent Event (with first and most recent event time and date stamps).
d) Scrollable List Display displays a scrollable list of active points for the event category (alarm, priority 2, supervisory, or trouble) selected. The position in this list will be the last acknowledged point (not flashing) at the top followed by the next 7 unacknowledged points (flashing).
e) General Event Status (alarm, priority 2, supervisory, or trouble in system)
f) Site Plan

3) Equal or hierarchal priority assignment. In systems with two or more operator interfaces, each operator interface shall be programmable to allow multiple operator interfaces to have equal operation priority or to allow hierarchal priority control to be assigned to individual operator interfaces (locations).
4) Up to 50 custom point detail messages for providing additional point specific information in detailed point status screens.
5) Bitmap file import for operator interface display of site plan and background watermark images.

D. Distributed Module Operation: FACU shall be capable of allowing remote location of the following modules; interface of such modules shall be through a Class B supervised serial communications channel (SLC):

1. Addressable Signaling Line Circuits
2. Initiating Device Circuits
3. Notification Appliance Circuits
4. Auxiliary Control Circuits
5. Graphic Annunciator LED/Switch Control Modules
    a. In systems with two or more Annunciators and/or Command Centers, each Annunciator/Command Center shall be programmable to allow multiple Annunciators/Command Centers to have equal operation priority or to allow hierarchal priority control to be assigned to individual Annunciator/Command Center locations.

1.4 ADDRESSABLE INITIATING

A. ADDRESSABLE MANUAL PULL STATIONS

1. General Requirements for Manual Fire-Alarm Boxes: Comply with UL 38. Boxes shall be finished in red with molded, raised-letter operating instructions in contrasting color; shall show visible indication of operation; and shall be mounted on recessed outlet box. If indicated as surface mounted, provide manufacturer's surface back box.
2. Description: Addressable single-action type, red LEXAN. Station shall mechanically latch upon operation and remain so until manually reset by

opening with a key common with the control units. Station shall be pull-lever type; be operable with one hand and shall not require tight grasping, pinching or twisting of the wrist; with integral addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire-alarm control unit.

3. Provide with a front showing red LED showing that will flash each time it is scanned by the Control Unit (once every 4 seconds). In alarm condition, the station LED shall be on steady.

B. ADDRESSABLE ANALOG SMOKE SENSORS

1. General Requirements for System Smoke Detectors:

a. Comply with UL 268, "Smoke Detectors for Fire Protective Signaling Systems." Include the following features:
b. Factory Nameplate: Serial number and type identification.
c. Operating Voltage: 24 VDC, nominal and shall be two-wire type.
d. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore normal operation.
e. Plug-In Arrangement: Sensor and associated electronic components are mounted in a module that connects to a fixed base with a twist-locking plug connection. Base shall provide break-off plastic tab that can be removed to engage the head/base locking mechanism. Provide terminals in the fixed base for connection to building wiring. No special tools shall be required to remove head once it has been locked. Removal of the detector head shall interrupt the supervisory circuit of the fire alarm detection loop and cause a trouble signal at the control unit. Sensors shall include a communication transmitter and receiver in the mounting base having a unique identification and capability for status reporting to the FACU. Sensor address shall be located in base to eliminate false addressing when replacing sensors. Integral Addressable Module shall be arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit. Each sensor base shall contain an integral visual-indicating LED that will flash to provide power-on status each time it is scanned by the Control Unit (once every 4 seconds). In alarm condition, the sensor base LED shall be on steady. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base.
f. Each sensor base shall contain a magnetically actuated test switch to provide for easy pre-certification alarm testing at the sensor location.
g. Each sensor shall be scanned by the Control Unit for its type identification to prevent inadvertent substitution of another sensor type. Upon detection of a "wrong device", the control unit shall operate with the installed device at the default alarm settings for that sensor; 2.5% obscuration for photoelectric sensor, 135-deg F and 15-deg F rate-of-rise for the heat sensor, but shall indicate a "Wrong Device" trouble condition.
h. Unless otherwise indicated, detectors shall be analog-addressable type, individually monitored at fire-alarm control unit for calibration,

sensitivity, and alarm condition and individually adjustable for sensitivity by fire-alarm control unit. Provide multiple levels of detection sensitivity for each sensor.

i. Environmental compensation, programmable sensitivity settings, status testing, and monitoring of sensor dirt accumulation for the duct smoke sensor shall be provided by the FACU.

j. The sensor's electronics shall be immune from nuisance alarms caused by EMI and RFI. Removal of the sensor head for cleaning shall not require the setting of addresses.

k. Bases: CO Sensor, relay output, sounder and isolator bases shall be supported alternatives to the standard base.

2. Addressable Sensor Bases

a. Standard base - Twist lock addressable base with address selection DIP switch accessible from front with sensor removed. Integral red LED for power-on (pulsing), or alarm or trouble (steady on). Locking anti-tamper design mounts on standard outlet box.

b. Sensor Base with remote device connection - All standard base features with wired connection for either a Remote LED alarm indicator or remote relay (relay is unsupervised and requires separate 24VDC)

c. Supervised Relay Bases - All standard base features and shall be available in either a 4-Wire Sensor Base to use with remote or locally mounted relay; requires separate 24 VDC, or as a 2-Wire Sensor Base to use with remote or locally mounted relay; no separate power required. Supervised relay operation shall be programmable and shall be manually operated from control panel.

d. Sensor base with built-in electronic alarm sounder - All standard base features and piezoelectric sounder shall provide high output (88 dBA) with low current requirements (20 mA). Sounder shall be synchronized via SLC communications or by the NAC if NAC powered, sounder shall operation shall be programmable and shall be manually operated from control panel.

C. ADDRESSABLE DUCT SMOKE SENSOR

1. Standard Addressable Duct Smoke Sensor Unit. Photoelectric type, with sampling tube of design and dimensions as recommended by the manufacturer for the specific duct size and installation conditions where applied. Duct housing shall include relay or relay driver as required for fan shutdown.

a. Environmental compensation, programmable sensitivity settings, status testing, and monitoring of sensor dirt accumulation for the duct smoke sensor shall be provided by the FACU.

b. The Duct Housing shall provide a supervised relay driver circuit for driving up to 15 relays with a single "Form C" contact rated at 7A@ 28VDC or 10A@ 120VAC. This auxiliary relay output shall be fully programmable independent of the sensor head for activation by other alarm initiating devices within the fire alarm system. Relay shall be

mounted within 3 feet of HVAC control circuit.

c. Duct Housing shall provide a magnetic test area and Red sensor status LED and Duct Housing shall provide a relay control Yellow LED trouble indicator.

d. Duct Housing shall have a transparent cover to monitor for the presence of smoke. Cover shall secure to housing by means of four (4) captive fastening screws.

e. Duct Housing shall provide two (2) Test Ports for measuring airflow and for testing. These ports will allow aerosol injection in order to test the activation of the duct smoke sensor.

f. For maintenance purposes, it shall be possible to clean the duct housing sampling tubes by accessing them through the duct housing front cover.

g. Each duct smoke sensor shall be provided with a Remote Test Station with an alarm LED and test switch.

h. Where indicated provide a NEMA 4X weatherproof duct housing enclosure that shall provide for the circulation of conditioned air around the internally mounted addressable duct sensor housing to maintain the sensor housing at its rated temperature range. The housing shall be UL Listed to Standard 268A.

2. Addressable In-Duct Mounted Smoke Sensors. Photoelectric type, for applications with controlled dust and humidity providing HVAC duct smoke sensing where sampling tube designs are not appropriate. In-Duct housing shall include relay or relay driver as required for fan shutdown.

a. Shall accommodate duct airflow from 0 to 4000 ft/min (0 to 1220 m/min), and provide environmental compensation, programmable sensitivity settings, status testing, and monitoring of sensor dirt accumulation for the duct smoke sensor by the FACU.

b. The In-Duct Housing shall provide a supervised relay driver circuit for driving up to 15 relays with a single "Form C" contact rated at 7A@ 28VDC or 10A@ 120VAC. This auxiliary relay output shall be fully programmable independent of the sensor head for activation by other alarm initiating devices within the fire alarm system. Relay shall be mounted within 3 feet of HVAC control circuit.

c. Standard models shall be for rectangular ducts from 6” (152 mm) square to 36” (914 mm) square with optional adapters available to allow use with round ducts of 6”, 8” (203 mm), 10” (254 mm) or 12” (305 mm) in diameter.

d. In-Duct Housing shall provide a magnetic test area and Red sensor status LED and In-Duct Housing shall provide a relay control Yellow LED trouble indicator.

e. Duct Housing shall have a transparent cover to monitor for the presence of smoke. Cover shall secure to housing by means of four (4) captive fastening screws.

f. Each duct smoke sensor shall be provided with a Remote Test Station with an alarm LED and test switch.

D. ADDRESSABLE HEAT SENSORS

1. General Requirements for Heat Detectors: Comply with UL 521.
2. Thermal Sensor Combination type: Fixed-temperature and rate-of-rise unit with plug-in base and alarm indication lamp; Actuated by either a selected fixed temperature or a rate of rise that exceeds a preset amount per minute unless otherwise indicated.
3. Thermal sensor shall be of the epoxy encapsulated electronic design. It shall be thermistor-based, rate-compensated, self-restoring and shall not be affected by thermal lag. Selectable rate compensated, fixed temperature sensing with or without rate-of-rise operation.
4. Mounting: Twist-lock base interchangeable with smoke-sensor heads.
5. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.
6. Unless otherwise indicated, sensors shall be analog-addressable type, individually monitored at fire-alarm control unit for calibration, sensitivity, and alarm condition and individually adjustable for temperature by fire-alarm control unit.
    a. Rate-of-rise temperature characteristic shall be selectable at fire-alarm control unit for 15 or 20 deg F (8 or 11 deg C) per minute.
    b. Fixed-temperature sensing shall be independent of rate-of-rise sensing and shall be settable at fire-alarm control unit to operate at 135 or 155 deg F (57 or 68 deg C).

E. ADDRESSABLE CIRCUIT INTERFACE MODULES

1. Addressable Circuit Interface Modules: Arrange to monitor or control one or more system components that are not otherwise equipped for addressable communication. Modules shall be used for monitoring of waterflow, valve tamper, non-addressable devices, and for control of AHU systems.
2. Addressable Circuit Interface Modules will be capable of mounting in a standard electric outlet box or be cabinet mounted using appropriate mounting to allow quick replacement. Modules will include cover plates to allow surface or flush mounting. Modules will receive their operating power from the signaling line circuit or a separate two wire pair running from an appropriate power supply, as required.
3. There shall be the following types of modules:
    a. Line Powered Monitor Circuit Interface Module
        1) This type of module is an individually addressable module that has both its power and its communications supplied by the two wire signaling line circuit. It provides location specific addressability to an initiating device by monitoring normally open dry contacts. This module shall have the capability of communicating four zone status conditions (normal, alarm, current limited, trouble) to the FACU.
        2) This module shall provide location specific addressability for up to five initiating devices by monitoring normally closed or

normally open dry contact security devices. The module shall communicate four zone status conditions (open, normal, abnormal, and short). The two-wire signaling line circuit shall supply power and communications to the module.

b. Single Address Multi-Point Interface Modules

1) This multipoint module shall provide location specific addressability for four initiating circuits and control two output relays from a single address. Inputs shall provide supervised monitoring of normally open, dry contacts and be capable of communicating four zone status conditions (normal, open, current limited, and short). The input circuits and output relay operation shall be controlled independently and disabled separately.

2) This dual point module shall provide a supervised multi-state input and a relay output, using a single address. The input shall provide supervised monitoring of two normally open, dry contacts with a single point and be capable of communicating four zone status conditions (normal, open, current limited, and short). The two-wire signaling line circuit shall supply power and communications to the module.

3) This dual point module shall monitor an unsupervised normally open, dry contact with one point and control an output relay with the other point, using a single address. The two-wire signaling line circuit shall supply power and communications to the module.

c. Line Powered Control Circuit Interface Module

1) This module shall provide control and status tracking of a Form "C" contact. The two-wire signaling line circuit shall supply power and communications to the module.

4. All Circuit Interface Modules shall be supervised and uniquely identified by the control unit. Module identification shall be transmitted to the control unit for processing according to the program instructions. Modules shall have an on-board LED to provide an indication that the module is powered and communicating with the FACU. The LEDs shall provide a troubleshooting aid since the LED blinks on poll whenever the peripheral is powered and communicating.

1.5 ADDRESSABLE NOTIFICATION

A. ADDRESSABLE ALARM NOTIFICATION APPLIANCES

1. Addressable Notification Appliances: The Contractor shall furnish and install Addressable Notification Appliances and accessories to operate on compatible signaling line circuits (SLC).

a. Addressable Notification appliance operation shall provide power, supervision and separate control of horns and strobes over a single pair of wires. The controlling channel (SLC) digitally communicates with each appliance and receives a response to verify the appliance's presence on the channel. The channel provides a digital command to

control appliance operation. SLC channel wiring shall be unshielded twisted pair (UTP), with a capacitance rating of less than 60pf/ft and a minimum 3 twists (turns) per foot.

b. All Notification Appliances shall operate as a completely independent device allowing for specific location alerting of both fire alarm and Mass Notification functions. Each visible device (both clear fire alarm and amber mass notification) shall be capable of operating on multiple notification zones or completely separate from all other notification devices, this allows “On the fly” program operation changes for Mass Notification alerting and fire alarm notification.

c. All Notification Appliances shall operate as a completely independent device allowing for appliances in handicap accessible rooms and other locations to operate on the same SLC and to activate individually based on an alarm condition in a room or as part of a general alarm condition where all appliances activate together.

d. Individual Notification Appliances shall be able to be grouped into zones (or operational groups) by central programming at the main fire alarm control unit.

e. Notification Appliances shall provide for “unobtrusive” testing. Each Notification Appliance shall be tested for audible and visible operation on an individual basis at the device or from the main fire alarm control unit, allowing for minimal invasive impact.

f. Class B (Style 4) notification appliances shall be wired without requiring traditional in/out wiring methods; addressable "T" Tapping shall be permitted. Up to 127 addresses can be supported on a single channel.

g. Each Addressable notification appliance shall contain an electronic module and a selectable address setting to allow it to occupy a unique location on the channel. This on-board module shall also allow the channel to perform appliance diagnostics that assist with installation and subsequent test operations. A visible LED on each appliance shall provide verification of communications and shall flash with the appliances address setting when locally requested using a magnetic test tool.

h. Each addressable notification appliance shall have electrical test point access without removing the device cover.

i. Both wall mount and ceiling mount devices shall be available along with weatherproof devices.

2. Addressable Horn: Addressable horn shall be listed to UL 464. Horn shall support Temporal Code 3, March Time (20, 60, or 120 BPM), Continuous, and Temporal Code 4 coding patterns. Horn appliances shall have a High/Low Setting, programmable by channel from the addressable controller or by appliance from the host FACU. The horn shall have a minimum sound pressure level of 83 or 89 dBA for steady) or of 79 or 85 dBA for coded operation. The horn device shall consist of three pieces: appliance, cover, and mounting plate. For ease of installation the mounting plate shall mount directly to a standard single gang, double gang or 4" square electrical box, without the use of special adapter or trim rings. When the appliance is

connected to an active circuit, the front cover of the appliance shall be removable without causing a trouble indication on the fire alarm control unit. Appliances shall be wired with UTP conductors, having a minimum of 3 twists per foot.

3. Addressable Visible/Only: Addressable strobe shall be listed to UL 1971. The V/O device shall consist of a xenon flash tube and associated lens/reflector system, cover and mounting plate. For ease of installation the mounting plate shall mount directly to standard single gang, double gang or 4" square electrical box, without the use of special adapters or trim rings. When the appliance is connected to an active circuit, the front cover of the appliance shall be removable without causing a trouble indication on the fire alarm control unit. Appliances shall be wired with UTP conductors, having a minimum of 3 twists per foot. The V/O appliance shall be provided with multiple minimum flash intensities of 15cd, 30cd, 75cd, 110cd, 135cd and 185cd. The Candela levels shall be settable from the fire alarm control unit or by using a hardware selector on the appliance.
4. Addressable Audible/Visible: Addressable combination Audible/Visible (A/V) Notification Appliances shall be listed to UL 1971 and UL 464. The strobe device shall consist of a xenon flash tube and associated lens/reflector system, cover and mounting plate. For ease of installation audible/visible mounting plate shall mount directly to standard single gang, double gang or 4" square electrical box, without the use of special adapters or trim rings. The strobe shall provide multiple minimum flash intensities of 15cd, 30cd, 75cd, 110cd, 135cd and 185cd. The Candela levels shall be settable from the fire alarm control unit or using a hardware selector on the appliance. The Horn shall support Temporal Code 3, March Time (20, 60, or 120 BPM), Continuous, and Temporal Code 4 coding patterns. The horn shall have a minimum sound pressure level of 83 or 89 dBA for steady or 79 or 85 dBA for coded operation. When the appliance is connected to an active circuit, the front cover of the appliance shall be removable without causing a trouble indication on the fire alarm control unit. Appliances shall be wired with UTP conductors, having a minimum of 3 twists per foot. The appliance shall be capable of two-wire synchronization with one of the following options:
    a. Synchronized Strobe with Horn on steady.
    b. Synchronized Strobe with Temporal Code Pattern on Horn.
    c. Synchronized Strobe with March Time cadence on Horn.
    d. Synchronized Strobe firing to NAC sync signal with Horn silenced.
5. Addressable Weatherproof Visible Only: Addressable weatherproof strobe shall be UL 1971 listed for indoor applications with strobe intensity selectable as 15 or 75 cd or UL 1638 listed for outdoor applications with strobe rated at 75 cd (WP75) or 185 cd (WP185). The appliances shall be acceptable for indoor and outdoor, extended temperature and extended humidity applications. The V/O device shall consist of a xenon flash tube and associated lens/reflector system, weatherproof cover and weatherproof mounting box. The V/O appliance shall be provided with multiple minimum flash intensities of 15, 75, WP 75, or WP 185 candela. The Candela levels shall be settable from the fire alarm control unit or by using a hardware

selector on the appliance.

6. Addressable Weatherproof Audible/Visible: Addressable weatherproof horn/strobe shall be UL 464 and UL 1971 listed for indoor applications with strobe intensity selectable as 15 or 75 cd or UL 1638 listed for outdoor applications with strobe rated at 75 cd (WP75) or 185 cd (WP185).. The appliances shall be acceptable for indoor and outdoor, extended temperature and extended humidity applications. The A/V device shall consist of a xenon flash tube and associated lens/reflector system, weatherproof cover and weatherproof mounting box. The strobe appliance shall be provided with multiple minimum flash intensities of 15, 75, WP 75, or WP 185 candela. The Candela levels shall be settable from the fire alarm control unit or by using a hardware selector on the appliance. The Horn shall support Temporal Code 3, March Time (20, 60, or 120 BPM), Continuous, and Temporal Code 4 coding patterns. The horn shall have a minimum sound pressure level of 81 or 87 dBA for steady or 80 or 87 dBA for coded operation.

7. Isolator Module: Isolator module provides short circuit isolation for addressable notification appliance SLC wiring. Isolator shall be listed to UL 864. The Isolator shall mount directly to a minimum 2 1/8" deep, standard 4" square electrical box, without the use of special adapter or trim rings. Power and communications shall be supplied by the Addressable Controller channel SLC; dual port design shall accept communications and power from either port and shall automatically isolate one port from the other when a short circuit occurs. The following functionality shall be included in the Isolator module:

    a. Report faults to the host FACU.
    b. On-board Yellow LED provides module status.
    c. After the wiring fault is repaired, the Isolator modules shall test the lines and automatically restore the connection.

B. ADRESSABLE APPLIANCE SLC REPEATER

1. Addressable Repeater shall supervise channel (SLC) wiring and communicate with and control addressable notification appliances. The Repeater shall be a stand-alone panel capable of powering one (1) NAC SLC. The channel (SLC) shall be rated for 3 amps and support up to 127 addresses. Power and communication for the notification appliances shall be provided on the same pair of wires. It shall be possible to program the High/Low setting of the audible (horn) appliances by channel from the addressable controller.

    a. The Repeater shall provide a constant voltage output to ensure NAC current and voltage do not vary whether the panel is operating on AC or battery. The output voltage during alarm conditions shall be 29 VRMS.
    b. Addressable SLC notification appliance circuits shall be Class B.
    c. For Class B circuits, the Repeater shall support up to 4 Class B branches directly at its output terminals for one SLC.
    d. The internal power supply and battery charger shall be capable of charging up two 12.7 Ah batteries internally mounted or 25Ah batteries mounted in an external cabinet.

e. The Repeater panel can be mounted close to the host fire alarm control unit or remotely.
f. The Repeater status shall be communicated to the host fire alarm control unit and locally indicated.
g. A 200mA auxiliary output shall be available
h. The Repeater shall be listed to UL 864

2. Accessories: The contractor shall furnish any necessary accessories.

1.6 REMOTE QVGA LCD ANNUNCIATOR

A. Provide a remote QVGA LCD Annunciator, where shown with the same "look and feel" as the FACU operator interface. The Remote QVGA LCD Annunciator shall use the same Primary Acknowledge, Silence, and Reset Keys as the FACU.

B. The QVGA Annunciator shall have an expanded content, multi-line display capable of supporting a minimum of 854 standard ASCII characters to minimize or eliminate the levels of navigation required for access to information when responding to critical emergencies and abnormal system conditions. The QVGA Annunciator shall provide:

1. Operator prompts and six context sensitive soft-keys for intuitive operation.
2. Seven (7) programmable control switches and associated LEDs.
3. Three (3) programmable general purpose LEDs.
4. Capability of supporting Dual Languages with Instant-Switchover between languages in runtime operation.
5. Support for both one-byte and two-byte characters.

C. Under normal conditions the QVGA LCD shall display a "SYSTEM IS NORMAL" message, the current time and date, and the quantity of abnormal status conditions for each event category (i.e., fire alarm, priority 2, supervisory, and trouble with status icons to indicate area status for highest priority active events.

D. The QVGA Annunciator shall be programmable for the following Activity display choices:

1. First 8 Events.
2. First 5 Events and Most Recent Event with First and Most Recent event time and date stamps.
3. First Event and Most Recent Event with First and Most Recent event time and date stamps.
4. Scrollable List Display displays a scrollable list of active points for the event category (alarm, priority 2, supervisory, or trouble) selected. The position in this list will be the last acknowledged point (not flashing) at the top followed by the next 7 unacknowledged points (flashing).
5. General Event Status (Alarm, Priority 2, Supervisory, or Trouble in system).
6. Site Plan with optional status icons to indicate area status for highest priority active events.

E. Should an abnormal condition be detected the appropriate LED (Alarm, Priority 2,

Supervisory or Trouble) shall flash. The unit audible signal shall pulse for alarm conditions and sound steady for trouble and supervisory conditions.

F. The QVGA LCD shall display the following minimum information relative to the abnormal condition of a point in the system:

1. 40 character custom location label.
2. Type of device (e.g., smoke, pull station, waterflow).
3. Point status (e.g., alarm, trouble).

G. QVGA Annunciators shall be protected from unauthorized use via a locked door or equivalent means. In addition, in systems with two or more Annunciators, each Annunciator shall be programmable to allow multiple Annunciators to have equal operation priority or to allow hierarchal priority control to be assigned to individual Annunciators (locations). Acknowledge, Silence and Reset operation shall be the same as the FACU.

1.7 DACT/IP/CELLULAR COMMUNICATOR TRANSMITTER

A. DACT/IP/Cellular communicator transmitter shall be listed to UL 864 for Central Station Service and be acceptable for use by the remote or central station.

B. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire-alarm control unit and automatically capture two telephone line(s) and dial a preset number for, or connected via TCP/IP or Cellular to a remote or central station. When contact is made with the remote or central station, signals shall be transmitted. If connecting by POTS and service on either line is interrupted for longer than 45 seconds, transmitter shall initiate a local trouble signal and transmit the signal indicating loss of telephone line to the remote alarm receiving station over the remaining line. Transmitter shall automatically report telephone service restoration to the remote or central station. If service is lost on both telephone lines, transmitter shall initiate the local trouble signal. If service is by TCP/IP or Cellular and connection is lost, transmitter shall initiate the local trouble signal and a loss of connection shall be indicated at the central station.

C. Local functions of the DACT/IP/Cellular communicator transmitter shall include the following:

1. Configurable with a primary and secondary path.
2. Paths can use any of the external connections, telephone line, cellular, or LAN Ethernet connections.
3. 3G with 2G fall back cellular connection through the cellular module. Antenna extension kits for areas of poor connectivity.
4. Communications failure with the remote or central station or fire-alarm control unit.

D. Digital data transmission shall include the following:

1. Address of the alarm-initiating device.
2. Address of the supervisory signal.

3. Address or loss of power.
4. Low battery.
5. Abnormal test signal.
6. Communication bus failure.

E. Secondary Power: Integral rechargeable battery and automatic charger.

F. Constant connection supervision and detects failures within 90 seconds for IP/Cellular connection.

G. Battery: Sealed lead-acid or nickel cadmium type. Provide sufficient capacity to operate the complete alarm system in normal or supervisory (non-alarm) mode for a period of 24 hours. Following this period of operation on battery power, the battery shall have sufficient capacity to operate all components of the system, including all alarm notification devices in alarm mode for a period of 5 minutes.

EXECUTION

2.1 INSTALLATION, GENERAL

A. Install system components and all associated devices in accordance with applicable NFPA Standards and manufacturer's recommendations.

B. Installation personnel shall be supervised by persons who are qualified and experienced in the installation, inspection, and testing of fire alarm systems. Examples of qualified personnel shall include, but not be limited to, the following:

1. Factory trained and certified personnel.
2. National Institute of Certification in Engineering Technologies (NICET) fire alarm level II certified personnel.
3. Personnel licensed or certified by state or local authority.

2.2 EQUIPMENT INSTALLATION

A. Furnish and install a complete Fire Alarm System as described herein and as shown on the plans. Include sufficient control unit(s), annunciator(s), manual stations, automatic fire detectors, smoke detectors, audible and visible notification appliances, wiring, terminations, electrical boxes, Ethernet drops, and all other necessary material for a complete operating system.

B. Existing Fire Alarm Equipment shall be maintained fully operational until the new equipment has been tested and accepted.

C. Equipment Removal: After acceptance of the new fire alarm system, disconnect and remove the existing fire alarm equipment and restore damaged surfaces. Package operational fire alarm and detection equipment that has been removed and deliver to the Owner. Remove from the site and legally dispose of the remainder of the existing material.

D. Water-Flow and Valve Supervisory Switches: Connect for each sprinkler valve required to be supervised.

E. Device Location-Indicating Lights: Locate in the public space immediately adjacent to

the device they monitor.

F. Install manual station with operating handle 48 inches (1.22 m) above floor. Install wall mounted audible and visual notification appliances not less than 80 inches (2.03 m) above floor to bottom of lens and not greater than 96 inches (2.44 m) above floor to bottom of lens.

G. Mount outlet box for electric door holder to withstand 80 pounds pulling force.

H. Make conduit and wiring connections to door release devices, sprinkler flow switches, sprinkler valve tamper switches, fire suppression system control units.

I. Automatic Detector Installation: Conform to NFPA 72.

J. Ethernet Drop: A standard RJ-45 Ethernet connection to the owner's Ethernet network shall be provided at each fire alarm control unit as part of the contract.

2.3 PREPARATION

A. Coordinate work of this Section with other affected work and construction schedule.

2.4 CONNECTIONS

A. For fire-protection systems related to doors in fire-rated walls and partitions and to doors in smoke partitions, comply with requirements in Division 08 Section "Door Hardware." Connect hardware and devices to fire-alarm system.

1. Verify that hardware and devices are NRTL listed for use with fire-alarm system in this Section before making connections.

B. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 3 feet (1 m) from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.

1. Alarm-initiating connection to smoke-control system (smoke management) at firefighter smoke-control system panel.
2. Alarm-initiating connection to stairwell and elevator-shaft pressurization systems.
3. Smoke dampers in air ducts of designated air-conditioning duct systems.
4. Alarm-initiating connection to elevator recall system and components.
5. Alarm-initiating connection to activate emergency lighting control.
6. Alarm-initiating connection to activate emergency shutoffs for gas and fuel supplies.
7. Supervisory connections at valve supervisory switches.
8. Supervisory connections at low-air-pressure switch of each dry-pipe sprinkler system.
9. Supervisory connections at elevator shunt trip breaker.
10. Supervisory connections at fire-pump power failure including a dead-phase or phase-reversal condition.

11. Supervisory connections at fire-pump engine control panel.

2.5 WIRING INSTALLATION

A. System Wiring: Wire and cable shall be a type listed for its intended use by an approval agency acceptable to the Authority Having Jurisdiction and shall be installed in accordance with the appropriate articles from the current edition of California Electrical Code.

B. Contractor shall obtain from the Fire Alarm System Manufacturer written instruction regarding the appropriate wire/cable to be used for this installation. No deviation from the written instruction shall be made by the Contractor without the prior written approval of the Fire Alarm System Manufacturer.

C. Color Coding: Color-code fire alarm conductors differently from the normal building power wiring. Use one color code for alarm initiating device circuits wiring and a different color code for supervisory circuits. Color-code notification appliance circuits differently from alarm-initiating circuits. Paint fire alarm system junction boxes and covers red.

D. Ethernet Circuits:

1. Ethernet circuits shall be provided to the Fire Alarm Control Unit as shown on the plans.

2. Where a dedicated Fire Alarm Ethernet LAN is specified only Agency Listed Fire Alarm Ethernet hardware shall be installed.

3. The electrical contractor shall coordinate and ensure proper Ethernet connections occur at the fire alarm control unit prior to system turnover.

2.6 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

B. Install framed instructions in a location visible from fire-alarm control unit.

2.7 GROUNDING

A. Ground fire-alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire-alarm control unit.

2.8 FIELD QUALITY CONTROL

A. Manufacturer's Field Services: Provide services of a factory-authorized service representative to supervise the field assembly and connection of components and the pretesting, testing, and adjustment of the system.

B. Service personnel shall be qualified and experienced in the inspection, testing, and maintenance of fire alarm systems. Examples of qualified personnel shall be permitted to include, but shall not be limited to, individuals with the following qualifications:

1. Factory trained and certified.

2. National Institute for Certification in Engineering Technologies (NICET) fire

alarm certified.

3. International Municipal Signal Association (IMSA) fire alarm certified.

4. Certified by a state or local authority.

5. Trained and qualified personnel employed by an organization listed by a national testing laboratory for the servicing of fire alarm systems.

C. Pretesting: Determine, through pretesting, the conformance of the system to the requirements of the Drawings and Specifications. Correct deficiencies observed in pretesting. Replace malfunctioning or damaged items with new and retest until satisfactory performance and conditions are achieved.

D. Inspection:

1. Inspect equipment installation, interconnection with system devices, mounting locations, and mounting methods.

2. Verify that units and controls are properly installed, connected, and labeled and that interconnecting wires and terminals are identified.

E. Acceptance Operational Tests:

1. Perform operational system tests to verify conformance with specifications:

a. Each alarm initiating device installed shall be operationally tested. Each device shall be tested for alarm and trouble conditions. Contractor shall submit a written certification that the Fire Alarm System installation is complete including all punch-list items. Test battery operated emergency power supply. Test emergency power supply to minimum durations specified. Test Supervising Station Signal Transmitter. Coordinate testing with Supervising Station monitoring firm/entity.

b. Test each Notification Appliance installed for proper operation. Submit written report indicating sound pressure levels at specified distances.

c. Test Fire Alarm Control Unit and Remote Annunciator.

2. Provide minimum 10 days notice of acceptance test performance schedule to Owner, and local Authority Having Jurisdiction.

F. Retesting: Correct deficiencies indicated by tests and completely retest work affected by such deficiencies. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

G. Report of Tests and Inspections: Provide a written record of inspections, tests, and detailed test results in the form of a test log. Use NFPA 72 Forms for documentation.

H. Final Test, Record of Completion, and Certificate of Occupancy:

1. Test the system as required by the Authority Having Jurisdiction in order to obtain a certificate of occupancy. Provide completed NFPA 72 Record of Completion form to Owner and AHJ.

2.9 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance

personnel to adjust, operate, and maintain fire-alarm system.

2.10 CLEANING AND ADJUSTING

A. Cleaning: Remove paint splatters and other spots, dirt, and debris. Clean unit internally using methods and materials recommended by manufacturer.

B. Occupancy Adjustments: When requested within one year of date of Substantial Completion, provide on-site assistance in adjusting sound pressure levels and adjusting controls and sensitivities to suit actual occupied conditions. Provide up to three visits to the site for this purpose.

2.11 TRAINING

A. Provide the services of a factory-authorized service representative to demonstrate the system and train Owner's maintenance personnel as specified below.

1. Train Owner's maintenance personnel in the procedures and schedules involved in operating, troubleshooting, servicing, and preventive maintaining of the system. Provide a minimum of 8 hours' training.

2. Schedule training with the Owner at least seven days in advance.

END OF SECTION 283111

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Specifications for the excavation, filling, recompacting, grading and disposal of excess material.

B. Excavated soil and land clearing debris to be 100% reused or recycled

C. Related Sections

1. Section 312324, “Trenching and Backfilling”

1.2 REFERENCED STANDARDS

A. ASTM International

1. ASTM C136-84a: Standard Method for Sieve Analysis of Fine and Coarse Aggregate

2. ASTM D1557: Laboratory Compaction Characteristics of Soil Using Modified Effort

3. ASTM D2922: Density of Soil and Soil-Aggregate in Place by Nuclear Methods

B. Caltrans – State of California Standard Specifications; latest edition

C. Geotechnical Investigation and Geologic Hazards Evaluation Laney College Library Learning Resource Center report prepared by Fugro dated February 28,2020

1.3 DEFINITIONS

A. Compaction

1. The degree of compaction is specified as percent compaction. Maximum densities refer to the maximum laboratory dry soil densities obtainable at optimum moisture content as determined by ASTM D1557.

2. Percent compaction (relative compaction) is the ratio of the measured field dry density to the laboratory maximum dry density.

B. Excavation Slope: Excavation slope shall be defined as an inclined surface formed by removing material from below existing grade.

1.4 SUBMITTALS

A. Product Data

1. Fill materials

2. Source of recycle facility

B. Test Reports

1. Gradation (ASTM C136)
2. Density-In-Place (ASTM D2922)

PART 2 – PRODUCTS

2.1 FILL MATERIALS

A. Class 2 Aggregate Base: Class 2 aggregate base for subsequent backfill and/or pavement base to be ¾ inches maximum Class 2 aggregate base conforming to Caltrans, Section 26.

PART 3 - EXECUTION

3.1 CONSTRUCTION

A. Surplus Material: Unless otherwise specified, surplus excavated material shall be disposed of off-site in accordance with applicable ordinances and environment requirements at the expense of the Contractor.

B. Hauling

1. When hauling is down over highways or city streets, loads shall be trimmed and the vehicle shelf areas shall be cleaned after each loading.
2. Loads shall be watered after trimming to eliminate dust.

C. Subgrade: Unless directed otherwise on the drawings, soil subgrades in areas to receive engineered fill, slabs-on-grade, or pavements shall be scarified to a depth of at least 12 inches, moisture conditioned to approximately 3 percent above optimum water content and compacted per the requirements indicated in the plans.

D. Finish Grading

1. Finish surfaces shall be smooth, compacted and free from irregularities. The degree of finish shall be that normally obtainable with a blade-grader.
2. Finish grades shall be as specified on the plans, except where a local change in elevation is required to match existing conditions, or to ensure proper drainage.
3. When the work is at an intermediate stage of completion, lines and grades shall be as specified within 0.1 foot or as necessary to provide adequate drainage.

3.2 FIELD QUALITY CONTROL

A. Fill material shall be placed in horizontal layers and compacted with power tampers, rollers, idlers, or vibratory equipment. Within the upper 5 feet of the finished ground surface, engineered fills shall be compacted to at least 90% relative compaction, as determined by ASTM D1557, or as approved by the Geotechnical Engineer. The

upper 6 inches of subgrade soils below pavements shall be compacted to 95% relative compaction or as indicated in the plans. Fill material shall be spread and compacted in lifts not exceeding 8-inches in uncompacted thickness.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Specifications and procedure for the de-watering of excavations and disposal of water.

1.2 SUBMITTALS

A. Prior to installation of the de-watering system, submit shop drawings and design data indicating the following:

1. The proposed type of de-watering system
2. Arrangement, location and depths of system components
3. Complete description of equipment and instrumentation to be used, with installation, operation and maintenance procedures
4. Methods of disposal of pumped water
5. Necessary permits for water disposal

PART 2 - PRODUCTS

2.1 EQUIPMENT

A. Furnish all materials, tools, equipment, facilities, and services as required for providing the necessary de-watering work and facilities.

B. Provide backup equipment as necessary for the replacement and for unanticipated emergencies.

PART 3 - EXECUTION

3.1 DE-WATERING

A. Keep excavation reasonably free from water during construction.

B. Disposal of water shall not damage property or create a public nuisance.

C. Have on hand pump equipment and machinery in good working condition for emergencies and workmen available for its operation.

D. De-watering systems shall operate continuously until trenches are backfilled.

E. Groundwater shall be controlled to prevent softening of the bottom of excavations, or formation of “quick” conditions.

F. De-watering systems shall not remove natural soils.

G. Control surface runoff to prevent entry or collection of water excavations.

H. Release of groundwater shall be controlled to prevent disturbance of the natural foundation soils or compact fill.

I. There shall be no discharge of turbid or hazardous water on site.

J. Discharge or disposal of water shall be controlled to prevent erosion.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Section Includes: Perform all excavation, shoring, potholing, dewatering, backfilling, compaction, pavement restoration, and grading necessary or required for the construction of the work as covered by these Specifications and indicated on the Drawings. The excavation shall include, without classification, the removal and disposal of all materials of whatever nature encountered, including water and all other obstructions that would interfere with the proper construction and completion of the required work.

B. Related Sections

1. Section 321123, “Aggregate Base”
2. Section 321216, “Asphaltic Concrete Paving”
3. Section 312319 “De-Watering”
4. Section 331000 “Water Utilities”
5. Section 333300 “Site Sanitary Sewerage System”
6. Section 334000 “Storm Drainage System”

1.2 REFERENCES

A. American Society for Testing and Materials (ASTM).

B. State of California, Department of Transportation, Standard Specifications (Standard Specifications) July 1992.

C. State of California, Department of Transportation, Manual of Test (California Test).

1.3 SUBMITTALS

A. Submit the following:

1. Sheeting and Shoring Plan: Refer to Paragraph 1.5 below.
2. Potholing Report as described in Paragraph 3.2.
3. Samples and Test Results: Furnish, without additional cost to the Owner, such quantities of import materials as may be required by the Owner’s Representative for test purposes. Cooperate with the Owner’s Representative and furnish necessary facilities for sampling and testing of all materials and workmanship. Submit test results for import materials. Tests shall have been performed within 60 days of submission. All material furnished and all work performed shall be subject to rigid inspection, and no material shall be delivered to the site until it has been favorably reviewed by the Owner’s Representative, or used in the construction work until it has been inspected in the field by Inspector of Record.

1.4 QUALITY ASSURANCE

A. Source Quality Control: Test import materials proposed for use to demonstrate that the materials conform to the specified requirements. Tests shall be performed by an independent testing laboratory.

B. Field Quality Control:

1. The Owner will:

a. Review and test materials proposed for use.

b. Inspect placement and compaction of fill.

c. Test soils during placement of fill.

2. Contractor shall excavate holes for in-place soil sampling. Contractor shall be responsible for costs of additional inspection and re-resting resulting from non-compliance.

C. Testing Methods:

1. Durability Index: Manual of Test, State of California, Department of Transportation.
2. Specific Gravity: ASTM D854.
3. Laboratory Compaction: ASTM D1557, Method A or C.
4. In-Place Density: ASTM D2922.
5. Particle Size Analysis of Soils: ASTM D422.
6. Plastic Limit and Plasticity Index: ASTM D4318.
7. Soil Classification: ASTM D2487.
8. In-Place Moisture Content: ASTM D3017.

1.5 EXCAVATION AND TRENCHING

A. General Protection: Pursuant to Labor Code Sections 6705 and 6707, Contractor shall include in its base bid all costs incident to the provision of adequate sheeting, shoring, bracing or equivalent method for the protection of life and limb which shall conform to the applicable Federal and State Safety Orders.

B. Before beginning any excavation five (5) feet or more in depth, submit to the Owner's Representative a detailed plan showing the design of shoring, bracing, sloping or other provisions to be made for worker protection from the hazard of caving ground during excavations. Comply with the Standards established by the State of California Construction Safety Orders Title 24 of the California Administrative Code. If the detailed plan varies from such shoring system Standards it shall be prepared by a registered civil or structural engineer whose name and registration number shall be indicated on the Drawing. If a dispute arises as to whether the plan must be prepared

by a registered civil or structural engineer, the Owner's Representative's determination of the matter shall be final and conclusive. The cost of required engineering services shall be borne by the Contractor and shall be deemed to have been included in the amount of bid for the work as stated in the Agreement.

C. Neither the review nor approval of any plan showing design of shoring, bracing, sloping or other provisions for worker protection shall relieve Contractor from his obligations to comply with Construction Safety order Standards and Title 24 CAC for design and construction of such protective work, and Contractor shall indemnify Owner and Owner's Representative from any and all claims, liability, costs, actions and a cause of action arising out of or related to the failure of such protective system. The Contractor shall defend the Owner, its officers, employees and agents and the Owner's Representative in any litigation or proceeding brought with respect to the failure of such protective systems.

D. The Contractor shall comply with Section 382 of the Civil Code of the State of California relating to lateral, general and sub-adjacent supports wherever structures or improvements adjacent to an excavation may be damaged by such excavation.

E. Contractors must still comply with the State of California Construction Safety Orders, Article 6 – Excavations, Trenches, Earthwork. The requirements of Article 6 apply whether the excavation, trench or earthwork is less than 5', or 5' or more.

F. The Contractor shall select, install and maintain shoring, sheeting, bracing, and sloping as necessary to maintain safe excavations. The Contractor shall be responsible for ensuring such measures: (1) comply fully with 29 CFR Part 1926 OSHA Subpart P Excavations and Trenches requirements, (2) provide necessary support to the sides of excavations, (3) provide safe access to the Engineer's sampling and testing within the excavation, (4) provide safe access for backfill, compaction, and compaction testings, and (5) otherwise maintain excavations in a safe manner that shall not endanger property, life, health, or the project schedule. All earthwork shall be performed in strict accordance with applicable law, including local ordinances, applicable OSHA, CalOSHA, California Civil Code, and California Department of Industrial Safety requirements.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Crushed Rock: ¾-inch maximum crushed virgin drain rock with a minimum durability rating of 58.

B. Import Backfill: Class 2, ¾-inch maximum aggregate base, Standard Specifications Section 26. Paragraphs 26-1.06 and 26-1.07 are not applicable.

Sieve Size	Percentage Passing
1-1/2 inch	100
1 inch	95 to 100
¾ inch	90 to 100

3/8 inch	15 to 85
No. 4	0 to 9

A. Geotextile Fabric: Mirafi FW300 or equivalent

B. Water: The water used shall be potable and free of objectionable quantities of silt, oil, organic matter, alkali, salts and other impurities. Water quality must be acceptable to the Owner's Representative.

C. Sandy Clay Loam: Provide sandy clay loam backfill in the top 18 inches in unpaved areas, 85% compaction.

1. Sandy Clay Loam Analysis: Submit a sample of sandy clay loam proposed for use to an accredited Soils Laboratory for "agricultural suitability" analysis report, including particle size, and evaluation of physical and chemical properties of soil and recommendations for adding amendments and fertilizers to the soil.

2. Upon approval of the Laboratory's report by the Owner's Representative, the recommendations in the report shall become a part of the Specifications and the quantities of soil amendment, fertilizer and other additives shall be adjusted to conform with the report at no additional cost to the Owner. Request Testing Laboratory to send one copy of test results directly to Owner's Representative.

3. Test Laboratory: Soil and Plant Laboratory, Inc. 352 Matthew Street (PO Box 153), Santa Clara, CA 95052, Tel. (408) 727-0330; or Root Zone Associates, PO Box 18911, San Jose, CA 95118, Tel. (408) 264-7024.

D. Controlled Density Fill (CDF):

1. Materials:

- Cement: ASTM C150, Type II or V. A maximum of twenty (20) lbs. of cement per cubic yard.
- Aggregate shall consist of fine aggregate, with our without coarse aggregate, with a maximum size of 1-inch, free of clay, organics, and other deleterious materials. Less than 10 percent by weight shall pass the No. 200 sieve, and materials passing the No. 40 sieve shall be nonplastic as determined in accordance with ASTM D4318.
- Water: Potable.
- Fly Ash: ASTM C618, Class F unless otherwise approved.

2. Mix Design:

- Performance Requirements: The CDF shall be proportioned to be a non-segregating, free flowing, self-consolidating, low shrink slurry.
- Mix Design Requirements: The Contractor and its supplier shall determine the materials and proportions used to meet the requirements of these Specifications. Design the mixes far enough ahead of placement to allow completion of trail mix testing and submittal of test results. The mix design(s) shall be prepared for the range of aggregate gradations that is expected to be used. The Contractor shall

make daily checks of the aggregate gradation and adjust the mix design as required to meet these Specifications.

- Material Strength Requirements: The unconfirmed compressive strength at 28 days shall be 100 psi as per ASTM D4832.

E. Concrete: Concrete encasement used for conduit backfill shall be rated 4000 psi at 28 days and shall have red dye additive. Submit mix design for approval.

F. Trench Plugs: Clayey soils as approved by the Geotechnical Engineer

PART 3 - EXECUTION

3.1 CONTROL OF WATER

A. All excavations shall be kept free from water and all construction shall be in the dry.

1. It should be presumed that the presence of groundwater will require dewatering operations. Furnish, install, maintain, and operate all necessary pumping and other equipment for dewatering all excavations. At all times have on the project sufficient pumping equipment for immediate use, including standby pumps for use in case other pumps become inoperable.

2. Provide a sufficient number of pumps so as to hold the groundwater level at an elevation of not less than 1 foot below the lowest elevation of the pipe, duct or other material to be placed.

3. Dispose of water in such a manner as to cause no injury or nuisance to public or private property, or be a menace to the public health.

4. The dewatering operation shall be continuous, so that the excavated areas shall be kept free from water during construction, while concrete is setting and achieves full strength, and until backfill has been placed to a sufficient height to anchor the work against possible flotation.

5. Continue dewatering during backfilling operations such that the groundwater is at least 1 foot below the level of the compaction effort at all times. No compaction of saturated materials will be allowed.

6. Dewatering devices must be adequately filtered to prevent the removal of fines from the soil.

7. The Contractor shall be responsible for any damage to the foundations or any other parts of existing structures or of the new work caused by failure of any part of the Contractor's protective works. After temporary protective works are no longer needed for dewatering purposes, they shall be removed by the Contractor.

8. If pumping is required on a 24-hour basis, requiring engine drives, then engines shall be equipped in a manner to keep noise to a minimum.

9. Prevent disposal of sediments from the soils to adjacent lands or waterways by employing whatever methods are necessary, including settling basins and holding tanks for disposal off site

B. The Contractor shall be responsible for furnishing temporary drainage facilities to convey and dispose of surface water falling on or passing over the site.

3.2 EXISTING UTILITIES

A. General: The known existing buried utilities and pipelines except building connections are shown on the Drawings in their approximate location. The Contractor shall exercise care in avoiding damage to all utilities, as he will be held responsible for their repair if damaged. There is no guarantee that all utilities or obstructions are shown, or that locations indicated are accurate. Utilities are piping, conduits, wire, cable, ducts, manholes, pull boxes and the like.

B. Check on Locations (Potholing):

1. Contact the Owner and request them to locate their respective utilities prior to the start of "potholing" procedures. The Owner shall be given 7 days written notice prior to commencing potholing. The Owner has performed a limited investigation and has recorded those findings on the Contract Documents.

2. Clearly paint the location of all affected utility underground pipes, conduits and other utilities on the pavement or identify the location with suitable markers if not on pavement. In addition to the location of metallic pipes and conduits, non-metallic pipe, ducts and conduits shall also be similarly located using surface indicators and detection tape if present and shall then be similarly marked.

3. After the utility survey is completed, commence "potholing" to determine the actual location and elevation of all utilities where crossings, interferences, or connections to the new pipelines are shown on the Drawings, or indicated by surface signs. Prior to the preparation of piping shop drawings, or the excavating for any new pipelines or structures, the Contractor shall locate and uncover these existing utilities to a point 1-foot below the utility. Submit a report identifying each underground utility and its depth and station. Any variation in the actual elevations and the indicated elevations shall be brought to the Owner’s Representative's attention.

4. Excavations around underground electrical ducts and conduits shall be performed using extreme caution to prevent injury to workmen or damage to electrical ducts or conduits. Similar precautions shall be exercised around gas lines, telephone and television cables.

5. Excavations shall have surface dimensions of no more than 18" x 18". Air spades and vacuum excavators shall be used to limit the size of excavations and damage to adjacent facilities. Backfill after completing potholing. In existing streets, repave with project typical pavement section or match existing pavement section, whichever is greater.

C. Interferences:

1. If interferences occur at locations other than shown on the Drawings, the Contractor shall notify the Owner’s Representative, and a method for correcting said interferences shall be supplied by the Owner’s Representative. Payment for interferences that are not shown on the plans, nor which may be inferred from

surface indications, shall be in accordance with the provisions of the General Conditions. If the Contractor does not expose all required utilities prior to shop drawing preparation, he shall not be entitled to additional compensation for work necessary to avoid interferences, nor for repair to damaged utilities.

2. Any necessary relocations of utilities, whether shown on the Drawings or not, shall be coordinated with the Owner if instructed to do so in writing from the Owner's Representative.

D. Overhead Facilities: There may be existing overhead electric and telephone transmission lines on the site. These overhead utilities are not shown on the Drawings. Extreme caution shall be used when working in the vicinity of overhead utilities so as to prevent injury to workmen or damage to the utilities. The Contractor shall be required to comply with the applicable provisions of the California Construction Safety Orders when working anywhere on this project.

E. Existing gas, water, sewer and communications laterals are not specifically shown on the Drawings but do exist along the existing utility corridors. Protect all service laterals from damage due to construction operations. If any laterals are damaged, notify the Owner's Representative immediately. The cost of repair shall be borne by the Contractor.

3.3 GENERAL CONSTRUCTION REQUIREMENTS

A. Site Access: Access to the site will be over public and private roads. Exercise care in the use of such roads and repair at the Contractor's expense any damage thereto caused by Contractor's operations. Such repair shall be to the satisfaction of the Owner or agency having jurisdiction over the road. Take whatever means are necessary to prevent tracking of mud onto existing roads and keep roads free of debris. Contractor shall provide access plan for all phases of work for approval by Owner's Representative prior to trenching operations.

B. Traffic Regulation: Provide such flagmen, lighted barricades, flares, lights, warning signs, and safety devices as may be required for control of traffic adjacent to all areas of work. A minimum of one 12-foot-wide lane of traffic shall be kept open at all times.

C. Open Excavations: Provide chain link fence around all excavations left open during non-working hours in unpaved areas. In all paved areas (walkways and fire lanes) excavations left open during non-working hours shall be covered with steel plates.

D. Access: Free access must be maintained to all fire hydrants, water valves and meters, and driveways.

E. Open Trench Limitations: The Owner's Representative shall have the authority to limit the amount of trench to be opened or left open at any one time. In roads, excavation and pipe laying shall be coordinated to the end that a minimum of interference with public traffic will result. Trenches in streets and pathways shall be covered with trench plates at the end of each day. An open trench in existing streets shall be defined as any trench that has not been completely backfilled, satisfactorily compacted, and capped with the permanent pavement.

F. Demolition of Pavement: Where trenching or excavation occurs in paved areas, the pavement shall be scored and broken ahead of the trenching or excavation operation. The extent of paving

removed shall be limited to the minimum necessary for the excavation. The final trench repair shall have sawcut edges.

G. Dust Control: Take proper and efficient steps to control dust.

3.4 TRENCH EXCAVATION

A. There is no room on site for storing excavated material. All excavated material shall be disposed of off campus. All backfill material shall be imported.

B. Excavation to the extent shown on the drawings and under the drip line of trees shall be hand excavated to a level below the root zone of the trees – NO EXCEPTIONS.

C. Excavation for pipe and duct shall be in open cut. The trench shall be as wide as necessary for sheeting and bracing and the proper performance of the work up to the maximum width permitted by the typical cross-sections shown on the Drawings. The sides of the trenches shall be vertical in existing streets. The bottom of the trench shall be constructed to the grades and shapes indicated on the Drawings. Should the Contractor desire to use other equivalent methods, he shall submit his method of construction to the Owner's Representative for favorable review prior to its use.

D. Take care not to overexcavate. Accurately grade the bottom of the trenches to provide uniform bearing and support for each section of the pipe at every point along its entire length, except for the portions of the pipe sections where it is necessary to excavate for bell holes and for the proper sealing of pipe joints, and as hereinafter specified. Dig bell holes and depressions for joints after the trench bottom has been graded, and, in order that the pipe rest on the bedding for as nearly its full length as practicable, bell holes and depressions shall be only of such length, depth and width as required for properly making the joint. Remove stones as necessary to avoid point bearing.

E. Backfill and compact overexcavations to 95% of its maximum dry density with Class II Aggregate Base material. Provide filter fabric (Mirafi, or equal) above, below, and on both sides of aggregate base as directed by the Owner's Representative. There shall be no additional payment to the Contractor for overexcavations not directed by the Owner's Representative. Remove unsatisfactory material encountered below the grades shown as directed by the Owner's Representative and replace as directed. Payment for removal and replacement of such unsatisfactory material directed by the Owner's Representative shall be made in accordance with the provisions of the General Conditions.

F. Grade trenches so that they are uniformly sloped between the pipe elevations shown on the Drawings. Comply with the minimum and maximum trench widths shown on the Drawings. Notify the Owner's Representative if the trench width exceeds the maximum allowable width for any reason.

G. For all piping or conduits to be placed in any excavated and backfilled area, such as at manholes or for building connections, the structural backfill shall be first compacted to a level at least 3 feet above the top of the piping or conduit elevation and then retrenched to pipe grade.

H. Provide ladders for access to the trench by construction and inspection personnel.

3.5 SAFETY BARRICADES AND LIGHTS

A. Where required for protection of workmen, public safety, or as required by State Laws, substantial barricades shall be provided for the areas where excavation, trenching, construction and demolition work are being performed. Safety Barricades shall not be used in lieu of required guardrails on temporary bridges crossing trenches, excavations or other openings. For protection of the *Visually Impaired*, safety barricades shall be joined together with 3" yellow *Caution* tape as follows:

1. Two strands of caution tape running continuous from barricade to barricade, one at the tops of the barricades and one at a height of from 4" to 12" above grade or mounting level.

2. In addition battery-operated warning lights shall be maintained on such barricades, whenever visibility is restricted, and at night.

3.6 BACKFILL AND COMPACTION

A. Place bedding and backfill materials true to the lines, grades, and cross-sections indicated on the Drawings and compacted to the degree specified on the Drawings. Place bedding and backfill materials in horizontal lifts not to exceed 8 inches in thickness measured before compaction. The difference in level on either side of a pipe or duct shall not exceed 4 inches.

B. Backfill material shall not be placed over the pipe or duct until after it has been inspected by the Owner's Representative.

C. It shall be incumbent upon the Contractor to protect the pipe or duct from damage during the construction period. It shall be the Contractor's responsibility to repair broken or damaged pipe or duct at no extra cost to the Owner. Tamping of backfill over the pipe shall be done with tampers, vibratory rollers and other machines that will not injure or disturb the pipe or duct. Carefully place backfill around and over the pipe or duct.

D. Do not allow construction traffic nor highway traffic over the pipe trench until the trench backfill has been brought back even with existing adjacent grade.

E. Add water to the backfill material or dry the material as necessary to obtain the optimum moisture content for the compaction shown on the Drawings or specified. If the Owner's Representative determines that the nature of the ground in which the trench lies precludes compaction of the backfill to the specified density, the backfill shall be compacted to the maximum practicable density. Employ such means as may be necessary to secure a uniform moisture content throughout the material of each layer being compacted. After the material has been moisture conditioned, compact it with compaction equipment approved by the Owner's Representative to achieve specified compaction. The Contractor shall be responsible for obtaining the densities specified. Should the Contractor fail, through negligence or otherwise, to compact to specified density, or to backfill and compact to surface grade, thus permitting saturation of the backfill material from rains or from any other source, the faulty material shall be removed and replaced with approved material which shall be compacted to the specified

density at optimum moisture content, and no additional payment will be made for doing such work or removal and replacement.

F. Compaction by flooding, ponding or jetting will not be permitted.

3.7 CONTROLLED DENSITY FILL (CDF)

A. Trench Backfill:

1. Contractor can choose to backfill trench with CDF in place of Class II Aggregate Base. (See trench sections on drawings.)

2. CDF shall be placed into the trench so that the CDF is placed evenly to prevent uneven loading of the pipe. CDF shall not be placed directly onto the pipe. The maximum depth of the first lift of CDF shall not allow the pipe to move or float. Subsequent lifts of CDF shall be placed so that that pipe does not shift or float. CDF placed in trenches with steep slopes shall be placed in lifts to prevent flotation of the pipe, and the Contractor shall install approved sand bags as needed to secure the pipe in place during placement of the CDF.

3. The maximum temperature of the CDF shall be 74°F at the time of placement. The minimum temperature of the CDF shall be 40°F at the time of placement. CDF shall be placed in lifts not exceeding 6 inches. Each lift shall be allowed to cure long enough to lose its fluid properties before placing the next lift.

3.8 SUPPORT OF EXCAVATIONS

A. Adequately support excavation for trenches and structures to meet all applicable requirements in the current rules, orders and regulations. Excavation shall be adequately shored, braced and sheeted so that the earth will not slide or settle and so that all existing structures and all new pipe and structures will be fully protected from damage. Keep vehicles, equipment and materials far enough from the excavation to prevent instability.

B. Take all necessary measures to protect excavations and adjacent improvements from running, caving, boiling, settling, or sliding soil resulting from the high groundwater table and the nature of the soil excavated. Attention is directed to Section 832 of the Civil Code of the State of California relating to lateral and subjacent supports, and wherever structures or improvements adjacent to the excavation may be damaged by such excavation, the Contractor shall comply with this law.

C. The support for excavation shall remain in place until the pipeline, duct or structure has been completed. During the backfilling of the pipeline or structure, the shoring, sheeting and bracing shall be carefully removed so that there shall be no voids created and no caving, lateral movement or flowing of the subsoils.

3.9 FINISH GRADING

A. Except where shown otherwise in the Drawings, restore the finish grade to the original contours and to the original drainage patterns. Grade surfaces to drain away from structures. The finished surfaces shall be smooth and compacted.

3.10 DISPOSAL OF EXCAVATED MATERIAL

A. Dispose of all excavated material offsite in a legal manner.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Slope protection, erosion control, and rip rap placement, and shall consist of all permanent and temporary erosion control features as indicated for the purpose of preventing on-site erosion and maintaining all sediments within the project boundaries and comply with the requirements of the District.

1.2 SCHEDULING

A. Apply erosion control features within five days after completion of all other work in each area.

B. Apply erosion control features as necessary for wet weather conditions and as directed by District.

1.3 REPLACEMENT

A. Any area in excess of 100 square feet of dead or damaged erosion control material shall be replaced.

B. The replaced erosion control shall be of the same formulation and quality as the original.

PART 2 - PRODUCTS

2.1 EROSION CONTROL BLANKETS

A. Erosion control blankets shall be North American Green single net straw blanket, Western Excelsior excel SR-1, or equivalent.

2.2 FIBER ROLLS

A. Fiber rolls shall be netted tubes, at least 12 inches in diameter, filled with straw or equivalent biodegradable product. Installation shall be in accordance with "Erosion and Sediment Control Field Manual" (latest edition) by the California Regional Water Quality Control Board, San Francisco Bay Region.

2.3 SILT FENCE

A. Silt fence shall be per "Erosion and Sediment Control Field Manual" (latest edition) by the California Regional Water Quality Control Board, San Francisco Bay Region.

2.4 RIP RAP

A. Rip rap shall conform to Class 1, Type B Drain Rock conforming to Caltrans Section 68, unless otherwise noted.

B. Geotextile fabric shall be Mirafi 600X Filter Fabric or equivalent.

C. Placing

1. The Contractor shall place a geotextile stabilization fabric over the areas to receive rip rap. Fabric edges shall overlap at least one and one-half feet.

2. Rip rap shall be placed to the line, grade and depth shown on the plans. Rip rap shall be placed in such a fashion (Caltrans Method A Placement) as not to puncture or tear the underlying fabric. The contractor shall replace torn sections of fabric with a piece of the same fabric. Fabric overlap in these areas shall be at least three feet.

3. Rip rap shall be placed in such a manner that the material does not segregate itself into areas of larger and smaller rip rap.

2.5 EQUIPMENT, MATERIALS, AND FACILITIES

A. Furnish all materials, tools, equipment, facilities, and services as required for providing the necessary erosion controls.

PART 3 - EXECUTION

3.1 APPLICATION

A. Erosion Control Blankets: Shall be installed and staked according to manufacturer's recommendations for slopes.

B. Silt Fences: Install to intercept and detain sediment prior to entering storm drainage.

C. As erosion control measures near capacity for silt retention, the Contractor shall remove the silt materials. The Contractor shall remove the materials from the site or to an area that is designated by the Owner. The Contractor shall then reestablish the silt fences, fiber rolls, straw bales, or rip rap to its original state.

3.2 INSPECTION

A. Silt fences, fiber rolls, and rip rap shall be inspected immediately after each rainfall and at least daily during prolonged rainfall. Any required repairs shall be made immediately, to the satisfaction of the Owner.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Machine drilled shaft.

B. Concrete and reinforcement.

C. Shaft liner, if required.

1.2 RELATED REQUIREMENTS

A. Section 03 20 00 - Concrete Reinforcement: Requirements for concrete reinforcement.

B. Section 03 30 00 - Cast-In-Place Concrete: Requirements for concrete.

1.3 REFERENCE STANDARDS

A. ACI 336.1 - Specification for the Construction of Drilled Piers; 2001.

B. ASTM A36/A36M - Standard Specification for Carbon Structural Steel; 2014.

C. ASTM A283/A283M - Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates; 2018.

D. ASTM A929/A929M - Standard Specification for Steel Sheet, Metallic-Coated by the Hot-Dip Process for Corrugated Steel Pipe; 2018.

1.4 SUBMITTALS

A. See Division 1 - Administrative Requirements, for submittal procedures.

B. Project Record Documents: Record actual locations of piers, pier diameter, and pier length. Accurately record the following:

1. Sizes, lengths, and locations of piers.

2. Sequence of placement.

3. Final base and top elevations.

4. Deviation from indicated locations.

C. Submit pier installer qualifications to the District's Representative for review and approval at least thirty (30) days prior to commencement of drilling.

D. Submit proposed support method to the District's Representative for review and approval at least thirty (30) days prior to commencement of drilling. Acceptable methods are full depth steel casing or drilling fluids.

E. Logs of concrete placement for each pier, documenting the theoretical volume of concrete required (cubic yards, to nearest cubic foot) versus the actual placed concrete volume for each pier.

1.5 QUALITY ASSURANCE

A. A. District's Quality Assurance Testing and Inspection: The District will employ a Geotechnical Engineer, to serve as the District's Representative, to inspect and test the work of this section. This does not alleviate the Contractor from providing quality control during this portion of the work. At the completion of this work the Geotechnical Engineer will be required to submit a written report stating that the Piers were properly constructed with acceptable materials and construction practices in accordance with the Contract Documents. The Geotechnical Engineer shall be permitted free and unrestricted access to the site as required for the performance of his duties.

B. The District's Representative (Geotechnical Engineer) will inspect pier shafts during drilling and during the installation of reinforcement, will test soil materials, will independently establish Pier depth, and will inspect completed piers for voids using non-destructive means via the inspection conduits and other methods.

C. Notice: Provide the District's Representative at least five (5) working days notice prior to start of each phase of earthwork operations

D. Contractor's Quality Control Testing and Inspection: Quality control requirements shall be the sole responsibility of the Contractor. The Contractor shall hire and pay for services of an independently operating Testing Agency, referred to herein as the Contractor's Testing Agency, to perform the tests needed to satisfy quality control requirements at no additional cost to the University. All test results shall be submitted to the District's Testing Agency for review. The Contractor shall submit the qualifications of the retained Testing Agency for approval. The Contractor's Testing Agency shall not be the same agency retained by the University for quality assurance tests and inspections.

E. Pre-Construction Conference: Before commencing pier work, conduct a conference at the project site with the District's Representative, and other concerned entities. Review pier construction procedures, the requirements for temporary shoring and dewatering, and work responsibilities including testing and inspection procedures. Notify participants at least three weeks prior to convening conference. Record discussions and agreements and furnish a copy to each participant.

F. Materials and installed work may require testing and retesting at any time during progress of work. Allow free access to material stockpiles and facilities.

1.4 CONTRACTOR'S QUALITY CONTROL

A. Comply with latest edition of the following standards:

1. American Concrete Institute (ACI) "Reference Specification for the Construction of Drilled Piers" (ACI 336.1), and Commentary (ACI336.1R-98), and as herein specified.

2. Where provisions of above standard conflict with local building regulations, building regulations will govern, but only to establish minimum requirements.

B. Comply with requirements of local, state and Federal Regulatory Agencies, including, but not limited to:

1. State of California Construction Safety Orders (CAL/OSHA), latest edition.

C. Pier Installer Qualifications:

1. The Pier installer must have completed not less than five successful projects with similar soil conditions, shaft sizes, depth and volumes of work contained in this project in past five years.

D. Survey work:

1. Engage a surveyor, registered in the State of California, to perform surveys, layouts, and measurements for Pier work.

2. Conduct layout work for each pier to lines and levels required before excavation, and actual measurements of each pier's horizontal axial location, shaft diameter, bottom and top elevations, deviations from specified tolerances, and other data as required.

3. Record and maintain information pertinent to each Pier and cooperate with other testing and inspection personnel to provide data for required reports.

E. Provide design and type of steel casing to meet project requirements, or design of hole support system using drilling fluids, including the containment and filtering of the drilling fluids.

1.5 PROJECT CONDITIONS

A. Existing Utilities: Locate existing underground utilities by careful hand excavation before starting pier excavation operations.

1. If utilities are to remain in place, provide protection from damage during pier operations.

2. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, consult District's Representative immediately for directions as to procedure.

3. Cooperate with District's Representative, and public or private utility companies in keeping their respective service and facilities in operation.

4. Repair damaged utilities to satisfaction of utility owner.

5. Do not interrupt existing utilities serving facilities occupied and used by the University or others, except when permitted in writing by the District's Representative and then only after acceptable temporary utility services have been provided.

C. Environmental Requirements:

1. When unfavorable weather conditions necessitate interrupting drilling of piers, work shall stop.

2. Provide adequate temporary drainage to prevent water accumulation in piers.

3. Pump Piers when directed by the District's Representative (Geotechnical Engineer).

D. Maintain and safe workplace and barricade open excavations and post with warning lights in accordance with Section 01 50 00 – Temporary Facilities.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Casing: Temporary casings of steel complying with ASTM A283/A283M, Grade C; ASTM A36/A36M; or ASTM A929/A929M; of sufficient strength to withstand handling and drilling stresses, concrete pressures, and surrounding earth and water pressures.

B. Concrete Materials and Mix: Specified in Section 03 30 00.

C. Reinforcement: Specified in Section 03 20 00; spiral wound.

D. PVC Pipe: Diameter as specified, Schedule 40 in accordance with ASTM D 2665, or approved equal.

PART 3 - EXECUTION

3.1 FABRICATION

A. Pier reinforcing cage shall be fabricated with extra diagonal reinforcement to maintain the integrity and alignment during the handling and placement of the cage. The cage shall be configured to allow for insertion of a tremie tube for concrete placement.

3.2 PREPARATION

A. Use placement method which will not cause damage to nearby structures.

B. Protect structures near the work from damage.

C. Prepare to place piers from existing site elevations.

D. Grade perimeter of pier and shaft area to prevent surface water from draining into soil borings. Provide temporary means and methods, as required, to maintain surface diversion until no longer needed, or as directed by the Architect.

3.3 EXAMINATION

A. Prior to commencement of drilling piers, become familiar with site conditions.

B. In the event unsatisfactory site conditions are found, immediately notify the District's Representative in writing, indicating the nature and extent of unsatisfactory conditions.

C. Protect adjacent affected structures from damage.

D. Drill and cast piers only in the physical presence of the District's Representative (Geotechnical Engineer).

1. Notify the District's Representative at least 48 hours prior to commencing work

3.4 PIER EXCAVATION

A. A. Excavate holes for piers, only after adjacent holes are filled with concrete and allowed to set for a minimum of 12 hours. No more than two holes may be drilled and open at any time.

B. Temporary Shaft Protection using Steel Casing:

1. The Contractor shall conduct investigations as needed to identify the requirements for casing. No adjustment to the contract amount will be made for casing that may be required.

2. Provide full-length watertight steel casings of sufficient thickness to withstand compressive and withdrawal stresses as required to maintain shaft walls without displacing.

3. Temporary casings shall be removed as concrete is placed.

C. Temporary Shaft Protection using Drilling Fluids: If drilling fluid (bentonite or polymer slurry) is to be used in lieu of steel casing, the contractor shall provide the details of such operation to the District's Representative for review and approval. Information shall contain drilling fluid to be used, methods for containing, collecting, filtering, clean-up and disposal of drilling fluids. Water may not be used as a drilling fluid.

D. Dispose of excavated material in accordance with provisions of Section 31 20 00 – Structural Earthwork.

3.5 INSTALLATION

A. Construct piers in accordance with ACI 336.1.

B. Drill vertical pier shafts to diameters and depths indicated. The depth, diameter, and plumbness/straightness of the drilled hole must be checked and verified after drilling is completed.C. Place steel casings immediately after drilling. Set firmly in place. If casing is to be temporary, install shaft liner with sufficient strength to withstand concrete pressures.

D. Clean shaft and bottom of loose material immediately before placing reinforcement and concrete. Provide temporary means and methods, as required, to remove water to 3 inches or less from soil borings, or as directed by the Geotechnical Engineer.

1. When slurry displacement method is used, conform to the requirements of ACI 336.1.

E. Allow inspection of shaft and liner prior to placement of reinforcement and concrete.

F. Place reinforcing steel in accordance with Section 03 20 00.

G. Place concrete in single pour, in accordance with Section 03 30 00 with equipment designed for vertical placement of concrete.

H. Coordinate casing withdrawal with concrete placement so that concrete pressure head exceeds anticipated outside soil and water pressure above bottom of casing at all times during withdrawal.

I. Extend reinforcement for connection of caps.

J. Set tops of piers to elevations indicated.

3.6 TOLERANCES

A. Install piers with maximum variation from location, plumbness, bottom area, diameter, and anchorage locations as specified in ACI 336.1.

B. Locate centerline of piers within the following tolerances:

1. Maximum permissible variation of location not more than 1/24 shaft diameter or 3 inches, whichever is less.

2. Shafts out of plumb, not more than 1.5 percent of length nor exceeding 12.5 percent of shaft diameter or 15 inches, whichever is less.

3. Concrete cut-off elevation, plus 1 inch to minus 3 inches.

4. If above tolerances are exceeded, provide additional or corrective construction to compensate for excessive eccentricity subject to approval of the District's Representative.

5. Submit proposed corrective construction methods to the District's Representative for review before proceeding.

3.7 DEWATERING

A. Comply with requirements of Section 01 50 00 – Temporary Facilities.

B. Do not allow water to accumulate in Piers.

3.8 OVERDRILLING

A. No payment will be made for extra length, when pier shafts are excavated to a greater depth than required or authorized by the District's Representative, due to over-drilling by Contractor.

B. Complete Pier and fill extra depth with concrete, if other conditions are satisfactory.

3.9 STEEL CASINGS

A. Install steel casing as excavation work progresses as required to ensure stability of Pier shaft walls. Remove and replace or repair casings which are damaged during installation, and which could impair strength or efficiency of completed Pier.

3.10 REINFORCING STEEL

A. Fabricate and erect reinforcing cages in accordance with provisions of Section 03 20 00 – Concrete Reinforcement.

B. Provide reinforcing cage as one continuous unit using inner ring reinforcing steel.

C. Place reinforcement accurately and symmetrically about axis of hole and hold securely in position during concrete placement.

D. Use templates to set reinforcing dowels. Provide blocking and holding devices to maintain required position during concrete placement.

E. Protect exposed ends of dowels from mechanical damage and exposure to weather.

3.11 CONCRETE PLACEMENT

A. General: Fill Piers with concrete immediately after inspection and approval by the District's Representative. Use protection sheets (cut out to receive concrete), extending at least 48 inches beyond edges of excavation openings.

1. Place concrete continuously and in a smooth flow without segregating the mixed materials. Provide mechanical vibration for consolidation of at least top 30 feet of each shaft.

2. Place concrete by means of a tremie pipe.

   a. Control placement operations to ensure that tremie pipe is not broken during continuous placing from bottom to top.

   b. Other methods of depositing concrete underwater may be used, if acceptable to the District's Representative.

3. Maintain a sufficient head of concrete to prevent reduction in diameter of pier shaft by earth pressure and to prevent extraneous material, slurry or water from mixing with fresh concrete. Maintain bottom of tremie at least 10 feet below the rising surface of the fresh concrete.

4. Coordinate withdrawal of temporary casings with concrete placement operations to maintain a head of concrete approximately 5 feet above casing bottom.

5. Stop concrete placement at cut-off elevation shown, screed level, and apply a scoured, rough finish. Where cut-off elevation is above ground elevation, form top section above grade and extend shaft to required elevation.

6. Interrupted placing operations of over 1 hour duration will require a cold joint installation.
    a. Leave resulting shaft surface approximately level and insert steel dowels as shown on drawings.
    b. At resumption of concrete placing, clean off surface laitance, roughen as required, and slush with a 1 to 1 cement grout before remainder of concrete is placed.

B. Hot Weather Placement: Provide in accordance with provisions of Section 03 30 00 – Cast-in-Place Concrete.

3.12 FIELD QUALITY CONTROL

A. Place two four-inch diameter PVC pipe inspection conduits near the center of each pier (at roughly the third points of the diameter, but not nearer than two inches to the vertical reinforcing). Cap the lower ends of the inspection conduits to keep the conduits free of concrete and other debris. After the piers are completed and accepted by the District's Representative, fill conduits with a fluid cementitious grout with the same compressive strength as the pier concrete.

B. Provide for field quality control and quality assurance testing and inspection for concrete and reinforcing steel as specified in Section 03 20 00 – Concrete Reinforcement and Section 03 30 00 – Cast-in-Place Concrete.

3.13 FIELD QUALITY ASSURANCE

A. The District's Representative will perform and report specified tests, and additional tests which may be required.
    1. Each pier will be inspected and tested before placing concrete.
        a. The Contractor shall provide facilities as required to assist inspection and testing of excavations and cooperate with inspecting and testing personnel to expedite work.
        b. The Contractor shall notify the District's Representative at least 48 hours prior to time excavations will be ready for inspection and tests.

B. The District's Representative will:
    1. Inspect drilling of piers.
    2. Verify drilling depth of piers.
    3. Inspect placement of reinforcement for conformance with the Contract Documents.
    4. Inspect placement of concrete in accordance with the Contract Documents.
    5. Perform non-destructive testing of the Piers using cross-hole sonic logging (CSL) techniques via the inspection conduits if the quality of the completed Piers is in doubt or needs to be confirmed.

6. Conduct tests and provide reports so as not to delay concreting operations for acceptable excavations.

3.14 UNACCEPTABLE PIERS

A. Unacceptable Piers: Piers that are placed out of position, are below elevations, or are damaged. Piers that have not passed the inspection of the shaft and liner prior to placing the concrete.

B. Provide additional piers or replace piers failing to comply with specified requirements.

3.15 MEASUREMENT AND PAYMENT

A. Basis of Bids: Bids shall be based on number of piers, design length from top elevation to bottom shaft and diameter of shaft, as required to support all design loads in accordance with the design criteria set forth in the Geotechnical Report.

B. Basis for Payment:

1. There will be no additional compensation for excavation, drilling, concrete fill, reinforcing, casings, or other costs associated with achieving the project requirements.

2. No additional payment will be made for unacceptable piers.

END OF SECTION

PART 1 – GENERAL

1.1 SUMMARY

A. Section Includes:
1. Weed Control and Prevention.
2. Pest Control and Prevention.
3. Disease Control and Prevention.
4. Fertilization.
5. Pruning of Plant Material.
6. Replacement of Dead or Unhealthy Plant Material.
7. Repair of Staking and Guying System.
8. Watering Plant Material.
9. Monitoring, Adjustment and Repair of Irrigation System.
10. Monitoring Changing Soil Moisture and Weather Conditions Relative to Plant Material Water Requirements.
11. Adjusting Length of Watering Cycles According to Changing Soil and Weather Conditions.

B. For Irrigation, see Section 32 84 00.

C. For Soil Preparation and Soil Mixes, see Section 32 91 13.

D. For Plant Material, see Section 32 93 00.

1.2 DEFINITIONS

A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of Owner’s representative in writing.

B. IPM — Integrated Pest Management: An approach to pest control that utilizes regular monitoring to determine if and when treatments are needed and employs physical, mechanical, cultural, biological and educational tactics to keep pest numbers low enough to prevent intolerable damage or annoyance. Least-toxic chemical controls are used as a last resort.

1.3 REFERENCES

A. ANSI — American National Standards Institute:
1. Z60.1 — American Standard for Nursery Stock. Most current edition.
2. A300 – Pruning. Most current edition.

B. NAA — National Arborist Association:
1. Pruning Standards for Shade Trees. Most current edition.

C. ICBN — International Code of Botanical Nomenclature.

D. ICNCP — International Code of Nomenclature of Cultivated Plants.

E. ISA — International Society of Arboriculture.

1.4 SUBMITTALS

A. Product Purchase and Delivery Documentation:
   1. Fertilizer: Within 5 working days of each application submit purchase orders, invoices and receipts showing supplier name and address, person who sold product, date of purchase, specific product purchased, quantity purchased, and delivery date.

B. Manufacturer's Current Printed Instructions:
   1. Fertilizer.
   2. Required chemicals.

C. Documentation of Accepted Conditions: Within 7 working days after Owner's acceptance of maintenance, submit color photographs and a written report documenting the accepted conditions of the plant material.

D. Inspection Reports:
   1. Monthly plant inspection report documenting signs of stress.

1.5 QUALITY ASSURANCE

A. Contractor Qualifications:
   1. Maintenance Contractor: Minimum 10 years experience in maintenance of commercial landscape projects.
   2. Maintenance Supervisor: Minimum of 10 years experience in landscape maintenance supervision, with experience and training in integrated pest management, turf management, entomology, pest control, soils, fertilizers and plant identification.
   3. Labor Force: Thoroughly familiar and trained in the work to be accomplished and perform the task in a competent, efficient manner acceptable to the Owner.
   4. Supervision: Directly employ and supervise the Work force at all times.

B. Notification of Change in Supervision: Notify Owner of changes in supervision.
   1. Identification: Provide proper identification for landscape maintenance firm's labor force.

C. Regulatory Requirements:
   1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.
   2. Provide for inspections and permits required by Federal, State, or local authorities in furnishing, transporting, and installing of chemicals.
   3. Submit a record of herbicides, insecticides and disease control chemicals used to the County Agricultural Commissioner's Office as required by law.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Plant Material: Meet requirements of Section 32 93 00.

1.7 SITE CONDITIONS

A. Environmental Requirements:
   1. Do not apply chemicals during windy conditions.

1.8 SEQUENCING AND SCHEDULING

A. Work Schedule:
   1. Perform maintenance during hours accepted by Owner.
   2. Be present at the project site at least once a week and as often as necessary to perform specified maintenance.

B. Chemical Applications:
   1. Notify Owner in advance of required chemical applications.
   2. Obtain Owner's approval of application schedule.

PART 2 — PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Gro-Power Products:
   1. Gro-Power Co. – www.gropower.com.
   2. Or equivalent and accepted substitute.

B. Other Fertilizers:
   1. Agri Tab Corporation – www.agritab.com.
   2. Or equivalent and accepted substitute.

C. Rock Mulch:
   1. Lyngso – www.lyngsogarden.com
   2. American Soil and Stone – www.americansoil.com.
   3. Or equivalent and accepted substitute.

D. Herbicide:
   1. Round-Up – www.roundup.com.
   2. Or equivalent and accepted substitute.

E. Polymer:
   1. Complete Green, El Segundo, CA, www.completegreencompany.com
   2. Or equivalent and accepted substitute.

2.2 MATERIALS

A. Replacement Plant Material:
   1. Match existing genus, species, cultivar and size.
   2. Meet requirements of Section 32 93 00.
   3. Meet requirements of ANSI Z60.1, ICBN and ICNCP.

B. Fertilizers:
   1. Gro-Power Plus 5-3-1.
   2. Gro-Power Hi-Nitrogen (14-4-9) and Gro- Power Premium Hi-Nitrogen 18-3-7.
   3. Gro-Power Controlled Release 12-8-8.
   4. Gro-Power Flower 'N' Bloom 3-12-12.
   5. Or accepted substitute.

C. Fertilizer Tablets for Replacement Plants:
   1. Gro-Power 21 Gram Planting Tablets 20-10-5.
   2. Or accepted substitute.

D. Herbicides, Insecticides, and Fungicides:
   1. Legal commercial quality non-staining materials with original manufacturers' containers, properly labeled with guaranteed analysis, least toxic required.

E. Replacement Staking and Guying Materials:
   1. Same as original installation.

F. Mulches:
   1. Same as original installation.

G. Polymer: Soil drain / PAM.

PART 3 — EXECUTION

3.1 PREPARATION

A. Protection of Existing Conditions:
   1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
   2. Provide barricades, fences or other barriers to protect existing conditions from damage during maintenance operations.
   3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants.
   4. Submit written notification of damaged plants and structures to Owner and Owner's representative immediately.

3.2 GENERAL MAINTENANCE

A. Maintenance Period for all planting: Continuously maintain each plant and each portion during progress of work, and for a minimum period of 365 days after Final completion until Owner accepts maintenance.

B. Integrated Pest Management: Employ principles of integrated pest management for each aspect of maintenance.

3.3 TREE, SHRUB AND VINE MAINTENANCE

A. Watering:
   1. Using a soil sample tube, check rootball moisture and surrounding soil moisture at representative plants at least twice a week.
   2. Maintain watering basins around trees and shrubs so that enough water can be applied to establish moisture through root zones.
   3. In rainy season, open basins to allow surface drainage away from the root crown where excess water may accumulate.
   4. Restore watering basins at end of rainy season.

5. Adjust frequency and length of time for watering cycles according to changing soil and weather conditions.
6. For supplemental hand watering of watering basins, use a water wand to break the water force.
7. Do not permit crown roots to become exposed to air through dislodging of soil and mulch.
8. Maintain depth of mulch to reduce evaporation and frequency of watering.

B. Settled or Leaning Plants: Reset plants to proper grades or upright position.

C. Weed Control:
1. Keep mulched areas between plants and watering basins weed free.
2. As a last resort use least toxic herbicides.
3. Avoid frequent soil cultivation that destroys shallow roots.

D. General Pruning:
1. Meet requirements of Pruning Standards for Shade Trees.
2. Prune trees to eliminate diseased or damaged growth.
3. Reduce toppling and wind damage by thinning out crowns.
4. Prune trees to maintain growth within space limitations, maintaining a natural appearance and balancing crown with roots.
5. Retain lower branches in a “tipped back” or pinched condition to promote caliper trunk growth.
6. Do not cut back to fewer than six buds or leaves on branches.
7. Prune damaged trees or those that constitute health or safety hazards at any time of year.
8. Make cuts clean and close to the trunk, without cutting into the branch collar.
9. Make larger cuts (one inch in diameter or larger) parallel to shoulder rings, with the top edge of the cut at the trunk or lateral branch.

E. Staking:
1. Inspect stakes and guys at least once a week to check for rubbing that causes bark wounds.
2. Adjust tree ties and guy cables as often as required to allow tree caliper growth and prevent bark wounds.
3. Replace defective materials with materials to match original materials.

F. Fertilizing Acid Loving Plants:
1. Feed 1 tablespoon of 3-12-12 fertilizer per each foot width of plant.
2. Spread evenly around plant and water thoroughly.
3. Start feeding when buds have formed until the plant is finished blooming at approximately 4 week intervals.

G. Replacement of Plants: Replace, without cost to Owner, and as soon as weather conditions permit, plants not in a vigorous, thriving condition, during and at the end of the maintenance period.

3.4 GROUND COVERS

A. Watering:
1. Using a soil sampling tube, check for moisture penetration throughout the root zone at least twice a week.
2. Water as frequently as necessary to maintain healthy growth of groundcovers.
3. Adjust frequency and length of time for watering cycles according to changing soil and weather conditions.

B. Weed Control:
   1. Maintain mulch layer.
   2. Minimize hoeing of weeds to avoid plant damage.
   3. As a last resort use least toxic herbicides required.

C. Fertilization During Growing Season:
   1. Apply Gro-Power Plus at 30 pounds per 1,000 square feet every 10 weeks after planting until Owner accepts maintenance.
   2. Meet requirements of manufacturer's current printed instructions.
   3. Apply fertilizers evenly over planting areas by spreading half the fertilizer in one direction and half in a direction 90 degrees to the first direction to assure even application.
   4. Apply dry fertilizers with either a broadcast centrifugal or gravity spreader on planting bed areas.
   5. Water planting areas thoroughly after application.

D. Replacement of Ground Cover: Replace, without cost to Owner, and as soon as weather conditions permit, ground cover plants not in vigorous, thriving condition, during and at the end of the maintenance period.

3.5 ANNUALS, PERENNIALS AND ACID LOVING PLANTS

A. Watering:
   1. Hand-water pots and planters that do not have an automatic irrigation system.
   2. Species, sizes of plants, container sizes and orientation shall dictate frequency of watering.
   3. Using a soil sample tube, check rootball moisture and surrounding soil moisture at representative plants at least twice a week.
   4. Adjust length of watering cycles as often as required according to changing soil and weather conditions.

B. Drainage of Pots:
   1. After watering and rainfall, siphon standing water from bottom of all pots which do not have drain holes.
   2. Provide siphon well pipes as required.

C. Weed Control:
   1. Hand pull weeds from planted areas every week.
   2. Smooth out disturbed soil and mulch.
   3. Replace mulch and soil mix as required.
   4. Match existing soil mix and mulch.

D. Pruning:
   1. Limit pruning to removal of damaged or dead twigs and foliage.
   2. Remove spent flowers on a weekly basis.

E. Fertilizing Acid Loving Plants:
   1. Feed 1 tablespoon of 3-12-12 fertilizer per each foot width of plant.
   2. Spread evenly around plant and water thoroughly.
   3. Start feeding when buds have formed until the plant is finished blooming at approximately 4 week intervals.

F. Fertilizing Annuals and Perennials:
1. Sprinkle 3-12-12 fertilizer at the rate of 1-1/2 to 2 lbs. per 100 square feet and water thoroughly.
2. Wash any fertilizer material from plant leaves.
3. Feed during the growing season when blooming begins at 4 week intervals.
4. Alternate feeding with 12-8-8 fertilizer per bag directions.

G. Replacement of Annuals:
1. Remove annuals when materials exhibit a “spent” condition.
2. Thoroughly cultivate soil after removal of “spent” or “dead” plants prior to planting new materials.
3. Incorporate slow release fertilizers and rake smooth.
4. Install accepted replacement plants.

3.6 INSECTS, PESTS, AND DISEASE CONTROL

A. General:
1. Employ principles of IPM in the selection of preventative and control measures for plant pests and diseases.
2. Insignificant pests will be tolerated providing they do not seriously threaten planting health and appearance.
3. Monitor the site closely and take timely action to address problems identified.
4. Use personnel licensed and experienced using materials approved by the EPA and conform to applicable laws, codes and regulations, under the direction of a licensed certified pest control operator.
5. Spray with extreme care to avoid hazards to any person, pet, or automobile in the area or adjacent areas.
6. Meet requirements of chemical manufacturer’s current printed instructions.
7. The Contractor shall be held liable for plant damage due to the use of chemicals.

B. Inspection:
1. Inspect plant material weekly for signs of stress and damage.
2. Submit a written and photographic inspection report of findings monthly to Owner and Owner’s representative.

C. Spraying:
1. When necessary apply the least toxic chemical required for the existing problem.
2. Apply in strict accordance with manufacturer’s current printed instructions.
3. Apply sprays only if a pest or disease is a serious threat and cease application after problem is under control.

3.7 IRRIGATION SYSTEM

A. Damages:
1. Repair without charge to Owner damages to system caused by Contractor’s operations.
2. Perform repairs within one watering period.

B. Cleaning and Monitoring the System:
1. Continually monitor the irrigation systems to verify that they are functioning properly as designed.
2. Clean filters and strainers at least once a month and as often as necessary to keep the irrigation systems free of sand and other debris.

3. Set and continuously adjust and program automatic controller for seasonal water requirement.
4. Make program adjustments as required by changing field conditions.
5. At least once a week, daily when required, use a soil sampling tube to check the rootball moisture of representative plants as well as the surrounding soil.
6. Prevent spraying on windows, building walls, and game courts, etc. by balancing the throttle control on the remote control valves and the adjustment screws on the sprinkler heads.
7. Do not allow water to atomize and drift.

3.8 FIELD QUALITY CONTROL

A. Maintenance Review:
   1. At the end of the maintenance period, request a review by the Owner's representative to determine whether maintenance Work meets the requirements of the Contract Documents.
   2. Submit a written request at least five working days prior to the anticipated date of review.
   3. If it is found that the maintenance Work does not meet the requirements of the Contract Documents, the Contractor will receive written notification from the Owner's representative of corrective Work preventing Owner acceptance of the maintenance Work.
   4. Perform corrective Work within ten calendar days after the review.
   5. Upon completion of the corrective Work, request another review to determine whether the maintenance Work meets the requirements of the Contract Documents.
   6. Corrective Work followed by review will be required until the corrective Work is found by the Owner's representative to meet the requirements of the Contract Documents.

B. Payment for Additional Maintenance Review Field Trips: If additional trips are required after the first review because of incomplete work, reimburse Owner for expenses and fee required to have Owner's representative make additional field trips.

C. Owner's Acceptance of Maintenance:
   1. When the Owner's representative determines that the maintenance Work conforms to the requirements of the Contract Documents the Contractor will receive written notification designating the day which the Owner will accept maintenance responsibility.
   2. Continue maintenance of landscape Work until the Owner accepts maintenance.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Specifications for furnishing, spreading, and compacting aggregate base course for pavements as indicated.

1.2 REFERENCES

A. American Society for Testing and Materials (ASTM):

B. ASTM D2922 Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)

C. ASTM D3017 Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth)

D. State of California, Department of Transportation (Caltrans), Standard Specifications:

E. Section 17 Watering

F. Section 26 Aggregate Bases

G. State of California, Department of Transportation (Caltrans), Standard Test Methods:

Calif. Test 201	Method of Soil and Aggregate Sample Preparation Aggregates
Calif. Test 202	Method of Tests for Sieve Analysis of Fine and Coarse Aggregates
Calif. Test 205	Method of Determining Percentage of Crushed Particle
Calif. Test 216	Method of Test for Relative Compaction of Untreated and Treated Soils and Aggregates
Calif. Test 217	Method of Test for Sand Equivalent
Calif. Test 229	Method of Test for Durability Index
Calif. Test 301	Method of Test for Resistance “R” Value of Treated and Untreated Bases, Subbases and Basement Soils by the Stabilometer

PART 2 - PRODUCTS

2.1 AGGREGATE BASE MATERIAL

A. Class 2 aggregate base shall be free of vegetable matter and other deleterious substances. Coarse aggregate, material contained on the No. 4 sieve, shall consist of material of which 25 percent by weight shall be crushed particles as determined by California Test Method No. 205. Class 2 aggregate base shall conform to one of the following gradings, determined in accordance with California Test Method No. 202:

Percentage Passing Sieves

Sieve	3/4 inch Maximum
2 inch	—

1 ½ inch	—
1 inch	100
3/4 inch	90-100
No. 4	35 - 55
No. 30	10 - 30
No. 200	2 - 9

B. Class 2 aggregate base shall conform to the following additional requirements:

Tests	Test Method No. Calif.	Requirements
Resistance (R-Value)	301	78 min.
Sand Equivalent	217	22 min.
Tests	Test Method No. Calif.	Requirements
Durability Index	229	35 min.

C. Aggregate base for bioretention area shall be permeable Class 2, 3/4" maximum. When the aggregate base is constructed in more than one layer, the previously constructed layer shall be cleaned of loose and foreign matter by sweeping with power sweepers or power brooms, except that hand brooms may be used in areas where power cleaning is not practicable. Adequate drainage shall be provided during the entire period of construction to prevent water from collecting or standing on the area to be covered with aggregate base.

D. Geotextile Fabric: Mirafi FW300 or equivalent

2.2 SOURCE QUALITY CONTROL

A. Submit certificate of compliance for approval prior to installation of material.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Call for an inspection by the Engineer and obtain written acceptance of the prepared subgrade or subbase before proceeding with the placement of aggregate base course.

B. The subgrade or subbase to receive aggregate base course, immediately prior to spreading, shall conform to the compaction and elevation tolerances indicated for the material involved and shall be free of standing water and loose or extraneous material.

3.2 INSTALLATION STANDARDS

A. Aggregate base course shall be applied over the prepared subgrade or subbase and compacted in accordance with Section 26 of the Caltrans Standard Specifications.

B. Aggregate base course shall be minimum uniform thickness after compaction of dimensions indicated. Where not indicated, compacted thickness shall be six inches for driveways/sidewalks and eight inches for roadways.

C. All compaction expressed in percentages in this section refers to the maximum dry density as determined by California Test Method No. 216.

3.3 SPREADING OF MATERIAL

A. Aggregate for base course shall be delivered as uniform mixture of fine and coarse aggregate and shall be spread in layers without segregation.

B. Aggregate base course material shall be free from pockets of large and fine material. Segregated materials shall be remixed until uniform.

C. Aggregate base material shall be moisture-conditioned to near optimum moisture content in accordance with the applicable requirements of Section 17 of the Caltrans Standard Specifications.

D. Aggregate base course six inches and less in thickness may be spread and compacted in one layer. For thicknesses greater than six inches, the base course aggregate shall be spread and compacted in two or more layers of uniform thickness not greater than six inches each.

3.4 COMPACTING

A. Relative compaction of each layer of compacted aggregate base material shall be not less than 95 percent as determined by California Test Method No. 216.

B. Thickness of finished base course shall not vary more than 3/4 inch from the indicated thickness at any point. Base which does not conform to this requirement shall be reshaped or reworked, watered, and recompacted to achieve compliance with specified requirements.

C. The surface of the finished aggregate base course at any point shall not vary more than 3/4 inch above or below the indicated grade.

3.5 FIELD QUALITY CONTROL

A. Perform field tests in accordance with ASTM D2922 to determine compliance with specified requirements for density and compaction of aggregate base material, and with ASTM D3017 to determine moisture-content compliance of the installed base course.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Specifications for providing asphaltic concrete paving as indicated.

B. Related Sections

1. Section 321123, “Aggregate Base”

1.2 REFERENCES

A. State of California, Department of Transportation (Caltrans), Standard Specifications

Section 39 Asphalt Concrete
Section 92 Asphalts
Section 93 Liquid Asphalts
Section 94 Asphaltic Emulsions

B. State of California, Department of Transportation (Caltrans), Standard Test Methods

Calif. Test 202	Method of Tests for Sieve Analysis of Fine and Coarse Aggregates
Calif. Test 304	Method of Preparation of Bituminous Mixtures for Testing
Calif. Test 366	Method of Test for Stabilometer Value
Calif. Test 375	Determining the In Place Density and Relative Compaction of AC Pavement

1.3 PROTECTION

A. Protect concrete pavements and walks, curbs and bases, and other improvements adjacent to the operations with suitable materials. The Contractor shall be responsible for any damage caused by the Contractor’s employees or equipment and shall make necessary repairs. Building and other surfaces shall be covered with paper or other protection, where required. All damage caused by the Contractor’s operations shall be prepared or replaced as required.

PART 2 - PRODUCTS

2.1 BASE COURSE MATERIAL

A. Class 2 Aggregate Base. Percentage composition by weight of aggregate base material shall conform to the 3/4 inch maximum grading when determined by California Test 202.

2.2 TACK COAT

A. Tack Coat: Diluted SS-1 or SS-1h emulsion or undiluted RS-1 emulsion in conformance with Section 94 or the Caltrans Standard Specifications.

2.3 ASPHALT PAVING MATERIALS

A. Paving Asphalt: All purpose, aged residue, steam refined, PG 64-10 grade, in accordance with Section 92 of the Caltrans Standard Specifications.

B. Aggregate: Type A, with the grading of the combined aggregate conforming to 1/2 inch maximum size, medium grading, as specified in Section 39 of the Caltrans Standard Specifications.

C. Mixing Facilities: Asphalt concrete surfacing material shall be furnished from an approved commercial asphalt central mixing plant.

2.4 SOURCE QUALITY CONTROL

A. Contractor shall submit Certificate of Compliance from manufacturer for approval prior to installation.

PART 3 - EXECUTION

3.1 PLACING OF BASE COURSE

A. The Contractor shall call for an inspection by the Engineer and obtain written approval of the subgrade before proceeding with the base course.

B. Base course shall be minimum uniform thickness after compaction of dimensions indicated.

C. Base course shall be placed over finished subgrade and compacted in accordance with Section 32 11 23 - Aggregate Base.

D. After base course has been completed, the Contractor shall call for an inspection by the Engineer and obtain written approval before proceeding with application of the asphalt wearing surface.

3.2 PLACING OF TACK COAT

A. The Contractor shall call for an inspection by the Engineer and obtain written approval of the subgrade before proceeding with the tack coat.

B. The tack coat shall be applied using a calibrated distributor truck spray bar, hand spraying, squeegee and brush application in locations where required and per manufacturers requirements. Tack coat shall be applied in accordance with Section 39-4 of the Caltrans Standard Specifications at the rate of from 0.22 to 0.28 gallons per square yard.

3.3 PLACING ASPHALT CONCRETE

A. Areas to be paved shall be covered with a layer of hot asphalt concrete surfacing not to exceed 3.0 inches after compaction.

B. Paving asphaltic concrete shall be delivered, laid, rolled, and finished in accordance with Section 39 of the Caltrans Standard Specifications.

C. Before placing asphalt concrete, a tack coat (paint binder) shall be applied to all vertical surfaces against which asphalt concrete surfacing will be placed. Tack coat shall be applied in accordance with Section 39-4 of the Caltrans Standard Specifications at the rate of from 0.02 to 0.10 gallons per square yard.

D. Finish surface of the wearing course shall be thoroughly compacted, smooth, and free from ruts, humps, depressions, cold joints, or other irregularities.

E. Finish paving shall conform to slopes, lines, and finish grades indicated, and shall drain properly. Where adjacent surfaces are intended to be flush (as at concrete gutters, walks, and paving), they shall conform smoothly at all joints.

F. Ridges, indentations, and other objectionable marks left in the surface of the asphalt concrete by paving or rolling equipment shall be eliminated by rolling. The use of equipment that leaves ridges, indentations, or other objectionable marks in the asphalt concrete shall be discontinued, and other acceptable equipment shall be employed.

G. Where cold joints are indicated or necessary, cut back the placed and compacted cold asphalt a minimum of three inches with a concrete or masonry power saw, so that a vertical face of compacted full thickness material is exposed. Treat this surface with a tack coat before proceeding with the placement of new asphaltic concrete surfacing.

H. Finish paving shall conform to finish elevations within plus or minus 0.01 of a foot and shall be level to within plus or minus 1/4 inch in 10 feet when measured with a 10 foot straightedge in any direction.

3.4 FIELD QUALITY CONTROL

A. The Contractor shall control the quality of the work and shall provide adequate testing to assure compliance with these Specifications.

B. After completion of paving work, all paving shall be flooded with water, and any resulting “ponds” shall be ringed with chalk. Such hollows shall be corrected with addition of asphalt paving materials and rerolling until all paving is completely level and free from hollows and high spots.

C. The Engineer shall perform in-place density and compaction tests of the completed pavement in accordance with California Test 375 to determine compliance with specified requirements. Test shall be performed as often as necessary to verify compliance, but not less frequently than the following:

1. One test required.

3.5 MAINTENANCE OF PAVEMENT

A. Upon completion of final rolling, traffic shall not be permitted on the finished pavement

for at least six hours, and until the asphalt concrete has cooled sufficiently to withstand traffic without being deformed. Finished pavement shall be maintained in finished clean condition until the work is accepted by the Engineer.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Section Includes: Provide concrete curbs and gutters, ramps, walkways, pavers as shown on the Drawings and as specified herein.

1.2 REFERENCE SPECIFICATIONS

A. Wherever the words "Standard Specifications" are referred to, the reference is to the State of California, Department of Transportation, Standard Specifications, latest edition.

1.3 SUBMITTALS

A. Submit certificate of compliance indicating that the concrete complies with the specifications as Product Information submittals.

PART 2 - PRODUCTS

2.1 CONCRETE

A. Comply with the Standards Specifications, Paragraph 73-1.01.

1. Cement: Type II Modified.
2. Provide air-entrainment of three percent with admixture conforming to ASTM C260.
3. Nominal size of large aggregate shall be 1”.
4. Minimum strength of concrete shall be 4000 psi at 28 days.
5. Bar reinforcement to be ASTM A615, Grade 60.
6. Coloring Admixtures for colored concrete to be ASTM C 979, Chromix Admixture, color as indicated on landscape drawings, as available from L. M. Scofield Company, Los Angeles, California (213)-723-5285, or Engineer approved equivalent.
7. Surface Retarder for colored concrete to be Top-Cast Surface Retarder, as available from Dayton Superior, www.daytonsuperior.com, or Engineer approved equivalent.

2.2 DOWELLED-IN CONCRETE BUFFER / ISLAND

A. See Section 2.1 Concrete for materials.

1. Minimum strength of concrete shall be 4000 psi at 28 days.
2. Bar reinforcement to be ASTM A615, Grade 60.

3. Asphaltic emulsion shall be applied to the surface of existing pavements preparatory to resurfacing with hot mix asphalt, and to all concrete surfaces which will be in contact with hot mix asphalt surfacing. Asphalt emulsion shall be SS-1H. The Contractor shall submit a copy of Certificate of Compliance for asphaltic emulsion.

4. Epoxy Adhesive Compound: Epoxy adhesive compound shall be Sikadur Hi-Mod, Sikadur Hi-Mod Gel, as manufactured by the Sika Chemical Corporation, represented by William C. Hodges, 467 Lincoln Ave., Palo Alto, CA 94301; Concresive 1001 LPL, Concresive AEX 1438, as manufactured by Adhesive Engineering Co., 1411 Industrial Road, San Carlos, CA 94070, or Engineer approved equivalent.

2.3 PAVER

A. Paver shall be 12” x 12” Pewter Concrete Stepping Stone or equal

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with the Standard Specifications, Section 73, Paragraph 1.03 Construction, inclusive, except as modified in the plans and herein.

B. Unless shown otherwise on the Drawings, replace existing curbs and sidewalks in kind within the City of Berkeley right-of-way.

C. Adjust structures such as valve boxes, manhole frames and covers, and electrical vaults to grade after the curb and gutter or sidewalk has been constructed for a reasonable distance on all sides of the structure. Complete the concrete work after the structure is adjusted.

D. New traffic rated concrete driveway/sidewalk within the City of Berkeley right-of-way shall have #4 rebar at 18-inches each way and shall be colored with 1-1/2 pounds of lamp black per cubic yard to match existing concrete sidewalk. Tie wire for reinforcement shall be eighteen (18) gauge or heavier black annealed conforming to the requirements of ASTM Designation A82.

E. When installing concrete curbs, gutters, and sidewalks within the City of Berkeley right-of-way the Contractor shall provide continuous access and concrete protection by whatever means necessary for the concrete until it dries. The Contractor shall replace any new concrete that is marked with graffiti before it dries at no additional cost to the Owner.

F. Control and expansion/construction joints shall be located and installed as indicated in the plans.

G. Concrete finish shall be as indicated in the plans.

3.2 FIELD QUALITY CONTROL

A. Field Samples:

a. Provide (1) 18” x 18” x 6” segment of concrete planter wall mock-up for review. Include the finish, control joints, expansion joints materials, and edge treatments.

b. Provide (4) 12” x 12” x 4” mock-up of colored concrete flatwork for review. Include the specified color admixture, finish, control joints, expansion joints materials. Provide (2) colors each with (2) finish levels for a total of (4) panels.

END OF SECTION

PART 1 - GENERAL

1.0 SECTION INCLUDES

A. Traffic striping and control markings on pavement, parking stall striping, and painted curbs.

1.1 RELATED DOCUMENTS

A. State of California, Department of Transportation (Caltrans), Standard Specifications and Manuals – Latest Edition:
   1. Section 84 Traffic Stripes and Pavement Markings.
   2. Traffic Manual Standard Drawings – Latest Edition.

B. State of California, Department of Transportation (Caltrans), Standard Test Methods:
   1. Calif. Test 669 Testing for Specification Compliance of Non-Reflective and Reflective Pavement Markers.

C. California Air Resources Board (CARB):
   1. CARB/VOC Permissible Content of Volatile Compounds (VOC in Paints)

D. CA Title 24 – ADA Pavement Markings

1.2 RELATED SECTIONS

A. Section 32 12 16, Asphalt Paving.

B. Section 32 16 13, Concrete Curbs, Gutter and Sidewalks.

1.3 SUBMITTALS

A. Shop Drawings: Submit drawings and diagrams and colors, indicating stripe width of roadway divider stripes and parking stalls, configuration and dimensions of directional arrows, style and size of letters for compact car and electric car, designations, configuration and dimension of international accessible symbol, where coating is applied by color section and enabling calculations of total square feet by color, and any other traffic control markings on pavement.

B. Color Samples: Submit manufacturer’s color charts or sample drawdowns of colors to be applied.

C. Product Data: Submit manufacturer's Technical Data Sheets (TDS) and Safety Data Sheets (SDS of products being applied.

D. Application Instructions/Rates: Submit manufacturer's application instructions/rates to achieve desired finished product dry mil thickness.

E. Maintenance Instructions: Submit maintenance and cleaning instructions.

F. Certificate of Compliance Certificate of Compliance: Submit evidence or affidavit, which certifies that paint to be used complies with latest CARB/VOC regulations.

PART 2 - PRODUCTS

2.0 MATERIALS

A. Traffic Line Paint:
   1. Provide paint conforming to the requirements of Section 84-3 of the Caltrans Standard Specifications, white in color for traffic striping, parking stalls, and other control markings on pavement, yellow in color for other traffic control markings where indicated, blue in color for accessible parking stalls, red in color for curbs where no parking is indicated, white in color for curbs where passenger discharge and pickup is indicated.

B. Thermoplastic Traffic Stripes and Pavement Markings:
   1. All striping and pavement markings shall be Thermoplastic where indicated on Contract Drawings and conform to either State Sepcifcations 8020-41G-19 or 8010-41G-21, including glass beads, conforming to the requirements of Section 84-2 of the Caltrans Standard Specifications.

C. Paint for parking stalls and ADA Striping shall be Waterborne, State Specification 8010 – 20B.

D. Curb paint

   1. Paint shall conform to the requirements in ASTM Designation: D 6628-01.
   2. Retroreflectivity of the paint traffic stripes and pavement markings shall conform to the requirements in ASTM Designation E 1710
   3. Paint type shall be Waterborne Traffic Line conforming to the requirements of Federal Specification TT-P-1952E.

E. Traffic Channelizer posts shall conform to CA MUTCD Section 3H.01. Each post shall have a minimum 2.25-inch diameter, be 42-inches tall and constructed of white PVC / polyethylene. Posts must have a minimum 3-inch by 12-inch retroreflective surface. Each post shall be equipped with an internal zinc-coated spring and mounted onto a rigid base designed for bolt/screw-in installation into asphalt. The posts shall be designed to withstand 60 mph impact while maintaining 360-degrees of flexibility.

F. Street Bond:
   1. Manufacturers
      a. Siplast (Irving TX) manufacturered pavement coating products.
         i. StreetBond SB120 Pavement Coating (Part A & B)
         ii. StreetBond Colorant
         iii. StreetBond Adhesive Promoter (for exposed stone in older asphalt)
         iv. StreetBond Sealer Concentrate

   2. Materials
      a. Asphalt Pavement Coating: A premium epoxy-modified, acrylic, waterborne coating designed for application on asphalt pavements receiving pedestrian traffic and minimal vehicular traffic. The coating shall be specially formulated to provide wear and crack resistance, color retention, adhesion, minimal water absorption and increased friction properties. Coating materials shall meet all local Volatile Organic Compounds (VOC) regulations.

         i. Coating Properties
            1. Solids by Volume: 54 - 61% (ASTM D2697)
            2. Solids by Weight: 71.5- 77.5% (ASTM D2369)
            3. Density: 14 lbs/gal (1.67 kg/l) (ASTM D1475)
            4. Drying Time: 1 – 4 hours at 77ºF (25°C) and 40% humidity (ASTM D5895)
            5. Taber Wear Abrasion Dry (H-10 wheel): 1.0g/1000 cycles after 1-day cure (ASTM D4060)
            6. Water Absorption: 3.5 – 6.5% (ASTM D471)
            7. Mandrel Bend: 1.0 – 1.5 inch (ASTM D522 - 93A)
            8. VOC Content: < 50 g/l
            9. Friction - Dry: 75 - 95 (ASTM E303)
            10. Permeance: 13.4 g/m^2/24hr/mmHg (52 mils) (ASTM D1653)

      b. Colorant: A highly concentrated, high quality, UV stable pigment blend designed to add color to the specified asphalt pavement coating.

      c. Adhesion Promoter: A liquid agent designed to enhance the adhesion fo the specified coating over surfaces with polished aggregates.

      d. Sealer Concentrate: A liquid sealer that is applied to a newly completed project to help seal coating and reduce dirt and tire pick-up.

PART 3 - EXECUTION

3.0 CONSTRUCTION

A. Provide traffic striping and control markings on pavement and parking stalls in accordance with the layout, configurations, and dimensions indicated on the Contract Drawings and

approved shop drawings. Prior to paint application, contractor shall coordinate a pre-application meeting with the owner to verify colors and their locations. Obtain approval from owner prior to paint application.

B. Paint application equipment shall conform to the requirements of the Caltrans Standard Specifications. Place markers in accordance with Section 85 of the Caltrans Standard Specifications.

C. All traffic striping, pavement markings (legend), and pavement markers removed shall be replaced except as modified in the Plans or as directed by the Engineer. Prior to replacement, the Contractor shall layout all striping patterns and marking locations by cat tracking or other suitable means for review and approval by the Engineer. Any striping and/or markings installed by the Contractor that the Engineer has not pre-approved, and that the Engineer determines are installed improperly or in the wrong location, shall be removed and replaced to the satisfaction of the Engineer at the Contractor's sole expense.

D. Surfaces which are to receive markings shall be thoroughly cleaned, free from loose materials and dry. Such areas shall be prepared by the Contractor to the satisfaction of the Engineer.

E. Any damage to existing or newly placed traffic striping due to the failure of the Contractor to protect the work, and correction of errors, shall be repaired by the Contractor at no additional cost.

F. Traffic control markings and parking stalls shall be applied with the use of substantial cutout patterns and templates, or with striping equipment which applies straight, uniform width, sharp lines. Coverage of paint shall be thorough and complete in accordance with the paint manufacturer's instructions and recommendations.

G. Traffic control markings and parking stalls shall be sharp and accurate, straight where required, without fuzziness at edges of lines.

H. Accessible parking stalls shall include the International Accessibility Symbol.

I. Thermoplastic Traffic Stripe Application:

   a. Use a ribbon extrusion or screed type applicator to apply a thermoplastic traffic stripe.

   b. Operate the striping machine at a speed of 8 mph or slower during the application of thermoplastic traffic stripe and glass beads.

   c. Apply a thermoplastic traffic stripe at a rate of at least 0.38 pounds per foot of 4-inch wide solid stripe. The applied thermoplastic traffic stripe must be at least 0.090 inch thick.

   d. Apply a thermoplastic pavement marking at a rate of at least 1.06 pounds per square foot. The applied thermoplastic pavement marking must be at least 0.100 inch thick.

e. Apply a thermoplastic traffic stripe and both types of glass beads in a single pass. Apply the thermoplastic 1st, followed immediately by consecutive applications of high-performance glass beads and then AASHTO M 247, Type 2 glass beads. Use 2 separate applicator guns for the glass beads, 1 applicator gun for each type of glass bead.

f. Contractor may apply glass beads by hand methods on pavement markings.

g. Distribute all glass beads uniformly on traffic stripes and pavement markings. Apply high-performance glass beads at a rate of at least 6 pounds per 100 square feet of stripe or marking. Apply AASHTO M 247, Type 2 glass beads at a rate of at least 8 pounds per 100 square feet of stripe or marking. The combined weight of the 2 types of glass beads must be greater than 14 pounds per 100 square feet of stripe or marking.

J. Curb paint application shall consist of two separate coats of traffic pain of the appropriate color to the face and top of curb. Nothing in these Specifications shall relieve the Contractor from their responsibilities as provided in Section 7-1.09, “Public Safety,” of the Standard Specifications.

K. Street Bond Coating Application:

a. Adhesion Promoter: For older asphalt with polished stone. Mix and apply according to manufacturer’s instructions and allow to dry completely prior application of the first layer of coating. If the asphalt substrate is newer without exposed polished stone an adhesive promoter is not needed.

b. Coating Application: Mix according to manufacturer instructions. Apply three (3) coats at the manufacturer specified rate of application to achieve a nominal dry mil thickness of 19 mils. Rough and/or porous asphalt surfaces may require an additional coat(s) to achieve desired dry mil thickness. Coating shall be applied by a heavy duty textured sprayer and back rolled, or roller, or brush applied according to the requirements published in the manufacturer’s installer’s guide. Allow each coat of material to dry before applying subsequent layers.

c. Sealer Concentrate: Mix according to manufacturer instructions and apply two (2) light coats using a low pressure handheld or backpack sprayer over coating application.

L. At completion, Contractor shall check the work thoroughly and shall touch-up traffic control markings and parking stalls which are not distinct or thorough in coverage, or which are not uniform in color.

3.1 FIELD QUALITY CONTROL

A. Perform tests in accordance with Caltrans Test 669 to verify compliance with Specification requirements.

B. Within 14 days of applying a thermoplastic traffic stripe or pavement marking with enhanced wet night visibility, the retroreflectivity must be a minimum of 700 millicandelas per square meter per lux for white stripes and markings and 500 millicandelas per square meter per lux for yellow stripes and markings. Test the retroreflectivity under ASTM E 1710. Have a reflectometer as described in ASTM E 1710 at the job site for making these measurements.

C. Thermoplastic traffic stripes and pavement markings with enhanced wet night visibility must consist of a single uniform layer of thermoplastic and 2 layers of glass beads as follows:

    a. The first layer of glass beads must be on the Authorized Material List under high-performance retroreflective glass beads for use in thermoplastic traffic stripes and pavement markings. The color of the glass beads must match the color of the stripe or marking to which they are being applied.

    b. The 2nd layer of glass beads must comply with AASHTO M 247, Type 2.

D. Both types of glass beads must be surface treated for use with thermoplastic under the bead manufacturer's instructions.

END OF SECTION

PART 1 — GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Fabrication of Site Furnishings.
   2. Placement of Site Furnishings.

B. For Site Concrete see 32 13 16.

1.2 DEFINITIONS

A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of Owner’s representative in writing.

B. Well Managed: “Well-managed” shall mean forests that are being managed through professionally administered forestry management and logging plans that ensure regeneration of desired species so that timber growth equals or exceeds harvesting rates in both quantity and quality over the long term. Other considerations include protecting rivers and streams from degradation, minimizing damage to the forest when harvesting, promoting biodiversity, operating in concert with the lawful interests of local populations, and maximizing both the yield and value of the forest products.

F. Forest Stewardship Council (FSC).

G. American Wood Preservers' Association (APE).

1.4 SUBMITTALS

A. Samples: Wood/Steel for Site Furnishings: 6-inch segment of finish for each material and condition

B. Product Data:
   1. Café Chair
   2. Café Table
   3. Lounge Chair
   4. Low Coffee Table
   5. Trash and Recycling Receptacles
   6. Tree grate
   7. Skate Deterrent

C. Shop Drawings:
   1. Requirements:
      a. Show shop and erection details, to scale, including dimensions, sizes, thicknesses, gauges, finishes, joining, attachments, holes, welds, bolts, elevations and relationship of work to adjoining construction. Prepare details at not less than 3 inches = 1 foot.
      b. Where items must fit and coordinate with finished surfaces and/or constructed spaces, take measurements at site and not from the Drawings.
      c. Indicate welded connections using AWS A2.0 welding symbols.
   2. Provide shop drawings for the following:
      a. Tree grate

D. Manufacturer's Current Printed Instructions:
   1. Furniture Manufacturer's Cleaning Instructions.

1.5 QUALITY ASSURANCE:

A. Fabricator Qualifications:
   1. Established reputation having work similar to that specified, in use for a minimum of 5 years.
   2. Shop shall have proper equipment for Work specified, including application of finish.
   3. Fabricators and finishers shall be recognized experts in the Work they are engaged to perform.

B. Regulatory Requirements:

1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over such Work.
2. Provide for inspections and permits required by federal, state and local authorities in furnishing, transporting, and installing materials.

1.6 DELIVERY, STORAGE AND HANDLING

A. Loading and Shipment:
   1. Carefully pack the units for shipment free from stains and other deleterious material.
   2. Exercise precautions against damage in transit.

B. Storage:
   1. Store units on non-staining wood skids or pallets at least four inches above grade.
   2. Place and stack skids and units to distribute weight evenly and to prevent breakage or cracking.
   3. Protect and store units from weather and soiling with waterproof non-staining covers or enclosure but allow air to circulate around units.

C. Handling:
   1. Handle units to prevent chipping, breakage, soiling or other damage.
   2. Do not use pinch or wrecking bars without protecting edges of units with wood or other rigid materials.
   3. Lifts with wide-belt type slings wherever possible.
   4. Do not use wire rope or ropes containing tar or other substances which might cause staining.
   5. If required, use wood rollers and provide cushion at end of wood slides.

1.7 WARRANTY

A. General Description: In addition to manufacturer's warranties, warrant Work for a period of one year from Date of Final Completion against defects in materials and workmanship.

B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship.

C. Exceptions: Contractor shall not be held responsible for failures due to normal wear, neglect by Owner, vandalism and other causes outside the Contractor's control.

PART 2 — PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS (Number and Types Will Vary)

A. Café Chair
   1. Vestre – http://www.vestre.com.
   2. Or equivalent and accepted substitute.

B. Café Table

1. Landsacpeforms – http://www.landscapeforms.com.
2. Or equivalent and accepted substitute.

C. Lounge Chair
1. Vestre – http://www.vestre.com.
2. Or equivalent and accepted substitute.

D. Low Coffee Table
1. Bludot – http://www.bludot.com.
2. Or equivalent and accepted substitute.

E. Trash and Recycling Receptacles
1. Vestre – http://www.vestre.com.
2. Or equivalent and accepted substitute.

F. Tree Grate
1. Urban Accessories - https://urbanaccessories.com/
2. Or equivalent and accepted substitute.

G. Skate Deterrent
1. Grind To A Halt– www.grindtoahalt.com.
   a. Model: Cylinder GrinderMinder
   b. Finish: Stainless steel with brushed finish
2. Or equivalent and accepted substitute.

2.2 MANUFACTURED UNITS (Number and Types Will Vary)

A. Café Chair:
1. Type: Munch Café Chair
2. Finish: Powdercoat
3. Color: TBD
4. Quantity: 30

B. Café Table:
1. Type: 45” DIA Round Dining Table
2. Finish: Powdercoat
3. Color: TBD
4. Quantity: 6

C. Lounge Chair:
1. Type: Munch Lounge Chair
2. Finish: Powdercoat
3. Color: TBD
4. Quantity: 8

D. Low Coffee Table:
   1. Type: Circula Small Coffee Table
   2. Finish: Powdercoat
   3. Color: TBD
   4. Quantity: 2

E. Trash and Recycling Receptacles:
   1. Type: BLOC
   2. Finish: Powdercoat
   3. Color: TBD
   4. Quantity: 4

F. Tree Grate:
   1. Type: Jamison
   2. Material: Recycled Aluminum
   3. Finish: Brushed Finish
   4. Size: per drawings

G. Skate Deterrent:
   1. Model: Cylinder GrinderMinder
   2. Material: Stainless steel
   3. Finish: Brushed Finish
   4. Quantity: per drawings

PART 3 — EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.

B. Notification of Unsuitable Conditions: Before proceeding with Work, notify Owner and Owner's representative in writing of unsuitable conditions.

3.2 PREPARATION

A. Protection:
   1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the Work.
   2. Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.

3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
4. Submit written notification of conditions damaged during construction to the Owner and Owner's representative within 2 working days of observed damage and before damage is covered.

3.4 INSTALLATION

A. General:
   1. Install as indicated on Drawings and per manufacturer's directions.

3.5 FIELD QUALITY CONTROL

A. Field Observation Reviews by Owner's representative: Coordinate and schedule with Owner's representative.

3.6 CLEANING

A. General: Clean and keep clean until Owner accepts maintenance.

B. Furniture Cleaning Method: Meet requirements of manufacturer's current printed instructions

3.7 PROTECTION

A. Furniture Storage: Protect furniture from damage due to construction Work operations and vandalism by storing in secure interior storage room until day of final review.

END OF SECTION

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes decorative, metallic-coated tubular steel fences, gates framework, hardware and accessories; excavation and concrete foundation for posts and gate center drops.

B. Related Sections:

1. Section 03 30 00 – Cast in Place Concrete

1.2 REFERENCES

A. ASTM International:

1. ASTM A123 – Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

2. ASTM A153 - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

3. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy Coated (Galvannealed) by the Hot-Dip Process.

4. ASTM F2408 – Ornamental Fences Employing Galvanized Steel Tubular Pickets.

B. Builders Hardware Manufacturers Association (BHMA):

1. BHMA A156.1 – Butts and Hinges.

2. BHMA A156.3 – Exit Devices.

3. BHMA A156.5 – Cylinders and Input Devices for Locks.

1.3 SUBMITTALS

A. Division 1 - Submittal Procedures: Requirements for submittals.

B. Product Data: Submit data on fencing components, finishes, accessories, fittings and hardware.

C Shop Drawings: Indicate plan layout, spacing of components, post foundation dimensions, hardware anchorage, gates, and schedule of components.

D. Samples: Submit samples of 12 inch minimum length representing linear materials, illustrating construction and colored finish.

E. Closeout: Furnish maintenance data for hardware.

1.4 PERFORMANCE REQUIREMENTS

A. The manufactured fence system shall be capable of meeting the vertical load, horizontal load, and infill performance requirements for Industrial application class under ASTM F2408.

1.5 QUALITY ASSURANCE

A. Manufacturer and Installer: Companies specializing in manufacturing or installing Products specified in this section with minimum three years' experience.

1.6 DELIVERY, STORAGE AND HANDLING

A. Division 1 - Product Requirements: Requirements for transporting, handling, storing, and protecting products.

B. Deliver fence components in packed cartons or firmly tied rolls. Check to ensure that no damage has occurred during shipping or handling.

C. Identify each package with manufacturer's name.

D. Store fence materials in a secure and dry place.

1.7 WARRANTY

A. General: Warranties shall pay for all costs associated with repairs and replacement upon notification of defects.

B. Material Warranty: Provide material manufacturer's product warranty for a minimum of five (5) years from date of Substantial Completion for defective components, and a minimum of twenty (20) years from date of Substantial Completion for defective material finish, including cracking, chipping, peeling, blistering or corroding.

PART 2 – PRODUCTS

2.1 DECORATIVE METAL FENCES AND GATES

A. Manufacturers: Furnish compliant product of the following or approved equal.

1. Ameristar Perimeter Security.

B. System Description: ASTM F2408 decorative fence made from steel tubing or formed steel sheet. Two-rail style, with extended, flat-topped pickets, with matching swing gate. Basis of Specification: Ameristar Perimeter Security's "Montage II" in "Genesis" style.

1. Fence Height: Six (6) feet.

2. Post Spacing: As indicated on Drawings to maximum of eight (8) feet.

2.2 MATERIALS

A. Post and Panel Steel: ASTM A653, welded construction, minimum yield strength of 45,000 psi and G-90 hot dip galvanized coating.

B. Concrete: ASTM C94, Option A; Normal Portland Cement, 2,500 psi strength at 28 days. Furnish compliant type specified in Section 03 30 00.

2.3 COMPONENTS

A. Posts: 2-1/2 inches square, 12 gauge.

B. Pickets: 1-inch square tubes, 14 gauge tubing. Terminate with galvanized steel caps.

C. Rails: Steel tube or channel, minimum 1-1/2 inch x 1-1/2 inch, 14 gauge with picket holes spaced between 4 and 5 inches.

D. Gate Posts: Match fence posts for gates up to 4 feet in width and over 6 feet in height.

E. Panel to Post Brackets: Manufacturer's standard, tamperproof, corrosion-resistant steel, color-coated to suit post size and spacing, and compatible fastener hardware.

F. Post Caps: Formed from steel sheet and hot-dip galvanized after forming.

G. Interior surface of tubes formed from uncoated steel sheet shall be either hot-dip zinc coated same as exterior, or coated with zinc-rich thermosetting coating to comply with ASTM F2408.

H. Galvanizing: For components indicated to be galvanized and for which galvanized coating is not specified in ASTM F2408, hot-dip galvanize to comply with ASTM A123. For hardware items, hot-dip galvanize to comply with ASTM A153.

2.4 PEDESTRIAN SWING GATES

A. General: Single-leaf. Swing gates in direction shown on drawings.

1. Gate Height and Width: As indicated to maximum 48 inch width.

B. Factory-assemble gates utilizing manufacturer's matching decorative fence material.

C. Gate Ends: 2 inch square, 12 gauge.

D. Hardware: Hardware shall be furnished by fencing manufacturer. Gates shall be locking, self-closing and ADA compliant for operating force, with panic-style exit device.

1. Hinges: BHMA A156.1, Grade 1, suitable for exterior use.

2. Exit Hardware: BHMA A156.3, Grade 1, Type 1 (rim exit device), with push pad actuating bar, suitable for exterior use.

3. Rim Locks: BHMA A156.5, Grade 1, suitable for exterior use.

a. Function: 621 - Latchbolt by key from outside and by turn from inside. Latchbolt is held retracted by device from inside.

2.5 FABRICATION

A. Pre-cut all pickets, rails and posts to specified lengths. Pre-punch rails to accept pickets.

B. Insure correct alignment of pickets once installed through panel and gate rails and weld to rails for a rigid panel assembly.

C. Join all gate rail and upright intersections by welding.

2.6 COATING MATERIALS

A. Finish all assembled panels, posts and gates with manufacturer's standard, 2 mil thick, epoxy primer and acrylic topcoat meeting specified performance requirements. Color: Standard Black..

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine areas scheduled to receive decorative metal fencing for conditions that will adversely affect execution, performance, or quality of work.

B. Do not start work until unsatisfactory conditions are corrected.

3.2 PREPARATION

A. Stake out locations of fence lines, posts and gates. Indicate locations of utilities and underground structures. For installations that must be raked to follow sloping grades, the post spacing dimension must be measured along the grade.

B. Verify elevation of finish grade and establish indicated fence heights above finish grade.

3.3 INSTALLATION

A. Install fences according to manufacturer's written instructions.

B. Fence panels shall be attached to posts with brackets supplied by the manufacturer.

C. Set posts in concrete footings as shown and specified. Set plumb, true to line and layout; temporarily brace as required. Crown top of post concrete footings to shed water away from the posts. Set base of crown level with surrounding asphalt or concrete, and 6 inches below grade at soil.

1. Footing Depth: 3'-0" minimum.

2. Footing Diameter: Four times post diameter.

D. When cutting/drilling rails or posts adhere to the following steps to seal the exposed steel surfaces:

1. Remove all metal shavings from cut area.

2. Apply zinc-rich primer to thoroughly cover cut edge and/or drilled hole; let dry.

3. Apply 2 coats of custom finish paint matching fence color. Use manufacturer's spray cans or paint pens shall be used to prime and finish exposed surfaces; it is recommended that paint pens be used to prevent overspray. Do not use products of other manufacturers.

E. Gates:

1. Gate posts shall be spaced according to the manufacturers' gate drawings, dependent on standard out-to-out gate leaf dimensions and gate hardware selected.

2. Install hardware per manufacturer's instructions, using tamper-resistant or concealed means. Adjust hardware for smooth operation and lubricate where necessary.

3.4 ERECTION TOLERANCES

A. Division 1 - Quality Requirements: Tolerances.

B. Maximum Variation From Plumb: 1/4 inch

C. Maximum Offset From Indicated Position: 1 inch

D. Minimum distance from property lines: 6 inches.

3.5 CLEANING

A. Scatter post-hole excavations uniformly, away from posts.

END OF SECTION

PART 1 — GENERAL

1.1 SUMMARY

A. Provide all products and execute all labor to achieve installation of the irrigation system complete as indicated by the Drawings and Specifications.

B. For Landscape Maintenance Period, see Section 32 01 00.

C. For Soil Preparation and Soil Mixes, see Section 32 91 13.

D. For Planting Area Finish Grading, see Section 32 91 19.

E. For Grasses, see Section 32 92 00.

F. For Plant Material, see 32 93 00.

G. Other Related Work: Consult all other relevant Specification Sections to determine the extent and character of work specified elsewhere, but related to that included herein.

1.2 DEFINITIONS

A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of Owner’s representative in writing.

1.3 REFERENCES

A. DIV — Division of Industrial Safety.

B. UPC — Uniform Plumbing Code published by the Association of Western Plumbing Officials. Most current edition.

C. ASTM — American Society for Testing and Materials.

D. NSF — National Sanitation Foundation.

1.4 SUBMITTALS

A. Product data: Prior to delivery to site, submit 5 copies of current manufacturer’s specifications and catalog cuts for the complete list of materials and assemblies to be installed.

B. Final Record Documents: Submit Final Record Documents to the Owner’s representative at Preliminary Review.

C. Test Reports

1. Analyses: Samples of materials may be taken and analyzed for conformity to specification at any time. The Contractor shall furnish samples as requested.

2. Rejected Materials: Contractor shall remove rejected materials immediately from the site.
3. Cost of Testing: The Contractor shall pay cost of testing of materials not meeting specifications.
4. Hydrostatic Testing Review
   a. Time of Review: The Owner's representative will review the completed irrigation work during the hydrostatic testing prior to the backfilling of the trenches.
   b. Notification of Review: Notify the Owner's representative and University Sprinkler Specialist (723-4995) at least 72 hours prior to the anticipated review.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements
   1. Laws, Codes and Regulations: Perform work in accordance with all applicable laws, codes, and regulations required by authorities having jurisdiction over such work.
   2. Inspections and Permits: Provide for all inspections and permits required by federal, state and local authorities in furnishing, transporting and installing materials.
   3. Traffic Control: It is the responsibility of the contractor to ensure adequate protection and controls for pedestrian and vehicular traffic in the vicinity of the project areas. The contractor shall provide all signs, barricades, flagmen, etc., necessary to meet all traffic requirements for this project at his own expense.

1.6 RECORD DOCUMENTS

A. Progress Record Documents:
   1. Maintain on the construction site at all times a record of all materials and equipment installed each day.
   2. Daily record information neatly to scale, on full-size prints of the irrigation construction documents.
   3. Record information neatly to scale, on full-size prints of the irrigation construction documents.
   4. Information shall include all changes, substitutions, and manufacturer's names and catalogue members for materials and equipment. Show actual locations of all valves and irrigation piping. Show dimensions from easily-identifiable permanent structures such as walls, curbs, fences, buildings or walks.

B. Final Record Documents:
   1. Transfer all information noted on Progress Record Documents.
   2. After Work completion, transfer information noted on prints. Submit Progress Record Documents to the Owner's representative for review of general information content (Owner's representative will not be responsible for errors or omissions).
   3. Contractor shall be responsible for accuracy of information and errors or omissions.
   4. If first submittal is not accepted by Owner's representative, resubmit until accepted.
   5. Once accepted, submit accepted final Record Documents to Owner

1.7 SERVICE MANUALS

A. Submittal Procedure: At Preliminary Review, submit five individually bound Service Manuals to the Owner's representative.

B. Content:
   1. Complete drawings, diagrams and spare parts lists of all equipment installed showing components and catalog numbers together with the manufacturer's name and address.
   2. Index sheet indicating the Contractor's name, address and telephone number.
   3. Copies of equipment, warranties and certificates.
   4. Complete operating and maintenance instructions in sufficient detail to permit operating personnel to understand, operate, and maintain all equipment.

1.8 INTENT OF DRAWING AND SPECIFICATIONS

A. It is the intent of the Drawings and Specifications to provide a complete operable irrigation system. Any items not specifically shown in the Drawings or called for in the Specifications, but which are normally required to conform with such intent, are to be considered as part of the work.

1.9 SUBSTITUTIONS

A. Written Acceptance: Specific reference to manufacturer's names and products specified in these sections are used as standards; this implies no right to substitute other materials or methods without written acceptance of the Owner's representative.

B. Contractor's Responsibility: Installations of accepted substitution(s) must be made to the satisfaction of Owner's representative and without additional cost to Owner.

1.10 REVIEW OF SITE

A. Visit project site and review conditions as they exist prior to submitting bid.

1.11 WORK SCHEDULE

A. Submit a proposed work schedule to the Owner's representative for acceptance at least fourteen days prior to start of irrigation work. Submit revised schedule(s) to the Owner's representative immediately.

1.12 COORDINATION

A. Coordinate and cooperate with other contractors to enable the work to proceed as rapidly and efficiently as possible in a workmanlike manner.

1.13 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Labeling: Furnish standard products in unopened manufacturer's standard containers bearing original labels showing quantity, analysis and name of manufacturer.

B. Storage: Store products with protection from weather or other conditions which would damage or impair the effectiveness of the product. Protect PVC pipes and fittings from direct sunlight. Beds on which pipe is stored must be full length of pipe.

1.14 SITE CONDITIONS

A. Existing Condition

1. General: The Contractor shall use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the work.
2. Barriers: Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.
3. Operations: Do not store materials or equipment, permit burning, or operate or park equipment under the drip line of existing plants to remain.
4. Notification of Damages: Submit written notification of all conditions damaged during construction to the Owner and Owner's representative immediately.
5. Determination of Damage: Owner's representative will determine the extent of damage and value of damaged plant material.
6. Replacement of existing plant material: Replace existing plants to remain which are damaged during construction with plants of the same species and size as those damaged at no cost to the Owner.
7. Replacement of Existing Irrigation System: Immediately repair damage to existing systems. After making repairs remove all heads in repaired circuit(s) and flush lines clear of all dirt and foreign matter. After cleaning lines replace heads and return system to operating status.

1.15 PRELIMINARY ACCEPTANCE, FINAL ACCEPTANCE AND COMMENCEMENT OF THE MAINTENANCE PERIOD

A. For Landscape Maintenance Period, see Section 32 01 00.

1.16 WARRANTY

A. In addition to manufacturer's guarantees or warranties, work shall be warranted for 1 year from the date of Final Acceptance against defects in material, equipment and workmanship. Warranty shall also cover repair of damage to any part of the premises resulting from leaks or other defects in materials, equipment, and workmanship to the satisfaction of the Owner.

1.17 WARRANTY FOR SPRINKLER IRRIGATION SYSTEM

A. Include the following warranty on contractor's letterhead with service manuals:

1. WE HEREBY WARRANT THAT THE SPRINKLER IRRIGATION SYSTEM WE HAVE FURNISHED AND INSTALLED IS FREE FROM DEFECTS IN MATERIALS AND WORKMANSHIP, AND THE WORK HAS BEEN COMPLETED IN ACCORDANCE WITH THE DRAWINGS AND SPECIFICATIONS. WE AGREE TO REPAIR OR REPLACE ANY DEFECTS IN MATERIAL OR WORKMANSHIP, ANY SETTLING OF BACKFILLED TRENCHES, WHICH MAY DEVELOP DURING THE PERIOD OF ONE

YEAR FROM DATE OF ACCEPTANCE AND ALSO TO REPAIR OR REPLACE ANY DAMAGE CAUSED BY ANY DEFECTS IN THE IRRIGATION SYSTEM OR RESULTING FROM THE REPAIRING OR REPLACING OF SUCH DEFECTS AT NO ADDITIONAL COST TO THE OWNER. ORDINARY WEAR AND TEAR, UNUSUAL ABUSE OR NEGLECT ARE ACCEPTED. WE SHALL MAKE SUCH REPAIRS OR REPLACEMENTS, INCLUDING COMPLETE RESTORATION OF ALL DAMAGED PLANTING, PAVING, OR OTHER IMPROVEMENTS OF ANY KIND, WITHIN A REASONABLE TIME, AS DETERMINED BY THE OWNER, AFTER RECEIPT OF WRITTEN NOTICE. IN THE EVENT OF OUR FAILURE TO MAKE SUCH REPAIRS OR REPLACEMENTS WITHIN A REASONABLE TIME AFTER RECEIPT OF WRITTEN NOTICE FROM THE OWNER, WE AUTHORIZE THE OWNER TO PROCEED TO HAVE SAID REPAIRS OR REPLACEMENTS MADE AT OUR EXPENSE AND WE WILL PAY THE COSTS AND CHARGES THEREFORE UPON DEMAND.

PART 2 — PRODUCTS

2.1 ACCEPTABLE MANUFACTURERES

2.2 WATER METER

A. Refer to Civil Section.

2.3 IRRIGATION BACKFLOW PREVENTER

A. As shown on the Drawings.

2.4 PIPE

A. General: All pipe shall be NSF approved.

B. Piping on Pressure Side of Control Valves:
1. One and one half inches and Smaller: ASTM D 1785 polyvinyl chloride (PVC) 1120-1220, Schedule 40.

C. Piping on Non-pressure Side of Control Valves:
1. ASTM D 2241 polyvinyl chloride (PVC) 1120-1220, SDR 21.0, Class 200.
2. ASTM D 2287 flexible PVC hose.

2.5 FITTINGS

A. Fittings for Pressurized Solvent-Welded Pipe:
1. Connections of ASTM D 2466 and ASTM D 1869 Class 200 PVC as provided by the same manufacturer as the pipe.
2. Connections of Mains to Remote Control and Quick-coupling Valves: ASTM D 2467 Schedule 80 PVC solvent-weld socket fittings.

B. Fittings for Non-Pressurized Solvent-Welded Pipe:
1. ASTM D 2466 and ASTM D 2467 Schedule 40 and Schedule 80, polyvinyl chloride, standard weight, as manufactured by “Sloane,” “Lasco,” or accepted substitute. Refer to installation details.
2. Threaded PVC Nipples: Schedule 80 PVC.

2.6 NIPPLES

A. Non-Ferrous: Schedule 40 red brass (85% copper, 15% zinc) with MIPT at both ends; ASTM B43.

B. Plastic: Schedule 80, Type I, Grade 1 polyvinyl chloride (PVC); threaded both ends; ASTM D1784 and D1785; uniformly grey in color.

C. Flexible: Factory made and assembled consisting of flexible polyvinyl chloride (PVC) hose fitted at each end with Schedule 40 PVC male adaptors; test rated at 200 psi static.

2.7 SLEEVE FOR CONTROL WIRE AND WATER LINE

A. PVC 1120-1220, Schedule 40 pipe.

2.8 IRRIGATION CONTROLLER

A. As shown on the Drawings.

2.9 REMOTE CONTROL VALVES

A. As shown on the Drawings.

2.10 CONTROL WIRE

A. As shown on the Drawings.

B. Splicing Materials: Aqua Splice Heat Shrink Splice as manufactured by Raychem or 3M DBY.

C. Communications and sensor cable: As required by Controller Manufacturer.

2.11 VALVE BOXES FOR REMOTE CONTROL VALVES IN PLANTING AREAS

A. Model No.: 1419B-12B.

B. Color of Box and Lid: As shown on Drawings.

C. Manufacturer: Carson Industries Inc., 1925 “A” Street, La Verne, Calif., 91750, (714) 596-1988.

2.12 VALVE BOXES FOR QUICK COUPLING VALVES IN PLANTING AREAS

A. Model No.: 910-12B.

B. Color of Box and Lid: As shown on Drawings.

C. Manufacturer: Carson Industries Inc., 1925 “A” Street, La Verne, Calif., 91750, (714) 596-1988.

2.13 VALVE BOXES

A. For Remote Control Valves:

1. Planted Areas: Injection-moulded of Polyesters and fibrous inorganic temperature resistant components. Box shall provide adequate clearance to operate and service valve. Box and lid to be black, as manufactured by “Ametek”, “Christy” or accepted equal.

2.14 QUICK-COUPLING VALVES

A. Valve and Key: As specified on Drawings.

B. Furnish 2 valve keys fitted with 3/4" swivel hose cells.

2.15 STEEL STAKES AND PIPE CLAMPS

A. As shown on Drawings.

PART 3 — EXECUTION

3.1 LAYOUT

A. General: During installation, conform as closely as possible to Drawings. Drawings are diagrammatic to the extent that swing joints, offsets and all fittings are not shown.

B. Coverage: Make any necessary minor adjustments to layout required to achieve full coverage of irrigated areas at no additional cost to Owner.

C. Stubouts: Where connections to existing stubouts are required, make necessary adjustments should stubouts be located differently than shown on the Drawings.

D. Piping: Where piping is shown to be under paved areas but running parallel and adjacent to planted area, install piping in planted areas, unless specifically noted to be installed under paved areas. Do not install directly over another line in same trench.

E. Existing Irrigation System: Adjust new head layout as necessary where it abuts existing irrigation systems.

3.2 TRENCHING

A. Trench Depths:

1. 18-inch deep over pipe on pressure side of irrigation control valve, control wires and quick coupling valves.
2. 12-inch deep on non pressure side of irrigation control valve.

B. Trench Slopes:

1. Mains: Slope to drain to control valves.
2. Laterals: Slope to or from control valves.

3.3 CONDUITS AND SLEEVES

A. Conduit: Furnish and install conduit where control wires pass under or through structures or paving. Conduits to be of adequate size to accommodate retrieval for repair of wiring and shall extend 12 inches beyond edges of walls.

B. Sleeving: Install sleeves for all pipes passing through or under structures or paving as shown on Drawings. Sleeving to be of adequate size to accommodate retrieval of wiring or piping for repair and shall extend 12 inches beyond edges of paving or other structures.

3.4 PIPE LINE ASSEMBLY

A. General:
1. Install pipes and fittings in accordance with manufacturer's latest printed instructions.
2. Clean all pipes and fitting of dirt, scales and moisture before assembly.
3. Install pipe fittings with at least 2 inches clearance from other pipes or fittings.

B. Solvent-Welded Joints for PVC Pipes:
1. Use solvents and methods specified by pipe manufacturer.
2. Let solvents cure a minimum of 1 hour before applying any external stress on the piping and at least 24 hours before placing the joint under water pressure.

C. Threaded Joints for Swing Joints:
1. Use Teflon tape on threaded PVC fittings for swing joints only.
2. Use strap-type friction wrench only. Do not use metal-jawed wrench.

D. Laying of Pipe:
1. Remove from trench all rocks or clods 1 inch diameter or larger. Bed pipes in at least 2 inches of soil excavated from trench. Backfill on all sides of piping to provide a uniform bearing.
2. Snake pipe from side to side of trench bottom to allow for expansion and contraction. One additional foot per 100 ft. of pipe is the minimum allowance for snaking.
3. Do not lay PVC pipe when there is water in the trench.

3.5 IRRIGATION CONTROL VALVES

A. Valve Locations: Install control valves where shown on Drawings and group together where practical.

B. Valve Box Locations: Where two or more valves are installed adjacent to each other, provide at least 6 inches separation between valve boxes and align boxes parallel to each other in a row.

C. Valve Boxes: Install valve boxes over valves to be flush with accepted finish grade.

3.6 SPRINKLER HEADS

A. Spray and Bubbler Heads: Install all spray and bubbler sprinklers on a swing joint assembly as detailed on the Drawings.

3.7 QUICK COUPLING VALVES

A. Install on a swing joint assembly as detailed on the drawings.

3.8 AUTOMATIC CONTROLLER

A. General: Install per local code and manufacturer's latest printed instructions.

B. Connection to Valves: Connect remote valves to controller in clockwise sequence to correspond with station setting beginning with Stations 1, 2, 3, etc.

C. Labeling: Affix controller name (i.e., "Controller A") on inside of controller cabinet door with minimum of 1 inch high permanent letters.

D. Irrigation Diagram: Affix a non fading copy of irrigation diagram to cabinet door below controller name. Irrigation diagram to be sealed between two plastic sheets 20 mil. minimum thickness. Irrigation diagram shall be a reduced copy of the Record Drawing, clearly showing all valves operated by the controller, station number, valve size, and type of planting irrigated.

E. Grounding and Certification: Per Manufacturers specifications and requirements.

3.9 CONTROL WIRING

A. Placement: Install control wires in common trenches with sprinkler mains and laterals wherever possible. Lay to the bottom side of pipe line. Provide a minimum of 3 feet of looped slack at valves. Snake wires in trench to allow for contraction of wires. Tie wires in bundles at ten 10-foot intervals.

B. Spare: Install one unconnected spare control wire running from the controller through each intermediate control valve box and label at controller.

C. Size: Control wire: 14 AWG. Common wire: 12 AWG.

D. Color Codes: Color code control wires as follows:

1. Common wire, white.
2. Control wire, black.
3. Extra wire, orange.
4. Detection wire, yellow.

E. Detection Wire: Install a AWG size #12 or greater wire on top of the PVC supply line for the purpose of possible future mine detection search as the control wires are being installed on the bottom for the PVC supply line with electrical tape every 10 feet.

F. Splicing: Crimp control wire splices at remote control valves. Seal with specified splicing materials. Line splices will be allowed only on runs of more than 2,500 feet.

3.10 CLOSING OF PIPE AND FLUSHING OF LINES

A. Capping: Cap or plug all openings as soon as lines have been installed to prevent entrance of materials that would obstruct the pipe. Leave in place until removal is necessary for completion of installation.

B. Flushing: Thoroughly flush out all water lines before installing heads, valves and other hydrants.

C. Testing: Test as specified below. Upon completion of testing, complete assembly and adjust sprinkler heads for proper water distribution.

3.11 HYDROSTATIC TESTING

A. Procedure: Make hydrostatic tests with risers capped when welded PVC joints have cured at least 24 hours. Center load piping with backfill to prevent pipe from moving under pressure. All couplings and fitting shall be exposed. Apply continuous static water pressure of 125 psi as follows:

1. All Piping on the Pressure Side of Control Valves: Four hour test.

2. All Piping on the Non pressure Side of Control Valves: Two hour test.

B. Leaks and Retest: Repair leaks observed from tests and repeat testing until system passes tests.

3.12 BACKFILLING AND COMPACTING

A. Backfill Material at Planting Areas:

1. After system is operating and required tests and reviews have been made, backfill excavations and trenches with clean sand and soil, free of debris.

2. Backfill in 6-inch lifts with compaction performed between each lift.

B. Backfill Material at Unsleeved Pipe Under Paving: Provide all PVC pipe under paving with minimum of 4 inches of sand backfill on all sides and 30 inches cover to bottom of paving.

C. Backfill Material at Existing Underground Pipes: Use only backfill material which has been screened to eliminate all material larger than 3/8 inches when backfilling adjacent to existing underground pipe lines.

D. Backfill Compaction:

1. Regardless of the type of pipe covered, compact to minimum 95% density under pavements, and 85% in planted areas.

2. Compact trenches in areas to be planted by thoroughly flooding or jetting.

3. Compact trenches in paved areas in 6-inch lifts.

E. Finish Grading: Dress off all areas to accepted finish grades. Refer to Section 02260 Planting Area Finish Grading

3.13 CLEAN-UP

A. Daily: Keep all areas of work clean, neat and orderly at all times.

B. Final: Clean up and remove all deleterious materials and debris from the entire work area prior to Final Review.

END OF SECTION

PART 1 – GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Subsoil Ripping of Planting Areas.
   2. Mixing and Placement of Import Soil Mix.
   3. Mixing and Placement of Planter Soils.

B. For Earthwork, see Division 31.

C. For Landscape Maintenance Period, see Section 32 01 00.

D. For Irrigation, see Section 32 84 00.

E. For Planting Area Finish Grading, see Section 32 91 19.

F. For Plant Material, see Section 32 93 00.

1.2 DEFINITIONS

A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of Owner’s representative in writing.

1.3 ALLOWANCE

A. Allowance for Backfill Mixes and Soil Amendment Programs:
   1. Provide cash allowance based on materials specified assuming new materials are purchased and installed.

B. Prior to purchase of materials, after final backfill mixes and amendment programs have been accepted by Owner’s representative, submit complete documentation of labor, materials and equipment comparing allowance with proposed installed costs of final mixes and amendment program.

C. Credit unused monies to Owner.

1.5 SUBMITTAL

A. Product Data:
   1. Planter Soil.
   2. Imported Soil.
   3. Organic compost.

B. Test Reports:
   1. Provide a “Complete Standard Analysis” of imported and planter soils and organic compost indicating the following:
      a. pH measurement in the Saturation Extract, Electrical Conductivity of the saturation extract and Sodium Adsorption Ration of the saturation extract. Utilize the following procedures utilizing the Methods of the United States Salinity Laboratory as published in the Agricultural Handbook Number 60 entitled “Diagnosis and Improvement of Saline and Alkali Soils”:
         (a) pH Method 21
         (b) Saturation Extract Method 2
         (c) Sodium Adsorption Ratio Method 20b
         (d) As determined by ammonium bicarbonate-DTPA: Methods of Soil Analysis, Part 1, Physical and Mineralogical Methods, Soil Science Society of America, Inc., 1986, identify the following nutrients and elements:
         (e) Boron, calcium, copper, iron, magnesium, manganese, molybdenum, phosphorous, potassium, sodium, sulfur, and zinc.
         (f) Analyze the saturation extract for calcium, magnesium, sodium, boron, chloride, phosphorus, nitrate and sulfate.
      b. Measure the following trace metals by the ammonium bicarbonate-DTPA extract: Methods of Soil Analysis, Part 1, Physical and Mineralogical Methods, Soil Science Society of America, Inc., 1986.
         (a) Aluminum, arsenic, cadmium, chromium, cobalt, lithium nickel, selenium, silver, strontium, tin and vanadium.
      c. Determine the presence of calcium carbonate and/or magnesium carbonate.

d. As determined by Methods of Soil Analysis, Part 3 Chemical Methods, Soil Science Society of America, Inc., 1996, identify Soil Texture (gravel, sand, silt and clay) and percent gravel.
e. As determined by Methods of Soil Analysis, Part 3 Chemical Methods, Soil Science Society of America, Inc., 1996, identify organic matter content by the measurement of organic carbon. The quality of organic matter shall be determined by measuring organic carbon and total nitrogen.
f. As determined by Method 34b of Agricultural Handbook Number 60, identify Water Infiltration Rate.
g. Interpretation of nutritional deficiencies or excesses and potential toxicities shall be given.
h. Define import soil source and organic matter locations.
   (a) Provide copy of the planting plan with each composite sample keyed by number to the area from which the composite samples were taken.
i. Soil Test for Parasitic Nematodes (if required).
j. Soil Test for Herbicide Contamination (if required).
k. Samples shall include location of source material, date of samples, and project name.
l. Bulk density and particle size analysis, including the following gradient of mineral content (USDA Designation is size in mm)
   (a) Gravel – over 2mm
   (b) Sand – 0.05 – 2mm
   (c) Silt – 0.002-0.05mm
   (d) Clay – minus 0.002mm
m. Sieve Analysis performed and compared with USDA Soil Classification System. Sieve analysis shall be by a combined hydrometer and wet sieving using sodium hexametaphosphate as a dispersant in accord with particle size analysis, Chapter 15, Methods of Soil Analysis, Part 1, SSSA-ASA, Inc., 1986.

2. Provide a percent pore space analysis as follows:
   a. 1 minus [rock specific gravity unit divided by the bulk specific gravity] times

1.6 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies:
   1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.
   2. Provide for inspections and permits required by federal, state and local authorities in furnishing, transporting, and installing materials.

B. Contractor Qualifications:
   1. Have successfully installed structural soil mixes similar to the quality specified for a period of not less than 5 years.
   2. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

1.7 SITE CONDITIONS

A. Environmental Requirements:
   1. Do not work soil when moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in the air or that clods will not break readily.
   2. Apply water, if necessary, to bring soil to an optimum moisture content for tilling.
   3. Do not work soil when muddy or frozen.
   4. Do not apply chemicals if wind conditions will cause hazardous drift to people or property.

B. Existing Conditions:
   1. Prior to Work commencement review locations of existing public underground utilities and structures with appropriate utility companies and clearly mark in field.
   2. Prior to Work commencement review location of existing private underground utilities and structures with Owner and clearly mark in field.
   3. Prior to Work commencement and after reviewing the Owner's record irrigation documents, review and clearly mark in field heads, valve boxes and other underground equipment, materials, and structures.

1.8 PROJECT CONDITIONS

A. Areas to receive structural soils shall be inspected by Owner's Representative before starting work.

B. Verify extent of work requirements, including but not limited to potential need for temporary storage and staging of soils, including moving soil stockpiles at site to accommodate other work and the need to protect installed soils from compaction, erosion and contamination.

PART 2 — PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

A. Pre-Plant Fertilizer for On-Grade Planting Areas:
   1. Gro-Power, Inc. – http://www.gropower.com.
   2. Or equivalent and accepted substitute.

B. Other Commercial Fertilizers:
   1. Or equivalent and accepted substitute.

C. Planter Soil:
   1. American Soil and Stone – http://www.americansoil.com.
   2. Or equivalent and accepted substitute.

D. Imported Soil
   1. American Soil and Stone – http://www.americansoil.com.
   2. Or equivalent and accepted substitute.

E. Soil Testing Agency:
   1. Wallace Laboratories – http://us.wlabs.com.
   2. Or equivalent and accepted substitute.

F. Geotextile Fabric
   1. Carthage Mills – http://carthagemills.com.
   2. TenCate Nicolon Corporation – http://www.tencate.com.
   3. Or equivalent and accepted substitute.

2.2 MATERIALS

A. Planter Soil:
   1. American Soil and Stone "Ultra Bedding Mix”.
   2. Or equivalent and accepted substitute.
   3. Soil shall be of uniform quality and free of phytotoxic compounds.
   4. Particle Size Analysis: Less than 80-percent and more than 60-percent sand; less than 40-percent silt; less than 20-percent clay.
   5. pH: Range 5.5 – 7.5.
   6. EC: Less than 2.0 ds/m (USDA Circular No. 982).
   7. SAR: Less than 6.0.
   8. Contaminants: Free of phytotoxic compounds and debris, seeds or rhizomes of noxious weeds, herbicides, pesticides, heavy metals, biological toxins, excesses of fertilizer, component toxic to plants or humans, and less than 2-percent gravel.
   9. Salts: The electrical conductivity of the soil shall not exceed 2.-0 decisemens per meter as determined by the saturated-soil test method described in USDA Circular No. 982. The sodium absorption ratio shall not exceed 6.0. Boron levels shall not exceed 1.0 ppm.
   10. Boron: Less than 1.0 ppm.
   11. Sodium: Less than 5.0 meq/1.
   12. Chloride: Less than 5.0 meq/1.

B. Imported Soil:
   1. American Soil and Stone “General Landscape Soil”.
   2. Or equivalent and accepted substitute.
   3. Soil shall be of uniform quality and free of phytotoxic compounds.
   4. Particle Size Analysis: Less than 80-percent and more than 60-percent sand; less than 40-percent silt; less than 20-percent clay.
   5. pH: Range 5.5 – 7.5.
   6. EC: Less than 2.0 ds/m (USDA Circular No. 982).
   7. SAR: Less than 6.0.
   8. Contaminants: Free of phytotoxic compounds and debris, seeds or rhizomes of noxious weeds, herbicides, pesticides, heavy metals, biological toxins, excesses of fertilizer, component toxic to plants or humans, and less than 2-percent gravel.
   9. Salts: The electrical conductivity of the soil shall not exceed 2.-0 decisemens per meter as determined by the saturated-soil test method described in USDA Circular No. 982.

The sodium absorption ratio shall not exceed 6.0. Boron levels shall not exceed 1.0 ppm.

10. Boron: Less than 1.0 ppm.
11. Sodium: Less than 5.0 meq/1.
12. Chloride: Less than 5.0 meq/1.

C. Organic Compost:
   1. Fully composted aerobic compost without presence of decomposition products.
   2. Redwood and cedar products are not acceptable.
   3. Ash content of not less than 8 percent and no more than 50 percent.
   4. pH between 6 and 7.
   5. Salt content shall be less than 10 millimho / cm @ 25 degrees (ECe less than 10) in a saturated paste extract.
   6. Boron content of saturated extract <1.0 parts per million.
   7. Silicon content (acid-insoluble ash) shall be less than 20 percent.
   8. Calcium carbonate shall not be present

D. Potential Chemical Amendments Required by Accepted Amendment Programs and Backfill Mixes:
   1. Ground Limestone: Agricultural limestone containing not less than 85 percent of total carbonate, ground to such fineness that 50 percent will pass No. l sieve and 90 percent will pass No. 20 sieve
   2. Dolomite Lime: Agricultural grade mineral soil conditioner containing 35-percent minimum magnesium carbonate and 49-percent minimum calcium carbonate, 100 percent passing #65 sieve.
   3. Gypsum: Agricultural grade product containing 80-percent minimum calcium sulfate.
   4. Iron Sulfate (Ferric or Ferrous): Supplied by a commercial fertilizer supplier, containing 20- to 30-percent iron and 35- to 40-percent sulfur.
   5. Potassium Sulfate: Agricultural grade (0-0-50).
   6. Single Superphosphate: Commercial product (0-20-0).
   7. Treble Superphosphate: Commercial product (0-48-0).
   8. Ammonium Nitrate: Commercial product (30-0-0).
   9. Calcium Nitrate: Agricultural grade containing 15.5-percent nitrogen.
   10. Urea Formaldehyde: Granular commercial product containing 38-percent nitrogen.
   11. IBDU (Iso Butyldiene Diurea): Commercial product containing 31-percent nitrogen.
   12. Soil Sulfur: Agricultural grade sulfur containing a minimum of 96-percent sulfur.
   13. Iron Sequestrene: Geigy Iron Sequestrene 330 Fe
   14. Silicic Acid Calcium: Commercial grade.

E. Perlite:
   1. Horticultural Perlite, 6.5 to 7.5 pH.
   2. Or accepted substitute.

F. Volcanic Rock:

1. Clean, free of materials toxic to plant growth, 60 pounds per cubic foot (961 kilograms per cubic meter) maximum damp weight, size as specified.
2. Or accepted substitute.

G. Preplant Fertilizer for Trees, Shrubs, Ground Cover and Turf Areas:
1. Gro-Power Plus 5-3-1.
2. Or accepted substitute.

PART 3 — EXECUTION

3.1 EXAMINATION

A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.
B. Underground Utilities and Structures: Verify that the locations of utilities, structures and other underground items have been clearly marked.
C. Notification of Unsuitable Conditions: Before proceeding with Work, notify Owner and Owner's representative in writing of unsuitable conditions and conflicts.

3.2 PREPARATION

A. Protection of Existing Conditions:
1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
2. Provide barricades, fences or other barriers to protect existing conditions to remain from damage during construction
3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
4. Submit written notification of damaged plants and structures to Owner and Owner's representative immediately.
B. Surface Preparation:
1. Inspect soil surface for sticks, oils, chemicals, plaster, concrete, and other deleterious materials.
2. Do Work required to remove and dispose of the deleterious materials.

3.3 SOIL TESTS TO DETERMINE AMENDMENT PROGRAM

A. Provide samples to Wallace Laboratories for "Complete Standard Analysis" report and amendment recommendations.
B. At least 30 days prior to soil installation, submit written "Complete Standard Analysis" report, including amendment recommendations, to Owner's representative for determination of the final mixes and amendment program.

3.4 SOIL TESTS FOR NEMATODES AND HERBICIDE

A. Parasitic Nematodes:
1. Test soils which have been used for agricultural purposes within the prior 12 months for parasitic nematodes.

2. Soil will be acceptable if the parasitic nematode population is less than 200 per 50 cubic centimeters of soil.
3. Do not artificially dry soil prior to testing.
4. Submit written test report to the Owner and Owner's representative.

B. Herbicide Contamination:
1. Perform a radish/rye grass growth trial on soils suspected of herbicide contamination.
2. Submit written test report to the Owner's representative.

3.5 IMPORTED SOIL INSTALLATION

A. Scarification:
Immediately prior to imported soil placement, scarify existing soils at bottom and sides of planting pit.
B. Placement: Place mix carefully into pits avoiding damage or contamination of other Work.
C. Settlement Allowance: Place backfill mix to depth and elevation which allows for settlement.
D. Mock-Up: Mock-up areas of backfill mix at the specified depths and apply irrigation to induce settlement, if required to help determine the amount of settlement which will be caused by irrigation and rain.

3.6 PLANTER SOIL INSTALLATION

A. Placement: Place mix carefully avoiding damage or displacement of other materials such as waterproof membrane, protection board, drain rock, filter fabric, lightweight fill material and irrigation piping.
B. Compaction: Compact soil mix by thoroughly watering or jetting the entire planter.
C. Settlement: Fill settled low areas with soil mix and repeat compaction and filling process until settlement ceases

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Specifications for furnishing, placing, and compacting bioretention soil, drainage rock, perforated pipe, area drains, pop-up emitters, and cobblestone as indicated in plans.

1.2 REFERENCES

American Society for Testing and Materials (ASTM):

ASTM D422 –	Standard Test Method for Particle-Size Analysis of Soils
ASTM D1557 –	Standard Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort
ASTM D2434 –	Standard Test Method for Permeability of Granular Soils (Constant Head)
ASTM D5268 –	Standard Specification for Topsoil Used for Landscaping Purposes

1.3 GENERAL REQUIREMENTS

A. Bioretention soil shall achieve a long-term, in-place infiltration rate of at least 5 inches per hour. Bioretention soil shall also support vigorous plant growth.

B. Bioretention Soil shall be a mixture of topsoil or fine sand, and compost, measured on a volume basis.

Mix A – Topsoil Blend
10%-20% Topsoil
50%-60% Fine Sand
30%-40% Compost

Mix B – Fine Sand Blend
60%-70% Fine Sand
30%-40% Compost

1.4 SUBMITTALS

A. The contractor shall submit for approval:

1. A sample of mixed bioretention soil.

2. Certification from the soil supplier or an accredited laboratory that the Bioretention Soil meets the requirements of this guideline specification.

3. Grain size analysis results of the fine sand component performed in accordance with ASTM D 422, Standard Test Method for Particle Size Analysis of Soils.

4. Quality analysis results for compost performed in accordance with Seal of Testing Assurance (STA) standards, as specified in Section 1.4.

5. Organic content test results of mixed Bioretention Soil. Organic content test shall be performed in accordance with by Testing Methods for the Examination of Compost and Composting (TMECC) 05.07A, “Loss-On-Ignition Organic Matter Method”.

6. A description of the equipment and methods used to mix the sand and compost to produce Bioretention Soil.

7. Provide the following information about the testing laboratory(ies) name of laboratory(ies) including:

   - Contact person(s)
   - Address(es)
   - Phone contact(s)
   - E-mail address(es)
   - Qualifications of laboratory(ies), and personnel including date of current certification by STA, ASTM, or approved equal

PART 2 - PRODUCTS

2.1 SAND FOR BIORETENTION SOIL

A. General

1. Sand shall be free of wood, waste, coating such as clay, stone dust, carbonate, etc., or any other deleterious material. All aggregate passing the No. 200 sieve size shall be non-plastic.

B. Sand for Bioretention Soil Texture.

1. Sand for Bioretention Soils shall be analyzed by an accredited lab using #200, #100, #40, #30, #16, #8, #4, and 3/8 inch sieves (ASTM D 422 or as approved by the Engineer), and meet the following gradation:

Sieve Size	Percentage Passing (by weight)	
	Min	*Max*
3/8 Inch	100	100
No. 4	90	100
No. 8	70	100
No. 16	40	95
No. 30	15	70
No. 40	5	55
No. 100	0	15
No. 200	0	5

Note all sands complying with ASTM C33 for fine aggregate comply with the above gradation requirements.

2.2 TOPSOIL FOR BIORETENTION SOIL

General: Topsoil shall be free of wood, waste, or any other deleterious material.

Topsoil for Bioretention Soil Texture: The overall topsoil texture shall be loamy sand as analyzed by an accredited laboratory. The overall dry weight percentages shall be 60-90% sand, with less than 20% passing than the #200 sieve and less than 5% clay of the total weight with no gravel.

2.3 COMPOSTED MATERIAL

A. Compost shall be a well decomposed, stable, weed free organic matter source meeting the standards developed by the US Composting Council (USCC). The product shall be certified through the USCC Seal of Testing Assurance (STA) Program (a compost testing and information disclosure program).

B. Compost Quality Analysis Before delivery of the soil, the Contractor shall submit a copy of lab analysis performed by a laboratory that is enrolled in the US Composting Council's Compost Analysis Proficiency (CAP) program and using approved Test Methods for the Evaluation of Composting and Compost (TMECC). The lab report shall verify:

1. Feedstock Materials shall be specified and include one or more of the following: landscape/yard trimmings, grass clippings, food scraps, and agricultural crop residues.

2. Organic Matter Content: 35% - 75% by dry wt.

3. Carbon and Nitrogen Ratio: C:N < 25:1.

4. Maturity/Stability: shall have a dark brown color and a soil-like odor. Compost exhibiting a sour or putrid smell, containing recognizable grass or leaves, or is hot (120F) upon delivery or rewetting is not acceptable. In addition, any one of the following is required to indicate stability:

   a. Oxygen Test < 1.3 O2 /unit TS /hr
   b. Specific oxy. Test < 1.5 O2 / unit BVS
   c. Respiration test < 8 C / unit VS / day
   d. Dewar test < 20 Temp. rise (°C)
   e. Solvita® > 5 Index value

5. Toxicity: any one of the following measures is sufficient to indicate non-toxicity.

   a. NH4- : NO3-N < 3
   b. Ammonium < 500 ppm, dry basis
   c. Seed Germination > 80 % of control
   d. Plant Trials > 80% of control
   e. Solvita® > 5 Index value

6. Nutrient Content: provide analysis detailing nutrient content including N-P-K, Ca, Na, Mg, S, and B.

   a. Total Nitrogen content 0.9% or above preferred.
   b. Boron: Total shall be <80 ppm; Soluble shall be <2.5 ppm

7. Salinity: Must be reported; < 6.0 mmhos/cm

8. pH shall be between 6.5 and 8. May vary with plant species.

    a. Particle size: 95% passing a 1/2” screen.

C. Bulk density: shall be between 500 and 1100 dry lbs/cubic yard

D. Moisture Content shall be between 30% - 55% of dry solids

E. Inerts: compost shall be relatively free of inert ingredients, including glass, plastic and paper, < 1 % by weight or volume

F. Weed seed/pathogen destruction: provide proof of process to further reduce pathogens (PFRP). For example, turned windrows must reach min. 55C for 15 days with at least 5 turnings during that period.

G. Select Pathogens: Salmonella <3 MPN/4grams of TS, or Coliform Bacteria <10000 MPN/gram

H. Trace Contaminants Metals (Lead, Mercury, Etc.) Product must meet US EPA, 40 CFR 503 regulations

I. Compost Testing. The Contractor will test all compost products within 120 calendar days prior to application. Samples will be taken using the STA sample collection protocol. (The sample collection protocol can be obtained from the U.S. Composting Council, 4250 Veterans Memorial Highway, Suite 275, Holbrook, NY 11741 Phone: 631-737-4931, www.compostingcouncil.org). The sample shall be sent to an independent STA Program approved lab. The Contractor will pay for the test.

2.4 PERMEABLE AGGREGATE BASE ROCK

Aggregate base shall be permeable Class 2, 3/4" maximum. When the aggregate base is constructed in more than one layer, the previously constructed layer shall be cleaned of loose and foreign matter by sweeping with power sweepers or power brooms, except that hand brooms may be used in areas where power cleaning is not practicable. Adequate drainage shall be provided during the entire period of

construction to prevent water from collecting or standing on the area to be covered with aggregate base.

2.5 COBBLESTONE:

3-inch to 6-inch diameter water-worn stone ("Lodi" or Engineer approved equal). Cobblestone to be rounded with no sharp grade breaks. Cobbles with breaks or fractures are not allowed

2.6 AREA DRAINS

Area Drain. 4" Round Atrium Grate, Green. HDPE. Open surface area shall be 17 sq.in. minimum.

2.7 Pop-up Emitters

NDS polypropylene (size per plan), green, or as approved by the Engineer

2.8 High Density Polyethylene Pipe (HDPE)

1. Perforated Pipe: HDPE Perforated pipe conforming to ASTM D3212, or ASTM 1417. Perforations shall be 2 rows of ½" holes on 5" centers, 120° apart.

PART 3 - EXECUTION

3.1 PLACEMENT AND COMPACTION OF BIORETENTION SOILS

Place the bioretention soil in 8" to 12" lifts. Lifts are not to be compacted but are placed to reduce the possibility of excessive settlement. Allow time for natural compaction and settlement prior to planting. Bioretention soil may be watered to encourage compaction.

3.2 CLEANING

Thoroughly clean the inside of each existing piping system of all dirt, loose scale, sand, and other foreign material. Cleaning shall be by sweeping, flushing with water, or blowing with compressed air, as appropriate for the size and type of pipe. Flushing shall achieve a velocity of at least 3 feet per second. Contractor shall be responsible for collection and disposal of all debris gathered from cleaning operations.

3.3 INSTALLATION OF PRECAST DRAIN INLETS

Set drainage pipe to grade as indicated in plans. Grout firmly in place to form a tight seal.

END OF SECTION

PART 1 — GENERAL

1.1 SUMMARY

A. Section Includes:
1. Fertilizers.
2. Plant Materials.
3. Rock Mulch.
4. Wood Chip Mulch.
5. Root Barriers.
6. Geotextile Fabric.
7. Staking and Guying.
8. Cobble.

B. For Earthwork, see Division 31.

C. For Landscape Maintenance Period, see Section 32 01 00.

D. For Irrigation, see Section 32 84 00.

E. For Planting Soil Preparation, see Section 32 91 13.

F. For Drainage, see Division 33.

1.2 DEFINITIONS

A. Acceptance: Wherever the terms “acceptance”, “accepted”, or “acceptable” are used herein, they mean acceptance of Owner’s representative in writing, unless indicated otherwise.

B. Tie Height: Lowest Height at which tree trunk will snap back to upright position when pulled to one side and released.

C. Plant Height: Measurement of main body height, not measurement to top branch tip.

D. Plant Spread: Measurement of main body diameter, not measurement from branch tip to tip.

E. Caliper: Trunk diameter measured at a point 6 inches (150 mm) above natural ground surface for trees up to 4 inches (100 mm) in caliper, and measured at a point 12 inches (300 mm) above natural ground surface for trees over 4 inches (100 mm) in caliper.

1.4 SUBMITTALS

A. Product Data:
   1. Fertilizer Tablets.
   2. Geotextile Fabric.
   3. Wetting agent and Soil Penetrant.

B. Samples:
   1. Rock Mulch — 1/2 pound bag.
   2. Wood Mulch — 1/2 pound bag.
   3. Cobble- 5 pieces representing range of color and size.

C. Plant Material Photographs:
   1. At least 14 days prior to submittal of plant material location data, submit three color photographs of individual plants, each of representative plants of each type of plant material. Plants photographed should not have plants in the background or be of groups of plants.
   2. Include a scale object in each photograph such as a tape measure or person.

D. Plant Material Location Data:
   1. Quantities and sizes of each plant material type at each nursery or other place of growth.
   2. Address, phone number, and contact person for each nursery or other place of growth.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.
   2. Provide for inspections and permits required by federal, state and local authorities in furnishing, transporting, and installing materials.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Handling Plants:
   1. Do not lift or handle container plants by tops, stems or trunks.
   2. Do not bind or handle plants with wire or rope.
   3. Pad trunk and branches where hoisting cables or straps contact.

B. Anti-Desiccant:
   1. Spray plant material in full leaf immediately before transporting with anti-desiccant.
   2. Meet requirements of anti-desiccant manufacturer's current printed application instructions.

C. Digging Plants: Dig ball and burlap plants with firm, natural balls of earth of diameter meeting or exceeding requirements of ANSI Z60.1 and of sufficient depth as required to include the fibrous and feeding roots.

D. Plant Storage Prior to Installation:
   1. Protect plant root balls from sun and drying winds.
   2. Keep root balls moist.
   3. Keep sun-sensitive plants shaded.
   4. Anchor plants to prevent damage from strong winds.

1.7 SITE CONDITIONS

A. Environmental Requirements:
   1. Protect plant material being stored on site from sun and drying winds.

B. Existing Conditions:
   1. Prior to Work commencement, review and clearly mark in field horizontal and vertical locations of public existing underground utilities and structures with respective utility companies.
   2. Prior to Work commencement, review and clearly mark in field horizontal and vertical locations of private underground utilities and structures with Owner.

1.8 WARRANTY

A. Warranty Period: Warrant that plant material, except annuals, will be healthy and in vigorous, flourishing condition of active growth one year from date of Final Completion.

B. Annuals: Warrant that annuals will be in a vigorous, flourishing condition of active growth until end of last annual change season.

C. Delays: Delays in completion of planting operations which extend the planting into more than one planting season shall extend the Warranty Period correspondingly.

D. Condition of Plants: Plants shall be free of dead or dying branches and branch tips, with foliage of a normal density, size and color.

E. Incorrect Materials:
   1. During Warranty Period, replace at no cost to Owner, plants revealed as being untrue to name.
   2. Provide replacements of a size and quality to match the planted materials at the time the mistake is discovered.

F. Replacements:

1. As soon as weather conditions permit, replace, without cost to Owner, dead plants and plants not in a vigorous, thriving condition, as determined by the Owner's representative during and at the end of Warranty Period.
2. Apply requirements of this Section to replacements.

G. Exceptions: Contractor shall not be held responsible for failures due to neglect by Owner, vandalism and other causes outside the Contractor's control.

1.9 MAINTENANCE

A. For Landscape Maintenance Period, see Section 32 01 00.

PART 2 — PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Fertilizer Tablets:
1. Gro Power, Inc. – www.gropower.com.
2. Grow Better – www.growbetter.com.
3. Agri Tab Corporation – www.agritab.com.
4. Or accepted substitute.

1. Aquatrols Corporation – www.aquatrols.com.
2. Or accepted substitute.

C. Steel Header and Stakes:
1. The J.D. Russell Company – www.jdrussellco.com.
2. Or accepted substitute.

D. Stress Reducing Agent: EarthWorks – www.soilfirst.com.
2. Or accepted substitute.

E. Wetting Agent and Soil Penetrant:
1. Aquatrols – www.aquatrols.com.
2. Harell's – www.harrells.com.
3. Or accepted substitute.

F. Tree Stakes:
1. J. R. Partners – www.reddystake.com.
2. Or equivalent and accepted substitute.

G. Rock Mulch:
1. Lyngso – www.lyngsogarden.com
2. American Soil Products – www.americansoil.com.

H. Wood Chip Mulch:
   1. Lyngso – www.lyngsogarden.com
   2. American Soil Products – www.americansoil.com.
   3. Or accepted substitute.

I. Cobble:
   1. Lyngso – www.lyngsogarden.com
   2. American Soil Products – www.americansoil.com.
   3. Or accepted substitute.

J. MPS Capillary / Aeration System:
   1. Primescape Products Company, Deerfield, Ill., (800) 872-4361.
   2. Or accepted substitute.

K. Geotextile Fabric:
   1. Carthage Mills – www.carthagemills.com.
   2. Mirafi – www.tcmirafi.com.
   3. Or accepted substitute.

L. Root Barriers:
   1. Deep Root – www.deeproot.com.
   2. Century Products – www.centuryrootbarrier.com.
   3. Or equivalent and accepted substitute.

M. Root Ball Anchors
   1. Platipus Earth Anchoring Systems – www.platipus-anchors.com.
   2. Or equivalent accepted substitute.

2.2 SUBSTITUTIONS

A. Plant Material: Accepted substitute plants shall be true to species and variety and shall meet requirements of this Section except that plants larger than specified may be used if accepted.

2.3 MATERIALS

A. Plants:
   1. Growing Practices: Nursery grown in accordance with best horticultural industry practices.
   2. Nomenclature: Plant nomenclature shall meet requirements of ICBN and ICNCP.
   3. Climatic Growing Conditions: Grown under climatic conditions similar to those of project for at least two years unless otherwise accepted.
   4. Container Growth Limitations: Container stock excluding annuals shall have been grown in the containers in which delivered for at least six months, but not over two years.
   5. Root Ball Size: Meet or exceed requirements of ANSI Z60.1.

6. Branching: Structurally strong, able to stand upright without stakes or guys on a windless day; exceptionally heavy, symmetrical, tightly knit, so trained or favored in development and appearance as to be superior in form, number of branches, compactness and symmetry.
7. Vigor: Sound, healthy and vigorous, well branched and densely foliated when in leaf.
8. Disease and Pests: Free of disease, insect pests, eggs, or larvae.
9. Root System: Healthy well-developed root systems, free of kinked, circling, girdling and center roots, root-bound condition and cracked or broken root balls.
10. Measurements: Measure plants when branches are in their normal upright position.
11. Pruning: Do not prune, thin or shape plants before delivery without acceptance.
12. Unacceptable Conditions: Multiple leaders, unless specified, damaged or crooked leaders, bark abrasions, sun-scalds, disfiguring knots, or fresh cuts of limbs over 3/4-inch diameter which have not completely callused.

B. Fertilizer Tablets:
   1. Grow-Power 21 gram tablets, 20-10-5 (N-P-K) formula.
   2. Grow-Power 7 gram ADS tablets, 12-8-8 (N-P-K) formula.
   3. Agri Tab Aquatic fertilizer, 12-20-8 in compressed spike form.
   4. Agri Tab Aquatic fertilizer, 20-5-10 5 gram tablets.
   5. Or equivalent and accepted substitute.

C. Water: Clean, fresh and potable.

D. Wood Chip Mulch:
   1. Ground Fir 1/4 inch.
   2. Or equivalent and accepted substitute.

E. Rock Mulch:
   1. ½” x 3/8” crushed black basalt.
   2. Or equivalent and accepted substitute.

F. Cobble:
   1. 3” – 5” Black La Paz Cobble.
   2. Or equivalent and accepted substitute.

G. Anti-Desiccant: Commercially available spray protective coating, designed to reduce plant transpiration loss, which produces a moisture retarding barrier not removable by rain or snow.

H. Stress Reducing Agent:
   1. Roots Concentrate.
   2. Or equivalent and accepted substitute.

I. Wetting Agent and Soil Penetrant:
   1. AquaGro 2000M.
   2. AquaGro 2000G.

3. Or equivalent and accepted substitute.

J. Geotextile Fabric:
   1. Mirafi Filterweave 140 NC non-woven geotextile composed of polypropylene fibers.
   2. Carthage FX-300MF
   3. Or equivalent and accepted substitute.

2.5 SOURCE QUALITY CONTROL

A. Plant Material Review and Tagging:
   1. Trees will be reviewed, photographed and tagged by the Owner's representative at the nursery, or other place of growth prior to delivery of trees to site.
   2. At Owner's representative's discretion, shrubs may or may not be reviewed, photographed, and tagged by the Owner's representative at the nursery or other place of growth.
   3. Tagging of plant material at the nursery or place of growth does not cancel the right of the Owner's representative to reject plant material at the site, if damage or unacceptable conditions are found that were not detected at the nursery, place of growth or in the submitted photographs.

PART 3 — EXECUTION

3.1 EXAMINATION
A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.
B. Fine Grading and Soil Preparation: Verify that fine grading and soil preparation Work is complete.
C. Verification Surface Drainage: Verify positive surface drainage of planted areas.
D. Notification: Before proceeding with Work, notify Owner and Owner's representative in writing of unsuitable conditions.

3.2 PREPARATION
A. Protection of Existing Conditions:
   1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
   2. Provide barricades, fences or other barriers to protect existing conditions to remain from damage during construction.
   3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
   4. Submit written notification of damaged plants and structures to Owner and Owner's representative immediately.

3.3 SUBSURFACE OBSTRUCTIONS

A. Plant Pit Excavation: If rock, underground utilities, structures, tree roots or other obstructions are encountered in the excavation of plant pits, alternate locations may be accepted by the Owner's representative.
B. Cost for Removal of Obstructions: Where locations cannot be changed, submit cost estimate for Work to remove the obstructions to a depth of not less than 6 inches below the required pit depth, and proceed with Work after Owner's approval.
C. Irrigation Piping: Reroute around the plant root ball.

3.4 HEADERS INSTALLATION

A. Locations: Install where indicated on Drawings.
B. Horizontal Alignment:
    1. Install straight sections free of "wiggles" using string lines as guides.
    2. Install curved sections as smooth curves free of small "wiggles" following alignment marked with paint by Owner's representative in field.
C. Vertical Alignment: Install parallel with finished grade.
D. Stakes:
E. Install stakes in solid undisturbed soil.
    1. Recompact loose disturbed soil to at least 85 percent relative compaction before installing stakes.
    2. Install stakes at every location in header sections designed to attach stakes to headers.
F. Damaged headers: Replace header sections damaged by construction operations.

3.5 PLANT LAYOUT

A. Trees:
    1. Stake location of trees where indicated on Drawings.
    2. Scale tree locations where no dimensions are given.
    3. Drive a 3-feet long wood lath stake at each tree location and mark each tree type with different color survey tape.
    4. Contact Owner's representative to review locations in field prior to excavating plant pits.
    5. Do not excavate plant pits until Owner's representative has accepted locations.
B. Shrubs and Groundcover.
    1. Layout according to Drawings.
    2. Contact Owner's representative if there are any conflicts that would prevent plants from being laid out according to Drawings.
    3. Contact Owner's representative to determine if a review of locations in field, prior to excavating plant pits, is required.

3.6 EXCAVATION OF PLANT PITS

A. Equipment:
    1. Excavate pits with a back hoe or hand digging.
    2. Do not use an auger.
B. Dimensions:

1. Excavate plant pits to a depth equal to the root ball height minus the amount needed to account for settlement and to install the root balls at the specified elevation relative to adjacent finished grade.
2. Install top of plant root balls 1-inch above adjacent finished grade except where indicated otherwise.
3. Excavate pits to a diameter which is 3 times the root ball diameter, except where indicated otherwise on the Drawings.
4. Center plant pits on plant locations where possible.
5. Where plant pits cannot be excavated to specified dimensions nor centered on plants due to obstructions such as paving, walls, curbs, or other structures excavate pits in directions without obstructions until pit volume equals the specified plant pit volume, except where indicated otherwise.
6. Do not undercut adjacent obstructions unless accepted by the Owner's representative.
7. Excavate plant pit sides along adjacent elements such as paving, walls, curbs, and other structures at a 45 degree angle sloping away from the bottom surfaces of the adjacent elements, except where indicated otherwise.

3.7 ROOT BARRIERS INSTALLATION

A. Locations: Install root barriers where shown on Drawings and according to manufacturer's current printed instructions.

3.9 PLANTING AND BACKFILL OPERATIONS

A. Protection of Plants Prior to Installation:
   1. Protect plant root balls from sun or drying winds.
   2. Keep root balls of plants that cannot be planted immediately upon delivery in the shade, well protected and well watered.
B. Removal of Containers:
   1. Remove canned stock carefully after cans have been cut on two sides with accepted cutter.
   2. Do not use spade to cut containers.
C. Root Ball Scarification:
   1. After removing plant from container, scarify side of root ball to prevent root bound condition.
   2. Loosen root ball soil surface to depth of 1/8 to 1/4 inch without damaging roots or breaking root ball.
   3. Do not scarify or cut into Bougainvillea root balls.
D. Cutting Circling Roots:
   1. If circling roots are encountered at root ball sides, notify Owner's representative for field review.
   2. Upon Owner's representative's acceptance, cut roots on 4 sides of root ball 90 degrees apart at no extra cost to Owner.
   3. Use a 4-inch wide sharp straight blade.
   4. Cut roots by pushing spade or knife down sides of root ball 90 degrees to root ball surface and 2 inches into root ball.
   5. Keep spade or knife sharp to cut roots cleanly.
E. Plant Placement:

1. Handling plant carefully, set plant root ball on pit bottom centered on accepted horizontal location.
2. Install plant root ball vertically so that top of root ball is 1 inch above adjacent finished grade after settlement except where indicated otherwise.

F. Removal of Root ball Wrapping Materials: Remove and dispose of burlap, nylon cord, wire baskets, twine and other materials prior to backfilling.

G. Backfill Mix Placement:
1. Place mix carefully as not to damage the plant root ball, trunk, branches, or foliage.
2. Fill pit until top of backfill mix is even with top of root ball.
3. Settle mix by watering evenly.
4. Fill settled backfill mix with additional soil mix as required to bring it even with top of root ball.
5. Continue filling and watering settled areas until settlement stops.

H. Settled Plant Adjustment: Raise plant root balls which settle so that top of root balls are at the specified elevation relative to adjacent finished grade.

I. Final Compaction: Compact soil mix by saturating with water.

J. Fertilizer Tablets:
1. Place maximum quantities recommended by the manufacturer's current printed instructions.
2. Place tablets between bottom of root ball and 1/3 way up root ball, 2 inches away from root ball.
3. Do not place tablets higher than 1/3 way up root ball.
4. Space tablets equally around root ball.
5. Install tablets at trees, shrubs, ground cover, ornamental grasses, and ferns.

K. Stress Reducing Agent:
1. After backfilling plant pits, drench backfill at rates recommended by manufacturer.
2. Drench backfill same day backfill is placed.

L. Wetting Agent and Soil Penetrant:
1. After backfilling plant pits, drench backfill at rates recommended by manufacturer.
2. Drench backfill same day backfill is placed.

3.10 TREE STAKE INSTALLATION

A. General: Install stakes plumb and per Manufacturer's current printed instructions.

B. Size and Quantity: Refer to Schedule at end of this Section.

C. Orientation:
1. Locate stakes in a line with trunk of tree, as close to the main trunk as possible without penetrating root ball.
2. Locate line of stakes and trunk perpendicular to the prevailing wind direction.
3. Owner's representative will determine directional orientation in the field.

D. Stake Depth:
1. Drive 8 feet long stakes two feet into firm, undisturbed ground below the plant pit bottom.
2. Drive 10 feet long stakes 3 feet into firm undisturbed ground below plant pit bottom.

3. Pre-drill pilot holes one half diameter of stake if required to drive stakes in hard soil conditions.

E. Tying to Stakes Trees Not Able to Stand Upright Without Support:
   1. Meet requirements of UCDAS Leaflet 2576 Staking Recommendations for trees requiring tree support.
   2. Hold trunk in one hand, pull top to one side and release to determine tie height.
   3. The height at which trunk will just return to upright when the top is released is the tie height.
   4. Loop ties around trunk at tie height and cross ends forming figure 8 shapes.
   5. Tie ends of ties with double-back locking configuration as recommended by the tie manufacturer.
   6. Nail rubber ties to stakes at tie height using 2 galvanized roofing nails at each end of tie.
   7. Cut off remaining stake 2 inches above upper tree tie.

F. Tying to Stakes Trees Able to Stand Upright Without Support:
   1. Refer to detail on Drawings.
   2. Tie ends of ties with double-back locking configuration as recommended by the tie manufacturer.

3.11 ROOT BALL ANCHOR INSTALLATION

A. Manufacturer's Requirements: Meet requirements of manufacturer's current printed instructions.
B. Root Ball Characteristics:
   1. Install anchors only on firm root balls.
   2. Do not install anchors on trees grown in sand, sawdust or other loose growing mixes.

3.12 WOOD CHIP MULCH INSTALLATION

A. Depth: Install a 3-inch deep layer of mulch at locations shown on the Drawings.
B. Surface: Rake mulch surface smooth.
C. Woody Plant Stems: Slope mulch away from woody plant stems so that mulch does not touch stems.

3.13 ROCK MULCH INSTALLATION

A. Depth: Install a 3-inch deep layer of rock mulch at locations shown on the Drawings.
B. Surface: Rake mulch surface smooth.
C. Woody Plant Stems: Slope mulch away from woody plant stems so that mulch does not touch stems.

3.14 COBBLE INSTALLATION

A. Depth: Install cobble with a minimum depth of 2 layers of stone at locations shown on the Drawings.
B. Surface: Adjust cobbles by hand to achieve a stable and even surface.

3.15 FIELD QUALITY CONTROL

A. Field Observation Reviews by Owner's representative: Coordinate and schedule with Owner's representative.

3.16 SCHEDULES

A. Tree Stake Schedule:

Tree Caliper at 12 inches	*Number of Inches Diameter × Above Grade*	*Stake Size Stakes × Feet Length*
To 1-3/4 inches	2.0	2 inches × 8 feet
2 to 3 inches	2.0	3-l/2 inches × 10 feet

B. Tree Guy Schedule:

Tree Caliper at 12 Inches Above Grade	*No. of Guys*	*Cable Size*	*Turn-buckle Size*	*Ground Anchors*
3 - 6 inches	3	1/8 inch 7 × 7	1/4 × 4 inches	4 × 4 × 24 × 18 inches deep deadmen (or) Laconia LA-4-40 SM (or) Duckbill 68
6 - 8 inches	3	3/16 inch 7 × 7	5/16 × 4-1/2 inches	6 × 6 × 30 × 30 inches deep deadmen (or) Laconia LA-6-60 (or) Duckbill 88
8 - 10 inches	3	1/4 inch 7 × 19	3/8 × 6 inches	6 × 6 × 36 × 36 inches deep deadmen (or) Laconia LA-8-90 (or) Duckbill 88
10 - 12 inches	3	5/16 inch 7 × 19	3/8 × 6 inches	8 × 8 × 48 × 48 inches deep deadmen (or) Laconia LA-10-120 (or) Duckbill 138

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Specifications for providing water service and distribution and modification to existing water mains and services as indicated. The extent of water distribution is indicated on the Contract Drawings and includes furnishing, installing, testing, and disinfecting permanent water supply piping and services as indicated.

B. The jurisdictional water utility district shall provide water services to the water meter as indicated on the Contract Drawings. The Contractor shall be responsible for making all such arrangements. All work on the jurisdictional agency's facilities shall be in accordance with the agency's adopted standards and performed by the agency or their representative.

1.2 RELATED SECTIONS

A. Section 31 23 33 – Trenching and Backfilling

1.3 REFERENCES

A. Codes and Standards: The design and installation of underground water piping shall conform to the following codes and standards except as specifically noted in these standards.

1. Latest edition of the California Plumbing Code (CPC)
2. Latest edition of the California Fire Code
3. Latest edition of the California Building Code
4. Latest adopted edition of the National Fire Protection Association (NFPA) 24: Standard for the Installation of Private Fire Service Mains and Their Appurtenances
5. American Water Work Association (AWWA) standards and manuals as appropriate for installation and materials including, but not limited to:
    a. C-104 (2013): Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water
    b. C-105 (2010): Polyethylene Encasement for Ductile-Iron Pipe Systems
    c. C-150 (2008): Thickness Design of Ductile-Iron Pipe
    d. C-151 (2009): Ductile-Iron Pipe, Centrifugally Cast for Water
    e. C-504 (2010): Rubber-Seated Butterfly Valves
    f. C-600 (2010): Installation of Ductile-Iron Water Mains and Their Appurtenances
    g. C-605 (2013): Underground Installation of Polyvinyl Chloride (PVC) Pressure Pipe and Fittings for water
    h. C-651 (2014): Disinfecting Water Mains
    i. C-900 (2007): Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 4 in. Through 12 in. (100 mm Through 300 mm), for Water

Transmission and Distribution

k. M-14 (2014): Recommended Practice for Backflow Prevention & Cross-Connection Control, 4th Ed.
l. M-23 (2002): PVC Pipe - Design and Installation, 2nd Ed.
m. M-27 (2013): External Corrosion: Introduction to Chemistry and Control, 2nd Ed.
n. M-41 (2009): Ductile-Iron Pipe and Fittings, 3rd Ed.
o. M-55 (2006): PE Pipe—Design and Installation, 2nd Ed.

1.4 SUBMITTALS

A. Shop Drawings, Product Data, and Samples

B. Shop drawings showing all piping layout and pipe sizes, valves, backflow prevention device, and locations of tie-ins, buttresses, and thrust blocks.

C. Manufacturer's product data for manufactured materials and equipment, including all valves and backflow prevention device.

1.5 SITE CONDITIONS

A. Excavations in which products will be buried shall be dry.

B. Coordinate the installation of water supply system with the jurisdictional water utility owner. Contractor shall coordinate with jurisdictional water utility owner for installation of the new domestic water meter and water lateral within the City right-of-way. The jurisdictional water utility owner shall install the new domestic water lateral from the existing water main to the new water meter. Contractor shall coordinate depth and location of new domestic water lateral with the jurisdictional water utility owner.

C. Existing Underground Piping: Existing utilities and piping, where known, are shown on the Drawings. Exact locations and depths of existing lines must be determined in the field by the Contractor by exploration using methods which will not damage any existing improvements.

D. Location and Alignment of New Work: Pipe alignments may be varied from those shown on the Drawings when field conditions indicate that the change would be advantageous. Any such proposed changes shall be brought to the attention of the Engineer. Changes shall not be made until written approval from Engineer has been obtained. Provide traffic cover plates over trenches at streets, parking areas and pedestrian pathways to maintain access, unless closure is permitted by the Engineer.

E. Interference with Normal Operations at the Site: All pipe work shall be coordinated with the required excavation and backfill so that there will be a minimum of interruption in the normal use of roads, parking areas, pathways and other existing facilities.

F. At least one week prior to the shutdown the Contractor shall submit to the Engineer a schedule and plan showing the following: a) how connections to existing facilities are

to be made; b) length of time required to accomplish the work and to get the systems into service, and c) a list of all equipment and materials required to make the tie-in. The shutdown will not be permitted to commence until the Contractor has received written permission from the Engineer and the Contractor has provided assurance to the Engineer that all necessary material, equipment and manpower will be available at the proper time so that the shutdown will proceed on schedule.

PART 2 - PRODUCTS

2.1 Valves and Cocks

A. Water: 250 lbs minimum AWWA standard, Pratt butterfly valve or equal with ends to suit pipe used. When below grade, delete hand wheel and install operating nut and valve box.

B. Install traffic rated concrete valve boxes (e.g.: G-5 Christy) and extensions to grade. Cover shall have type of service (water, gas, etc.) cast in.

C. Provide one tee handle operating wrench for each size operating nut, with length to suit maximum valve depth. See Appendix, Typical Water Service and Piping Systems, for PVC details for extension stem.

2.2 PIPE MATERIALS, SIZES AND OTHER REQUIREMNTS

A. All piping is to be either:

1. Cement-lined ductile-iron pipe (DIP) may be used only in underground fire service mains supplying building fire protection systems, which shall use cement-lined ductile-iron pipe from five feet (5’-0”) outside of the foundation wall through the foundation wall to the inside of the building and be fitted with a Link Seal (or equal) device to prevent transfer of water through the wall.

2. Domestic water lateral shall be ASTM B88 type “K” copper pipe with brazed joints using minimum 15 % silver brazing alloy. At interior installations, pipe 3 inches and smaller shall be ASTM B88 type “L” copper pipe with lead-free solder joints.

B. Couplings and pipe thread adapters for copper tubing shall be Mueller 110 compression connection series or equal. Soldered joints are not allowed.

C. All ferrous materials, restrainers, T-Head bolts, clamps, joint restraint clams, washers, tie rods, bolts and nuts shall have at least one coat of protective coating (bituminous mastic) of an approved type before backfilling.

D. All restrainers and ductile-iron fittings shall be wrapped with at least one layer of 10-mil plastic.

E. All ductile-iron pipe shall be wrapped with at least one layer of 10-mil plastic.

F. Hot tapping and use of saddles are not permitted.

G. Refer to the latest edition of the California Building Code. Materials and systems must

be based on a comprehensive review of the project design requirements. Use of non-standard materials requires the express written consent of the Engineer.

2.3 Valves

A. Valves shall conform to AWWA C-504. Valves shall be Pratt Butterfly Valves (or equivalent) except as required by section (5) (below).

B. Indicating posts used for underground valves or wall indicating valves shall be of the type that use the words “OPEN” when the valve is open and “SHUT” when the valve is closed. Mueller gate valves with a resilient seal (or equivalent) shall be used.

C. Valves shall open when turned counter-clockwise.

D. The pressure ratings for all valves shall be as follows: Table 1 Pressure Zone Hydrostatic Test Pressure (PSI) Rated Working Pressure (PSI) High 200 or 50 psi + max static pressure 250 Medium 200 250 Low 200 250

E. A concrete pad shall be placed under all valves.

PART 3 - EXECUTION

3.1 GENERAL

A. After demands are determined, size water lines on the basis of friction loss. Do not exceed ten percent (10%) of the initial pressure at full demand or 7.5 feet per second velocity with a minimum pressure of 60 psi for building services.

B. Show valves at all services from mains and at other points to minimize disruption of building operations. Valves should be located at the building exterior and where mains enter the building.

C. Use separate cold water services for domestic and fire where it is from the University system.

D. Use two pressure zones where the pressure at the lowest point of use will exceed 80 psi to maintain 35 psi at the highest point of use.

E. Thrust blocks shall be as indicated in the plans

F. Fire protection service from single building service.

1. Fire Sprinklers

a. Provide separate service from exterior mains for buildings served by the utility company.

3.2 MAINTAINING WATER SERVICES

A. Maintain water service and conduct operations at times selected to minimize duration and inconvenience of service interruption.

B. Water valves in service owned by the jurisdictional water utility Owner shall be

operated only by personnel of that jurisdictional water utility district.

C. Except as specified otherwise herein, and where applicable, materials and construction methods shall be in accordance with the provisions of the jurisdictional water utility district standard drawings and specifications.

3.3 INSTALLATION

A. Installation Requirements

1. Excavating and backfilling, including bedding and compacting requirements, to the backflow preventer assemblies shall be in accordance with the provisions of the jurisdictional water utility district standard drawings and specifications. Excavating and backfilling, including bedding and compacting requirements, beyond the backflow preventer assemblies shall conform to Section 312333 - Trenching and Backfilling.

2. Provide concrete thrust blocks for elbows, tees, valves, and appurtenances of buried piping. Thrust blocks shall be constructed as indicated.

3. Install piping true to line and grade, supported and guided to assure alignment under all conditions.

4. Install unions at each connection to valves.

5. Make change in line with fittings. Do not spring joints to effect change of direction.

6. Do not field cut pipe unless necessary. Make such necessary cuts by means of equipment designed for the purpose, ensuring a smooth square end.

7. For connection to existing pipe, provide pipe with suitable ends or adapters, after verification of size and type of existing pipe.

B. Valves

1. Install valves in accordance with the valve manufacturer’s installation instructions.

2. Where valves are provided by the jurisdictional water utility, provide suitable access for operation of valves.

C. Thrust Blocks and Harnessing

1. Provide for counteracting thrust caused by static and dynamic forces, including water hammer at bends, tees, reducers, valves, and dead-ends by installing harnessing as indicated or required. For other methods, submit details for approval of the Engineer prior to use.

2. Provide concrete thrust blocks as indicated where harnessing is not practicable.

D. Water Service Connectors

1. Make water service connections, as indicated, in accordance with California Plumbing Code and the installation instructions of the service pipe and fittings manufacturer.

E. Acceptance Requirements

1. After installation of pipes, ends of pipes shall be either capped or plugged. No piping shall be buried before being inspected and tested.

F. Corrosion Protection

All buried ferrous metal fittings and appurtenances shall be provided with bituminous coating corrosion protection and as indicated in the design plans.

1. Ferrous metal fittings and appurtenance as herein referred to are: valves, tees, elbows, reducers, crosses, plug assemblies, pumping tees, services, blowoff installations, flexible couplings, leak clamps, tie rods, etc.

2. Joints, fittings, and appurtenances that are required to be coated by the Contractor may be coated before or after installation in the trench.

3. Cast-iron pipe or bare metal pipe extending into the soil from a concrete structure shall be insulated from the concrete and leak-proofed. The insulation shall extend through the concrete a minimum of three (3) inches on each side. The insulation shall consist of one layer of Scotchrap Tape No. 50 and two coats of bituminous paint. The pipe shall be clean, dry, and free from loose scale before applying the adhesive and tape. The edges of the tape shall be lapped not less than one-half (1/2) inch.

4. Bituminous coating shall be applied in <u>two coats</u> with a minimum 20-mil dry thickness per coat. Applications shall be in accordance with manufacturer's instructions. Allow first coat to dry as recommended by the manufacturer before application of second coat. Allow second coat to dry before encasing in polyethylene tubing or wrap. Inspector must inspect coating prior to covering with polyethylene. Joints must be not be covered with polyethylene during the pressure test witnessed by the Owner’s Representative.

3.4 TESTS

A. Protection from Flooding

Provide positive measures to protect exposed, installed pipe and compacted pipe bedding from flooding during testing.

B. Notice of Testing

1. Give three (3) days notice of intention of testing to the Engineer and jurisdictional agency. The Contractor will furnish, install, and operate pumps, gages, meters, and individual pipe connections to test openings.

2. Designate largest sections feasible for testing and sterilizing.

C. Testing Requirements

1. Prior to backfilling, isolate system by use of approved valves, caps and plugs, or other means.
2. Maintain such isolation throughout the performance of leakage and pressure testing.
3. Where valves are used for isolation, eliminate leakage through such valves if it occurs. Maintain new work isolated from existing water mains, except for test connections, until testing and sterilization have been completed.
4. For hydrostatic tests, provide approved caps and plugs in sections to be tested and remove them after testing.
5. Prevent leakage in pipes and fittings at openings. Temporarily block plugged and capped ends to prevent displacement.
6. Install water source connection for testing, as directed.
7. Provide labor and materials required for leakage testing, including excavation for installation and removal of pumps, gages, meters, and water source connections.
8. Where leakage exceeds the Owner's standards, perform necessary corrective measures.
9. Remove and replace defective pipes, joints, fittings, valves and appurtenances. Reset such items if displaced.

D. Hydrostatic Tests

1. Perform hydrostatic tests in accordance with the Owner's requirements. All such tests shall be witnessed by the representative. The Contractor shall be responsible for making all such arrangements.
2. Test the fire water system hydrostatically in sections to a pressure of at least 200 psi for not less than 120 minutes. Test the domestic water system for building service lateral(s) at 60 psi for 120 minutes. Pressure test pipe before backfilling. Repair leaks and retest the system until the system is leak free. Use instruments calibrated by a quality laboratory.

   Test sequence shall be as follows:

   a. Lines shall be fully flushed.
   b. Lines shall be hydrostatically tested.
   c. Lines shall be fully flushed.
   d. Lines shall be fully disinfected.

3.5 SYSTEM DISINFECTION

A. Standard Disinfection Procedure For Domestic Water System

1. Supervision and Testing: Perform entire disinfection procedure under the

supervision of Environment, Health and Safety (EH&S). Provide five (5) days' notice to schedule procedure.

2. Contractor's Responsibility: Furnish a copy of the California Department of Pesticide Regulation (DPR) Qualified Applicator License, equipment, materials and transportation to disinfect domestic hot and cold water systems and fire lines directly connected thereto, in conformity with procedures and standards described herein.

3. Disinfecting Agent: An aqueous solution of sodium hypochlorite (minimum 5.25% available chlorine). The use of powdered hypochlorite and chlorine gas are prohibited unless specifically approved by Environment, Health and Safety (EH&S).

4. Preliminary Preparations:

    a. Service Cock: Provide within three feet (3'-0") of the entrance of the supply main to the building, a three-quarter inch (3/4") service cock, or valve, for the purpose of introducing the disinfecting agent.
    b. Flushing: After final pressure tests and before draining for disinfection, open each fixture or outlet until the water flow is clear.

5. Disinfection Procedure:

    a. Drain entire domestic water system including fire line.

    b. Post suitable warning signs at each outlet: Warning - Do Not Use - Water System Being Chlorinated.
    c. Inject disinfectant solution into the system through the service cock by means of a pump, or other pressure device, at a slow continuous rate, simultaneous with a reduced flow from the water main, until the Ortho-Tolidin test for residual chlorine at each outlet shows a concentration of at least 50 ppm, but note more than 100 ppm.
    d. Close all outlets and valves, including the service valve at the main and the injection cock. Retain the chlorinated water in the system for 24 hours.
    e. After the 24 hour holding period, the residual chlorine concentration shall be not less than 50 ppm as shown by the Ortho-Tolidin test.
    f. Drain and flush entire domestic water system until Ortho-Tolidin tests show background residual chlorine concentration at any and all outlets.
    g. Environment, Health and Safety (EH&S) shall determine whether samples of water must be collected and analyzed for the determination of bacteriological quality.

6. Standards Necessary for Approval:

    a. The water system shall have been uniformly chlorinated under the supervision of Environment, Health and Safety (EH&S) as outlined above.
    b. The results of water sample analysis shall be negative for the Coliform organisms.
    c. If the test for the bacteriological quality of the water in the system does not meet the standards, repeat the disinfection procedure until the specified standards are met.

d. Final Approval: Environment, Health and Safety (EH&S) shall give written approval to the University for acceptance and use of the water system after the above procedures have been successfully completed and the standards met.

3.6 CONNECTIONS TO EXISTING MAINS

A. Following testing and sterilization, new water distribution lines shall be connected to the existing main as indicated. The connection shall be made at a time and in a manner which will result in the least interruption of service.

B. All connections involving shut down of jurisdictional water utility's existing facilities shall be made under the immediate supervision of the jurisdictional water utility district. No member of the Contractor's forces may operate any valve controlling the flow of water in the water utility's existing system.

C. The Contractor shall make tie-ins to the existing system at a time which is convenient to jurisdictional water utility district, which may be in the evenings and on weekends.

D. All piping to be abandoned, as shown on the plans, is abandoned only when the pipe has been taken out of service, physically disconnected from the active water system, and has been sealed by the Contractor.

E. The Contractor shall seal all cut ends of the existing piping that are not connected to the new system by either installing temporary fittings on the existing pipe or by plugging the cut end with concrete extending two pipe diameters into the pipe. After the concrete placement, the pipe end shall be blocked with a two-inch thick redwood block.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. The CONTRACTOR shall provide all materials, equipment, and labor necessary to furnish and install all solid wall pipe as indicated in the Drawings; and all appurtenant work, complete and operable, including all manholes, cleanouts, fittings and connections as shown on the Drawings and as specified herein.

B. Piping under existing pavement and retaining walls may be installed by jacking, boring or by hydraulic driving except as otherwise indicated in Drawings or directed. Use existing sleeves where applicable. At location where cutting is required make all cuts clean using power saws. Replace and restore all surfaces to original conditions, including grades and landscaping. Match restoration work with original work in every respect, including type, strength, texture and finish.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 31 23 24 Trench Excavation and Backfill

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Commercial Standards:

ASTM A 48	Specification for Gray Iron Castings.
ASTM C 150	Specification for Portland Cement.
ASTM C 478	Specification for Precast Reinforced Concrete Manhole Sections.
ASTM D 3212	Standard Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals
ASTM F 477	Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe

1.4 CONTRACTOR SUBMITTALS

A. Certificates of Compliance: Certificates of Compliance shall be provided for all products and materials proposed to be used under this Section.

B. Submit plan and profile drawings for sewer connection showing pipe sizes, location, alignment of sewer service and elevations along with the details associated with the improvements, location of boring pits.

1.5 QUALITY ASSURANCE

A. Tests: All materials used in the manufacture of the pipe shall be tested in accordance with the requirements of the referenced standards as applicable.

B. All costs of such inspection and tests shall be borne by the CONTRACTOR.

C. The pipe shall be subjected to the specified hydrostatic strength tests, flexure tests, and crushing tests. The crushing tests shall be made on samples taken from the center of full-length sections of pipe.

1.6 PROJECT CONTROLS

A. Interruption of Existing Sanitary Sewerage: Do not interrupt service to facilities occupied by District or others unless permitted under the following conditions and then only after arranging to provide temporary service according to the requirements indicated:

1. Notify the ENGINEER no fewer than eleven (11) working days in advance of the proposed interruption of service.

2. Do not proceed with interruption of service without ENGINEER'S written permission.

3. Submit plans to the ENGINEER showing rerouting of the temporary sanitary sewer service and obtain written approval from ENGINEER prior to proceeding with the work.

PART 2 - PRODUCTS

2.1 GENERAL

A. All solid wall pipes shall be continuously and permanently marked in conformance with the appropriate ASTM.

B. The CONTRACTOR shall also require the manufacturer to mark the date of extrusion on the pipe.

C. Pipe shall be of the pipe pressure class as shown on the Drawings.

2.2 PIPE

A. HDPE DR 17 (125 PSI) ASTM F714, ASTM D3035, ANSI/AWWA C906

1. Sanitary sewer pipes shall be green colored. If not manufactured green, sanitary sewer pipes shall be wrapped with Christy ™ TA-33-PW21, 2" x thick green 10mil polywrap, or approved equal.

2.3 FITTINGS

A. All fittings including wyes and sanitary sewer lateral cleanouts for pipe shall conform to the requirements of ASTM D 2657, D3350, AND AWWA C906.

B. The strength class of the fittings shall be not less than the strength class of any adjoining pipe.

2.4 BEDDING MATERIAL

A. Unless otherwise specified or shown, all material used for pipe bedding shall conform to the requirements for bedding in Section 31 23 24 “Trench Excavation and Backfill”.

2.5 FLEXIBLE COUPLINGS

A. Flexible couplings used for repairs shall be rubber, full-circle, clamp-on type conforming with ASTM C 425 and provided with 2 stainless steel band screw-clamps to secure the coupling tightly to entering and exiting pipes. All screw-clamp hardware shall be Type 304 or Type 316 stainless steel. Rubber material shall be suitable for use on sewage systems. Sanitary sewer connection at the building point of connections shall be made by using Calder Couplings or approved equal.

2.6 LATERAL CONNECTIONS TO SANITARY SEWER

A. Service lateral connections to new sewers shall be made with Wye fittings, installed as the sewer pipe is laid.

B. Service lateral connections to existing sewer lateral shall be made approved by the City of Berkeley Engineer.

PART 3 - EXECUTION

3.1 GENERAL

A. All laying, jointing, testing for defects and for leakage shall be performed in the presence of the ENGINEER, and shall be subject to its approval before acceptance. All material found during the progress to have defects will be rejected and the CONTRACTOR shall promptly remove such defective materials from the site of the WORK.

3.2 TRENCHING AND BACKFILL

A. Trench excavation and backfill shall conform to the requirements of Section 312324 “Trench Excavation and Backfill” and as specified herein.

3.3 PIPE LAYING

A. The pipe shall be installed in conformance with the requirements of ASTM D 2321, as specified herein and as shown on the Drawings. The pipe sections shall be closely jointed to form a smooth flow line. Immediately before placing each section of pipe in final position for connecting joints, the bedding for the pipe shall be checked for firmness and uniformity of surface.

B. Proper implements, tools, and facilities as recommended by the pipe manufacturer's printed instructions shall be provided and used by the CONTRACTOR for safe and efficient execution of the work. All pipe, fittings, and accessories shall be carefully lowered into the trench by means of derrick, ropes, or other suitable equipment in such a manner as to prevent damage to pipe and fittings. Under no circumstances shall pipe or accessories be dropped or dumped into the trench.

C. Cutting and machining of the pipe shall be accomplished in accordance with the pipe manufacturer's standard procedures for this operation. Pipe shall not be cut with a cold chisel, standard iron pipe cutter, nor any other method that may fracture the pipe or will produce ragged, uneven edges.

D. Installation of pipes in prepared trenches shall start at the lowest point, with the spigot ends pointing in the direction of flow.

E. The pipe and accessories shall be inspected for defects prior to lowering into the trench. Any defective, damaged or unsound pipe shall be repaired or replaced. All foreign matter or dirt shall be removed from the interior of the pipe before lowering into position in the trench. Pipe shall be kept clean during and after laying. All openings in the pipe line shall be closed with water tight expandable type sewer plugs or test plugs at the end of each day's operation or whenever the pipe openings are left unattended. The use of burlap, wood, or other similar temporary plugs will not be permitted.

F. Adequate protection and maintenance of all underground and surface utility structures, drains, sewers, and other obstructions encountered in the progress of the work shall be furnished by the CONTRACTOR at its own expense.

G. Installation of Warning Tape shall be THOR ENTERPRISES, CALPICO, or equal. Tape to hold the wire in place shall be pipe wrap tape, 2 inches wide, 10 mil.

3.4 PIPE HANDLING

A. Handling of all pipe shall be done with care to insure that the pipe is not damaged in any manner during storage, transit, loading, unloading, and installation.

B. Pipe shall be inspected both prior to and after installation in the trench and all defective lengths shall be rejected and immediately removed from the working area.

3.5 FIELD JOINTING

A. Each pipe elastomeric-gasket joint shall be installed in conformance with the manufacturer's printed recommendations. Elastomeric Gaskets shall be conform to ASTM D3212.

B. The ring and the ring seat inside the bell shall be wiped clean before the gasket is inserted. Lubricant other than that furnished with the pipe shall not be used. The end of the pipe shall be then forced into the ring to complete the joint.

C. The pipe shall not be deflected either vertically or horizontally in excess of the printed recommendations of the manufacturer.

D. When pipe laying is not in progress, the open ends of the pipe shall be closed to prevent trench water from entering pipe. Adequate backfill shall be deposited on pipe to prevent floating of pipe. Any pipe which has floated shall be removed from the trench, cleaned, and re-laid in an acceptable manner. No pipe shall be laid when, in

the opinion of the ENGINEER, the trench conditions or weather are unsuitable for such work.

3.6 FITTINGS

A. All fittings shall be installed utilizing standard installation procedures. Fittings shall be lowered into trench by acceptable means without damage to the fittings. Fittings shall be carefully connected to pipe or other facility, and joint shall be checked to insure a sound and proper joint.

3.7 SANITARY SEWER CLEANOUTS

A. Two-way Sanitary Sewer Clean outs on 4 inch sanitary sewer laterals shall be cast iron ANACO, Two-Way Combination Clean-out; American Brass and Iron; or equal. Sanitary sewer cleanouts on 6 inch and larger pipe shall be a combination Wye and 1/8th bend, ANACO; American Brass and Iron; or equal.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Section Includes: Furnish and install all structures, piping, fittings, and accessories, and perform all earthwork, grading, adjustments of inlets and flushing of all existing systems as shown on the Drawings, described in these specifications, and as required to construct a complete and operable storm water runoff drainage system.

1.2 REFERENCES

A. American Association of State Highway and Transportation Officials (AASHTO)

B. State of California, Department of Transportation, Standard Specifications (Standard Specifications) Current Edition.

C. Standard Specifications for Public Works Construction written by the Southern California Chapter, American Public Works Association

1.3 SUBMITTALS

A. Submit the following in the Product Information category.

1. Shop Drawings: Submit detailed drawings and specifications on all precast drop inlets, junction boxes and accessories, including gratings, covers and frames.

1.4 QUALITY ASSURANCE

A. All products and materials furnished under this Section shall be of a manufacturer who has been regularly engaged in the design and manufacture of said products and materials for a period of at least 5 years. If the product of an alternate supplier is proposed, it shall be demonstrated to the satisfaction of the Owner's Representative to be of a quality and serviceability equal to the product made by the manufacturer specifically named herein.

B. The Owner will inspect and verify percent of slope.

PART 2 - PRODUCTS

2.1 PRECAST DRAIN INLETS, GRATES AND FRAMES

A. Drain Inlets and Junction Boxes: Precast concrete structures, sizes appropriate designed to withstand an AASHTO H-20 loading. Provide interlocking joints where depth requires more than one unit. Minor variations from the drawings may be accepted to permit the use of manufacturer's standard methods of fabrication. Manufacturers: Santa Rosa Cast Products Company; Christy; or equal. Contractor shall be responsible for field verifications for sizing of all storm drain elements.

2.2 STORM DRAINAGE SYSTEM PIPES

A. High Density Polyethylene Pipe (HDPE)

1. Pipe: HDPE pipe conforming to ASTM D3212, or ASTM 1417 (ADS N-12 1B WT pipe or equivalent)
2. Fittings shall be the same material as pipe molded or formed to suite pipe sizes and end design

B. Sidewalk Underdrain

1. See Section 2.1 Precast Drain Inlets, Grates and Frames for junction box
2. See Section 32 16 13 Concrete Curbs, Gutters, and Sidewalks for concrete materials
3. Box Steel Pipe - AWWA C200, Sch. 40 for use with sidewalk underdrains, as indicated in plans

C. Inlets / Area Drains

1. Grates and frames shall be ADA compliant, bicycle-proof and supplied by the manufacturer of the catch basin and be matched to the Drain Inlet.
2. Christy 12” x 12” drop inlet with cast-in frame, or approved equivalent
3. Area drain atrium grate shall be NDS Atrium Grate, Green or approved equivalent
4. Pop-up drainage emitter shall be NDS Pop-up Drainage Emitter or approved equivalent

PART 3 - EXECUTION

3.1 CLEANING

A. Thoroughly clean the inside of each existing piping system of all dirt, loose scale, sand, and other foreign material. Cleaning shall be by sweeping, flushing with water, or blowing with compressed air, as appropriate for the size and type of pipe. Flushing shall achieve a velocity of at least 3 feet per second. Contractor shall be responsible for collection and disposal of all debris gathered from cleaning operations.

3.2 FIELD TESTING

A. Perform leakage tests on all pipe installed in this project. Water exfiltration test or air pressure test in accordance with Section 306-1.4 of the Standard Specifications for Public Works Construction written by the Southern California Chapter, American Public Works Association, et al.

3.3 INSTALLATION OF PRECAST DRAIN INLETS

A. Install drain inlets, level and set to grade, on a 6-inch sand or gravel leveling course, compacted to 95% relative density. Grout firmly in place to form a tight seal.

B. Set drainage pipe to grade as indicated in plans. Grout firmly in place to form a tight seal.

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

The High Performance 2.5" Aperture (HPX) is a patented LED linear luminaire with a square micro profile and internal driver design. This Line-of-Light luminaire delivers excellent performance and is equipped with a unique LED configuration for superior illumination. HPX can be tailored from 2' to 12' sections in 1' increments and is available in Pendant, Surface Mount, and Recessed.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving **Red List Approved** and **Declared** status.

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard.

LENGTHS: Any length, 2' minimum section length. Increments of 1'. 12' maximum section length.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). A separate chart summarizes lumen distribution and wattage. For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

DOWNLIGHT OPTION: 12' maximum diffuser length. Flush (**F**) frost white snap-in diffuser, standard; 73% transmissive, 99% diffusion

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

ELECTRICAL OPTIONS

STATIC WHITE FEED: 18-gauge/5-conductor single-circuit feed wire, standard. 14-gauge feed wire used when luminaire current exceeds 5 amps.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when fixture current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10% - 100%. Dimming to 1% available; Consult factory. Driver is fully accessible from below the ceiling.

- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON STATIC DRIVER OPTIONS:

- **LUTES1** Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series)
- **LUTES5** 5-Series 5% EcoSystem (LDE5 Series)
- **LUT2W** Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series);

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V/277V.

- **Power factor** ≥0.9
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100 - 1%
- **Expected driver lifetime:** 100,000 hours

LUTRON TUNABLE WHITE DRIVER OPTION: LUTDTW 1% T-Series 2-Channel Digital Tunable White (PSQ Series).

MOUNTING TYPE

HANGING HARDWARE:

- **Recessed Spackle Flange:** Drywal surfaces (walls or ceilings): 1/4" - 20 stud and nut (provided by others). Mounted with three equidistant suspension points.
- **Recessed T-Bar:** Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets connect the luminaire to the T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

OTHER OPTIONS

ENDCAPS: Flat endcaps (**FE**) at each end of run add 1/16" to each end of luminaire.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery.

Backup Battery

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

SPECIFICATIONS

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) Occupancy (**OBO**) or Daylight Sensors (**OBD**) available with Flush and Bottom Glow downlight diffusers. PIR sensors not recommended for stairwell applications. Refer to Occupancy Sensor & Daylight Sensor tech sheet and the Embedded Intelligence landing page for more information and additional sensor options.

FINISHES: Finelite Signal White (**SW**) powder coat standard. Finelite Black (RAL 9005) with semi gloss fine texture (**FB**) [1] and satin Aluminum (**SA**) [1] are available. Optional Adders: 185 RAL colors. [1]

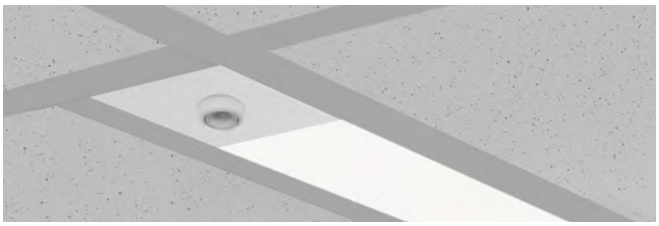
LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request, contact factory for more details. These fixtures are rated for Damp Location. IC Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. HPX can be used to comply with 2016 Title 24, Part 6 (JA8); high efficacy LED light source requirements. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT: 2.3 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

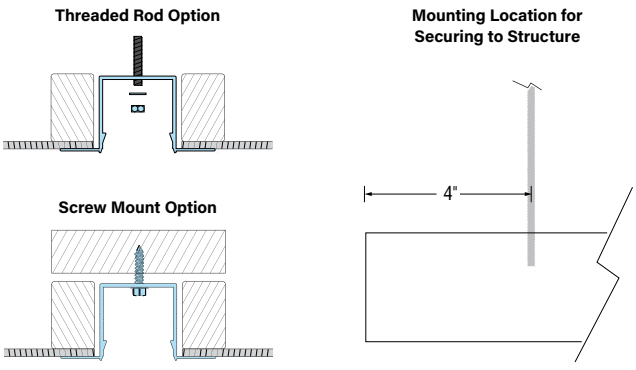
[1] 20 business day lead time for color

INTEGRATED SENSOR



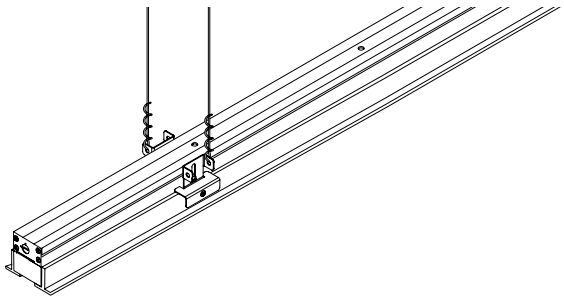
Integrated PIR (Passive Infrared) occupancy or daylight sensors available with Flush and Bottom Glow downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

HARD CEILING MOUNTING OPTIONS



Two mounting options: threaded rod and screw mounting options. Mounting locations are located on each end of the luminaire. Mounting location is 4" away from each end of luminaire

T-BAR INSTALLATION



HPX-R for T-Bar installations comes standard with a splice plate at the end of the luminaire. Mounting brackets (supplied) secure the luminaire to T-Bar and provide support to structure location. All even foot length (2, 4, 6...) luminaire runs are reduced in length an appropriate amount to fit within typical 2×2 and 2×4 T-Bar grid systems. For uncommon T-Bar systems please consult factory.

Spec Guide

ZipTwo® | Square 3535 | 707

Direct lighting for open office and ambient applications.

Square 3535, Critical Edge, white

Benefits & Features

Low Profile Design
Square profile. 1.38" (35mm) x 1.42" (36mm).

Superior Light Quality & Performance
Output up to 1316 lm/ft (4318 lm/m) (HO), 135 lm/W (SO). 80 or 90 CRI & tunable white (2200K-5000K) available.

Versatile Mounting, Easy Installation
Magnet with tape-on metal strip or low profile clip allow for mounting to almost any surface or T-Bar ceiling.

Extensive Optics
Options of Diffuse, Critical Edge, and Side Diffuse give designers the power to create and design their space using one product.

ZipTwo® | Square 3535 | 707 Spec Guide

Structure

Rail Lengths	*24" (610mm) - 144" (3658mm) See **Rail Length Chart** for more details.*
Rail Dimensions	1.38" (35mm) x 1.42" (36mm). See dimensions section for details
Construction	Extruded and machined 6063 aluminum.
Mounting	Clip, Clip with Micro J-Box, Magnet with Tape-On Metal Strip, T-Bar Clips for most grid/panel construction, Strut Channel Clip.
Run Length	24" (610mm) minimum. Rail lengths may be installed end-to-end to any length.
Operating Temperature	32°F to 104°F (0°C to 40°C).
Humidity	0-95%, non-condensing. Suitable for damp locations.
System Weight	0.25lbs per ft (0.11kg per 305mm). *Power supply and housing not included.*

Materials

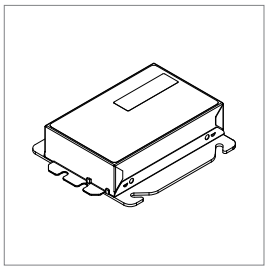
LED Board Construction	Aluminum core PCB, black LCP connectors, RoHS compliant.
Lens	High-impact extruded acrylic glass (PMMA).
Power Cable	Ø3mm, 33/2 AWG, Plenum (CMP) rated semi-rigid PVC or FEP, flame tested UL-910 *(PVC free in 2020)*
Cable Connectors	Unfilled black nylon, rated UL 94 V-0, halogen free, PVC or FEP overmold, RoHS compliant *(PVC free in 2020)*
Remote Linear Power Housing (RLP)	20.7" x 2.375" x 2.53", 0.054" formed Galvanized Steel
Remote Brick Power Housing (RBP)	4.32" x 3.37" x .078" Galvanized Steel mounting plate

Power and Controls

Power Type	Class 2 (<60v output) constant current driver
Dimming Controls	Dimming (0.1%, 1%), 0-10v, DALI, DMX, Lutron Hi-lume 1% are available. *See **Power Guide** for details.*
Input Voltage	120v - 277v, 50/60hz
Power Location	Remote power. Maximum remote distance up to 100' (30.5m) *depending* on driver selection. *See **Power Guide** for details.*

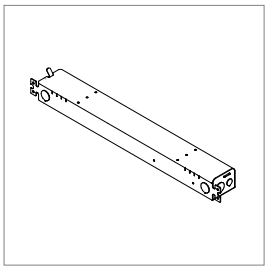
Remote power is locating the power supply away from the fixture. Remote power comes in two housing styles: brick style and linear style. Consult ***Power Guide*** to determine which type you will receive.

Remote Brick Power Housing



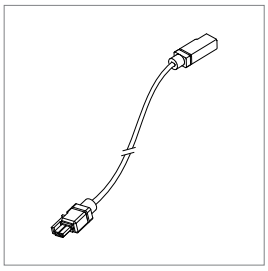
Supplied for some remote power applications. One remote power supply housing is supplied for each rail. Provided driver mounting plate fits standard 4" metal, square J-Boxes with a minimum volume of 21 in^3 (J-Box not provided).
See ***Tech Sheet*** for details.

Remote Linear Power Housing



One remote power supply housing is supplied with each power supply. All Vode linear remote drivers come in a 0.054" (0.8mm) formed galvanized steel power supply housing with five (5) knockouts: (4) 1-1/8", (1) 7/8" and (1) 9/16". Accommodates standard linear power supplies.
See ***Tech Sheet*** for details.

Wire Harness

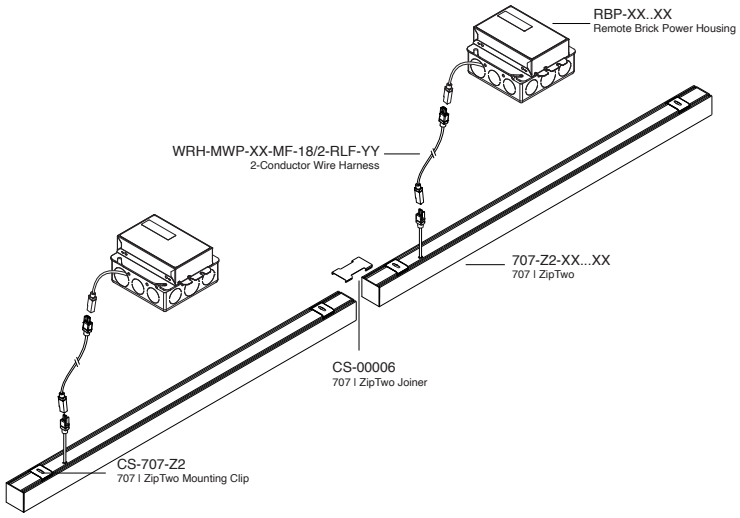


Wire harness connects driver to rail. Wire hareness is 25' (7.6m) with micro fit molex connectors for quick and easy installation. Multiple harnesses can be combined for a total length of up to 100' (30.5m).
See ***Tech Sheet*** for details.

Power and Controls

Flexible 1 to 1 power

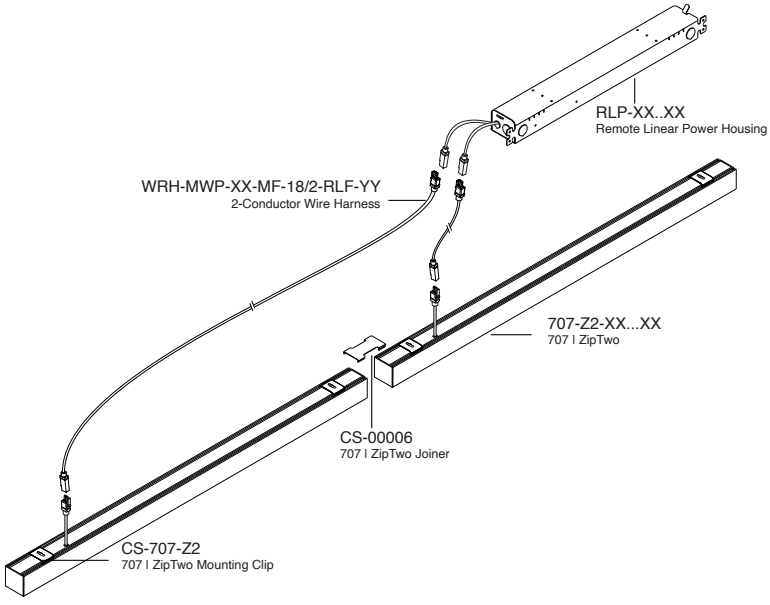
For Flexible 1 to 1 Power, Vode supplies one single output driver per fixture, allowing each fixture to be controlled independently. Direct/Indirect fixtures are supplied with two single output drivers, allowing the direct and indirect lighting to be controlled independently. Consult ***Power Guide*** to determine which type you will receive.



Optimized Power

To optimize power, Vode configures specifications with drivers that have 2 or 4 outputs. Depending on system configurations and power requirements, up to 4 fixtures can be powered from a 4-output driver. Consult ***Power Guide*** to determine which type you will receive.

IMPORTANT: Each fixture will still require individual wire harnesses, as shown below.

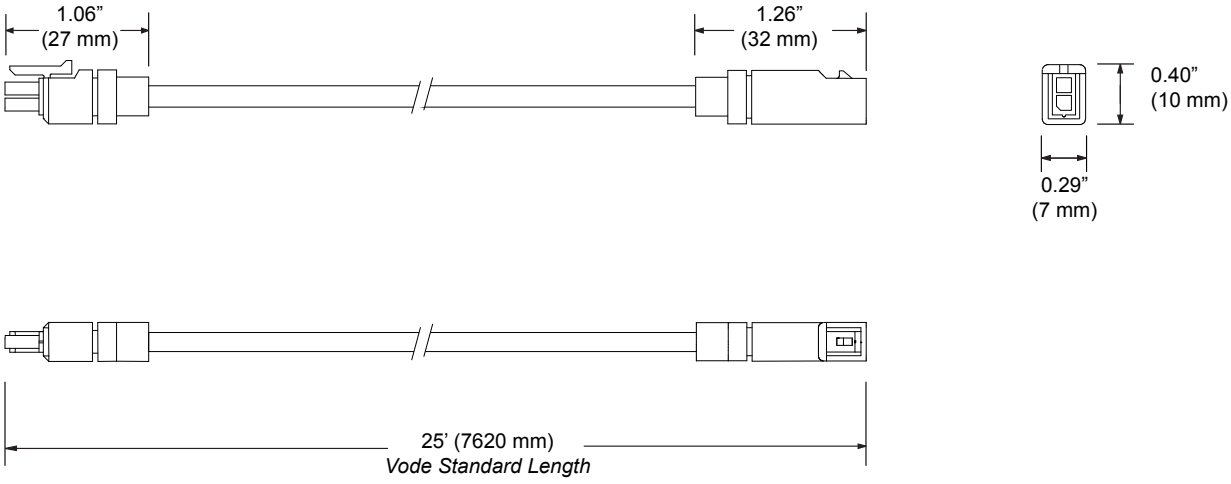


Note: Drawings not to scale, for reference only.

Power and Controls

Wire Harness

Low voltage wire harness connects driver to rail. Wire hareness is 25' (7.6m) 18/2 AWG stranded wire with provided micro fit molex connectors on either end for quick and easy installation. Multiple haresses can be combined for a total length of up to 100' (30.5m). Refer to Vode Power Guide for max remote distance based on power selection. Consult ***Power Guide*** to determine which type you will receive.



Note: Drawings not to scale, for reference only.

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2 WS)
Perimeter Slot

HP-2 WS Perimeter Slot provides ultimate flexibility for perimeter lighting with exact fit tailored lengths or optional adjustable telescoping sections. Prebuilt, fully-illuminated 90° inside and outside corners add to its clean aesthetics. HP-2 WS Perimeter Slot delivers excellent performance using an advanced optical design and mid-power LEDs. Achieving 90% of initial light output at 100,000+ hours and backed by a 10-year performance-based warranty on all standard components. An all-in-one box shipping approach to reduce labor and streamline installation.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving Red List Approved and Declared status.

Note: see page 6 for all aesthetic options

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system and plug-together wiring are standard.

LENGTHS: Any length, 2' minimum, in increments down to 1/16th" (±1/32"). 12' maximum section length. Telescoping (**TXL**) Minimum run length with Std. Osram drivers: 4'-1" adjustable to 5'-0". Telescoping (**TXL**) Minimum run length with all other drivers: 5'-1" adjustable to 6'-0". Max single section length with TXL adjustable from 11'-1" to 12'-0". Just one optional TXL provides fully illuminated adjustability of up to 11". Choose TXL-L(Left), TXL-M (Middle), or TXL-R(Right).

PRE-BUILT 90 DEGREE CORNERS [1]: Fully illuminated 90 degree inside and outside corners available. Pre-built corners account for 2' of wall length for both inside and outside corners. Consult factory for non-90 degree corners.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

DOWNLIGHT OPTION : 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 83% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white powder coat paint.

ELECTRICAL OPTIONS

STATIC WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed wire controlling downlight (power and dimming). 14-gauge feed wire used when luminaire current exceeds 5 amps. Telescoping section available with end feed only.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V constant current reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.
- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON DRIVER OPTIONS:
- **LUT-ES1 (LDE1)** (Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series)) (LDE1)
- **LUT-2W (LTES2W)** (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series)) (LTEA2W)

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.
- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime:** 100,000 hours
- FineTune DMX is 1%

LUTRON TUNABLE WHITE DRIVER OPTION:
LUT-TW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)). (PSQ02U)

MOUNTING OPTIONS

HANGING HARDWARE: Threaded Rod (TR) option eliminates the need to install luminaires prior to the slot be- ing framed. Luminaire mounts on threaded rods. Gasket runs length of luminaire ensuring a clean finish at the wall. Optional mounting includes a wall bracket that is attached to the wall. Luminaires are then snapped onto the bracket. Luminaire installation that uses the mounting bracket must be performed before the perimeter slot framing is built. Blocking may be required to properly secure and position the luminaire. Be sure to allow room for finished wall materials such as stone, tile etc. Refer to details on page 7.

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are pre-wired with plug-and-play interconnection cables to support easy plug-together joining of luminaire runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

SPECIFICATIONS

OTHER OPTIONS

END CONDITIONS: Flat end condition (**FE-L & FE-R**)[1] at each end of run add 1/8" to each end of luminaire and are used when luminaire terminates at a vertical surface such as a finished wall. Pocket slot end condition (**PE-L & PE-R**)[1] to end and are used when slot terminates before meeting additional vertical wall surface. Includes the necessary hardware to accommodate ceiling materials when the luminaire doesn't terminate at a wall. Adds 1-1/4" for Spackle Flange and 1" for T-Bar per endcap to overall length of the luminaire.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery.

Backup Battery				
	Legrand 10W		Bodine BSL310LP 4ft. & 6ft.+ is okay. 4.1~5.9 not okay.	
Min. Housing Length	8'*	10'* + TXL	4'*	6'* + TXL
EM Lumen Output	1608	1608	956	956
EM Section Illuminated	2'	2'	2' or 4'	2' or 4'

* Minimum luminaire housing length for battery pack approved without sensor

TUNABLE WHITE ELECTRICAL OPTIONS[6]:
- **TW Driver Options 0-10V:** EM/GEN, GTD or Battery Back up
- **FineTune DMX:** EM/GEN or Battery Back up
- **DMX:** Battery Back up
- **DALI:** EM/GEN, GTD or Battery Back up
- **LUTRON:** EM/GEN, GTD or Battery Back up

REMOTE SENSORS: Remote mounted PIR (Passive Infrared) occupancy or daylight sensors available. Refer to Occupancy Sensor, Daylight Sensor, and Enlighted Sensor tech sheets for more info.

FINISHES: Finelite Signal White (**SW**) powder coat finish standard. Optional Adder: 185 RAL colors[2] are available. Custom color applies to the visible T-Bar flange.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request. These luminaires are rated for Damp Location. IC Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT[8]: Wall Mount T-Bar: 4.6 lb/ft; Wall Mount SF: 4.4 lb/ft; Threaded-Rod T-Bar: 3.1 lb/ft; Threaded-Rod SF: 2.9 lb/ft

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

[1] Minimum 3' body section length when using standard Finelite Osram drivers.
Minimum 4' body section length when using other drivers
[2] 20 business days lead time for color

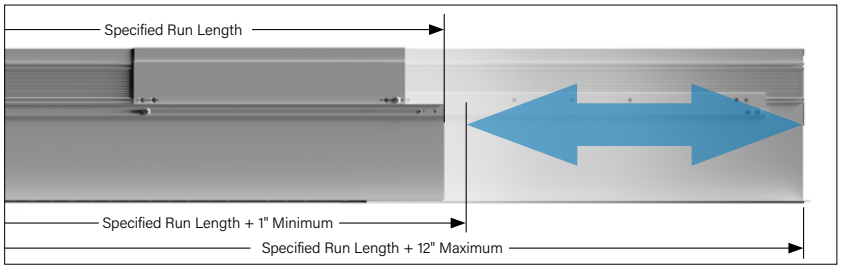
TELESCOPING

One telescoping (**TXL**) provides on-site flexibility with up to 11" of adjustability. and can be specified on either end of a run. Telescope adds a minimum of 1" and maximum of 12" to the run length provided. Max single section length with TXL adjustable from 11'-1" to 12'-0". Offered with flat endcap (standard) or pocketslot endcap.



SF WM Telescoping Shown

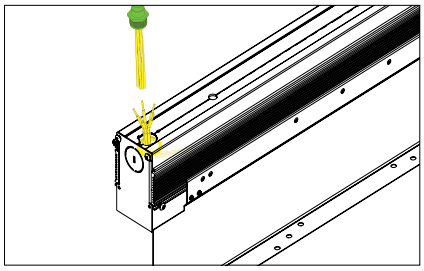
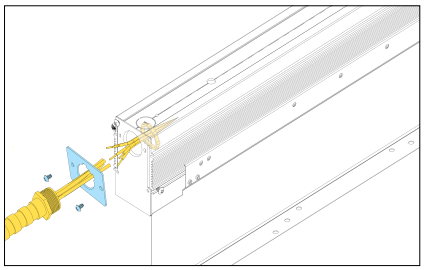
POWER FEED



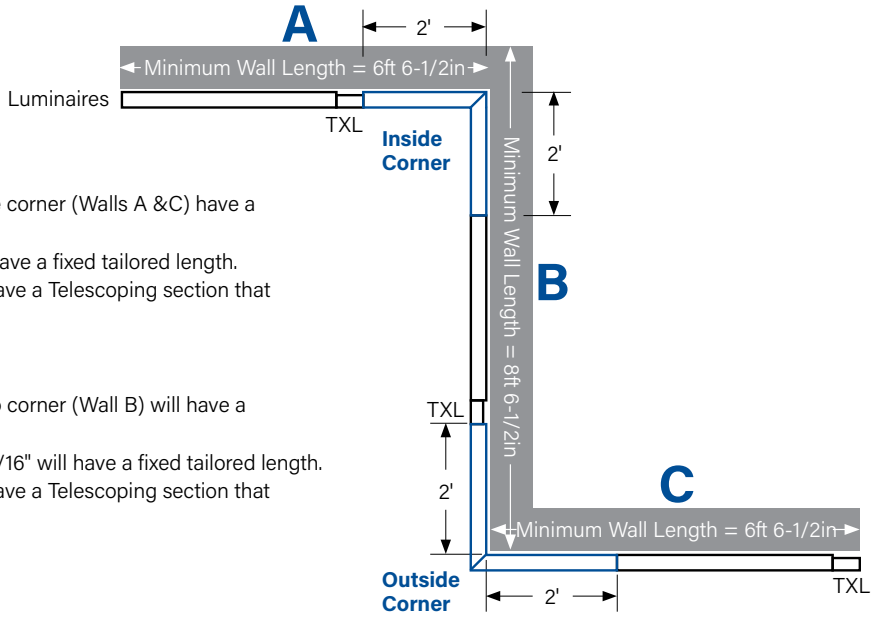
Top feed is standard. Top feed not available on a section with telescoping



End feed options

CONFIGURATIONS WITH PRE-BUILT CORNERS AND TELESCOPING

The example below demonstrates the target minimum wall length requirements for a configuration with pre-built 90 degree corners and telescoping. Consult factory for applications that require shorter than minimum lengths than shown below.



For configurations, wall segments with **One** corner (Walls A &C) have a minimum wall length of 4'.
- Wall lenghts between 4' to 6' 6-7/16" will have a fixed tailored length.
- Wall lengths of 6' 6-1/2" and greater will have a Telescoping section that provides +/- 5-1/2" of adjustability

For configurations, wall segments with **Two** corner (Wall B) will have a minimum wall length of 6'.
- Wall lengths between between 6' to 8' 6-7/16" will have a fixed tailored length.
- Wall lengths of 8' 6-1/2" and greater will have a Telescoping section that provides +/- 5-1/2" of adjustability

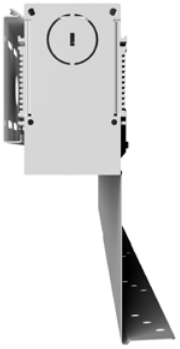
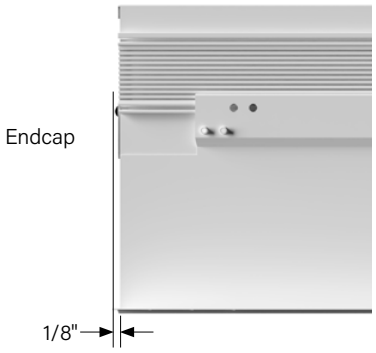
ENDCAP OPTIONS

Endcap Information
The **Flat Endcap** adds 1/8" per endcap to the section length.
The **Pocket Slot Endcap** adds 1-1/4" for Spackle Flange and 1" for T-Bar per endcap to the section length.
Example: Overall Luminaire Length = Luminaire Section + Endcap + Endcap
11' - 3-1/2" = 11' - 3-1/4" + 1/8" + 1/8"

Standard Flat (FE-L or FE-R)
Add 1/8" per endcap to the section length. Spackle Flange version shown T-Bar available. Flat end condition for when luminaire terminates at a vertical surface such as a finished wall.





Pocket Slot (PE-L or PE-R)
Adds 1-1/4" for Spackle Flange and 1" for T-Bar (includes endcap dimension 1/8") per endcap to the housing length on shop drawings T-Bar version shown, Spackle Flange available.

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

The High Performance 2.5" Aperture (HPX) is a patented LED linear luminaire with a square micro profile and internal driver design. This Line-of-Light luminaire delivers excellent performance and is equipped with a unique LED configuration for superior illumination. HPX can be tailored from 2' to 12' sections in 1' increments and is available in Pendant, Surface Mount, and Recessed.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving **Red List Approved** and **Declared** status.

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard.

LENGTHS: Any length, 2' minimum section length. Increments of 1'. 12' maximum section length.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). A separate chart summarizes lumen distribution and wattage. For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

DOWNLIGHT OPTION: 12' maximum diffuser length. Flush (**F**) frost white snap-in diffuser, standard; 73% transmissive, 99% diffusion

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

ELECTRICAL OPTIONS

STATIC WHITE FEED: 18-gauge/5-conductor single-circuit feed wire, standard. 14-gauge feed wire used when luminaire current exceeds 5 amps.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when fixture current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10% - 100%. Dimming to 1% available; Consult factory. Driver is fully accessible from below the ceiling.

- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON STATIC DRIVER OPTIONS:

- **LUTES1** Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series)
- **LUTES5** 5-Series 5% EcoSystem (LDE5 Series)
- **LUT2W** Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series);

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V/277V.

- **Power factor** ≥0.9
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100 - 1%
- **Expected driver lifetime:** 100,000 hours

LUTRON TUNABLE WHITE DRIVER OPTION: LUTDTW 1% T-Series 2-Channel Digital Tunable White (PSQ Series).

MOUNTING TYPE

HANGING HARDWARE:

- **Recessed Spackle Flange:** Drywal surfaces (walls or ceilings): 1/4" - 20 stud and nut (provided by others). Mounted with three equidistant suspension points.
- **Recessed T-Bar:** Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets connect the luminaire to the T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

OTHER OPTIONS

ENDCAPS: Flat endcaps (**FE**) at each end of run add 1/16" to each end of luminaire.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery.

Backup Battery

	Legrand 18W	Legrand 10W/ Bodine BSL310LP

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

SPECIFICATIONS

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) Occupancy (**OBO**) or Daylight Sensors (**OBD**) available with Flush and Bottom Glow downlight diffusers. PIR sensors not recommended for stairwell applications. Refer to Occupancy Sensor & Daylight Sensor tech sheet and the Embedded Intelligence landing page for more information and additional sensor options.

FINISHES: Finelite Signal White (**SW**) powder coat standard. Finelite Black (RAL 9005) with semi gloss fine texture (**FB**) [1] and satin Aluminum (**SA**) [1] are available. Optional Adders: 185 RAL colors. [1]

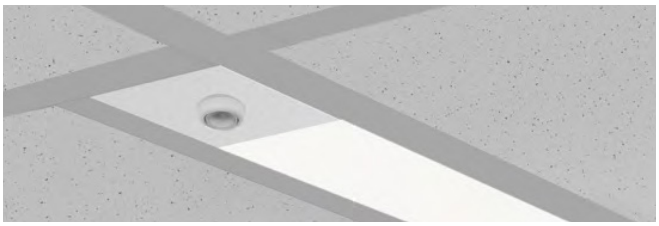
LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request, contact factory for more details. These fixtures are rated for Damp Location. IC Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. HPX can be used to comply with 2016 Title 24, Part 6 (JA8); high efficacy LED light source requirements. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT: 2.3 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

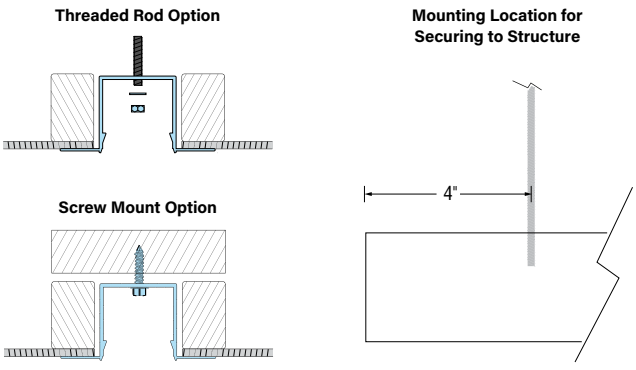
[1] 20 business day lead time for color

INTEGRATED SENSOR



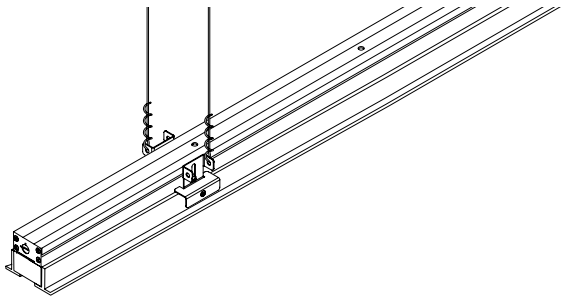
Integrated PIR (Passive Infrared) occupancy or daylight sensors available with Flush and Bottom Glow downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

HARD CEILING MOUNTING OPTIONS



Two mounting options: threaded rod and screw mounting options. Mounting locations are located on each end of the luminaire. Mounting location is 4" away from each end of luminaire

T-BAR INSTALLATION



HPX-R for T-Bar installations comes standard with a splice plate at the end of the luminaire. Mounting brackets (supplied) secure the luminaire to T-Bar and provide support to structure location. All even foot length (2, 4, 6...) luminaire runs are reduced in length an appropriate amount to fit within typical 2×2 and 2×4 T-Bar grid systems. For uncommon T-Bar systems please consult factory.

DOWNLIGHT / HOUSING

A LED
Integral LED module design enables field service / replacement through housing aperture.

B OPTIC
Proprietary optic integrates Reflection, Refraction and TIR offering 10°, 15°, 22°, 40° & 60° beams.

C TRIMLESS WOOD SPACERS
Provided for Trimless Wood installations; includes (1) 1/16" spacer and (5) 1/8" spacers.

D TRIM EXTENSION
Provided for -2 ceiling thickness; accommodates 2.125" max ceiling thickness.

E MICROFLANGE PROFILE
Features 0.30" flange. Thickness measures 0.06". Installed after ceiling is complete. Requires 3.375" diameter cutout. Wet location features integral silicone gasket.

F TRIMLESS DRYWALL PROFILE
Installs totally flush with the ceiling with no visible trim. Appliqué includes screws for mounting and has 0.06" plaster stop. Not recommended for stucco applications.

G EFFECTS DEVICES / LENS RETAINER
Fixture is limited to 1 effects device. Wet location effects device is sealed in place. Suction tool provided for removal of baffle with wet location. Lens retainer allows effects devices to be changed in Dry /Damp locations.

H ROUND BAFFLE
Die-cast removable baffle provides easy access to tilting mechanism and features 62° glare cutoff. Minimizes aperture glare and conceals view into housing; includes gasket.

SQUARE TRANSITIONAL BAFFLE
Die-cast removable baffle provides easy access to tilting mechanism and features 62° glare cutoff. Transitions from square aperture at ceiling plane to round aperture at light source. Minimizes aperture glare and conceals view into housing; includes gasket.

[FAX] +1-210-227-4967

FRAXION3 SLIM FIXED

DOWNLIGHT / HOUSING

I **IC HOUSING**
- For IC ceilings.
- No setback from polycell spray foam insulation having max R-Value of 60 on all sides and top of housing.

J **NIC HOUSING**
- Minimum 0.50" setback from combustible and non-combustible materials on all sides and top of housing.
- Minimum 3.00" setback from insulation material having max R-Value 30 on all sides and top of housing.
- Minimum 6.00" setback from polycell spray foam insulation having max R-Value 60.

K **ADJUSTABLE HANGER BAR HEIGHT ACCESSORY**
Provided with ceiling thickness "T" and recommended for installations in T-Grid and furring channel up to 1.5" tall. Hanger bars are installed to adjustable bracket. Allows housing to be raised and lowered; ceiling thickness remains 0.5" to 1.375" max.

L **APPLIQUÉ DETAIL**
Appliqué for plaster floating directly to baffle.

M **REMOTE POWER SUPPLY**
Provided with install Types "V", "W" and "D". Remote power supply provides additional driver options. Consult installation guide for maximum allowable secondary run lengths between PSF3-RMT and fixture. Must be installed in an accessible location.

HOUSING NOTES

- Do not install in environments where ambient temperatures exceed 25°C (77°F).
- Power supply compartment and all splice connections may be serviced from room side.
- Consult factory for spacing requirements for any installations exceeding R-Value 60.
- Hanger bars fitted to short side of housing or long side when TG accessory is specified; extend from 14.0" to 24.0", but may be field cut to accommodate narrow stud spacing. Can be extended up to 46" maximum with FRX-HBE-46 kit.
- Hanger bars and brackets add 4.00" max to the overall dimension, but are exclusive of the setback requirements.
- Housings for round trims feature a round aperture housing collar. Housings for square trims feature a square housing collar that rotates up to 90 degrees for fixture alignment. Housing collars accommodate ceiling thicknesses between 0.50" and 2.125".

TECHNICAL

CONSTRUCTION
Downlight: Painted finishes are granulated powder coat.
Housing: Aluminum and 22 Gauge galvanized steel. Extruded aluminum housing panel to act as heat-sink.
Remote Power Supply: 22 Gauge galvanized steel.
Appliqué: Zinc alloy.

STATIC WHITE LED
2-step MacAdam ellipse LED module available in 80+, 90+ and 97+ CRI configurations in color temperatures of 2200K, 2700K, 3000K, 3500K and 4000K. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

WARM DIM LED
3-step MacAdam ellipse warm dim LED module available in 90+ CRI configuration. 3200K or 2700K at full brightness, warming to 1800K at full dim. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

TUNABLE WHITE LED
5-step MacAdam ellipse tunable white LED module available in 90+ CRI configuration. Features tuning range of 2700K to 5000K. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

LISTING
cTUVus listed to UL1598 standard for Dry / Damp and Wet locations. Chicago Plenum, Airtight and Title 24 JA8-2019 Listed.

WARRANTY
Manufacturer's 1-year warranty guarantees product(s) listed to be free from defects in material and workmanship under normal use and service. 5-year warranty on LED and power supply to operate with 70% of the original flux and remain within a range of 3 duv. 10-year Lutron Advantage limited warranty available on Lutron equipped systems. Warranty period begins from the date of shipment by Seller and conditional upon the use of manufacturer-supplied power supply. Consult website for full warranty terms and conditions.

CHANGE LOG
1. 01/12/2021: ADDED 2200K, 2700K-1800K WARM DIM AND 10 DEGREE OPTIC OFFERINGS.
2. 04/30/2021: REMOVED QUICK SHIP.

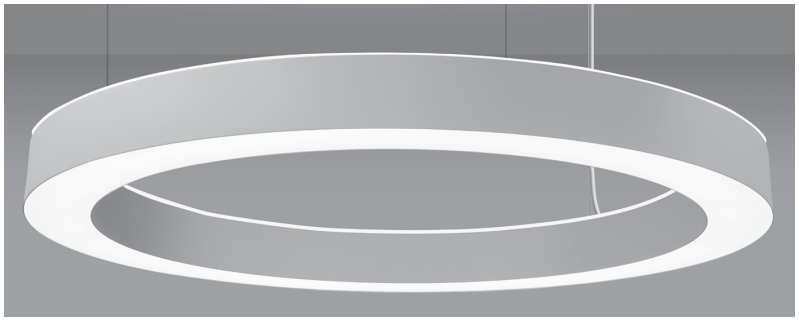
FINELITE® Better Lighting

High Performance 4" Aperture Circle (HP-4 C)



High Performance 4" Aperture Circle (HP-4 C) is a patented, circular LED luminaire. Constructed with an extruded aluminum body and single-piece direct diffuser, the HP-4 C provides a seamless finish aesthetic. Delivering excellent performance using an advanced optical design and mid-power LEDs to achieve 90% of initial light output at 100,000+ hours.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options acheiving Red List Approved and Declared status.

Signal White is standard finish

FINELITE® Better Lighting

High Performance 4" Aperture Circle (HP-4 C)

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6063-T4 extruded aluminum with 16 gauge steel assembly body.

SIZES: Circles are available in nominal diameters of 2', 3' and 4'.

OUTPUT and LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

MECHANICAL FEATURES

UPLIGHT DIFFUSER: Patented Top Glow frost white diffuser standard. 80% transmissive, 99% diffusion. Optional: Flush frost white snap-in diffuser, 80% transmissive, 99% diffusion.

DOWNLIGHT DIFFUSER: Single piece, seamless lens. Flush frost white snap-in lens standard, 80% transmissive, 99% diffusion.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white powder coat paint.

ELECTRICAL FEATURES

STATIC FEED: Standard with one 18-gauge/5-conductor single-circuit feed.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V constant current reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 100%-10% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.

- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON STATIC DRIVER OPTIONS [1]:

- **LUTES1** (Hi-lume 1% EcoSystem with Soft-On, Fade to Black dimming (LDE1 series))
- **LUTES5** (5-Series 5% EcoSystem (LDE5 Series))
- **LUT2W** (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series))

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.

- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime.:** 100,000 hours
- FineTune DMX is 1%

LUTRON TUNABLE WHITE DRIVER OPTION [1]: LUTDTW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)).

MOUNTING TYPE

MOUNTING:

- **Pendant:** 50" to 300" Fully Adjustable (**FA**) plated steel aircraft cable with safety stop hardware standard. Mounted with three equidistant vertical suspension cables.
- **Recessed Spackle Flange**: Drywall surfaces (walls or ceilings): 1/4" 20 stud and nut (provided by others). Mounted with three equidistant suspension points.
- **Surface Mount**: Lay-in ceiling types: caddy clip with 1/4" 20 stud and nut. Drywall or concrete surfaces (walls or ceilings): 1/4" 20 stud and nut (provided by others). Mounted with three equidistant suspension points.

TUNABLE WHITE DMX MOUNTING: For grid ceiling applications the dual GridBox™ mounting is supplied (standard). For hard ceiling applications the ceiling mounting box is supplied (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths. Available DMX pendant feed lengths are 5', 12', and 30' (5' standard).

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are prewired with plug-and-play interconnection cables to support easy plug-together joining of fixture runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

OTHER FEATURES

EMERGENCY STYLE: Optional emergency to generator/inverter wiring.

SPECIFICATIONS

TUNABLE WHITE ELECTRICAL OPTIONS:
- **TW Driver Options 0-10V:** EM/GEN
- **FineTune DMX:** EM/GEN
- **DALI:** EM/GEN
- **LUTRON:** EM/GEN

FINISHES: Finelite Signal White (**SW**) powder coat, Finelite Black (RAL 9005) with semi gloss fine texture (**FB**)[2], and Satin Aluminum (**SA**)[2] are standard. Optional Adder: 185 RAL colors[2] are available.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 PoE options available on request. These fixtures are rated for Damp Location. Chicago Plenum options available for C1, C2, or C3 suspension using our GridBox. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add - **RLA** (Red List Approved) or - **RLD** (Declared Label) to your part number.

FINELITE® Better Lighting

High Performance 4" Aperture Circle (HP-4 C)

High Performance 4" Aperture Circle (HP-4 C) is a patented, circular LED luminaire. Constructed with an extruded aluminum body and single-piece direct diffuser, the HP-4 C provides a seamless finish aesthetic. Delivering excellent performance using an advanced optical design and mid-power LEDs to achieve 90% of initial light output at 100,000+ hours.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options acheiving Red List Approved and Declared status.

Signal White is standard finish

FINELITE® Better Lighting

High Performance 4" Aperture Circle (HP-4 C)

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6063-T4 extruded aluminum with 16 gauge steel assembly body.

SIZES: Circles are available in nominal diameters of 2', 3' and 4'.

OUTPUT and LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. A separate chart summarizes lumen distribution and wattage. Light engines are replaceable.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

MECHANICAL FEATURES

UPLIGHT DIFFUSER: Patented Top Glow frost white diffuser standard. 80% transmissive, 99% diffusion. Optional: Flush frost white snap-in diffuser, 80% transmissive, 99% diffusion.

DOWNLIGHT DIFFUSER: Single piece, seamless lens. Flush frost white snap-in lens standard, 80% transmissive, 99% diffusion.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white powder coat paint.

ELECTRICAL FEATURES

STATIC FEED: Standard with one 18-gauge/5-conductor single-circuit feed.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V constant current reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 100%-10% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.

- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON STATIC DRIVER OPTIONS [1]:

- **LUTES1** (Hi-lume 1% EcoSystem with Soft-On, Fade to Black dimming (LDE1 series))
- **LUTES5** (5-Series 5% EcoSystem (LDE5 Series))
- **LUT2W** (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series))

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.

- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime.:** 100,000 hours
- FineTune DMX is 1%

LUTRON TUNABLE WHITE DRIVER OPTION [1]: LUTDTW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)).

MOUNTING TYPE

MOUNTING:

- **Pendant:** 50" to 300" Fully Adjustable (**FA**) plated steel aircraft cable with safety stop hardware standard. Mounted with three equidistant vertical suspension cables.
- **Recessed Spackle Flange**: Drywall surfaces (walls or ceilings): 1/4" 20 stud and nut (provided by others). Mounted with three equidistant suspension points.
- **Surface Mount**: Lay-in ceiling types: caddy clip with 1/4" 20 stud and nut. Drywall or concrete surfaces (walls or ceilings): 1/4" 20 stud and nut (provided by others). Mounted with three equidistant suspension points.

TUNABLE WHITE DMX MOUNTING: For grid ceiling applications the dual GridBox™ mounting is supplied (standard). For hard ceiling applications the ceiling mounting box is supplied (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths. Available DMX pendant feed lengths are 5', 12', and 30' (5' standard).

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are prewired with plug-and-play interconnection cables to support easy plug-together joining of fixture runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

OTHER FEATURES

EMERGENCY STYLE: Optional emergency to generator/inverter wiring.

[1] 3' & 4' only

SPECIFICATIONS

TUNABLE WHITE ELECTRICAL OPTIONS:
- **TW Driver Options 0-10V:** EM/GEN
- **FineTune DMX:** EM/GEN
- **DALI:** EM/GEN
- **LUTRON:** EM/GEN

FINISHES: Finelite Signal White (**SW**) powder coat, Finelite Black (RAL 9005) with semi gloss fine texture (**FB**)[2], and Satin Aluminum (**SA**)[2] are standard. Optional Adder: 185 RAL colors[2] are available.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 PoE options available on request. These fixtures are rated for Damp Location. Chicago Plenum options available for C1, C2, or C3 suspension using our GridBox. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add - **RLA** (Red List Approved) or - **RLD** (Declared Label) to your part number.

WEIGHTS:
- Direct (pendant and surface mount): 2' = 15 lbs, 3' = 27 lbs, 4' = 42 lbs
- Recessed (spackle flange): 2' = 18 lbs, 3' = 30 lbs, 4' = 45 lbs
- Indirect/Direct (pendant): 2' = 18 lbs, 3' = 30 lbs, 4' = 45 lbs

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories are covered by their individual manufacturer warranties.

MECHANICAL/OPTICAL OPTIONS

Downlight

◯ F - Flush (standard)
◯ DL - 1" Drop Down Lens
◯ RG-D - Flat Diffuser with 1" Regress [1]
◯ RG-WCB - White Cross Blade Baffle [1]
◯ RG-LHE - Hollowed Ellipse Louver [1]
◯ RG-LHC - Hex Louver [1]
◯ DAO-L - Downlight Asymmetric Left [4]
◯ DAO-R - Downlight Asymmetric Right [4]
◯ DSO - Downlight Spread Optic [4]
◯ K - Kicker for Wall Wash only (standard)
◯ FO - Fully Open for Wall Wash only

Reflector System

◯ 96LG - 96 Low Gloss White
◯ SW - Signal White for Wall Wash only

ELECTRICAL OPTIONS

Voltage

◯ 120 - 120 Voltage
◯ 277 - 277 Voltage
◯ 347 - 347 Voltage

Circuiting [2]

◯ SC - Single Circuit*
One single circuit in a run
◯ MC - Multi-Circuit*
More than one switch leg or zone. Factory shop drawings required

* Battery, Night Light, and Emergency to Generator circuits are in addition to the normal luminaire circuit(s)

ELECTRICAL OPTIONS

Driver Selection

0-10V Driver Options

◯ FC-10% - 0-10V 10% [3] (standard)
◯ FC-1% - 0-10V 1% [3]
◯ OSR-10% - Osram OTi, 0-10V 10% [3]
◯ OSR-1% - Osram OTi, 0-10V 1% [3]
◯ ELD-10V-0% - EldoLED SOLOdrive, 0-10V 0.1%
◯ OSR-10V-TW - Osram OTi, 0-10V 10% *(Tunable White)* [3]

DALI Driver Options

◯ FC-DALI-1% - DALI 1%
◯ OSR-DALI-1% - Osram Dexal, 1%
◯ ELD-DALI-0% - EldoLED SOLOdrive, 0.1%
◯ ELD-DALI-TW - EldoLED DUALdrive LightShape, 0.1% *(Tunable White)*

DMX Driver Options

◯ FIN-DMX - Finelite DMX 1% *(Tunable White - FineTune Controls Only)* [5]
◯ ELD-DMX - EldoLED POWERdrive, 0.1%
◯ ELD-DMX-TW - EldoLED POWERdrive, 0.1% *(Tunable White)*

Lutron Driver Options

◯ LUT-ES1 - Lutron, Ecosystem 1%
◯ LUT-2W - Lutron, 2-wire (120V only) 1%
◯ LUT-TW - Lutron T-Series, EcoSystem 0.1% *(Tunable White)*

See Page 3 for additional driver options and details

MOUNTING OPTIONS

Ceiling Hardware Type

◯ C1 - 1" T-Bar
◯ C1T - 1" Tegular
◯ C2 - 9/16" T-Bar
◯ C2T - 9/16" Tegular
◯ C3 - Screw Slot
◯ C3F - Flush Screw Slot
◯ SF - Spackle Flange
◯ VF - Visible Flange
◯ TZ4 - Tech Zone 4" _____ (C1, C2, C2T, C3, C3F)

OTHER OPTIONS

Endcap Style

◉ FE - Flat Endcap (standard)

Finish

◯ SW - Signal White (standard)
◯ FB - Finelite Black [6]
◯ SA - Satin Aluminum [6]
◯ #### - RAL Color Code [6]
_____

Emergency Style (Optional)

◯ FAC CHO - Factory Choice Battery Back-up
◯ EM/GEN - Emergency to Generator
◯ NL - Night Light
◯ BSL310LP - Bodine Battery Back up Low Profile
◯ GTD - Generator Transfer Device
◯ ALCR - Automatic Load Control Relay

Integrated Sensor (Optional)

◯ OBO - Occupancy [7]
◯ OBD - Daylight [7]
◯ OBE - Enlighted [8]
◯ W601 - Wattstopper [9] Wireless Sensor
◯ REE - Remote Enlighted [10]

Special Options (Optional)

◯ CP - Chicago Plenum
◯ FLX - Flex Whip
◯ RLA - Red List Approved
◯ RLD - Declared

[1] Recessed Regressed straight run only
[2] Contact factory for switching options
[3] Add DTO to gain "Dim to Off" functionality (FC-10% - DTO)
[4] Not available with Regressed or Curves
[5] B & V outputs only
[6] 20 business days lead time for color
[7] Not available with Wall Wash
[8] Enlighted components installed by Finelite, provided by others
[9] LMFS-601 w/ 0-10V driver(s) and LMFI-111, up to 6 drivers may be connected. LMFS-601 w/ Dali driver, only 1 driver can be connected.
[10] Enlighted for Wall Wash fixtures. Enlighted Control Unit & Sensor Cable installed for Remote mounting sensor.

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2) Recessed

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system and plug-together wiring are standard.

LENGTHS: Any length, 2' minimum, in increments down to 1/16th" (±1/32"). 12' maximum section length. Hollowed Ellipse Louver (**LHE**), Hex Louver (**LHC**), and White Cross Blade Baffle (**WCB**) are available in 1' increments.

MITERED CORNERS [1] : Illuminated corners of greater than 60° and less than 180° in a single plane, available with Flush Diffuser, Bottom Glow Diffuser, 1" Drop Down Lens, Regressed Diffuser, or White Cross Blade Baffle [2]. Corners not available with Wall Wash (**WW-D**), Hollowed Ellipse Louver (**LHE**) or Hex Louver (**LHC**). Contact factory for Double miters using the White Cross Blade Baffle. Consult factory for tailored lighting options.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For lengths 3' and greater, the uplight and downlight can be specified with different lumen packages and dual controls. For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

DOWNLIGHT OPTION: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Available with Flush (**F**), Bottom Glow **(BG**), 1" Drop Down Lens (**DL**), White Cross Blade Baffle (**WCB**) [3,4], Ellipse Louver (**LHE**) [3], Hex Louver (**LHC**) [3], Downlight Asymmetric Optic (**DAO**) [5], Downlight Spread Optic (**DSO**) [5], and Regressed downlight diffusers (**RG**) [3]. 1" Drop Down Lens made of highly efficient acrylic. Available with a solid endcap or an endcap with a diffuse filler to continue the luminous aesthetic. Downlight Spread & Downlight Asymmetric Optics are extruded lenses with a subtle ribbed appearance providing a batwing or asymmetric distribution for improved optical performance. Consult factory for more tailored lumen outputs.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white powder coat paint. The standard Semi-Specular Aluminum (**SSA**) Kicker (**K**) reflector delivers light high on the vertical surface. The Kicker reflector can be easily removed for open distribution (**FO**).

ELECTRICAL OPTIONS

STATIC WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed wire controlling uplight and downlight together (power and dimming). Specify dual feed wires for independent control of uplight and downlight. 14-gauge feed wire used when luminaire current exceeds 5 amps.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V constant current reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.

- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON DRIVER OPTIONS:

- **LUT-ES1 (LDE1)** - (Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series))
- **LUT-2W (LTEA2W)** - (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series)).

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.

- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime:** 100,000 hours
- **FineTune DMX:** 1%

LUTRON TUNABLE WHITE DRIVER OPTION:

LUT-TW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)).

[1] Not available with Wall Wash
[2] White Cross Blade (WCB) baffles not available with custom angles. Available in 90 degrees only
[3] Recessed Regressed straight run only
[4] White Cross Blade Baffle (WCB) currently not advisable for drywall
[5] Not available with Regressed or Curves

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2) Recessed

SPECIFICATIONS

MOUNTING OPTIONS

HANGING HARDWARE:

- Recessed T-Bar: Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets connect the luminaire to the T-Bar for securing to structure. Consult local codes for tie-wire recommendations.
- Recessed Spackle Flange: Drywall surfaces (walls or ceilings): 1/4" - 20 stud and nut (provided by others). Mounted with three equidistant suspension points.

TUNABLE WHITE DMX HANGING HARDWARE: For grid ceiling applications the dual GridBox™ mounting is supplied (standard). For hard ceiling applications the ceiling mounting box is supplied (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths. Available DMX pendant feed lengths are 5' (standard), 12', and 30'.

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are pre-wired with plug-and-play interconnection cables to support easy plug-together joining of fixture runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

OTHER OPTIONS

ENDCAPS: Flat endcaps (**FE**) at each end of run add 1/16" to each end of luminaire. Drop Down Lens Illuminated Endcap (**DE**) includes diffuse element to continue luminance of drop lens.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery.

Backup Battery		
	Factory Choice	Bodine BSL310LP
HP2-R-D		
Min. Housing Length	8'*	4'*
EM Lumen Output	1608	956
EM Section Illuminated	2'	2' or 4'
HP2-R-WW-D		
Min. Housing Length	8'*	4'*
EM Lumen Output	1500	891
EM Section Illuminated	4'	4'

* Minimum fixture housing length for battery pack approved without sensor

TUNABLE WHITE ELECTRICAL OPTIONS [6]:

- **TW Driver Options 0-10V:** EM/GEN, GTD or Battery Back up
- **FineTune DMX:** EM/GEN or Battery Back up
- **DMX:** Battery Back up
- **DALI:** EM/GEN, GTD or Battery Back up
- **LUTRON:** EM/GEN, GTD or Battery Back up

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy or daylight sensors available with Flush and Bottom Glow downlight diffusers. Refer to Occupancy Sensor, Daylight Sensor, and Enlighted Sensor tech sheets for more info.

FINISHES: Finelite Signal White (**SW**) powder coat, Finelite Black (RAL 9005) with semi gloss fine texture (**FB**) [7], and Satin Aluminum (**SA**) [7] are standard. Optional Adder: 185 RAL colors [7] are available.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request. These fixtures are rated for Damp Location. IC Rated. HP-2 can be used to comply with 2016 Title 24, Part 6 (JA8); high efficacy LED light source requirements. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT [8]: R - 2.3 lb/ft; WW-R - 2.9 lb/ft

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

[6] Consult Finelite for Generator Transfer Device and Battery Backup fit
[7] 20 business days lead time for color
[8] Excludes Battery Backup and Generator Transfer Device weight

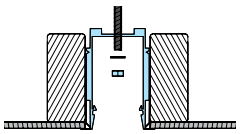
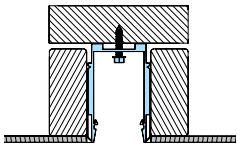
HARD CEILING MOUNTING OPTIONS

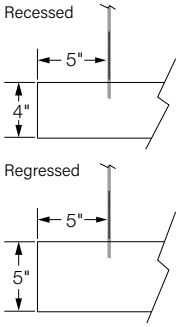
Threaded Rod Option



Screw Mount Option

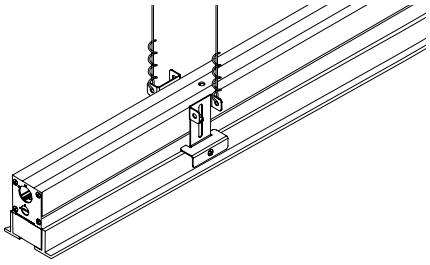


Mounting Location for Securing to Structure



Two mounting options: threaded rod and screw mounting options. Mounting locations are located on each end of the luminaire. Mounting location is 5" away from each end of luminaire.

T-BAR INSTALLATION



HP-2 R for T-Bar installations comes standard with a splice plate at the end of the luminaire. Mounting brackets (supplied) secure the luminaire to T-Bar and provide support to structure location. All even foot length (2, 4, 6, ...) luminaire runs are reduced in length by an appropriate amount to fit within typical 2x2 and 2x4 T-Bar grid systems. For uncommon T-Bar systems please consult factory.

FINELITE® Better Lighting

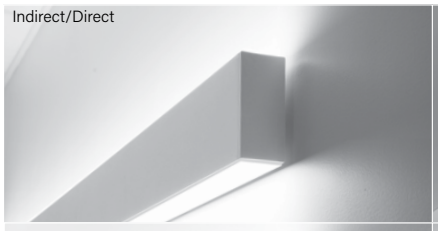
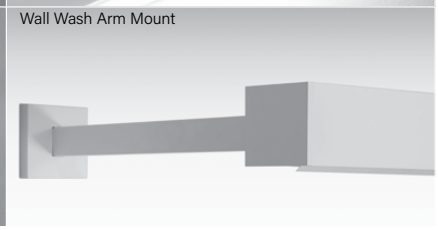
High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount





High Performance 2" Aperture is a patented, linear LED luminaire family. HP-2 delivers excellent performance using an advanced optical design and mid-power LEDs. Achieving 90% of initial light output at 100,000+ hours and backed by a 10-year performance-based warranty on all standard components.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving **Red List Approved** and **Declared** status.

Signal White is standard finish

Note: see page 6 for all aesthetic options

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system and plug-together wiring are standard.

LENGTHS: Any length, 2' minimum, in increments down to 1/16th" (±1/32"). 12' maximum section length. Hollowed Ellipse Louver (**LHE**), Hex Louver (**LHC**), and White Cross Blade Baffle (**WCB**) are available in 1' increments.

MITERED CORNERS[1]: Illuminated corners of greater than 60° and less than 180° in a single plane, available with Flush Diffuser, Bottom Glow Diffuser, 1" Drop Down Lens[2], Regressed Diffuser, or White Cross Blade Baffle[3]. Corners not available with Wall Wash (**WW-D**), Hollowed Ellipse Louver (**LHE**) or Hex Louver (**LHC**). Contact factory for Double miters using the White Cross Blade Baffle. Consult factory for tailored lighting options.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For lengths 3' and greater, the uplight and downlight can be specified with different lumen packages and dual controls. For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

UPLIGHT OPTION[4]: Patented Top Glow frost white diffuser standard. 12' maximum diffuser length. 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination Optional: Flush frost white snap-in diffuser, 73% transmissive, 99% diffusion; **ASY-L** distributes light to the left, **ASY-R** distributed light to the right of the luminaire. Consult factory for more tailored lumen outputs.

DOWNLIGHT OPTION[5]: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Available with Flush (**F**), Bottom Glow (**BG**), 1" Drop Down Lens (**DL**), White Cross Blade Baffle (**WCB**)[6], Hollowed Ellipse Louver (**LHE**)[6], Hex Louver (**LHC**)[6], Downlight Asymmetric Optic (**DAO**)[7], and Regressed downlight diffusers (**RG**). 1" Drop Down Lens made of highly efficient acrylic. Available with a solid endcap or an endcap with a diffuse filler to continue the luminous aesthetic. Downlight Asymmetric Optic is an extruded lens with a subtle ribbed appearance providing an asymmetric distribution for improved optical performance. Consult factory for more tailored lumen outputs.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

REFLECTORS: Wall Mount: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white power coat paint. **Arm Mount**: The standard Signal White (**SW**) Kicker (**K**) reflector delivers light high on the vertical surface. The Kicker reflector can be easily removed for open distribution (**FO**).

ELECTRICAL FEATURES

STATIC WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed controlling uplight and downlight together (power and dimming). Specify dual feeds for independent control of uplight and downlight. 14-gauge feed used when luminaire current exceeds 5 amps.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.
- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON DRIVER OPTIONS:
- **LUT-ES1 (LDE1)** - (Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series))
- **LUT-2W (LTEA2W)** - (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series)).

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.
- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime.:** 100,000 hours
- **FineTune DMX:** 1%

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount

SPECIFICATIONS

LUTRON TUNABLE WHITE DRIVER OPTION: LUT-TW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)).

MOUNTING OPTIONS

HANGING HARDWARE: Wall Mount: Luminaire hangs securely from mounting brackets fastened directly to the wall for easy installation. Luminaire stands 1/2" off the wall. The mounting bracket is concealed behind the luminaire. **Arm Mount**: bracket mounts directly to wall j-box, extends luminaire 12", 18", or 24" from wall. Other lengths available. Consult factory.

TUNABLE WHITE DMX HANGING HARDWARE: For grid ceiling applications the dual GridBox™ mounting is supplied (standard). For hard ceiling applications the ceiling mounting box is supplied (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths. Available DMX pendant feed lengths are 5' (standard), 12', and 30'.

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are pre-wired with plug-and-play interconnection cables to support easy plug-together joining of luminaire runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

OTHER OPTIONS

ENDCAPS: Flat diecast aluminum endcaps (**FE**) add 1/4" to each end of luminaire. 1" Drop Down Lens Endcap (**DE**)[8] includes diffuse element to continue luminance of drop lens. Open Endcap (**OE**) is for use with the Hollowed Ellipse Louver (**LHE**); following the curve of the louver.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Factory choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack.
- **Indirect/Direct:** backup batteries deliver 1608 lumens. 12' minimum luminaire length. 2' illuminated (downlight standard).
- **Direct:** backup batteries deliver 1608 lumens. 8' minimum luminaire length. 2' illuminated.
- **Indirect:** backup batteries deliver 1874 lumens. 8' minimum luminaire length. 2' illuminated.
- **Wall Wash:** backup batteries deliver 1500 lumens. 8' minimum luminaire length. 2' illuminated.

Tunable White ELECTRICAL OPTIONS[9]:
- **TW Driver Options 0-10V:** EM/GEN, GTD or Battery Back up
- **FineTune DMX:** EM/GEN or Battery Back up
- **DMX:** Battery Back up
- **DALI:** EM/GEN, GTD or Battery Back up
- **LUTRON:** EM/GEN, GTD or Battery Back up

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy or daylight sensors available with Flush and Bottom Glow downlight diffusers. Refer to Occupancy Sensor, Daylight Sensor, and Enlighted Sensor tech sheets for more info.

FINISHES: Finelite Signal White (**SW**) powder coat, Finelite Black (RAL 9005) with semi gloss fine texture (**FB**)[10], and Satin Aluminum (**SA**)[10] are standard. Optional Adder: 185 RAL colors[10] are available.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request. These fixtures are rated for Damp Location. HP-2 can be used to comply with 2016 Title 24, Part 6 (JA8); high efficacy LED light source requirements. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT[11]: ID - 2.9 lb/ft; D - 2.3 lb/ft; I - 2.3 lb/ft; AM - 2.9 lb/ft (luminaire only)

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

[8] Available in Indirect/Direct Regressed & Direct Regressed only
[9] Consult Finelite for Generator Transfer Device and Battery Back up fit
[10] 20 business days lead time for color
[11] Excludes Battery Back up and Generator Transfer Device weight

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2 WS)
Perimeter Slot

HP-2 WS Perimeter Slot provides ultimate flexibility for perimeter lighting with exact fit tailored lengths or optional adjustable telescoping sections. Prebuilt, fully-illuminated 90° inside and outside corners add to its clean aesthetics. HP-2 WS Perimeter Slot delivers excellent performance using an advanced optical design and mid-power LEDs. Achieving 90% of initial light output at 100,000+ hours and backed by a 10-year performance-based warranty on all standard components. An all-in-one box shipping approach to reduce labor and streamline installation.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving Red List Approved and Declared status.

Note: see page 6 for all aesthetic options

Platform	Series Name	Regressed Optic Depth	Total Length of Run
◉ HP - High Performance	◉ 2 WS	◉ 4D - 4" Depth	For configurations provide nominal total length. Actual length calculated by factory. Please provide drawings to clearly illustrate corners and wall dimensions _____ **Tailored Runs:** Minimum 2' section length. Increments accurate to 1/16" (±1/32), standard. 12' maximum section length. **TXL Runs:** Optional TXL adds 1" to run length and up to an additional 11" of fully illuminated adjustability. Minimum length with TXL: 4'-1" with Std. Osram drivers or 5'-1" with all other drivers. Max single section length with TXL adjustable from 11'-1" to 12'-0".

OUTPUT AND LED TYPE

Downlight Output	LED CRI/CCT
○ S - Standard (326 lm/ft) ○ B - Boosted Standard (410 lm/ft) ○ H - High (619 lm/ft) ○ V - Very High (796 lm/ft) ○ TL - Tailored:_____lm/ft* * Specify lm/ft of outputs between Standard (S) and Very High (V). Consult factory for tailored lumen output outside of this range.	○ 830 - 80 CRI, 3000K ○ 835 - 80 CRI, 3500K ○ 840 - 80 CRI, 4000K ○ 930 - 90 CRI, 3000K ○ 935 - 90 CRI, 3500K ○ 940 - 90 CRI, 4000K ○ 8TW - 80 CRI, Tunable White ○ 9TW - 90 CRI, Tunable White

MECHANICAL/OPTICAL OPTIONS

Reflector System	Voltage	Circuiting[1]
○ 96LG - 96 Low Gloss White	○ 120 - 120 Voltage ○ 277 - 277 Voltage ○ 347 - 347 Voltage	○ SC - Single Circuit* One single circuit in a run ○ MC - Multi-Circuit* More than one switch leg or zone. Factory shop drawings required * Battery, Night Light, and Emergency to Generator circuits are in addition to the normal luminaire circuit(s)

ELECTRICAL OPTIONS

Driver Selection

0-10V Driver Options

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2 WS)
Perimeter Slot

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system and plug-together wiring are standard.

LENGTHS: Any length, 2' minimum, in increments down to 1/16th" (±1/32"). 12' maximum section length. Telescoping (**TXL**) Minimum run length with Std. Osram drivers: 4'-1" adjustable to 5'-0". Telescoping (**TXL**) Minimum run length with all other drivers: 5'-1" adjustable to 6'-0". Max single section length with TXL adjustable from 11'-1" to 12'-0". Just one optional TXL provides fully illuminated adjustability of up to 11". Choose TXL-L(Left), TXL-M (Middle), or TXL-R(Right).

PRE-BUILT 90 DEGREE CORNERS [1]: Fully illuminated 90 degree inside and outside corners available. Pre-built corners account for 2' of wall length for both inside and outside corners. Consult factory for non-90 degree corners.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

DOWNLIGHT OPTION : 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 83% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white powder coat paint.

ELECTRICAL OPTIONS

STATIC WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed wire controlling downlight (power and dimming). 14-gauge feed wire used when luminaire current exceeds 5 amps. Telescoping section available with end feed only.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V constant current reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.
- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON DRIVER OPTIONS:
- **LUT-ES1 (LDE1)** (Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series)) (LDE1)
- **LUT-2W (LTES2W)** (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series)) (LTEA2W)

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.
- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime:** 100,000 hours
- FineTune DMX is 1%

LUTRON TUNABLE WHITE DRIVER OPTION:
LUT-TW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)). (PSQ02U)

MOUNTING OPTIONS

HANGING HARDWARE: Threaded Rod (TR) option eliminates the need to install luminaires prior to the slot be- ing framed. Luminaire mounts on threaded rods. Gasket runs length of luminaire ensuring a clean finish at the wall. Optional mounting includes a wall bracket that is attached to the wall. Luminaires are then snapped onto the bracket. Luminaire installation that uses the mounting bracket must be performed before the perimeter slot framing is built. Blocking may be required to properly secure and position the luminaire. Be sure to allow room for finished wall materials such as stone, tile etc. Refer to details on page 7.

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are pre-wired with plug-and-play interconnection cables to support easy plug-together joining of luminaire runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

SPECIFICATIONS

OTHER OPTIONS

END CONDITIONS: Flat end condition (**FE-L & FE-R**)[1] at each end of run add 1/8" to each end of luminaire and are used when luminaire terminates at a vertical surface such as a finished wall. Pocket slot end condition (**PE-L & PE-R**)[1] to end and are used when slot terminates before meeting additional vertical wall surface. Includes the necessary hardware to accommodate ceiling materials when the luminaire doesn't terminate at a wall. Adds 1-1/4" for Spackle Flange and 1" for T-Bar per endcap to overall length of the luminaire.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery.

Backup Battery				
	Legrand 10W		Bodine BSL310LP 4ft. & 6ft.+ is okay. 4.1~5.9 not okay.	
Min. Housing Length	8'*	10'* + TXL	4'*	6'* + TXL
EM Lumen Output	1608	1608	956	956
EM Section Illuminated	2'	2'	2' or 4'	2' or 4'

* Minimum luminaire housing length for battery pack approved without sensor

TUNABLE WHITE ELECTRICAL OPTIONS[6]:
- **TW Driver Options 0-10V:** EM/GEN, GTD or Battery Back up
- **FineTune DMX:** EM/GEN or Battery Back up
- **DMX:** Battery Back up
- **DALI:** EM/GEN, GTD or Battery Back up
- **LUTRON:** EM/GEN, GTD or Battery Back up

REMOTE SENSORS: Remote mounted PIR (Passive Infrared) occupancy or daylight sensors available. Refer to Occupancy Sensor, Daylight Sensor, and Enlighted Sensor tech sheets for more info.

FINISHES: Finelite Signal White (**SW**) powder coat finish standard. Optional Adder: 185 RAL colors[2] are available. Custom color applies to the visible T-Bar flange.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request. These luminaires are rated for Damp Location. IC Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT[8]: Wall Mount T-Bar: 4.6 lb/ft; Wall Mount SF: 4.4 lb/ft; Threaded-Rod T-Bar: 3.1 lb/ft; Threaded-Rod SF: 2.9 lb/ft

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

[1] Minimum 3' body section length when using standard Finelite Osram drivers.
Minimum 4' body section length when using other drivers

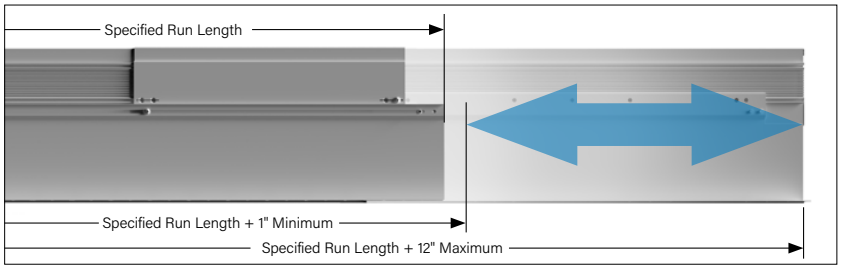
TELESCOPING

One telescoping (**TXL**) provides on-site flexibility with up to 11" of adjustability. and can be specified on either end of a run. Telescope adds a minimum of 1" and maximum of 12" to the run length provided. Max single section length with TXL adjustable from 11'-1" to 12'-0". Offered with flat endcap (standard) or pocketslot endcap.



SF WM Telescoping Shown

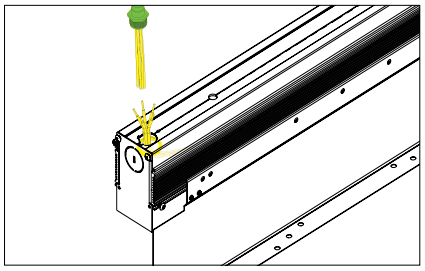
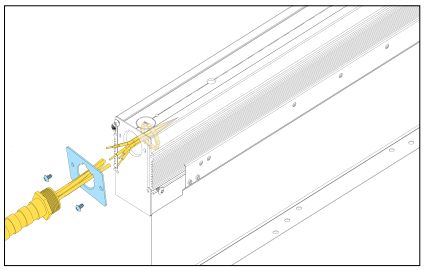
POWER FEED



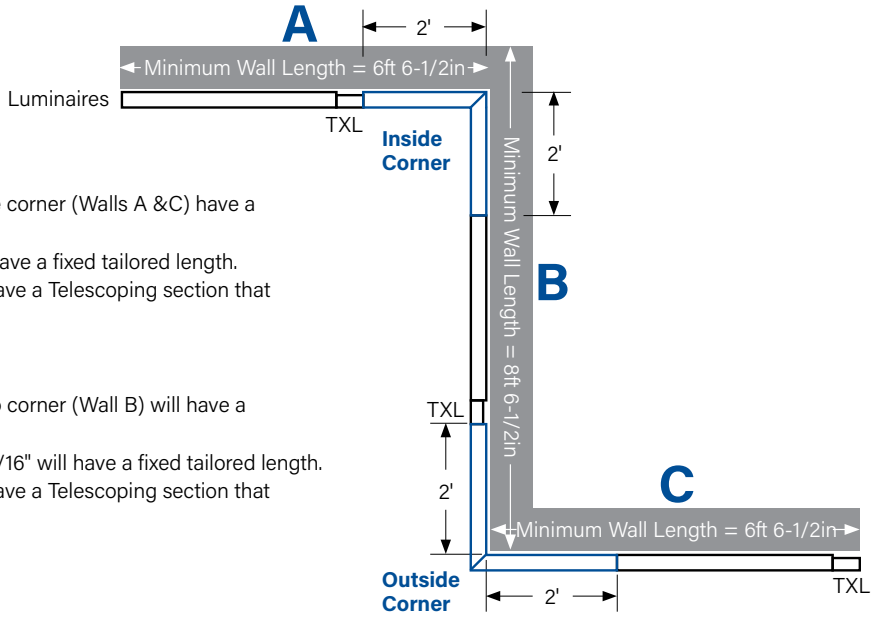
Top feed is standard. Top feed not available on a section with telescoping



End feed options

CONFIGURATIONS WITH PRE-BUILT CORNERS AND TELESCOPING

The example below demonstrates the target minimum wall length requirements for a configuration with pre-built 90 degree corners and telescoping. Consult factory for applications that require shorter than minimum lengths than shown below.



For configurations, wall segments with **One** corner (Walls A &C) have a minimum wall length of 4'.
- Wall lenghts between 4' to 6' 6-7/16" will have a fixed tailored length.
- Wall lengths of 6' 6-1/2" and greater will have a Telescoping section that provides +/- 5-1/2" of adjustability

For configurations, wall segments with **Two** corner (Wall B) will have a minimum wall length of 6'.
- Wall lengths between between 6' to 8' 6-7/16" will have a fixed tailored length.
- Wall lengths of 8' 6-1/2" and greater will have a Telescoping section that provides +/- 5-1/2" of adjustability

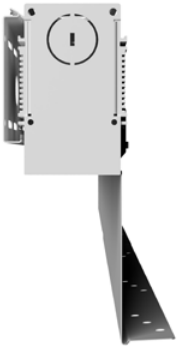
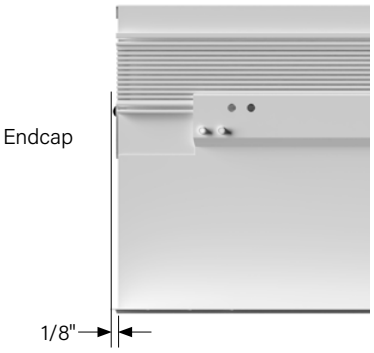
ENDCAP OPTIONS

Endcap Information
The **Flat Endcap** adds 1/8" per endcap to the section length.
The **Pocket Slot Endcap** adds 1-1/4" for Spackle Flange and 1" for T-Bar per endcap to the section length.
Example: Overall Luminaire Length = Luminaire Section + Endcap + Endcap
11' - 3-1/2" = 11' - 3-1/4" + 1/8" + 1/8"

Standard Flat (FE-L or FE-R)
Add 1/8" per endcap to the section length. Spackle Flange version shown T-Bar available. Flat end condition for when luminaire terminates at a vertical surface such as a finished wall.





Pocket Slot (PE-L or PE-R)
Adds 1-1/4" for Spackle Flange and 1" for T-Bar (includes endcap dimension 1/8") per endcap to the housing length on shop drawings T-Bar version shown, Spackle Flange available.

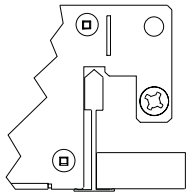
Mounting Details

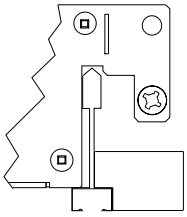
Flat T-Grid

Integrates with most common T-Grid ceiling types



Works with 9/16" & 15/16" flat T-Grid ceilings

Slot T-Grid



Can also be used with slot T-Grid ceilings. For 9/16" slot T-Grid ceilings, fixture will sit 5/16" above bottom of T-Bar.

SilkSpace recessed

2'x2', 1'x4' & 2'x4'

Specifications

Optical System

The optical system is comprised of arrays of LEDs edge lighting a low profile light guide panel. The micro structured surface of the light guide panel optimizes the light extraction creating a homogeneously luminous appearance. Light is then controlled by MesoOptics film suppressing the high-angle light creating an ultra low-glare bat-wing distribution.

Finish

Housing and Frame painted, high quality,
powder coated matte white only.

Housing

Sides and center spine: precision aluminum extrusion; end caps, back housing and driver cover: die-formed, 20 gauge cold-rolled steel, pre and post painted. Available in white. Multiple wire entrances are available (top or side) to allow continuous row mounting of fixtures.

Weight

Maximum 28lbs (2x4); 21lbs (1x4); 15lbs (2x2).

Electrical

Factory pre-wired with driver safety disconnect.

Mounting

Fixtures are factory pre-wired and tested for all circuits and emergency battery packs. Compatible with 15/16" lay-in acoustical ceilings using exposed grid suspension (NEMA type G). For 9/16" slot T-grid ceilings, fixture will sit 5/16" above bottom of Tee. Optional drywall kit trim mount can be fastened to a wood frame or with hangar wire. Continuous row mounting not available with drywall kit trim mounts.

Standard Driver

Advance Xitanium 0-10V, 1% dimming.

Advance Xitanium Sensor Ready (SR), 5% dimming.

PoE Lighting Controller (for PoE tunable white).

Lutron EcoSystem LDE1, 1% dimming with Soft-on, Fade-to-Black.

Class 2 rated output.
Consult Ledalite for other available drivers.

Standard Battery Packs

Bodine Battery Pack, 90 min, 10W, Class 2 rated output.
Lumen output = 10W x luminaire efficacy x 1.1. Typical output 1100lm.

PoE Battery Pack, 90 min, 6W, Class2 rated output.
Lumen output = 6W x luminaire efficacy. Typical output 650lm.

Lumen Maintenance

LEDs have been tested by the manufacturer in accordance with IESNA LM-80-08. At an ambient temperature of 25°C, the LED lumen maintenance expectation according to IES TM-21-11:
L90 (10k) >60,000 hrs (Reported methodology)
L80 (10k) 125,000 hrs (Projected methodology)

Source Color

LEDs rated for color rendering of:
CRI >80 & R9 >0
CRI >90 & R9>50

Fixture to fixture color accuracy within:
2 SDCM for Static White luminaires
3 SDCM for Tunable White luminaires

Wiring

Optional flex whips are supplied in 6' lengths.

Approvals

Certified to UL, CSA, and IES standards. City of Chicago Approved CCEA (housing option C). Certain versions without battery packs are DesignLights Consortium® qualified. Please see the DLC QPL list for exact catalog numbers www.designlights.org/QPL.

Quick Ship

Available for most non-connected configurations upon request. More information available at: www.signify.com/en-us/brands/ledalite/quickship

Warranty

Five-year luminaire limited warranty including LED boards and driver.
www.signify.com/warranties

Environment

Rated for dry & damp locations in operating ambient temperatures of 0-25°C (32-77°F). Many luminaire components, such as reflectors, refractors, lenses, and LEDs are made from various types of plastics which can be adversely affected by airborne contaminants. If sulfur based chemicals, petroleum based products, cleaning solutions, or other contaminants are expected in the intended area of use, consult factory for compatibility. Damage caused by sulfur, chlorine, petroleum based solution or other contaminants are not covered under warranty.

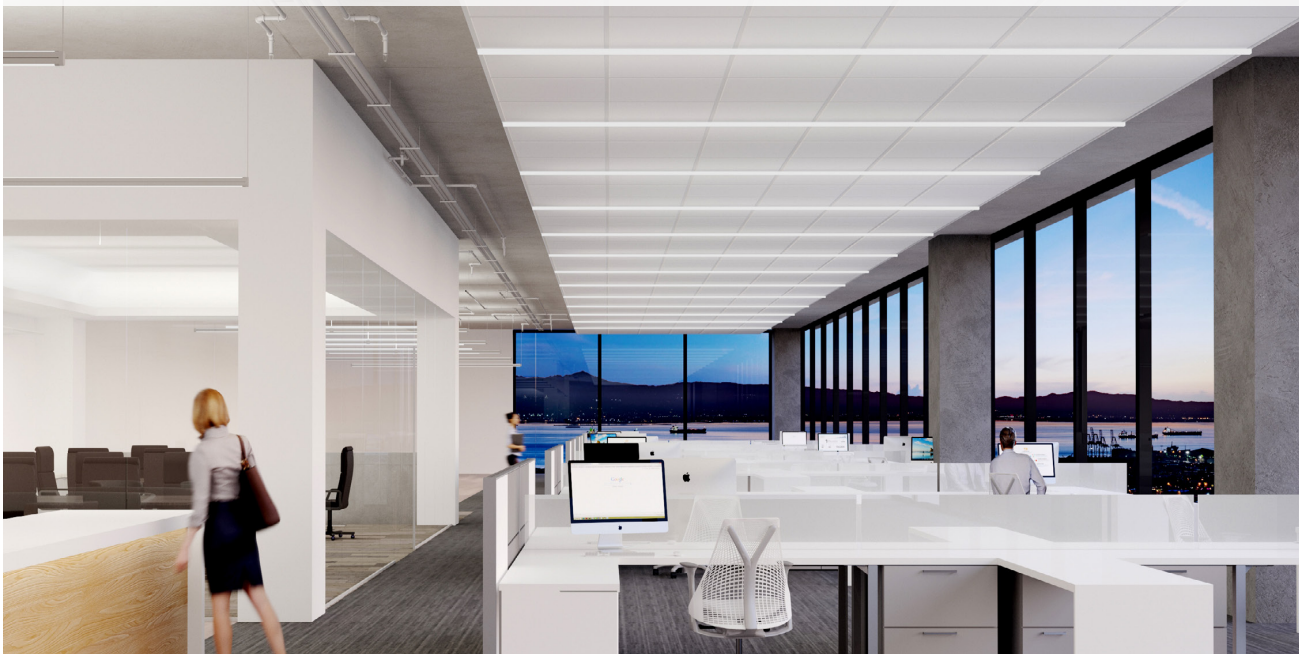
vode® Adaptive architectural lighting systems



Spec Guide

ZipTwo® | Round 3515 | 707

Direct lighting for open office and ambient applications.

Round 3515, Diffuse, white

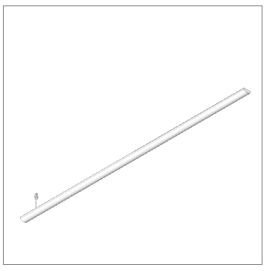
Benefits & Features

Low Profile Design
Round profile. 1.38" (35mm) x 0.60" (15mm).

Superior Light Quality with High Diffusion
Output up to 1071 lm/ft (3512 lm/m) (HO), 110 lm/W (SO). 80 or 90 CRI & tunable white (2200K-5000K) available.

Versatile Mounting Options, Easy Installation
Magnet with tape-on metal strip or low profile clip allow for mounting to almost any surface or T-Bar ceiling.

High Diffusion & Uniform Distribution
Wide, soft distribution without diode image.



Single Rail

5 Year Limited Warranty. See full Vode warranty description ***here*** *or at vode.com.*

Listed to UL standards for damp location by a Nationally Recognized Testing Laboratory (NRTL) recognized by OSHA.

Structure

Rail Lengths	*24" (610mm) - 144" (3658mm) See **Rail Length Chart** for more details.*
Rail Dimensions	1.38" (35mm) x 0.60" (15mm). See dimensions section for details.
Construction	Extruded and machined 6063 aluminum.
Mounting	Clip, Clip with Micro J-Box, Magnet with Tape-On Metal Strip, T-Bar Clips for most grid/panel construction, Strut Channel Clip.
Run Length	24" (610mm) minimum. Rail lengths may be installed end-to-end to any length.
Operating Temperature	32°F to 104°F (0°C to 40°C).
Humidity	0-95%, non-condensing. Suitable for damp locations.
System Weight	0.25lbs per ft (0.11kg per 305mm). *Power supply and housing not included.*

Materials

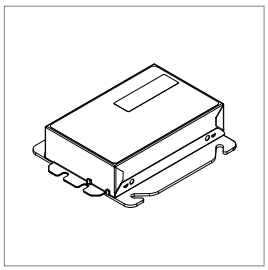
LED Board Construction	Aluminum core PCB, black LCP connectors, RoHS compliant.
Lens	High-impact extruded acrylic glass (PMMA).
Power Cable	Ø3mm, 33/2 AWG, Plenum (CMP) rated semi-rigid PVC or FEP, flame tested UL-910 *(PVC free in 2020)*
Cable Connectors	Unfilled black nylon, rated UL 94 V-0, halogen free, PVC or FEP overmold, RoHS compliant *(PVC free in 2020)*
Remote Linear Power Housing (RLP)	20.7" x 2.375" x 2.53", 0.054" formed Galvanized Steel
Remote Brick Power Housing (RBP)	4.32" x 3.37" x .078" Galvanized Steel mounting plate

Power and Controls

Power Type	Class 2 (<60v output) constant current driver
Dimming Controls	Dimming (0.1%, 1%), 0-10v, DALI, DMX, Lutron Hi-lume 1% are available. *See **Power Guide** for details.*
Input Voltage	120v - 277v, 50/60hz
Power Location	Remote power. Maximum remote distance up to 100' (30.5m) *depending* on driver selection. *See **Power Guide** for details.*

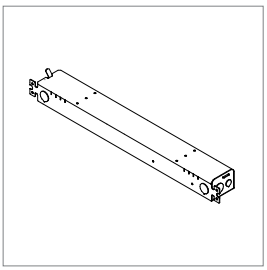
Remote power is locating the power supply away from the fixture. Remote power comes in two housing styles: brick style and linear style. Consult ***Power Guide*** to determine which type you will receive.

Remote Brick Power Housing



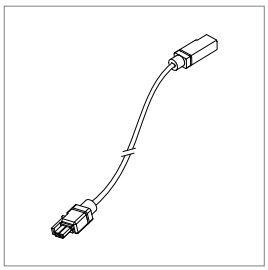
Supplied for some remote power applications. One remote power supply housing is supplied for each rail. Provided driver mounting plate fits standard 4" metal, square J-Boxes with a minimum volume of 21 in^3 (J-Box not provided).
See ***Tech Sheet*** for details.

Remote Linear Power Housing



One remote power supply housing is supplied with each power supply. All Vode linear remote drivers come in a 0.054" (0.8mm) formed galvanized steel power supply housing with five (5) knockouts: (4) 1-1/8", (1) 7/8" and (1) 9/16". Accommodates standard linear power supplies.
See ***Tech Sheet*** for details.

Wire Harness

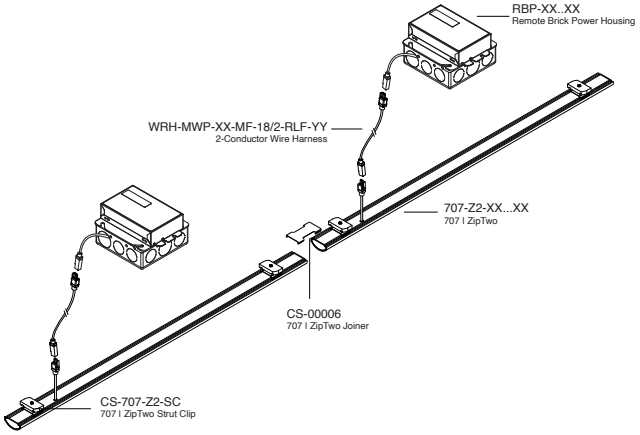


Wire harness connects driver to rail. Wire hareness is 25' (7.6m) with micro fit molex connectors for quick and easy installation. Multiple harnesses can be combined for a total length of up to 100' (30.5m).
See ***Tech Sheet*** for details.

Power and Controls

Flexible 1 to 1 power

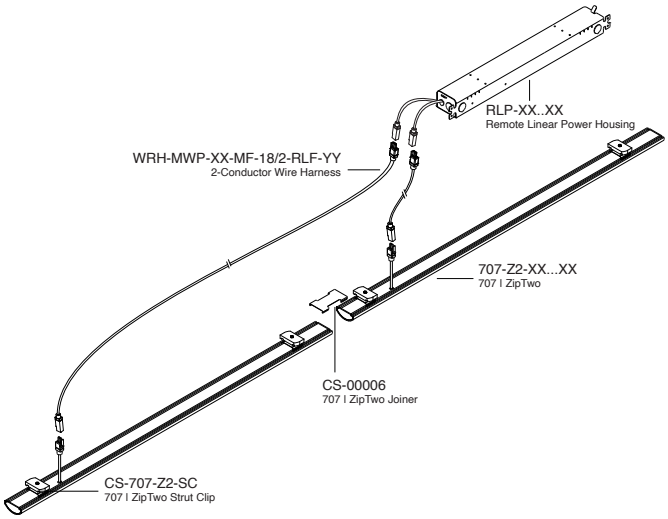
For Flexible 1 to 1 Power, Vode supplies one single output driver per fixture, allowing each fixture to be controlled independently. Direct/Indirect fixtures are supplied with two single output drivers, allowing the direct and indirect lighting to be controlled independently. Consult ***Power Guide*** to determine which type you will receive.



Optimized Power

To optimize power, Vode configures specifications with drivers that have 2 or 4 outputs. Depending on system configurations and power requirements, up to 4 fixtures can be powered from a 4-output driver. Consult ***Power Guide*** to determine which type you will receive.

IMPORTANT: Each fixture will still require individual wire harnesses, as shown below.

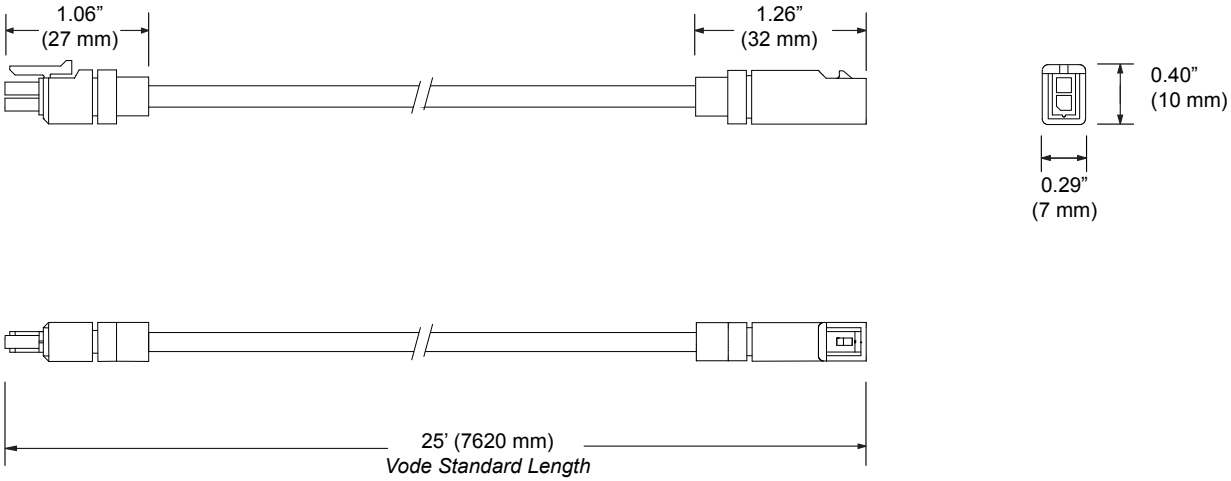


Note: Drawings not to scale, for reference only.

Power and Controls

Wire Harness

Low voltage wire harness connects driver to rail. Wire hareness is 25' (7.6m) 18/2 AWG stranded wire with provided micro fit molex connectors on either end for quick and easy installation. Multiple haresses can be combined for a total length of up to 100' (30.5m). Refer to Vode Power Guide for max remote distance based on power selection. Consult ***Power Guide*** to determine which type you will receive.



Note: Drawings not to scale, for reference only.

Nolan LED Sconce
NLS Series

Features
Metal accents with a clear outer glass and white acrylic inner diffuser.
Ideal use in hallways, entrances or anywhere general lighting is needed.
Provides lighting in residential, commercial and hospitality applications.
Meets ADA requirements. Fixture mounts standard to junction box (not included).

Construction
A 22-gauge shallow metal pan is made by stamping process and plated.
The front plate is 20-gauge steel with decorative metal trim plated.
The shade in shade design with clear outer acrylic and white inner diffuser.
Fixture has an open top with white acrylic diffuser on bottom.
Power supply connections must be made inside a junction box (not included).

Finish
Satin Nickel or Oakley Bronze with clear lacquer finish.

Diffuser
White acrylic interior diffuser is .100" thick. Exterior clear acrylic diffuser is .100" thick. Distance between both diffusers and diffuser assembly is held by a plastic spacer at the bottom of the diffuser.

Electrical
Input 120-277 VAC 60 Hz. 0.14A at 120 VAC.
Compatible with residential (TRIAC/ELV) and commercial (0-10V) dimmers.
TRIAC and ELV dimming only at 120 VAC.

LED
Integrated LED modules capable of producing:
17W = 1400 source lumens
Adjustable Choice 3000K, 3500K, 4000K (CCT).
Rated for 50,000 Hrs. 90 CRI.

Certification
All fixtures are cETLus listed for indoor damp locations.
ADA

Warranty
Limited warranty: This fixture is free from defects in materials and workmanship for a period of 5 years from date-of-purchase.

Specifications and dimensions subject to change without notice.

BPM • 120/277V • LED

The miniature BPM series is a professional grade high output LED instrument with features such as 360 degree gate rotation, true "E" size gobo projection, 3 plane cool touch shutters and easily changed zoom lenses (narrow and wide).

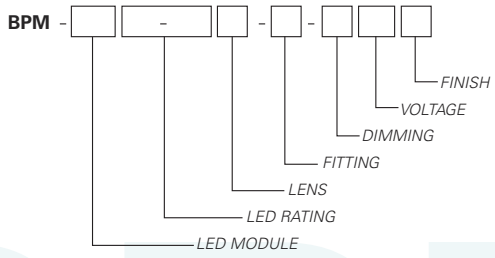
- 36,300 hour life to 70% lumen output, L70 at 95° max ambient
- Ideal for medium throw applications up to 20 feet
- Accepts industry standard, size "E" Gobo or custom projection patterns
- Fully rotatable lens barrel for easy image alignment
- Can be configured for use on 120, 230, or 277V systems
- Four cool-touch framing shutters on 3 planes for creating unlimited variations of geometric shapes, including true triangles
- Vertical and horizontal tool-less locking
- On/off safety switch (on most mounting types)
- Lexan track fitting with integral electronic driver compatible with reverse phase (ELV compatible) dimmers down to 5%
- Integral drop-in accessory cartridge accepts dichroic color filters and accessories (Industry size E; LSI size BPM)
- Locking zoom lens produces smooth, continuous change of beam size (Choose narrow beam or wide beam lens) 20° through 60°
- Spring loaded front accessory holder for gel media
- Finishes: LSI Black, White, and Silver
- Fixture weight: 3.5 lbs.

FIXTURE PART NUMBERS

Please review the **ORDERING INFORMATION** section on the next page as well as the **MOUNTING OPTIONS** on page 3 to create a part number for each fixture that specifies the following:

- LED Module
- LED Rating
- Lens
- Fitting/Controls (Dimming)
- Voltage
- Finish

PART NUMBER



Example Part Number: **BPM-C0615-9030W-00-TE120W** is a fixture with a COB LED module, 1500 Lumen/90 CRI/ 3000°K Color Temperature/19 Watt LED rating, Wide Angle Lens Assembly, 00 Track fitting with Trailing Edge group dimming capability, 120V and a Black finish.

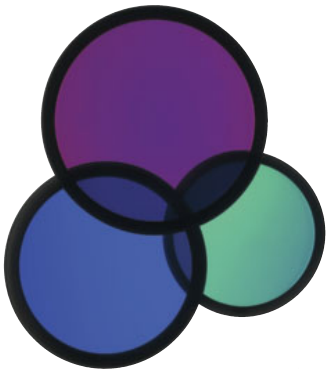
COLOR MEDIA

DICHROIC COLOR FILTERS

In addition to our complete line of glass color filters, LSI now offers dichroic glass color filters that achieve purer, more saturated, richer color by selective wavelength transmission. Since these filters reflect rather than absorb the unwanted color wavelengths, a higher intensity of colored light can be obtained with fewer or lower wattage fixtures. In addition, this selective transmission allows for very accurate color matching from filter to filter.

All standard LSI filter sizes are available in a wide palette of well chosen dichroic colors that can be used with all LSI fixtures that accept accessories.



Size	Diameter	LSI Fixture Series
BPM (Industry size E)	37.5mm (1 1/2")	BPM

Technical Data

Dichroic color filters are created in a vacuum chamber by multi-layer vapor deposits of different minerals onto low expansion, chemically resistant Borosilicate glass.

Deposits are made in alternating layers of varying microscopic thickness which allow very narrow color wavelengths to be selectively transmitted and all other wavelengths to be reflected.

LSI does not recommend using dichroic color filters with lamps or fixtures that have beam spreads greater than 40° because a secondary color aura is created by the wide angular transmitted wavelengths that are different than the desired color wavelength.

Since there is mainly transmission and reflection of the color wavelengths by the dichroic filter and very little absorption, the dichroic filter can be used with many high temperature lights that normally would not accept color filters.

Lighting Services Inc

SURFACE TRACK (120/250V) • SPECIFICATIONS

GENERAL Lighting Track shall allow fixtures to be located anywhere along the track length. Fixtures shall be easily focused, switched, dimmed, accessorized and removed as desired. Track system shall have a twelve year warranty from date of shipment.

MECHANICAL Lighting Track shall be constructed of .070 (2mm) extruded aluminum with overall height of 1.42 (36mm) and overall width of 1.812 (46mm). Track shall have same overall dimensions and physical appearance for both one and two circuit models.

Track shall be available in nominal 4 foot (1.2m), 8 foot (2.4m), and 12 foot (3.7m) lengths, in Silver, Black, and White high temperature baked paint finish. Track shall be field cuttable to any length with a single cut.

Track system shall be available with End Feed, End Cap, Straight Mini-Joiner, Straight Joiner/Feeder, Flexible Joiner and L, T, and X Joiner/Feeders as standard components.

Track shall have the ability to be directly surface mounted. Track shall have pre-punched mounting slots for direct mounting to any surface. Track shall have the ability to: be mounted 1/2 inch (13mm) from a surface by extruded aluminum mounting clips, be suspended from a surface by a field cuttable stainless steel cable system, be suspended from a surface by a field cuttable steel stem system, and be mounted into UniTrack housing.

ELECTRICAL Lighting Track and components shall be UL and CUL listed, CE Certified, and comply with the National Electric Code standards for Lighting Track. One and two circuit Lighting Track shall be rated at 120/250 volt, 50/60 Hz. 2400 watts maximum each circuit. Each 20 amp/120 volt circuit shall be comprised of flat copper busbars and have a separate neutral busbar for each circuit busbar. The neutral busbar shall be oversized to be comparable to #10 gauge 30 amp wire to reduce the possibility of overheating due to non-linear loads and harmonics. **Track shall have integral wiring channels for six (6) additional #12 THHN wires to create three (3) additional 20 amp/120 volt circuits, which can be dropped into any Joiner/Feeder, for a total track power capacity of 100 amps.** A separate grounding busbar shall be integral in all track lengths. All busbars shall be insulated to prevent contact with aluminum extrusion.

Track shall have electric feed capability through all Joiner/Feeders (except Flexible Joiner and Straight Mini-Joiner) using either 1/2 or 3/4 U.S. trade size knock-outs (.875 diameter [22mm] or 1.125 diameter [29mm]). Joiner/Feeders can be electrically field modified by removing the Lexan™ cover and rerouting internal pre-wired jumpers. All Joiner/Feeders shall be available in Black, White, and Silver GE fiber reinforced Lexan™.

One and two circuit Lighting Track with separate neutral busbars shall have the ability to have each circuit separately dimmed as required when using standard voltage and low voltage fixtures with either magnetic or electronic transformers. Track shall have the ability to be dimmed or switched in selected sections in addition to dimming or switching an entire track configuration or track run.

FIXTURE FITTING INTERFACE Track shall accept GE fiber reinforced Lexan™ fixture fittings which positively lock into track and cannot be energized by the integral switch until safety interlock handle is in the closed position. Safety interlock shall also prevent fixture fitting removal from track unless the switch is in the "off" position. Upon insertion of fixture fitting into track, grounding connection from fixture fitting to track shall be automatically completed before any electrical contact is made with busbars. When removing fixture fitting from track, the grounding connection shall automatically be disconnected last. The fixture fitting shall recess into the track, creating a minimal profile below the track. Fixture fittings for magnetic low voltage fixtures shall be furnished with fuse of the correct ampere rating for integral transformer protection, and shall not be fused as a branch circuit.

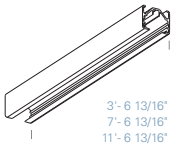
SURFACE TRACK (120/250V) • COMPONENTS

Key Features / Applications

UL and CUL listed, CE Certified, Dry Location • IBEW union made at LSI plant in USA • Specification grade heavy duty .070 (2mm) extruded aluminum track • 4 foot (1.2m), 8 foot (2.4m) and 12 foot (3.7m) field cuttable lengths • One circuit 20 amp or two circuit 40 amp capacity/120/250 volt • 100 amp total capacity when using integral wireways • Copper busbars equivalent to #12 AWG wire used as circuit and ground track conductors • Oversized copper busbars equivalent to #10 AWG wire used as neutral track conductors • Separate neutral track conductor used for each circuit • Separate copper grounding busbar used throughout track system • Black, White, and Silver finishes • All Joiner/Feeders, Flexible Joiners, Mini-Joiners, End Feeds and End Caps are injection molded of GE fiber reinforced Lexan™ • All Joiner/Feeders and Flexible Joiners are prewired and simply couple into track • All Joiner/Feeder circuits can be easily field modified by changing internal jumper wires • Fixture fitting recesses into track for minimum profile • LSI surface track can be mounted directly to any surface 5'-0" above finished floor.

Surface Track Sections



120/250V Surface Track Sections are used in conjunction with an End Feed, End Cap and a variety of Joiner/Feeders to form track runs and configurations. Track Section lengths are nominal 4 foot (1.2m), 8 foot (2.4m) and 12 foot (3.7m) which are field cuttable.

Finish		Nominal Length 4 ft	8 ft	12 ft

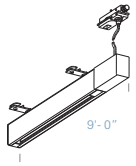
Bridge Track



120/250V Bridge Track is a complete, portable, field cuttable, surface UniTrack system that mechanically and electrically mounts to and spans parallel runs of LSI Track. Bridge Track provides an additional range of striking angles for track lighting fixtures or for centering a fixture over a target located between parallel runs of track up to 8 foot (2.4m) on center.

Finish		9 ft
Silver	One Ckt	31025
Black	One Ckt	31225

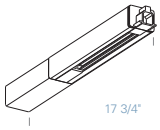
Security/Worklight Track



120/250V Security/Worklight Track is a separately fed one circuit Track Section, suitable for most LSI track fixtures, that integrates into any LSI Track run or configuration at any location. Consult fixture cutsheet. LSI fixtures (add suffix EF) mechanically lock into Security/Worklight Track by means of special hardware and do not have on/off switches.

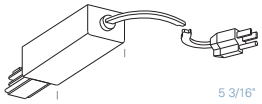
Lighting Services Inc

SURFACE TRACK (120/250V) • COMPONENTS

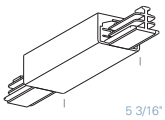
Portable Feed



120/250V Portable Feed is used when a portable or temporary track hookup is desired. Supplied with 15 foot #16 AWG-10 Amp/125 Volt 3 wire flexible cord with NEMA 5-15P grounding plug. Non-UL listed.

Finish		
Silver	One Ckt	**31101**
Black	One Ckt	**31201**
White	One Ckt	**31301**

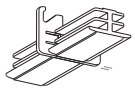
Straight Joiner/Feeder



120/250V Straight Joiner/Feeder is used to mechanically and electrically couple any two lengths of track in a straight line. Straight Joiner/Feeder can also be top fed to energize the track from a recessed outlet box when used in conjunction with appropriate Canopy Kit or can be top fed directly with cable.

Finish		
Silver	One Ckt Two Ckt	**31104** **32104**
Black	One Ckt Two Ckt	**31204** **32204**
White	One Ckt Two Ckt	**31304** **32304**

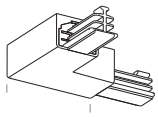
Straight Mini-Joiner



120/250V Straight Mini-Joiner is used to mechanically and electrically couple any two lengths of track in a straight line. Add .125 (3mm) for Straight Mini-Joiner when calculating overall lengths of straight runs or configurations (overall lengths are not the same as when using Straight Joiner/Feeder). Not for use as feeder.

Finish		
Silver	One Ckt Two Ckt	**31111** **32111**
Black	One Ckt Two Ckt	**31211** **32211**
White	One Ckt Two Ckt	**31311** **32311**

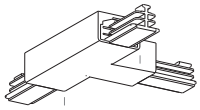
L Joiner/Feeder



120/250V L Joiner/Feeder is used to mechanically and electrically couple any two lengths of track in an L right angle configuration. This L Joiner/Feeder can also be top fed to energize the track from a recessed outlet box when used in conjunction with appropriate Canopy Kit or can be top fed directly with cable.

Finish		
Silver	One Ckt Two Ckt	**31105** **32105**
Black	One Ckt Two Ckt	**31205** **32205**
White	One Ckt Two Ckt	**31305** **32305**

T Joiner/Feeder



120/250V T Joiner/Feeder is used to mechanically and electrically couple any three lengths of track in a T configuration. This T Joiner/Feeder can also be top fed to energize the track from a recessed outlet box when used in conjunction with appropriate Canopy Kit or can be top fed directly with cable. Internal Joiner wiring can be field modified. Note that in the one circuit version, a right or a left T must be ordered and must be used directly opposite each other when used in a configuration so that busbar continuity is maintained. For two circuit track, a left and right T is not necessary.

Finish		Left Joiner	Right Joiner

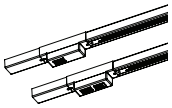
Current Limiter



LSI Track Current Limiters integrate directly into 1 and 2 circuit track runs in Black, White and Silver finishes. Available amperage rating include: (0.5) amp (60 watts), (1) amp (120 watts), (1.5) amp (180 watts), (2) amp (240 watts), (2.5) amp (300 watts), (3) amp (360 watts), (5) amp (600 watts), (8) amp (960 watts) and (12) amp (1440 watts). Other amperages available, consult factory.

California Energy Commission (CEC) approved and Title 24 compliant.

See spec sheet on LSI website for ordering information.

Adjustable Angle Bracket

The Adjustable Angle Bracket for Flex Joiner is designed to attach to cable mounted track. This assembly locks the set angle of a Flex Joiner when there is no rigid mounting means.

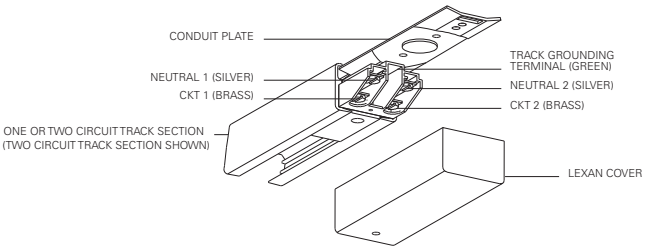
SURFACE TRACK (120/250V) • INSTALLATION

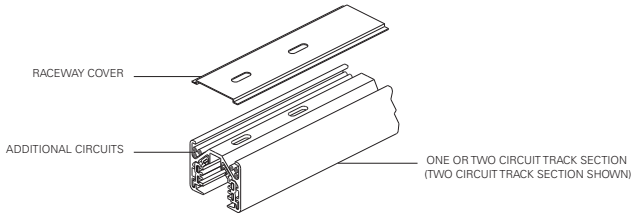
Electrical

Remove the Lexan™ cover from any End Feed or Joiner/Feeder, bring wires through combination 1/2, 3/4 U.S. trade size knock-out (.875 diameter [22mm], 1.125 diameter, [29mm]) in conduit plate and attach conductors to identified terminals. Joiner/Feeders can be electrically field modified after removal of Lexan™ cover by rerouting internal pre-wired jumpers.



Additional Circuits

LSI Track has integral wiring channels for six additional #12 THHN wires to create three additional 20 amp circuits with separate neutrals. Place conductors in wiring channels and slide raceway covers into track prior to mounting.



Installing LSI Fixtures

To insert a fixture fitting into the track, the switch must be in the "off" position, with the handle open. Insert the fixture fitting straight up into the track until it seats evenly, close handle completely, switch on. If using one circuit track, make sure that the brass contacts which protrude from the side of the fixture fittings are inserted facing the copper busbars. If using two circuit track, inserting the fixture fitting in one direction will connect to circuit one. Removing and reversing the direction of the fitting will connect to circuit two.

PRODUCT FEATURES:

- » Ceiling mount – 8"×48"
- » Product must be specified and ordered in pairs
- » Indirect Ambient and Direct Exam functions
- » Adjustable MR16 Reading light
- » Ingress Barrier door provides consistent surface for ease of cleanability

*Shown with Reading Light

SPECIFICATIONS

HOUSING: 20-gauge CRS; one-piece seam welded construction. 18-gauge housing flange with mitered and welded corners. White TGIC polyester powder coat – 5-stage pre-treatment. Salt spray test: 1,000 hours; Reflectance: 92%.

DOORFRAME: Heavy duty extruded marine grade aluminum with clear satin anodized finish. Doorframe supported to housing with aircraft cables (IB-AC) to provide NSF2 listing, or an optional continuous hinged doorframe (IB-HD). Select in ordering options below. Phillips-head stainless steel fasteners secure door to housing- six (6) with IB-AC and two (2) with IBHD. Closed cell silicone gasket seals the doorframe to housing. Lens sealed to extruded aluminum frame using a vinyl gasket.

OPTIC: Clear impact-resistant acrylic outer lens with inner high-efficiency diffuser. Exam function: direct 15° asymmetric linear overlay optic. Ambient function: Indirect high-efficiency TGIC painted white reflector. Optional reading light MR16 LED 20° beam with field aiming capability (90° rotation and 0-45° vertical).

LED MODULE: AMBIENT/EXAM: Serviceable mid-power LED array. See Ordering Information for CCT options. 3-step MacAdam variation allowance. 82 CRI minimum. READING: Single 6.5W MR16 LED lamp; 3000K CCT with 80 CRI minimum; non-dimming.

DRIVER: 120-277VAC or 347VAC, 50/60Hz electrical input (PF ≥ 0.9, THD < 20%). Minimum 85% electrical efficiency. Serviceable constant-current programmable driver. 0-10V dimming with 1-100% range and dim-to-dark capabilities (non dim-to-dark with 347V); 165µA max. source current per circuit. Specified-voltage required for optional Reading lamp. Optional LVCD controls low-voltage patient interface, controlling the ambient function independently with dimming control and the exam function independently without dimming. Optional secondary conduit entry available.

INSTALLATION: GRID MOUNT: Designed for 1" grid. Includes integral brackets for securing hanger wire. FLANGE MOUNT: Supplied with Drywall Frame Kit.

WARRANTY: Limited five (5) year warranty.

LISTINGS: Luminaire is certified to UL Standards by Intertek Testing Laboratory for Wet Locations and Non-IC installation. UL certified IP65 per IEC 60598. NSF2 Splash/Non-Food Zone (IB-AC only).

LED · ETL · NSF · IP65

ADVANCED HIGH CEILING

Whiz 2.0 - Standard

METEOR

High lumen compact luminaire with lumen output 12400 – 35400lm. Additional features include IP65 and outdoor/Natatorium rating.

Quantity		Type	
Project		Note	

Electrical System

- 13900lm (120W)
  19600lm (170W)
  26700lm (240W)
  35400lm (300W)
- Power Input: Universal (120-277V); 347-480V
- Operating Temperature: -40°F~112°F
- Surge Protection: 4KV
- Power Factor Greater than 0.9

LED Technology

- 3000K, 3500K, 4000K, 5000K
- 75 CRI, 85 CRI
- Beam Angle: 25°, 40°, 60° and 100° (with diffuser)
- Rated Life > 100,000 hours (L70)
- Lumen Maintenance > 0.90 at 60,000 hours

Advanced Dimming

(Proprietary VX Driver is incorporated to all dimming options for video flicker-free lighting)

- Standard 0-10V: dims to 10%
- Superior 0-10V: dims to 1%
- LDE1: Hi-Lume 1% EcoSystem (UNV only)
- LTE: Hi-Lume 1% 2-Wire TRIAC (120V only)
- DALI: dims to 10%
- DMX: high resolution dims to 0.1%
  (Supports ANSI E1.20 RDM protocol)

Housing

- Diameter: 16.24" (420mm)
- Material: Die-Cast Aluminum, Tempered Glass
- Weight: 33lbs

Mounting

- Stem 2ft, 4ft
- Adjustable Aircraft Cable 10ft
- Uplight 2ft, 4ft
- Adjustable Uplight 2ft, 4ft

Warranty

- 5 years limited warranty.

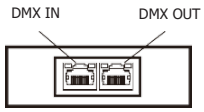
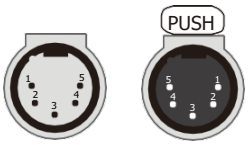
DMX Requirements*

The Whiz 2.0 LED fixture with DMX is a ONE CHANNEL DMX unit.
When placing order, please indicate DMX address. (The DMX address will be listed on the back of the fixture.)
The LED fixture provide RJ45 Socket or XLR socket to connect. (DMX cable NOT included.)
The final fixture should be terminated by the use of DMX Terminator (by others).

RJ45 Sockets



XLR Sockets



CONNECTION	RJ45 (CAT5e)	5-PIN XLR
Common	WHITE/BROWN(PIN7) & BROWN (PIN 8)	PIN 1
Signal -	ORANGE (PIN 2)	PIN 2
Signal +	WHITE/ORANGE (PIN 1)	PIN 3
Spare	-	PIN 4
Spare	-	PIN 5

Compatible DMX Cabling List

DMX uses a cable consisting of two twisted pairs plus a shield to carry data. The cable must be specifically impedance matched for the digital DMX signal, meaning that microphone cable or other non-rated cable **must not be used to carry DMX**. Network cable (Cat5, 5e or 6 cable) may be used to carry DMX in an installation; however special consideration must be given to shielding and termination. Under no circumstances should solid core cable like Cat5 be terminated into a screw down connector.

Meteor recommends the use of Belden 9729 for DMX installation. Belden 9729 is a two pair cable, which allows for a spare pair for 'out and back' type terminations if needed. Below is a list of other compatible Belden cables.

		8[16] 8'	**60L** 6000				

1 8' is tandem (2) 4' lenses with single piece 8' body.
2 Nominal delivered lumens at 25°C ambient.
3 Not available in 3' model.
4 XDIM option only available with 120V.
5 347V with EMLED only available in 8' models.
6 Not available in 2' or 3' model.
7 Not available in 4' 70L model or 8' 140L model.
8 DALI available up to 80L models only, consult factory for other options.
9 EMLED on 8' models illuminates 4' section in emergency mode.
10 Available with DIM driver option only.
11 Integral controls options dimmable to 5% via wireless wall switch. Non-integral controls configurations are 0-10V dimmable to 1%.
12 Must be installed in conjunction with a UL1008 device.
13 Must be ordered with an integral sensing option.
14 High bay motion detector. Motion sensing zone is extremely limited if used below 15' mounting height.
15 Must order IRT9015 Interact commissioning remote with each system order.
16 EMLED on 8' models illuminates 4' section in emergency mode.
17 ER100 options not available in 2', 3' only has availability when selecting UNV.
18 Failure to properly select the "BAC" suffix could result in you receiving product that is not BAA compliant product with no recourse for an RMA or refund. This BAC designation hereunder does not address (i) the applicability of, or availability of a waiver under, the Trade Agreements Act, or (ii) the "Buy America" domestic content requirements imposed on states, localities, and other non-federal entities as a condition of receiving funds administered by the Department of Transportation or other federal agencies.
19 Consult Signify to confirm whether specific accessories are BAA-compliant.

Accessories[19] (order separately)

- **FSSD2L** - 2' Diffuse replacement lens
- **FSSD3L** - 3' Diffuse replacement lens
- **FSSD4L** - 4' Diffuse replacement lens (order two for 8' models)
- **FSSWG4** - 4' wire guard (order two for 8' models)
- **FSTH** - Sliding hanger bracket (set of two)
- **LSXR10** - Low bay PIR motion sensor, 120-277V (not available with PoE)
- **LSXR10ADC** - Low bay PIR motion sensor with photocell and hi/lo trim dimming, 120-277V (not available with PoE)
- **FSSDEK** - Decorative plastic end cap (set of two)

(See last page for details and more options)

SWZCS accessories[19] (order separately)

- **IRT9015** – handheld remote for grouping and configuration(at least one remote required for any SWZCS installation).
- **UID8451/10** – Wireless Dimmer Switch Selector
- **UID8461/10** – Wireless Scene Selector

General notes

Many luminaire components, such as reflectors, refractors, lenses, sockets, lampholders, and LEDs are made from various types of plastics which can be adversely affected by airborne contaminants. If sulfur based chemicals, petroleum based products, cleaning solutions, or other contaminants are expected in the intended area of use, consult factory for compatibility.

PAF (Paint after fabrication) option is required for all products that will be used in a damp or humid location, such as under a canopy or covered parking area.

Not all product variations listed on this page are DLC qualified. To ensure that a specific model is qualified, visit www.designlights.org/search

interact ready.

FSS FluxStream LED strip

2', 3', 4' and 8'

Features

- Compact design for installation in tight spaces.
- Frosted acrylic diffuser provides wide light distribution and superior glare control.
- Diffuser and LED plate snap into place allowing tool-free access to LED boards and driver.
- 2', 3', 4' and 8' tandem lengths available to accommodate many field applications.
- Up to 100,000 hour predicted L70 LED lumen maintenance provides long service life to reduce maintenance costs.
- Can be surface mounted on ceilings or walls, or suspended via chain, pendants or cables.
- Wall mountable – ADA compliant.
- Ideal for cold applications (-20°C).
- Continuous row mounting using standard end caps. No extra parts needed.
- 7/8" knock out provided at each end and on base of luminaire. Note: Center knockout is covered and not useable in 4' version with EMLED option.
- Multiple driver options available with 0-10V as standard.
- Enclosed lens minimizes penetration of dust, insects, and other debris into the LED compartment.
- 8' tandem unit is two 4' optical assemblies with a center mullion on a single full length chassis.
- Integral controls options include sensor mounted in control module extension mounted on fixture end (see dimension drawing).
- Fluxstream luminaires are Designlights Consortium® qualifed. Please see the DLC QPL list for exact catalog numbers www.designlights.org/QPL.
- 5 year manufacturer's limited warranty. Visit signify.com/warranties for complete warranty information.

Finish

- Baked white acrylic matte high reflectance paint finish.
- PAF (Paint after fabrication) option, which is required for all products that will be used in damp or humid locations, such as a canopy or covered parking area, provides extra corrosion resistance.

Shielding

- Contoured frosted acrylic lens.

Electrical

- LED boards and drivers are RoHS (Restriction of Hazardous Substances) compliant. Total system life rated at 50,000 hours. Predicted L70 lifetime based on LED manufacturer's supplied LM-80 data and in-situ laboratory testing.
- Integral emergency driver with EMLED option. To estimate lumen output in emergency mode, multiply emergency pack wattage by efficacy, then by 1.10.
- The GTD/E option is used to bypass wall switches and allow luminaire operation on auxiliary power. Generator transfer requires installation in conjunction with a UL1008 listed device.
- The GTD/SNSR option is used to bypass integrated sensor control in the event of utility power loss. Generator transfer requires installation in conjunction with a UL1008 listed device.

Materials

- Heavy gauge cold rolled steel housing, LED plate, and end caps.

Labels

- cETLus listed.
- Suitable for damp locations.

Performance data

Fixture	Lumens	Wattage	Efficacy
FSS220L	2000lm	17W	123lm/w
FSS330L	3000lm	26W	119lm/w

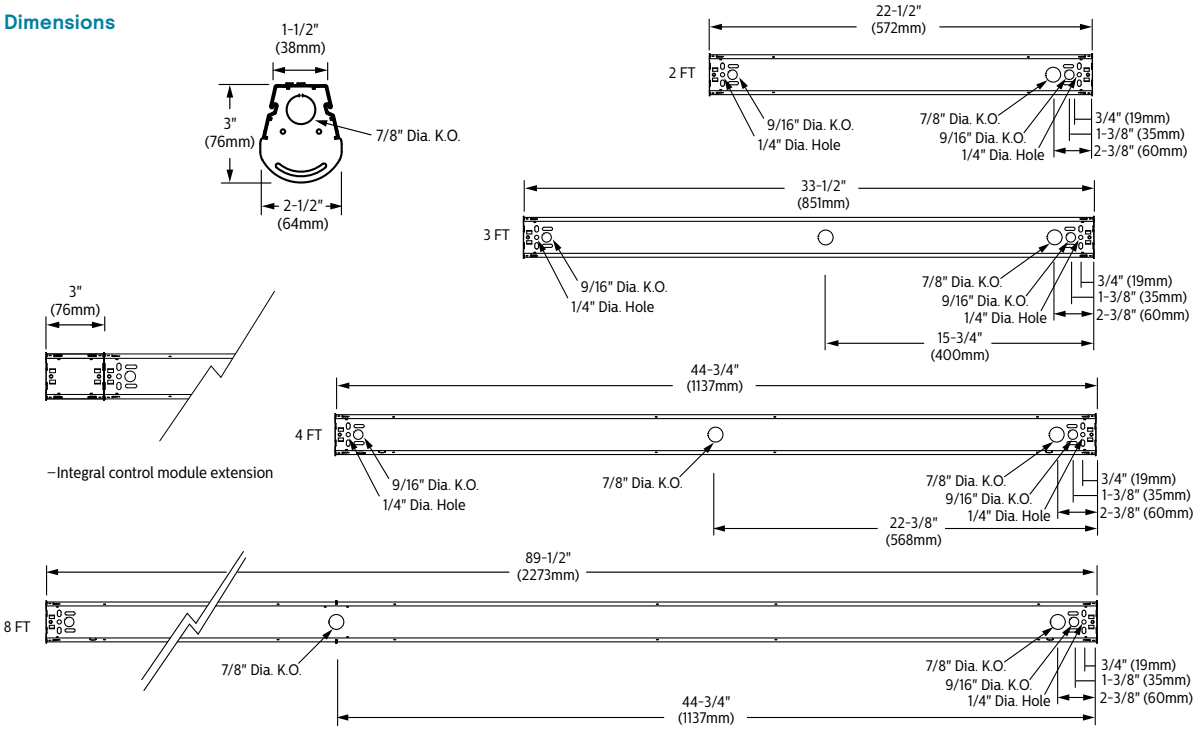
FSS8140L	-20°C to 25°C
EMLED option	Minimum 0°C
All others	-20°C to 40°C

Dimensions



FSS FluxStream LED strip

2', 3', 4' and 8'

Wireless Controls Options

SpaceWise DT (SWZDT)

- Standalone daylight and occupancy sensing with advanced grouping, wireless mesh networking and dwell time.
- Commissioning via compatible Android phone and Philips Field App
- Dimming via compatible Zigbee wireless wall switch only (see link below for details)
- Register for the commissioning app at http://registration.componentcloud.philips.com/appregistration/
- Integral sensing options may not be combined
- For more information including recommended switches, refer to the following: –

  SWZDT – www.usa.lighting.philips.com/systems/lighting-systems/spacewise

Emergency Options (ER100)

- Power Sensing (Factory default) – Recommended UL924 option requires unswitched power sense line, absence of voltage on the normal circuit triggers luminaire to 100% output
- Power Interruption Detection (Field option) – Detects AC power interruption >30ms triggers 90 minute emergency mode with luminaire at 100% output

FluxStream strip shown with integral sensor

Interact Pro scalable sensor for Foundation, Advanced & Enterprise tiers (SWZCS/SWZCSH and an evolution of SpaceWise)

- SWZCS/SWZCSH is a connected sensor with integral occupancy and daylight sensing and supports wireless mesh connectivity.
- The sensor works in the Foundation mode (similar to SpaceWise) when configured without a gateway or in an Interact Pro Advanced or Enterprise mode if a compatible gateway is used.
- Interact Pro includes an App, a portal and a broad portfolio of wireless luminaires, lamps and retrofit kits all working on the same system.
- Startup is implemented via Interact Pro App (Android or iPhone) & BlueTooth connectivity. The App provides flexibility to choose between a gateway or non gateway mode for setup.
- Setup with the gateway requires wired internet access to the gateway. It is possible to add a gateway at a later point.
- Prepare project configuration steps remotely and use IRT9015 remote onsite to identify and group devices together.
  - Compatible with:
    - UID8451/10 wireless dimmer switch
    - SWS200 wireless scene switch
    - Battery powered IP42 presence sensor OCC sensor IA CM WH 10/1
    - Battery powered IP42 presence & daylight sensor OCC-DL sensor IA CM IP42 WH
    - Battery powered IP65 presence sensor OCC sensor IA CM IP65 WH
    - Battery powered IP65 presence & daylight sensor OCC-DL sensor IA CM IP65 WH
- For more information on Interact Pro visit: www.interact-lighting.com/interactproscalablesystem

Radio only sensor (RADIO)

- Integral RADIO only sensor simply enables wireless mesh connectivity to the luminaire without any occupancy or daylight sensing.
- Ideal for applications where sensing functionality is managed by other Interact devices and the luminaire only needs to have wireless connectivity.

Interact Pro scalable sensor bundles for Enterprise tier

- IAOSB option in addition to occupancy and daylight sensing supports advanced IoT capabilities such as people estimation analysis, desk level temperature & humidity sensing, noise classification, and BLE beacon.
- Compatible with UID8451/10 wireless dimmer switch, SWS200 wireless scene switch, wireless Occ sensor (OCC SENSOR IA CM IP42 WH 10/1) and wireless Day/Occ sensor (OCC MULTI SENSOR IA CM WH 10/1) and wireless Occupancy or Daylight & Occupancy sensors available.
- Use Interact software and insights to increase building efficiency, achieve building wide integration and optimize space through occupancy analytics.
- Requires compatible Gateway and internet connectivity for commissioning.
- For more information, visit: www.interact-lighting.com/office or www.usa.lighting.philips.com/systems/system-areas/offices

Wired Controls Options

Interact PoE

- PoE based IoT connected lighting solution for large enterprises that span across multiple floors, buildings and require multiple gateways.
- Use Interact software and insights to increase building efficiency, achieve building wide integration and optimize space through occupancy analytics.
- IAOSB option in addition to occupancy and daylight sensing supports advanced IoT capabilities such as people estimation analysis, desk level temperature & humidity sensing, noise classification, and BLE beacon.
- PoE lighting controller is accessible from below.
- Integral sensor option for occupancy sensing (PIR) and/or daylight harvesting available for additional energy savings.
- Optional integral emergency controller and battery pack provides 600lm nominal output. Test switch and indicator light mounted on side of chassis on one end.
- Emergency battery has a 3 month pre-installed shelf life, and must be stored and installed in environments of 20C to 30C (-4F to 86F) ambient, and 45-85% relative humidity.
- For more information, visit: www.interact-lighting.com/office or www.usa.lighting.philips.com/systems/system-areas/offices

Accessories[19]

Accessory Catalog Code	Description	
FSTH	Sliding hanger bracket (pair)	
SV5F12	12" Stem and canopy kit	White stem and canopy kit, 1/4" trade size (1/2" O.D.) locknuts included. Works with 9/16" k.O. on base of housing.
SV5F18	18" Stem and canopy kit	
SV5F24	24" Stem and canopy kit	
SV5F36	36" Stem and canopy kit	
SV5F48	48" Stem and canopy kit	
FKR-126	Chain hanger set (pair)	Includes two 5' heavy duty link chains with "V" hooks. Attaches to base of housing.
DACHxx	Adjustable cable hanger kit (single)	Works with 1/4" hole on base of housing or FSTH hanger bracket. **xx**=cable length in inches, enter 48" to 180" lengths in 12" increments
DACHxx-1-SC	Adjustable cable hanger kit with white straight 18/3 cord (single)	
DACHxx-1-CC	Adjustable cable hanger kit with white coiled 18/3 cord (single)	
DACHxx-2-SC	Adjustable cable hanger kit with white straight 18/4 cord (single)	
DACHxx-2-CC	Adjustable cable hanger kit with white coiled 18/4 cord (single)	
DACHxx-1D-SC	Adjustable cable hanger kit with white straight 18/5 cord with dimming leads (single)	
LSXR10	Low bay pir motion sensor (120-277v)	
LSXR10ADC	Low bay pir motion sensor with photocell and hi/lo trim dimming (120-277v)	
FSSWG4	4' Wire guard (order two for 8' models)	
FSSD2L	2' Diffuse replacement lens	
FSSD3L	3' Diffuse replacement lens	
FSSD4L	4' Diffuse replacement lens (order two for 8' models)	
FSSDEK	Decorative plastic end cap (set of two)

FRAXION3 SLIM WALLWASH

DOWNLIGHT / HOUSING

A LED
Integral LED module design enables field service / replacement through housing aperture.

B OPTIC
Proprietary wallwash optic integrates Reflection, Refraction and TIR principles.

C TRIMLESS WOOD SPACERS
Provided for Trimless Wood installations; includes (1) 1/16" spacer and (5) 1/8" spacers.

D TRIM EXTENSION
Provided for -2 ceiling thickness; accommodates 2.125" max ceiling thickness.

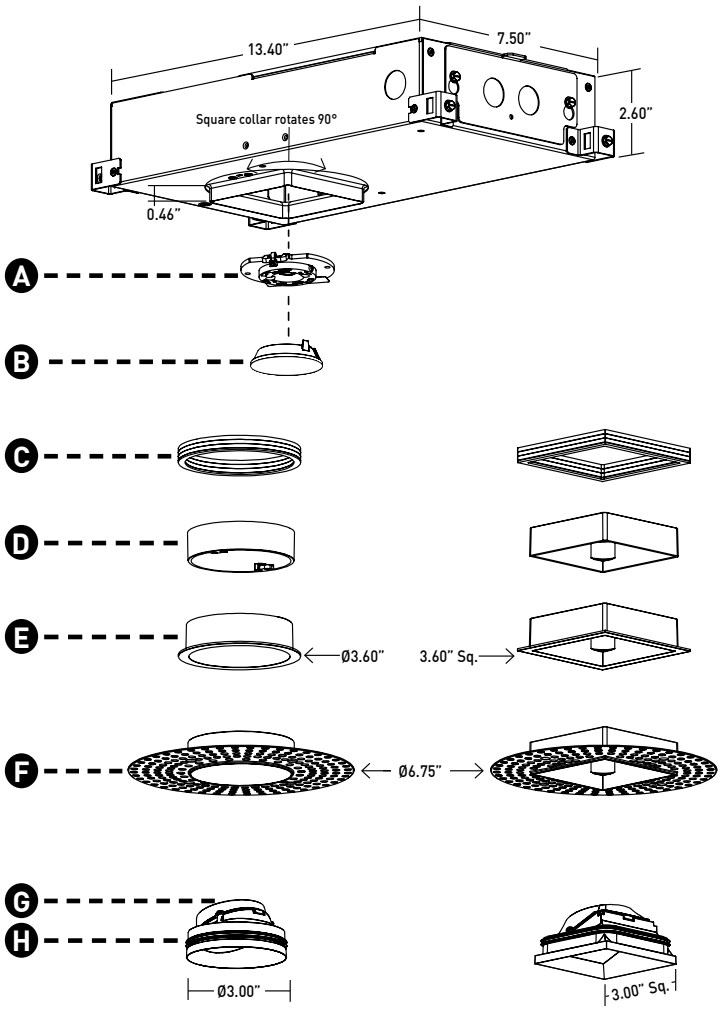
E MICROFLANGE PROFILE
Features 0.30" flange. Thickness measures 0.06". Installed after ceiling is complete. Requires 3.375" diameter cutout. Wet location features integral silicone gasket.

F TRIMLESS DRYWALL PROFILE
Installs totally flush with the ceiling with no visible trim. Appliqué includes screws for mounting and has 0.06" plaster stop. Not recommended for stucco applications.

G EFFECTS DEVICES
Asymmetrical spread lens, included and sealed in place, combined with angled optic and wide aperture enhance uniformity. Suction tool provided for removal of baffle.

H BAFFLE
Die-cast baffle minimizes aperture glare and conceals view into housing; includes gasket.

DIMENSIONS / DRAWINGS



[PH] +1-210-227-7329
[FAX] +1-210-227-4967

FRAXION3 SLIM WALLWASH

DOWNLIGHT / HOUSING

I **IC HOUSING**
- For IC ceilings.
- No setback from polycell spray foam insulation having max R-Value of 60 on all sides and top of housing.

J **NIC HOUSING**
- Minimum 0.50" setback from combustible and non-combustible materials on all sides and top of housing.
- Minimum 3.00" setback from insulation material having max R-Value 30 on all sides and top of housing.
- Minimum 6.00" setback from polycell spray foam insulation having max R-Value 60.

K **ADJUSTABLE HANGER BAR HEIGHT ACCESSORY**
Provided with ceiling thickness "T" and recommended for installations in T-Grid and furring channel up to 1.5" tall. Hanger bars are installed to adjustable bracket. Allows housing to be raised and lowered; ceiling thickness remains 0.5" to 1.375" max.

L **APPLIQUÉ DETAIL**
Appliqué for plaster floating directly to baffle.

M **REMOTE POWER SUPPLY**
Provided with install Types "V", "W" and "D". Remote power supply provides additional driver options. Consult installation guide for maximum allowable secondary run lengths between PSF3-RMT and fixture. Must be installed in an accessible location.

HOUSING NOTES

- Do not install in environments where ambient temperatures exceed 25°C (77°F).
- Power supply compartment and all splice connections may be serviced from room side.
- Consult factory for spacing requirements for any installations exceeding R-Value 60.
- Hanger bars fitted to short side of housing or long side when TG accessory is specified; extend from 14.0" to 24.0", but may be field cut to accommodate narrow stud spacing. Can be extended up to 46" maximum with FRX-HBE-46 kit.
- Hanger bars and brackets add 4.00" max to the overall dimension, but are exclusive of the setback requirements.
- Housings for round trims feature a round aperture housing collar. Housings for square trims feature a square housing collar that rotates up to 90 degrees for fixture alignment. Housing collars accommodate ceiling thicknesses between 0.50" and 2.125".

FRAXION3 SLIM WALLWASH

TECHNICAL

CONSTRUCTION
Downlight: Painted finishes are granulated powder coat.
Housing: Aluminum and 22 Gauge galvanized steel. Extruded aluminum housing panel to act as heat-sink.
Remote Power Supply: 22 Gauge galvanized steel.
Appliqué: Zinc alloy.

STATIC WHITE LED
2-step MacAdam ellipse LED module available in 80+, 90+ and 97+ CRI configurations in color temperatures of 2200K, 2700K, 3000K, 3500K and 4000K. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

WARM DIM LED
3-step MacAdam ellipse warm dim LED module available in 90+ CRI configuration. 3200K or 2700K at full brightness, warming to 1800K at full dim. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

TUNABLE WHITE LED
5-step MacAdam ellipse tunable white LED module available in 90+ CRI configuration. Features tuning range of 2700K to 5000K. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

Note: For L2, LP, EG and EN drivers consult chart on page 7 to confirm appropriate dimming curve for compatibility with selected control.

SPACING
Recommended fixture spacing is 36" on center with 36" setback from wall plane.

LISTING
cTUVus listed to UL1598 standard for Dry / Damp and Wet locations. Chicago Plenum, Airtight and Title 24 JA8-2019 Listed.

WARRANTY
Manufacturer's 1-year warranty guarantees product(s) listed to be free from defects in material and workmanship under normal use and service. 5-year warranty on LED and power supply to operate with 70% of the original flux and remain within a range of 3 duv. 10-year Lutron Advantage limited warranty available on Lutron equipped systems. Warranty period begins from the date of shipment by Seller and conditional upon the use of manufacturer-supplied power supply. Consult website for full warranty terms and conditions.

CHANGE LOG
1. 01/12/2021: ADDED 2200K AND 2700K-1800K WARM DIM OFFERINGS.
2. 04/30/2021: REMOVED QUICK SHIP.

DOWNLIGHT / HOUSING

A LED
Integral LED module design enables field service / replacement through housing aperture.

B OPTIC
Proprietary optic integrates Reflection, Refraction and TIR offering 10°, 15°, 22°, 40° & 60° beams.

C TRIMLESS WOOD SPACERS
Provided for Trimless Wood installations; includes (1) 1/16" spacer and (5) 1/8" spacers.

D TRIM EXTENSION
Provided for -2 ceiling thickness; accommodates 2.125" max ceiling thickness.

E MICROFLANGE PROFILE
Features 0.30" flange. Thickness measures 0.06". Installed after ceiling is complete. Requires 3.375" diameter cutout. Wet location features integral silicone gasket.

F TRIMLESS DRYWALL PROFILE
Installs totally flush with the ceiling with no visible trim. Appliqué includes screws for mounting and has 0.06" plaster stop. Not recommended for stucco applications.

G EFFECTS DEVICES / LENS RETAINER
Fixture is limited to 1 effects device. Wet location effects device is sealed in place. Suction tool provided for removal of baffle with wet location. Lens retainer allows effects devices to be changed in Dry /Damp locations.

H ROUND BAFFLE
Die-cast removable baffle provides easy access to tilting mechanism and features 62° glare cutoff. Minimizes aperture glare and conceals view into housing; includes gasket.

SQUARE TRANSITIONAL BAFFLE
Die-cast removable baffle provides easy access to tilting mechanism and features 62° glare cutoff. Transitions from square aperture at ceiling plane to round aperture at light source. Minimizes aperture glare and conceals view into housing; includes gasket.

DIMENSIONS / DRAWINGS

FRAXION3 SLIM FIXED

DOWNLIGHT / HOUSING

I **IC HOUSING**
- For IC ceilings.
- No setback from polycell spray foam insulation having max R-Value of 60 on all sides and top of housing.

J **NIC HOUSING**
- Minimum 0.50" setback from combustible and non-combustible materials on all sides and top of housing.
- Minimum 3.00" setback from insulation material having max R-Value 30 on all sides and top of housing.
- Minimum 6.00" setback from polycell spray foam insulation having max R-Value 60.

K **ADJUSTABLE HANGER BAR HEIGHT ACCESSORY**
Provided with ceiling thickness "T" and recommended for installations in T-Grid and furring channel up to 1.5" tall. Hanger bars are installed to adjustable bracket. Allows housing to be raised and lowered; ceiling thickness remains 0.5" to 1.375" max.

L **APPLIQUÉ DETAIL**
Appliqué for plaster floating directly to baffle.

M **REMOTE POWER SUPPLY**
Provided with install Types "V", "W" and "D". Remote power supply provides additional driver options. Consult installation guide for maximum allowable secondary run lengths between PSF3-RMT and fixture. Must be installed in an accessible location.

HOUSING NOTES

- Do not install in environments where ambient temperatures exceed 25°C (77°F).
- Power supply compartment and all splice connections may be serviced from room side.
- Consult factory for spacing requirements for any installations exceeding R-Value 60.
- Hanger bars fitted to short side of housing or long side when TG accessory is specified; extend from 14.0" to 24.0", but may be field cut to accommodate narrow stud spacing. Can be extended up to 46" maximum with FRX-HBE-46 kit.
- Hanger bars and brackets add 4.00" max to the overall dimension, but are exclusive of the setback requirements.
- Housings for round trims feature a round aperture housing collar. Housings for square trims feature a square housing collar that rotates up to 90 degrees for fixture alignment. Housing collars accommodate ceiling thicknesses between 0.50" and 2.125".

TECHNICAL

CONSTRUCTION
Downlight: Painted finishes are granulated powder coat.
Housing: Aluminum and 22 Gauge galvanized steel. Extruded aluminum housing panel to act as heat-sink.
Remote Power Supply: 22 Gauge galvanized steel.
Appliqué: Zinc alloy.

STATIC WHITE LED
2-step MacAdam ellipse LED module available in 80+, 90+ and 97+ CRI configurations in color temperatures of 2200K, 2700K, 3000K, 3500K and 4000K. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

WARM DIM LED
3-step MacAdam ellipse warm dim LED module available in 90+ CRI configuration. 3200K or 2700K at full brightness, warming to 1800K at full dim. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

TUNABLE WHITE LED
5-step MacAdam ellipse tunable white LED module available in 90+ CRI configuration. Features tuning range of 2700K to 5000K. Average rated lamp life of 50,000 hours. LED and driver assemblies are field-replaceable.

Note: For L2, LP, EG and EN drivers consult chart on page 7 to confirm appropriate dimming curve for compatibility with selected control.

LISTING
cTUVus listed to UL1598 standard for Dry / Damp and Wet locations. Chicago Plenum, Airtight and Title 24 JA8-2019 Listed.

WARRANTY
Manufacturer's 1-year warranty guarantees product(s) listed to be free from defects in material and workmanship under normal use and service. 5-year warranty on LED and power supply to operate with 70% of the original flux and remain within a range of 3 duv. 10-year Lutron Advantage limited warranty available on Lutron equipped systems. Warranty period begins from the date of shipment by Seller and conditional upon the use of manufacturer-supplied power supply. Consult website for full warranty terms and conditions.

CHANGE LOG
1. 01/12/2021: ADDED 2200K, 2700K-1800K WARM DIM AND 10 DEGREE OPTIC OFFERINGS.
2. 04/30/2021: REMOVED QUICK SHIP.

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

The High Performance 2.5" Aperture (HPX) is a patented LED linear luminaire with a square micro profile and internal driver design. This Line-of-Light luminaire delivers excellent performance and is equipped with a unique LED configuration for superior illumination. HPX can be tailored from 2' to 12' sections in 1' increments and is available in Pendant, Surface Mount, and Recessed.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving **Red List Approved** and **Declared** status.

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system, plug-together wiring, standard.

LENGTHS: Any length, 2' minimum section length. Increments of 1'. 12' maximum section length.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). A separate chart summarizes lumen distribution and wattage. For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

DOWNLIGHT OPTION: 12' maximum diffuser length. Flush (**F**) frost white snap-in diffuser, standard; 73% transmissive, 99% diffusion

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

ELECTRICAL OPTIONS

STATIC WHITE FEED: 18-gauge/5-conductor single-circuit feed wire, standard. 14-gauge feed wire used when luminaire current exceeds 5 amps.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when fixture current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10% - 100%. Dimming to 1% available; Consult factory. Driver is fully accessible from below the ceiling.

- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON STATIC DRIVER OPTIONS:

- **LUTES1** Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series)
- **LUTES5** 5-Series 5% EcoSystem (LDE5 Series)
- **LUT2W** Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series);

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V/277V.

- **Power factor** ≥0.9
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100 - 1%
- **Expected driver lifetime:** 100,000 hours

LUTRON TUNABLE WHITE DRIVER OPTION: LUTDTW 1% T-Series 2-Channel Digital Tunable White (PSQ Series).

MOUNTING TYPE

HANGING HARDWARE:

- **Recessed Spackle Flange:** Drywal surfaces (walls or ceilings): 1/4" - 20 stud and nut (provided by others). Mounted with three equidistant suspension points.
- **Recessed T-Bar:** Standard bracket design works with most lay-in ceiling types. Brackets secure luminaire to the ceiling grid from above. Tie-in T-Bar brackets connect the luminaire to the T-Bar for securing to structure. Consult local codes for tie-wire recommendations.

OTHER OPTIONS

ENDCAPS: Flat endcaps (**FE**) at each end of run add 1/16" to each end of luminaire.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery.

Backup Battery

	Legrand 18W	Legrand 10W/ Bodine BSL310LP
HPX-R-D		
Min. Housing Length	8'*	4'*
EM Lumen Output	2024	1202

FINELITE® Better Lighting

High Performance 2.5" Aperture (HPX) Recessed

SPECIFICATIONS

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) Occupancy (**OBO**) or Daylight Sensors (**OBD**) available with Flush and Bottom Glow downlight diffusers. PIR sensors not recommended for stairwell applications. Refer to Occupancy Sensor & Daylight Sensor tech sheet and the Embedded Intelligence landing page for more information and additional sensor options.

FINISHES: Finelite Signal White (**SW**) powder coat standard. Finelite Black (RAL 9005) with semi gloss fine texture (**FB**) [1] and satin Aluminum (**SA**) [1] are available. Optional Adders: 185 RAL colors. [1]

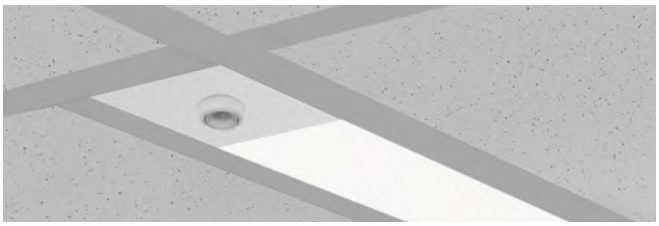
LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request, contact factory for more details. These fixtures are rated for Damp Location. IC Rated. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. HPX can be used to comply with 2016 Title 24, Part 6 (JA8); high efficacy LED light source requirements. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT: 2.3 lb/ft.

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

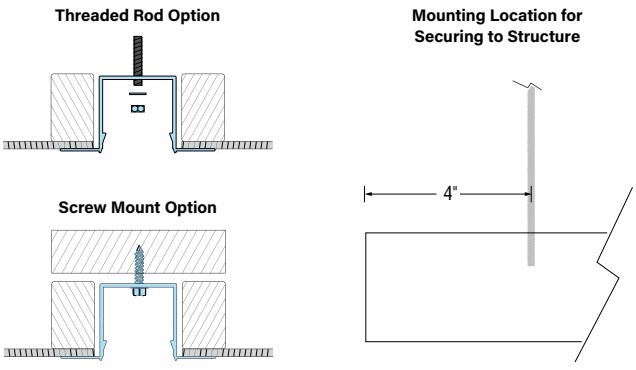
[1] 20 business day lead time for color

INTEGRATED SENSOR



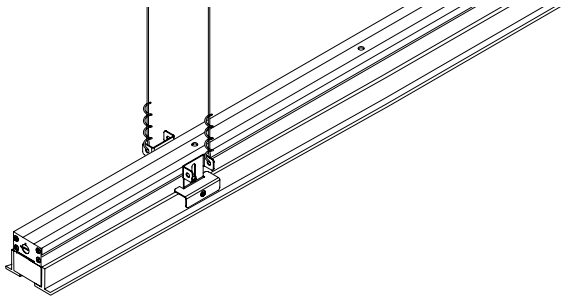
Integrated PIR (Passive Infrared) occupancy or daylight sensors available with Flush and Bottom Glow downlight diffusers. Refer to Occupancy Sensor and Daylight Sensor tech sheets for more info.

HARD CEILING MOUNTING OPTIONS



Two mounting options: threaded rod and screw mounting options. Mounting locations are located on each end of the luminaire. Mounting location is 4" away from each end of luminaire

T-BAR INSTALLATION



HPX-R for T-Bar installations comes standard with a splice plate at the end of the luminaire. Mounting brackets (supplied) secure the luminaire to T-Bar and provide support to structure location. All even foot length (2, 4, 6...) luminaire runs are reduced in length an appropriate amount to fit within typical 2×2 and 2×4 T-Bar grid systems. For uncommon T-Bar systems please consult factory.

LED VideoPlus

Videoconference Fixture Plus Task Light

Construction
The fixture housing is made of 6063-T5 aluminum extrusions. The video light provides vertical illumination for videoconferencing while direct task light provides general room illumination. As an option, fixtures can be configured with task or video lights only.

Fixture Body Finish
Low-gloss Signal White finish (Ral #9003, smooth satin).

Drivers
All drivers are high-frequency electronic, with a power factor >.95, THD <10%, and a Class A sound rating. Drivers are mounted in the fixture module housing. The power and control inputs are on the back of fixtures. Operational voltage is universal, 120 - 277V.

Low Voltage Control
19" Rack-mounted driver is available with up to 600w of power. Multiple drivers can be linked for any size project. Low voltage control available for 120-230V applications.

Power Over Ethernet Control
Fixture are available with PoE control nodes. Consult with factory for specification of complete PoE systems. PoE control available for 120-230V applications.

LED Technology
The fixture utilizes mid-power LEDs with high-quality illumination (>90 CRI) for videoconferencing and general lighting applications. Each 2-foot fixture has a power consumption of 32 watts per channel, each 4-foot fixture has a power consumption of 64 watts per channel.

Directional Beam Angle
The two video components are positioned at a 45° angle. The task component emits a 55° beam angle. The beams overlap slightly, creating a combined field of light.

Accessories
Louvers provide complementary aesthetics to most architectural styles. Louvers available in white or custom finish. Glare reduction filter is integral to the fixture. 45°-angle mounting panel is available for 2-ft fixtures only.

Fixture Dimensions, Aperture and Weight

2-foot: Inch 23.75-in x 9.85-in x 7.50-in
(603.25-mm) x (248.92-mm) x (190.50-mm)
Aperture: 5.00-in x 23.55-in
(127.00-mm) x (598.17-mm)
Fixture weight: 30-lbs* (13.61-kg)

4-foot: Inch 47.75-in x 9.85-in x 7.50-in
(1212.85-mm) x (248.92-mm) x (190.50-mm)
Aperture: 5.00-in x 47.55-in
(127.00-mm) x (1207.77-mm)
Fixture weight: 60-lbs* (27.22-kg)

* Weight provided is for Double VideoPlus configuration; consult factory for weights for other configurations. Weight is approximate.

CYL6 SERIES | 6" Indoor/Outdoor Integrated LED Specification Grade Round Cylinders

PRODUCT DETAILS

Construction

- Specification grade 6" diameter aluminum housing for indoor and outdoor applications
- Driver canopy for flexible cable option is 16 gauge steel
- Ceiling, Pendant, Up/down, Wall Mount Down Light, and Wall Mount Up Light models are available in either Dry/Damp (Indoor) or Wet (Outdoor) Location types. Flexible Cable versions are only available in Dry/Damp Location type.
- Wet Location type cylinders feature a silicone sealed clear glass lens in a gasketed die-cast trim ring to ensure unit is watertight
- Available in Matte White, Matte Black, Matte Silver and Satin Bronze finishes. Black Flexible Cable with Black or Bronze Cylinders, White with White and Gray with Silver.
- Custom finish colors available. Consult factory for pricing, minimum order quantities and lead time.
- UL8750 and Class 2 compliant: RoHS compliant, U.S. only.
- Output over voltage, over current and short circuit protected.

Features

- Ceiling and Pendant Cylinders provide a hang support for hands-free wiring
- Wall Mount Cylinders employ a bracket which provides support for hands-free wiring
- Rigid Stem Pendant Mount Option includes a Slope Ceiling Canopy (up to 45°) and 6-inch Stem. Extra stem lengths must be ordered separately as needed. Maximum Stem Length: 8 Ft. 6-inches; consult factory for longer lengths. Stem thread: 1/4-18NPS.
- Flexible Cable Pendant Mount Cylinders include 120-inches of Field Adjustable 18/3 SJTOW Cable.

Performance Summary

- Optical system employs either a Clear or Platinum reflector. Clear reflector is available in Narrow (36°), Medium (54°) and Wide (80°) beam distributions. Platinum is only available in a single beam distribution (57°).
- Wall Wash and Pencil Beam optic accessories are also available on select models
- Select from 2700K, 3000K, 3500K and 4000K color temperatures; CRI 80 min., 83 typical; High CRI 90+ available
- Excellent fixture-to-fixture color consistency within a 3-step MacAdam Ellipse tolerance
- Wet Location models must be installed per specific product installation instructions and all appropriate National Electrical Codes
- All CYL6 Cylinders are available for non-dimming and dimming applications. For a list of compatible dimmers, refer to Dimming Specification sheet.
- Assembled in the U.S.A

DIMMING SPECIFICATIONS | 6" and 8" Cylinders: CYL6 Series, SQL6 Series and CYL8 Series

- Incandescent 120VAC dimmers adjust the light with "forward phase control," where the dimmer "chops" the forward part of the AC wave to deliver less or more power to the light source. No neutral wire connection required.
- Electronic vow voltage 120VAC dimmers adjust the light with "reverse phase control," where the dimmer "chops" the back part of the AC wave to deliver less or more power to the light source. Neutral wire connection required.
- 0-10V DC low voltage dimmers operate using two low voltage dimming wires that are separate from the 120V or 277V AC power. The dimmer sends a variable output voltage to the fixture based upon the dimming level. 10V corresponds to undimmed operation, 5V to 50% and so on. Switching on/off is controlled with the line voltage power (120V or 277V AC) input to the dimmer and then dimming operation is controlled with the 0-10V DC low voltage wiring connection between the dimmer and the LED driver. The control signal runs on two low voltage control wires (color coded violet and gray).
- Lutron HiLume and EcoSystem dirvers provide continuous dimming from 1%-100%. For a complete list of compatible dimmers and controls, please visit www.lutron.com
- Use DALI approved controls for dimming eldoLED MVD7 (1%-100%) and MVD9 (0.1%-100%) options.

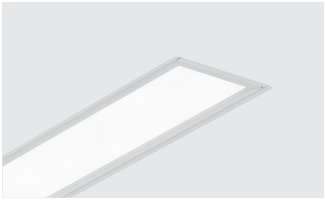
NOTES

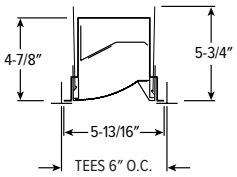
1. Testing was performed with a single fixture connected to dimmer.
2. Testing has been performed on these dimmers, but this does not imply any warranty of compatibility.
3. Dimming performance can be influenced by different loads, as well as variations in dimmer switches within the same model.
4. Dimmer maximum load rating with LED may differ from published traditional source dimmer ratings. Consult manufacturer for maximum dimmer information.
5. Consult factory for additional dimming information.

NOT USED

HETW LED Architectural Lensed Wall Wash

Williams





CATALOG #:

TYPE:

PROJECT:

FEATURES

- Attractive and efficient architectural fixture delivers comfortable, uniform perimeter illumination
- Frosted acrylic diffuser combined with highly reflective matte white paint provides visual comfort
- Multiple dimming protocols available
- Fully room-side accessible without the use of tools
- Quick-wire access plate in back of fixture housing for easy attachment of incoming power supply
- Made Right Here® in the USA

SPECIFICATIONS

- HOUSING – 22-gauge die-formed C.R.S.
- DOOR FRAME – Steel door frame with integral torsion springs to secure the frame within the fixture.
- SHIELDING – Frosted, ribbed acrylic.
- FINISH – Textured matte white polyester TGIC powder coat bonded to phosphate-free, multi-stage pretreated metal. All parts painted after fabrication to facilitate installation, increase efficiency, and inhibit corrosion.
- ELECTRICAL – High quality mid-power LED boards. Rated for 50,000 hours at 70% lumen maintenance (L70).
- MOUNTING – Designed for NEMA Type "G" 1" grid ceiling standard. For NEMA Type "NFG" and "SG" 9/16" grid installations, specify EQCLIPS option. Drywall kit accessories available for flange applications, shipped separately, see options. Fixture must be installed prior to Drywall Kit.
- LISTINGS –
  - cCSAus certified as luminaire suitable for dry or damp locations.
- WARRANTY – 5-year limited warranty, see hew.com/warranty.

NOTES

1. When using in NEMA Type "SS" or "NFG" applications, must specify EQCLIPS option. For flange installations use the Drywall Kit (DFK), ordered separately, see page 3 for DRYWALL KIT (DFK) OPTIONS. Fixture must be installed prior to Drywall Kit.
2. Lumen output based on 3500 CCT with A shielding. Other shielding options may reduce lumen output. Actual lumens may vary +/-5%.
3. Other shielding options may reduce lumen output.
4. Extended lead times may apply. Consult factory for availability.
5. See page 2 for ADDITIONAL CONTROL OPTIONS.
6. 2 per fixture. Optional for 1" grid installations. Required for 9/16" grid mounting.
7. Specify in increments of 100 nominal lumens. Option must be specified with next higher lumen package.
8. Fixture must be installed prior to Drywall Kit (DFK). See page 3 for DRYWALL KIT (DFK) OPTIONS.
9. Not available with EM drivers.

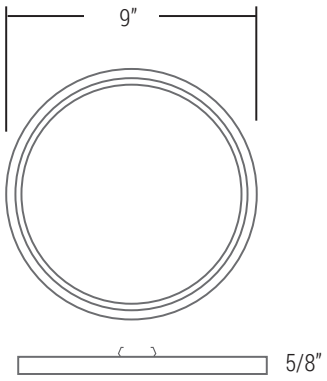
elite LED LIGHTING

RL991

9 Inch Round LED Slim Surface Mount Dimmable Fixture

9″



FEATURES

The Elite LED Slim Surface Mount has been engineered to install into most standard junctionboxes. Up to 1200 usable lumens are directed from the luminaire to the work surface. Easy to install, applicable to junction box or recessed can installation.

LUMENS	1200
CCT	30K, 40K, 50K
CRI	90+
COLOR QUALITY	3-Step MacAdam Ellipse
DIMMING	DIMTR (Triac Dimming)
FINISH	WH (White), BK (Black), SN (Satin Nickel), BZ (Bronze)
LIFETIME	50,000 Hours

OPTICS

The Elite LED Module system is much more than just a simple LED retrofit. The Elite LED system is a highly engineered work of design and optical science which produces up to 1200 lumens. Our meticulously crafted optics gather the light scattered by the LED chip and shape it into a functional beam with uniform light distribution.

DIMMING

Intended for Triac (120V) based on configuration. Minimum 90ºC supply conductors.

COMPLIANCE

Non-conductive fixture for shower light application. Product complies with the requirements of the California Energy Commission regulated under Title 24.

LISTING

ETL listed for damp location (wet location - with covered ceilings)
Energy Star certified

WARRANTY

The Elite LED lighting system carries a five-year carefree warranty for parts and components. (Labor not included)

NOMINAL LUMENS	DELIVERED LUMENS	WATTAGE
1200	1515	19W

Based on 4000K, 90+ CRI. Actual wattage may vary +/- 5%

INSTALLATION

You MUST seal all gaps between the ceiling and fixture with weatherproof silicone sealant. This deters moisture and water from damaging fixtures and other mechanical ceiling elements.

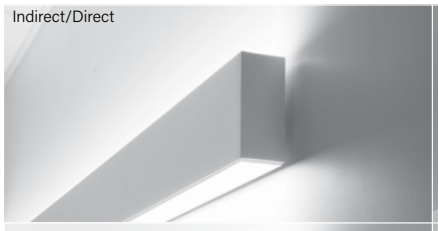
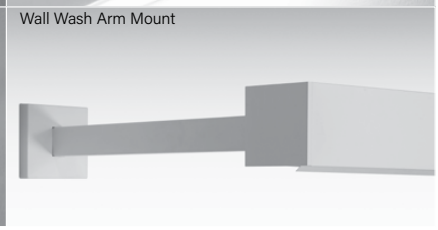
FINELITE® Better Lighting

High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount





High Performance 2" Aperture is a patented, linear LED luminaire family. HP-2 delivers excellent performance using an advanced optical design and mid-power LEDs. Achieving 90% of initial light output at 100,000+ hours and backed by a 10-year performance-based warranty on all standard components.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving **Red List Approved** and **Declared** status.

Signal White is standard finish

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system and plug-together wiring are standard.

LENGTHS: Any length, 2' minimum, in increments down to 1/16th" (±1/32"). 12' maximum section length. Hollowed Ellipse Louver (**LHE**), Hex Louver (**LHC**), and White Cross Blade Baffle (**WCB**) are available in 1' increments.

MITERED CORNERS[1]: Illuminated corners of greater than 60° and less than 180° in a single plane, available with Flush Diffuser, Bottom Glow Diffuser, 1" Drop Down Lens[2], Regressed Diffuser, or White Cross Blade Baffle[3]. Corners not available with Wall Wash (**WW-D**), Hollowed Ellipse Louver (**LHE**) or Hex Louver (**LHC**). Contact factory for Double miters using the White Cross Blade Baffle. Consult factory for tailored lighting options.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For lengths 3' and greater, the uplight and downlight can be specified with different lumen packages and dual controls. For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

UPLIGHT OPTION[4]: Patented Top Glow frost white diffuser standard. 12' maximum diffuser length. 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination Optional: Flush frost white snap-in diffuser, 73% transmissive, 99% diffusion; **ASY-L** distributes light to the left, **ASY-R** distributed light to the right of the luminaire. Consult factory for more tailored lumen outputs.

DOWNLIGHT OPTION[5]: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Available with Flush (**F**), Bottom Glow (**BG**), 1" Drop Down Lens (**DL**), White Cross Blade Baffle (**WCB**)[6], Hollowed Ellipse Louver (**LHE**)[6], Hex Louver (**LHC**)[6], Downlight Asymmetric Optic (**DAO**)[7], and Regressed downlight diffusers (**RG**). 1" Drop Down Lens made of highly efficient acrylic. Available with a solid endcap or an endcap with a diffuse filler to continue the luminous aesthetic. Downlight Asymmetric Optic is an extruded lens with a subtle ribbed appearance providing an asymmetric distribution for improved optical performance. Consult factory for more tailored lumen outputs.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

REFLECTORS: Wall Mount: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white power coat paint. **Arm Mount**: The standard Signal White (**SW**) Kicker (**K**) reflector delivers light high on the vertical surface. The Kicker reflector can be easily removed for open distribution (**FO**).

ELECTRICAL FEATURES

STATIC WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed controlling uplight and downlight together (power and dimming). Specify dual feeds for independent control of uplight and downlight. 14-gauge feed used when luminaire current exceeds 5 amps.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.
- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON DRIVER OPTIONS:
- **LUT-ES1 (LDE1)** - (Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series))
- **LUT-2W (LTEA2W)** - (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series)).

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.
- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime.:** 100,000 hours
- **FineTune DMX:** 1%

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount

SPECIFICATIONS

LUTRON TUNABLE WHITE DRIVER OPTION: LUT-TW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)).

MOUNTING OPTIONS

HANGING HARDWARE: Wall Mount: Luminaire hangs securely from mounting brackets fastened directly to the wall for easy installation. Luminaire stands 1/2" off the wall. The mounting bracket is concealed behind the luminaire. **Arm Mount**: bracket mounts directly to wall j-box, extends luminaire 12", 18", or 24" from wall. Other lengths available. Consult factory.

TUNABLE WHITE DMX HANGING HARDWARE: For grid ceiling applications the dual GridBox™ mounting is supplied (standard). For hard ceiling applications the ceiling mounting box is supplied (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths. Available DMX pendant feed lengths are 5' (standard), 12', and 30'.

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are pre-wired with plug-and-play interconnection cables to support easy plug-together joining of luminaire runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

OTHER OPTIONS

ENDCAPS: Flat diecast aluminum endcaps (**FE**) add 1/4" to each end of luminaire. 1" Drop Down Lens Endcap (**DE**)[8] includes diffuse element to continue luminance of drop lens. Open Endcap (**OE**) is for use with the Hollowed Ellipse Louver (**LHE**); following the curve of the louver.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Factory choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack.
- **Indirect/Direct:** backup batteries deliver 1608 lumens. 12' minimum luminaire length. 2' illuminated (downlight standard).
- **Direct:** backup batteries deliver 1608 lumens. 8' minimum luminaire length. 2' illuminated.
- **Indirect:** backup batteries deliver 1874 lumens. 8' minimum luminaire length. 2' illuminated.
- **Wall Wash:** backup batteries deliver 1500 lumens. 8' minimum luminaire length. 2' illuminated.

Tunable White ELECTRICAL OPTIONS[9]:
- **TW Driver Options 0-10V:** EM/GEN, GTD or Battery Back up
- **FineTune DMX:** EM/GEN or Battery Back up
- **DMX:** Battery Back up
- **DALI:** EM/GEN, GTD or Battery Back up
- **LUTRON:** EM/GEN, GTD or Battery Back up

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy or daylight sensors available with Flush and Bottom Glow downlight diffusers. Refer to Occupancy Sensor, Daylight Sensor, and Enlighted Sensor tech sheets for more info.

FINISHES: Finelite Signal White (**SW**) powder coat, Finelite Black (RAL 9005) with semi gloss fine texture (**FB**)[10], and Satin Aluminum (**SA**)[10] are standard. Optional Adder: 185 RAL colors[10] are available.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request. These fixtures are rated for Damp Location. HP-2 can be used to comply with 2016 Title 24, Part 6 (JA8); high efficacy LED light source requirements. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT[11]: ID - 2.9 lb/ft; D - 2.3 lb/ft; I - 2.3 lb/ft; AM - 2.9 lb/ft (luminaire only)

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

[8] Available in Indirect/Direct Regressed & Direct Regressed only
[9] Consult Finelite for Generator Transfer Device and Battery Back up fit
[10] 20 business days lead time for color
[11] Excludes Battery Back up and Generator Transfer Device weight

KURV-SW-HE

Q-CAP Flexible Fixtures

KURV-SW-HE is a fully encapsulated flexible linear LED fixture suitable for use in direct viewing applications because diodes are not visible due to its unique shape. KURV has a built-in parabolic curve, which allows the fixture to push out asymmetrical light with its internal reflector. Because of its dry and wet rating, it is perfect for not only indoor use but also as outdoor accent lighting, especially when the light needs to be wrapped around a mass. KURV-SW-HE encapsulates our one step, one bin 24-volt static white high efficacy LED strips in polyurethane. It is offered in three different outputs: standard output (1.5W/ft), high output (3.0W/ft), and very high output (6.0W/ft). Available in a clear finish, where diodes are visible, or a translucent finish, where light is diffused.

Output [Calculated L70 = 35000 hours]

Tested for KURV-SW-HE-WSC-DRY

Connector/ Wire in: **BW**, **BRL**

Connector/ Wire out: **N/A**, **BW**, **BRL**

End Caps (No feed): **CL**, **WH**, **N/A**

Length (in):

- **BW** comes in standard 24"- request custom length (Max 120") by writing it in inches next to "BW" in the order code box (ex. BW48)
- **Connector/Wire In or Out** not needed to specify product. Standard configuration is type S1, Connector/Wire In: BW & Connector/Wire Out: N/A with white endcap (WH)
- **PPS** mounting clip recommended for seamless applications

Flexibility

- 5 year warranty
- Field modifications are not covered under Q-Tran warranty
- Side Bend
- IK10 impact rated
- Data subject to change, all data has +/- 5% tolerance
- **PPS-FT** is to be cut at Q-Tran to requested length

Specification subject to change. Rev-06-10-21

CYL6 SERIES | 6" Indoor/Outdoor Integrated LED Specification Grade Round Cylinders

PRODUCT DETAILS

Construction

- Specification grade 6" diameter aluminum housing for indoor and outdoor applications
- Driver canopy for flexible cable option is 16 gauge steel
- Ceiling, Pendant, Up/down, Wall Mount Down Light, and Wall Mount Up Light models are available in either Dry/Damp (Indoor) or Wet (Outdoor) Location types. Flexible Cable versions are only available in Dry/Damp Location type.
- Wet Location type cylinders feature a silicone sealed clear glass lens in a gasketed die-cast trim ring to ensure unit is watertight
- Available in Matte White, Matte Black, Matte Silver and Satin Bronze finishes. Black Flexible Cable with Black or Bronze Cylinders, White with White and Gray with Silver.
- Custom finish colors available. Consult factory for pricing, minimum order quantities and lead time.
- UL8750 and Class 2 compliant: RoHS compliant, U.S. only.
- Output over voltage, over current and short circuit protected.

Features

- Ceiling and Pendant Cylinders provide a hang support for hands-free wiring
- Wall Mount Cylinders employ a bracket which provides support for hands-free wiring
- Rigid Stem Pendant Mount Option includes a Slope Ceiling Canopy (up to 45°) and 6-inch Stem. Extra stem lengths must be ordered separately as needed. Maximum Stem Length: 8 Ft. 6-inches; consult factory for longer lengths. Stem thread: 1/4-18NPS.
- Flexible Cable Pendant Mount Cylinders include 120-inches of Field Adjustable 18/3 SJTOW Cable.

Performance Summary

- Optical system employs either a Clear or Platinum reflector. Clear reflector is available in Narrow (36°), Medium (54°) and Wide (80°) beam distributions. Platinum is only available in a single beam distribution (57°).
- Wall Wash and Pencil Beam optic accessories are also available on select models
- Select from 2700K, 3000K, 3500K and 4000K color temperatures; CRI 80 min., 83 typical; High CRI 90+ available
- Excellent fixture-to-fixture color consistency within a 3-step MacAdam Ellipse tolerance
- Wet Location models must be installed per specific product installation instructions and all appropriate National Electrical Codes
- All CYL6 Cylinders are available for non-dimming and dimming applications. For a list of compatible dimmers, refer to Dimming Specification sheet.
- Assembled in the U.S.A

DIMMING SPECIFICATIONS | 6" and 8" Cylinders: CYL6 Series, SQL6 Series and CYL8 Series

- Incandescent 120VAC dimmers adjust the light with "forward phase control," where the dimmer "chops" the forward part of the AC wave to deliver less or more power to the light source. No neutral wire connection required.
- Electronic vow voltage 120VAC dimmers adjust the light with "reverse phase control," where the dimmer "chops" the back part of the AC wave to deliver less or more power to the light source. Neutral wire connection required.
- 0-10V DC low voltage dimmers operate using two low voltage dimming wires that are separate from the 120V or 277V AC power. The dimmer sends a variable output voltage to the fixture based upon the dimming level. 10V corresponds to undimmed operation, 5V to 50% and so on. Switching on/off is controlled with the line voltage power (120V or 277V AC) input to the dimmer and then dimming operation is controlled with the 0-10V DC low voltage wiring connection between the dimmer and the LED driver. The control signal runs on two low voltage control wires (color coded violet and gray).
- Lutron HiLume and EcoSystem dirvers provide continuous dimming from 1%-100%. For a complete list of compatible dimmers and controls, please visit www.lutron.com
- Use DALI approved controls for dimming eldoLED MVD7 (1%-100%) and MVD9 (0.1%-100%) options.

NOTES

1. Testing was performed with a single fixture connected to dimmer.
2. Testing has been performed on these dimmers, but this does not imply any warranty of compatibility.
3. Dimming performance can be influenced by different loads, as well as variations in dimmer switches within the same model.
4. Dimmer maximum load rating with LED may differ from published traditional source dimmer ratings. Consult manufacturer for maximum dimmer information.
5. Consult factory for additional dimming information.

Luminaire Specifications

Housing
Die cast aluminum housing with back mounting plate and outdoor rated cable. Back mounting plate includes novel hanging features to allow one-person installation. Knockouts on the top and bottom of the housing allow conduit entry. Electrical components are accessed behind gasketed optical cover.

Light Emitting Diodes
Hi--flux/Hi-power white LEDs are tested in accordance with IES LM--80 testing procedures. Warm White (3000K), Neutral White (4000K) and Cool White (5000K) with minimum 70 CRI are standard. LEDs are 100% mercury and lead free.

Optical Systems
The OMNILens™ system creates a low brightness source to reduce glare with precise Wide or Forward Throw distributions. Lens cover is UV stabilized, vandal-resistant polycarbonate. Luminaire produces 0% total lumens above 90° (BUG Rating, U=0).

Electrical
Power supply features a minimum power factor of .90 and <20% Total Harmonic Distortion (THD). EMC meets or exceeds FCC CFR Part 15. Transient voltage complies with ANSI C62.41 Cat. A. Integral surge protector is tested per ANSI/ IEEE C62.45 procedures based on ANSI/IEEE C62.41.2 definitions for standard and optional waveforms for Location Category C High.

Finish
Housing receives a fade and abrasion resistant epoxy polyester powder coat. Finish tested to withstand 5000 hours in salt spray exposure per ASTM B117. Finish tested 5000 hours in UV exposure per ASTM G154 and meets ASTM D523 gloss retention.

Listings/Ratings/Labels
Luminaires are UL listed for use in wet locations and emergency lighting in the United States and Canada. Ambient operating temperature is -40°C to 40°C with non- EM unit. Entire fixture maintains an IP66 and IK10 rating. DesignLights Consortium™ 3000K, 4000K and 5000K qualified product. Assembled in the United States.

Photometry
Luminaires are photometrically tested by certified independent testing laboratories in accordance with IES LM-79 testing procedures.

Lumen Maintenance

	TM-21 Lumen Maintenance (hours) at 25°C	
Models	**At 50,000**	**At 100,000**

Motion Sensor (Optional) Specifications

Description
Digital passive infrared luminaire integrated outdoor occupancy sensor provides high/low/off control based on motion. Initial setup and subsequent sensor adjustments are made using a handheld configuration tool.

Operation
Standard factory setting will dim the luminaire to 50% until motion is sensed and then it will power to 100%. When motion is not detected for five minutes, the luminaire will dim back to 50%. Ramp up and fade down times are adjustable, but initially set to NONE.

The percent dimming and time durations may be field adjusted as required using FSIR100 option. FSIR user guide available at: www.wattstopper.com.

Optical System
Multi-cell, multi-tier Fresnel lens with a 360 degree view detects unobstructed motion. L2 lens is designed for a mounting height up to 8 feet and detects motion up to 3 times mounting height. L3 lens is designed for a mounting height up to 20 feet and detects motion within one mounting height.

Finish
Sensor exterior ring and lens are white polycarbonate, UV and impact resistant.

Listings/Ratings
Sensor is TUV, UL and cUL listed, IP66 rated and CE compliant.

Warranty
5-year limited warranty on luminaires and components with a motion sensor.

Emergency Battery System (Optional) Specifications

Description
Emergency battery system option provides a nominal 2300 lumens for a minimum of 90 minutes and can be specified with motion sensor option. Test switch and charging indicator light are visible and accessible on the optical cover.

Temperature Rating
Ambient operating temperature is -20C to +60C.

Listings/Ratings/Labels
Emergency LED driver and batteries are UL recognized and CSA certified. Emergency illumination time exceeds the National Electrical Code (NEC), Life Safety Code (NFPA-LSC), National Building Code of Canada (NBC), National Fire Code of Canada (NFC) and UL 90-minute requirements.

Warranty
3-year limited warranty on Emergency Battery System.

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2) Surface Mount

Signal White is standard finish

Note: see page 6 for all aesthetic options

High Performance 2" Aperture is a patented, linear LED luminaire family. HP-2 delivers excellent performance using an advanced optical design and mid-power LEDs. Achieving 90% of initial light output at 100,000+ hours and backed by a 10-year performance-based warranty on all standard components.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving **Red List Approved** and **Declared** status.

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2) Surface Mount

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system and plug-together wiring are standard.

LENGTHS: Any length, 2' minimum, in increments down to 1/16th" (±1/32"). 12' maximum section length. Hollowed Ellipse Louver (**LHE**), Hex Louver (**LHC**), and White Cross Blade Baffle (**WCB**) are available in 1' increments.

MITERED CORNERS[1]: Illuminated corners of greater than 60° and less than 180° in a single plane, available with Flush Diffuser, Bottom Glow Diffuser, Regressed Diffuser, or White Cross Blade Baffle[2]. Corners not available with Wall Wash (**WW-D**), Hollowed Ellipse Louver (**LHE**), Hex Louver (**LHC**) or 1" Drop Down Lens. Contact factory for double miters using the White Cross Blade Baffle. Consult factory for tailored lighting options.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For lengths 3' and greater, the uplight and downlight can be specified with different lumen packages and dual controls. For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

DOWNLIGHT OPTION: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Available with Flush (**F**), Bottom Glow (**BG**), 1" Drop Down Lens (**DL**), White Cross Blade Baffle (**WCB**)[3], Ellipse Louver (**LHE**)[3], Hex Louver (**LHC**)[3], Downlight Asymmetric Optic (**DAO**)[4], Downlight Spread Optic (**DSO**)[4], and Regressed downlight diffusers (**RG**). 1" Drop Down Lens made of highly efficient acrylic. Available with a solid endcap or an endcap with a diffuse filler to continue the luminous aesthetic. Downlight Spread & Downlight Asymmetric Optics are extruded lenses with a subtle ribbed appearance providing a batwing or asymmetric distribution for improved optical performance. Consult factory for more tailored lumen outputs.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

REFLECTORS: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white powder coat paint. The standard Semi-Specular Aluminum (**SSA**) Kicker (**K**) reflector delivers light high on the vertical surface. The Kicker reflector can be easily removed for open distribution (**FO**).

ELECTRICAL OPTIONS

STATIC WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed controlling uplight and downlight together (power and dimming). Specify dual feeds for independent control of uplight and downlight. 14-gauge feed used when luminaire current exceeds 5 amps.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when fixture current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.

- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON DRIVER OPTIONS:

- **LUT-ES1 (LDE1)** - (Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series)).
- **LUT-2W (LTEA2W)** - (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series)).

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.

- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime.:** 100,000 hours
- FineTune DMX is 1%

LUTRON TUNABLE WHITE DRIVER OPTION: LUT-TW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)).

MOUNTING OPTIONS

HANGING HARDWARE: Lay-in ceiling types: caddy clip with 1/4" - 20 stud and nut. Drywall or concrete surfaces (walls or ceilings): 1/4" - 20 stud and nut (provided by others). Mounted with three equidistant suspension points.

TUNABLE WHITE DMX HANGING HARDWARE: For grid ceiling applications the dual GridBox™ mounting is supplied (standard). For hard ceiling applications the ceiling mounting box is supplied (standard). DMX

[1] Not available with Wall Wash
[2] White Cross Blade (WCB) baffles not available with custom angles. Available in 90 degrees only
[3] Regressed only
[4] Not available with Regressed or Curves

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2) Surface Mount

SPECIFICATIONS

feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths. Available DMX pendant feed lengths are 5' (standard), 12', and 30'.

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are pre-wired with plug-and-play interconnection cables to support easy plug-together joining of fixture runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

OTHER FEATURES

ENDCAPS: Flat diecast aluminum endcaps (**FE**) add 1/4" to each end of luminaire. 1" Drop Down Lens Endcap (**DE**) includes diffuse element to continue luminance of drop lens. Open Endcap (**OE**) is for use with the Hollowed Ellipse Louver (**LHE**)[5]; following the curve of the louver.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery.

Daylight	6'
Generator + Daylight	8'

Tunable White ELECTRICAL OPTIONS[6]:
- **TW Driver Options 0-10V:** EM/GEN, GTD or Battery Back up
- **FineTune DMX:** EM/GEN or Battery Back up
- **DMX:** Battery Back up
- **DALI:** EM/GEN, GTD or Battery Back up
- **LUTRON:** EM/GEN, GTD or Battery Back up

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) Occupancy (**OBO**) or Daylight Sensors (**OBD**) available with Flush and Bottom Glow downlight diffusers. PIR sensors not recommended for stairwell applications. Refer to Occupancy Sensor & Daylight Sensor tech sheet and the Embedded Intelligence landing page for more information and additional sensor options.

FINISHES: Finelite Signal White (**SW**) powder coat, Finelite Black (RAL 9005) with semi gloss fine texture (**FB**), and Satin Aluminum (**SA**) are standard. Optional Adder: 185 RAL colors[7] are available.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request. These fixtures are rated for Damp Location. HP-2 can be used to comply with 2016 Title 24, Part 6 (JA8); high efficacy LED light source requirements. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT[8]: SM - 2.3 lb/ft; WW - 2.9 lb/ft

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

[5] Regressed only
[6] Consult Finelite for Generator Transfer Device and Battery Back up fit
[7] 20 business days lead time for color

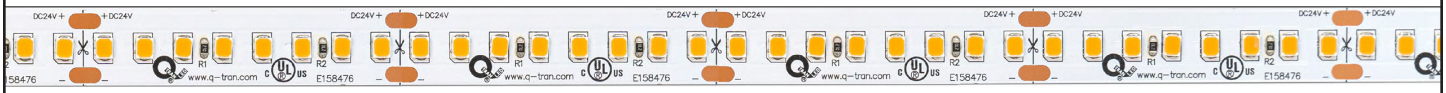
STRIP: High Efficacy Static White



Our first high-efficacy, one step, one bin static white LED tape provides consistent color project to project with exceptional photometric qualities. SW-HE24/1.5, is a 1.5-watt/foot, 24-volt strip featuring 8 diodes per 2" cutpoint, is dry- and wet-rated, field-cuttable up to 768", and available in color temperatures ranging from 2000K to 4000K. Pair with an aluminum extrusion to create a custom fixture.

Technical Information [Calculated L70 = 70000 hours]

Tested with SW-HE24/1.5-DRY

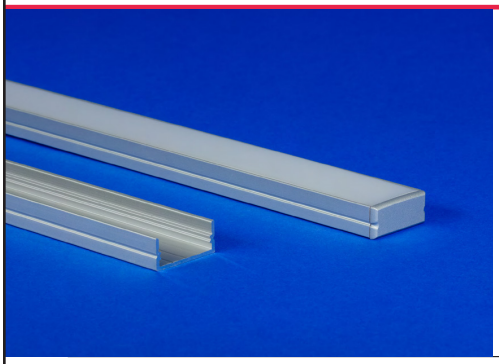
WIDE ALUMINUM EXTRUSION



The WIDE LED extrusion is Q-Tran's widest profile extrusion, making it able to fit even our widest LEDs: RGBW. It is available in satin, black, and bronze finishes and is offered in three different lenses; clear, polar, and diffused. It has a unique plastic mounting clip, and with a clear lens, its light transmission is 97 degrees. WIDE can be configured with in-fed wires, back-fed wires, and wires from the left and right for both lead and exit, giving you more freedom with your design. Available in lengths up to 98.43".

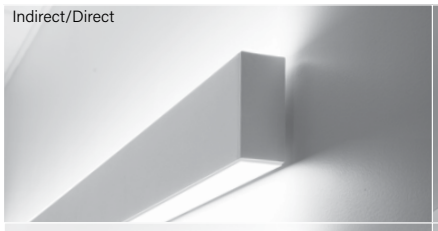
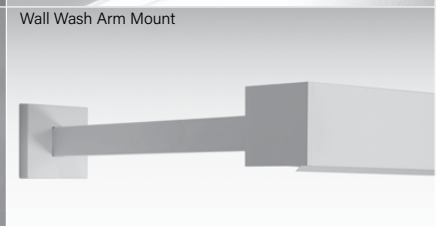
FINELITE® Better Lighting

High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount





High Performance 2" Aperture is a patented, linear LED luminaire family. HP-2 delivers excellent performance using an advanced optical design and mid-power LEDs. Achieving 90% of initial light output at 100,000+ hours and backed by a 10-year performance-based warranty on all standard components.

This product is enrolled in the International Living Future Institute (ILFI) Declare 2.0 Program and is third-party verified with options achieving **Red List Approved** and **Declared** status.

Signal White is standard finish

Note: see page 6 for all aesthetic options

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount

SPECIFICATIONS

BODY TYPE

CONSTRUCTION: Precision-cut 6061-T6 extruded aluminum body. Internal joiner system and plug-together wiring are standard.

LENGTHS: Any length, 2' minimum, in increments down to 1/16th" (±1/32"). 12' maximum section length. Hollowed Ellipse Louver (**LHE**), Hex Louver (**LHC**), and White Cross Blade Baffle (**WCB**) are available in 1' increments.

MITERED CORNERS[1]: Illuminated corners of greater than 60° and less than 180° in a single plane, available with Flush Diffuser, Bottom Glow Diffuser, 1" Drop Down Lens[2], Regressed Diffuser, or White Cross Blade Baffle[3]. Corners not available with Wall Wash (**WW-D**), Hollowed Ellipse Louver (**LHE**) or Hex Louver (**LHC**). Contact factory for Double miters using the White Cross Blade Baffle. Consult factory for tailored lighting options.

OUTPUT AND LED TYPE

LIGHT OUTPUT: Four lumen packages available, Standard (**S**), Boosted Standard (**B**), High (**H**), and Very High (**V**). For lengths 3' and greater, the uplight and downlight can be specified with different lumen packages and dual controls. For Tailored Outputs outside of range from Standard (**S**) to Very High (**V**), consult factory. Light engines are replaceable.

MECHANICAL/OPTICAL OPTIONS

UPLIGHT OPTION[4]: Patented Top Glow frost white diffuser standard. 12' maximum diffuser length. 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination Optional: Flush frost white snap-in diffuser, 73% transmissive, 99% diffusion; **ASY-L** distributes light to the left, **ASY-R** distributed light to the right of the luminaire. Consult factory for more tailored lumen outputs.

DOWNLIGHT OPTION[5]: 12' maximum diffuser length. Flush frost white snap-in diffuser standard, 73% transmissive, 99% diffusion. Internal secondary diffusers at corners ensure visually seamless, uniform, continuous illumination. Available with Flush (**F**), Bottom Glow (**BG**), 1" Drop Down Lens (**DL**), White Cross Blade Baffle (**WCB**)[6], Hollowed Ellipse Louver (**LHE**)[6], Hex Louver (**LHC**)[6], Downlight Asymmetric Optic (**DAO**)[7], and Regressed downlight diffusers (**RG**). 1" Drop Down Lens made of highly efficient acrylic. Available with a solid endcap or an endcap with a diffuse filler to continue the luminous aesthetic. Downlight Asymmetric Optic is an extruded lens with a subtle ribbed appearance providing an asymmetric distribution for improved optical performance. Consult factory for more tailored lumen outputs.

LUMEN MAINTENANCE: 90% of initial light output (L90) at 100,000+ hours; 70% of initial light output (L70) at 200,000+ hours.

REFLECTORS: Wall Mount: Die-formed 20-gauge cold-rolled steel reflectors finished in 96LG High Reflectance white power coat paint. **Arm Mount**: The standard Signal White (**SW**) Kicker (**K**) reflector delivers light high on the vertical surface. The Kicker reflector can be easily removed for open distribution (**FO**).

ELECTRICAL FEATURES

STATIC WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed controlling uplight and downlight together (power and dimming). Specify dual feeds for independent control of uplight and downlight. 14-gauge feed used when luminaire current exceeds 5 amps.

TUNABLE WHITE FEED: Standard with one 18-gauge/5-conductor single-circuit feed. 14-gauge feed used when luminaire current exceeds 5 amps. DMX and power feed at same location (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths.

STATIC WHITE DRIVER: Replaceable 120V, 277V, and 347V Constant Current Reduction dimming driver standard. Can be wired dimming or non-dimming. 0-10V dimming controls with a range of 10%- 100% standard. Dimming to 1% available. Separate dimming for uplight and downlight available. Driver is fully accessible from below the ceiling.
- **Power Factor:** ≥ 0.9
- **Total Harmonic Distortion (THD):** <20%
- **Expected driver lifetime:** 100,000 hours

LUTRON DRIVER OPTIONS:
- **LUT-ES1 (LDE1)** - (Hi-lume 1% EcoSystem with Soft-On, Fade-to-Black dimming (LDE1 series))
- **LUT-2W (LTEA2W)** - (Hi-lume 1% 2-wire, 120V forward phase dimming (LTEA series)).

TUNABLE WHITE DRIVER: Replaceable LED driver. Driver is accessible from below the ceiling. 120V, 277V, and 347V.
- **Power factor:** ≥0.90
- **Total Harmonic Distortion (THD):** <20%
- **Dimming Range:** 100%-10%
- **Expected driver lifetime.:** 100,000 hours
- **FineTune DMX:** 1%

FINELITE® Better Lighting

High Performance 2" Aperture (HP-2)
Wall Mount and Arm Mount

SPECIFICATIONS

LUTRON TUNABLE WHITE DRIVER OPTION: LUT-TW (1% T-Series 2-Channel Digital Tunable White (PSQ Series)).

MOUNTING OPTIONS

HANGING HARDWARE: Wall Mount: Luminaire hangs securely from mounting brackets fastened directly to the wall for easy installation. Luminaire stands 1/2" off the wall. The mounting bracket is concealed behind the luminaire. **Arm Mount**: bracket mounts directly to wall j-box, extends luminaire 12", 18", or 24" from wall. Other lengths available. Consult factory.

TUNABLE WHITE DMX HANGING HARDWARE: For grid ceiling applications the dual GridBox™ mounting is supplied (standard). For hard ceiling applications the ceiling mounting box is supplied (standard). DMX feeds cannot be cut or spliced. DMX feeds should be ordered based on fixed lengths. Available DMX pendant feed lengths are 5' (standard), 12', and 30'.

TUNABLE WHITE DMX INTERCONNECTION CABLES: Luminaires are pre-wired with plug-and-play interconnection cables to support easy plug-together joining of luminaire runs. If a non-FineTune DMX system has been specified, a DMX to RJ45 converter is provided.

OTHER OPTIONS

ENDCAPS: Flat diecast aluminum endcaps (**FE**) add 1/4" to each end of luminaire. 1" Drop Down Lens Endcap (**DE**)[8] includes diffuse element to continue luminance of drop lens. Open Endcap (**OE**) is for use with the Hollowed Ellipse Louver (**LHE**); following the curve of the louver.

EMERGENCY STYLE: Optional emergency to generator/inverter wiring, internal generator transfer switch, nightlight wiring, step-dimming driver, backup battery. Factory choice low-profile backup battery available. 8' minimum luminaire length for low profile battery pack.
- **Indirect/Direct:** backup batteries deliver 1608 lumens. 12' minimum luminaire length. 2' illuminated (downlight standard).
- **Direct:** backup batteries deliver 1608 lumens. 8' minimum luminaire length. 2' illuminated.
- **Indirect:** backup batteries deliver 1874 lumens. 8' minimum luminaire length. 2' illuminated.
- **Wall Wash:** backup batteries deliver 1500 lumens. 8' minimum luminaire length. 2' illuminated.

Tunable White ELECTRICAL OPTIONS[9]:
- **TW Driver Options 0-10V:** EM/GEN, GTD or Battery Back up
- **FineTune DMX:** EM/GEN or Battery Back up
- **DMX:** Battery Back up
- **DALI:** EM/GEN, GTD or Battery Back up
- **LUTRON:** EM/GEN, GTD or Battery Back up

INTEGRATED SENSORS: Integrated PIR (Passive Infrared) occupancy or daylight sensors available with Flush and Bottom Glow downlight diffusers. Refer to Occupancy Sensor, Daylight Sensor, and Enlighted Sensor tech sheets for more info.

FINISHES: Finelite Signal White (**SW**) powder coat, Finelite Black (RAL 9005) with semi gloss fine texture (**FB**)[10], and Satin Aluminum (**SA**)[10] are standard. Optional Adder: 185 RAL colors[10] are available.

LABELS: Luminaire and electrical components are ETL-listed conforming to UL 1598 in the U.S.A. and CAN/CSA C22.2 No. 250.0 in Canada. In accordance with NEC Code 410.130 (G), this luminaire contains an internal driver disconnect. UL 924 and UL 2108 - PoE options available on request. These fixtures are rated for Damp Location. HP-2 can be used to comply with 2016 Title 24, Part 6 (JA8); high efficacy LED light source requirements. Finelite products use electronic components that are RoHS compliant, and the mechanical components of the luminaire have been verified to not knowingly contain any restricted substances listed per RoHS Directive 2015/863. Consult factory for tailored lighting options. Finelite makes the specification process easy when putting healthier products on your projects. Simply add – **RLA** (Red List Approved) or – **RLD** (Declared Label) to your part number.

WEIGHT[11]: ID - 2.9 lb/ft; D - 2.3 lb/ft; I - 2.3 lb/ft; AM - 2.9 lb/ft (luminaire only)

WARRANTY: 10-year performance-based warranty on all standard components. Optional accessories such as emergency battery packs are covered by their individual manufacturer warranties.

[8] Available in Indirect/Direct Regressed & Direct Regressed only
[9] Consult Finelite for Generator Transfer Device and Battery Back up fit
[10] 20 business days lead time for color
[11] Excludes Battery Back up and Generator Transfer Device weight

Prestige™ Thin Die-Cast Series

Die-cast aluminum slim profile exit sign with long-lasting LED performance

Construction
- Die-cast aluminum
- 6 inch EXIT lettering legend, available in red or green
- Choice of finishes: all white or black with brushed aluminum faceplate: Field-selectable chevrons

Mounting
- Surface mount
- Canopy included for end or ceiling mount applications: Universal J-box mounting

Approvals
- UL 924 listed
- Damp location 50°F to 104°F (10°C to 40°F)
- Meets NFPA101 (Life Safety Code), NFPA 70-NEC and OSHA illumination standards
- Compatible with Emergi-Lite Min Inverters (contact your sales representative for more information)

Warranty (subject to proper installation and maintenance)
- Unit has a three-year warranty
  Detailed warranty terms located on page 202 or online at: **www.emergi-lite.com/usa/files/EL_Warranty.pdf**

PRODUCT SPECIFICATION

The wall-mounted, low consumption siphon jet flushing toilet shall be 1.0, 1.28, or 1.6 GPF (3.8, 4.8, or 6.0 LPF) when paired with a flush valve of corresponding flush volume. Toilet shall have optional CeFiONtect ceramic glaze. Toilet can be mounted at ADA height. Toilet shall be TOTO Model CT708U_____.

CODES/STANDARDS

- Meets and exceeds ASME A112.19.2/CSA B45.1
- Certifications: IAPMO(cUPC), State of Massachusetts, City of Los Angeles, and others
- Code compliance: UPC, IPC, NSPC, NPC Canada, and others
- ADA compliant

To complete a WaterSense listed combination, the bowl must be paired with a flush valve which is EPA WaterSense listed.

ECOPOWER® High-Efficiency Toilet Flush Valve, 1.28 GPF

FEATURES

- 1.28 GPF
- Self-powered hydroelectric flush valve system
- No minimum daily usage requirement
- Durable chrome plated body with tamper-proof screws and solid bronze valve body
- Self-cleaning piston valve with 360° filter screen
- Neutral rough-in and adjustable tail piece connection
- True mechanical flush override
- Smart sensor with self-adjusting detection range
- 6-second detection time to prevent ghost flushing
- For toilet with 1-1/2" top spud inlet
- Exposed flush valve with 1" angle stop and 1-1/2" vacuum breaker set
- ADA compliant

(or equal product)

ECOPOWER® High-Efficiency Toilet Flush Valve, 1.28 GPF

SPECIFICATIONS

- Material — Bronze casting
- Power supply — ECOPOWER
- Sensor detection time — Factory setting at six (6) seconds minimum
- Sensor detection range — Self-adjusting to environment
- Discharge quantity — Preset to 1.28 GPF/ 4.8 LPF
- Operating temperature — 32°-104°F (0°-40°C)
- Water supply pressure — 35 psi - 125 psi*
- Water supply connection — 1" NPT
- Warranty — Three year limited

*Water pressures over 80 psi are not recommended for most plumbing fixtures. Check your local plumbing code for details.

INSTALLATION NOTES

For commercial applications only.
Warning: Failure to properly adjust angle stop to the appropriate level can potentially cause property damage.

For detailed installation instructions, please refer to the installation manual.

Max flow rate to be used with
TET1LA_____: 1.28 GPF

Confirm with local codes and standards for floor drain requirement. Adjust control stop for proper flow rate to the fixture.

SLOANSTONE® SINK
ELGR-82000

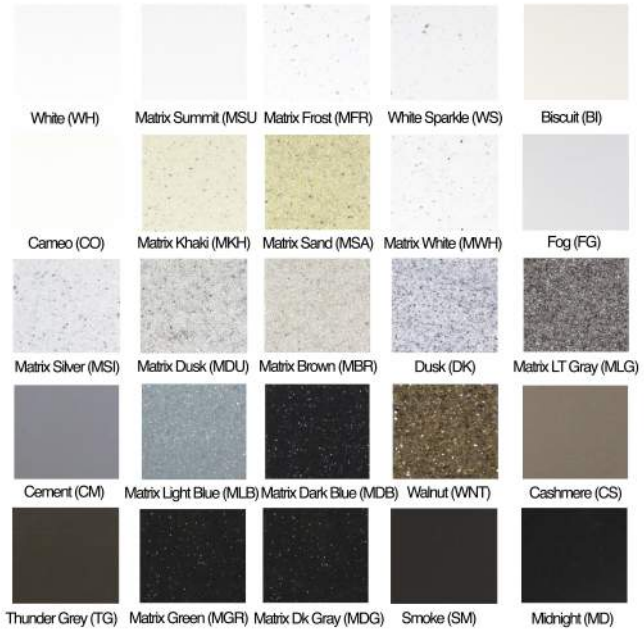
DESCRIPTION
SloanStone® 2-Station Wall-Mounted Gradient Sink.

DETAILS
- Material: SloanStone
- Height: 127" (3,226mm)
- Width: 60" (1,524mm)

FEATURES
Two Station Lavatory System with the following features:

- Dimensions: 60” x 22” x 5”
- A Monolithic deck fabricated from Sloanstone® solid surface
- Available in 25 colors
- Multiple Mounting Options
- Pairs great with Sloan faucets and soap dispensers

COLORS



RECOMMENDED SPECIFICATION
SloanStone Series Sink model no. ELGR 8X000 Gradient Style Sink. Product to be molded using SloanStone solid surface. Sloan automated sensor faucet. Sloan sensor operated foam soap dispenser. Sink design to be ADA compliant and IAPMO certified. Supplied with either angle brackets or enclosure.

4" Trim Plate, Battery Power Supply, Back-Check Tee, Polished Chrome Finish, 0.35 gpm, Multi-Laminar Spray, Infrared Sensor, Sloan® Battery-Powered Deck-Mounted Mid Body Faucet.

DETAILS

- Flow Rate: 0.35 gpm (1 Lpm) (0.35GPM)
- Spray Type: Multi-Laminar (MLM)
- Spout Type: Pedestal ()
- Sensor Type: Infrared (IR)
- Mounting Type: Single Hole ()
- Trim Plate: 4" (102mm) (4)
- Power Supply: Battery (BAT)
- Temperature Mixer: Back-Check Tee (TEE)
- Finish: Polished Chrome (CP)
- Factory Default Timeout: 30s
- Factory Default GPC: 0.175

FEATURES

Commercial Grade, ADA Compliant, Electronic, Sensor-Activated, Brass Pedestal Hand Washing Faucet with the following features:

- Adjustable Infrared Sensor Range
- 36” (914 mm) Long Sensor Cable
- 24” (610 mm) Long Flex Hose
- Filtered Solenoid Valve with serviceable Strainer Filter
- Includes Four (4) AA-size Batteries
- Includes appropriate Mounting Hardware

ELECTRICAL SPECIFICATIONS

- Battery Life: 2 years 8,000 cycles/month
- Sensor Range: 4"–12" (102–305mm)
- Timeout Adjustment Settings: 30s

OPTIMA® ACCESSORY
0326045PK

CODE NUMBER
0326045PK

DESCRIPTION
Thermostatic mixing valve supplied with Sloan Optima® and Optima Plus® faucets that are specified with the “BDT” (Below Deck Thermostatic) variation, or available separately.

FEATURES
MIX-135-A Thermostatic Water Mixing Valve with the following features:

- Designed for under-the-lavatory applications where the outlet temperature of hot water must be controlled for safe, economic use.
- Installs in place of the Tee fitting supplied with the faucet prior to the solenoid valve
- Designed to quickly sense and compensate for temperature fluctuations induced by water temperature and pressure changes in the supply line
- Rugged construction features solid brass valve body and corrosion resistant internal components
- Water temperature adjustment stem with lock nut to prevent tampering
- Equipped with integral check valves at inlets
- 3/8” compression connection on inlets and outlet
- Meets all the performance standards of ASSE 1070 and CSA B125
- Capacity — standard: 4.0 gpm (15.0 Lpm)
  - At 45 PSI differential (310 kPa), with hot water supply between 140°-180° F (60°-82° C).
- Maximum Hot Water Supply Temperature: 180° F (82° C)
- Minimum Hot Water Supply Temperature: 5° F (2.8° C) above set point
- Maximum Operating Pressure:125 psig (862kPa)
- Minimum flow — standard: 0.25 gpm (1.0 Lpm) to ASSE 1016
- Factory set: 105° F (40° C)

TEL103 Series

Standard EcoPower® Faucet

FEATURES

- Self-generating hydropowered EcoPower system
- No minimum daily usage requirement
- Micro-sensor positioned underneath the spout head for accurate hand detection ensuring smooth and consistent water distribution
- Vandal resistant aerator housing
- Durable chrome plated spout body
- Single-hole mount
- Kit includes spout body, controller box, and mounting hardware - less supply lines
- 0.35 gpm aerated flow
- Contributes to earning LEED® credits

MODELS

COLORS/FINISHES

- #CP Polished Chrome

OPTIONAL ACCESSORIES

- THP3158#CP - 4" Cover Plate
- THP3159#CP - 8" Cover Plate

PRODUCT SPECIFICATION

TOTO Model #_____ The faucet shall have hydropowered self-generating, EcoPower System. The faucet shall have maximum of 20 seconds on-demand flow (0.11gpc). The faucet shall have self-adjusting sensor. Product equipped with 0.35gpm flow regulator.

EcoPower

CODES/STANDARDS

- Operates below federally mandated consumption limit of 0.25gpc
- Complies to California Green Building Code, CALGreen of 0.20 gpc
- Meets or exceeds ASME A112.18.1M/CSA B125.1, and NSF372-2011
- Certifications: IAPMO(cUPC), State of Massachusetts, and others
- California Green Code and City of Los Angeles Water Efficiency Ordinance
- ADA compliant
- Complies with federal and state statutes as low-lead (contains a weighted average of 0.25% lead or less)

For codes and standards of mixing valves TLM10, please refer to corresponding product spec sheet.

LOW-LEAD

TEL103 Series

L-2
(or equal product)

Standard EcoPower® Faucet

SPECIFICATIONS

Power Supply	Ecopower
Sensor Detection Range	5-1/8" - 7-7/8" (130 - 200mm) Sensor is self-adjusting
Water Supply Pressure	Min (Dynamic/Flowing) Pressure: 15 psi (100kPa) Max (Static) Pressure: 80 psi (551kPa)
Water Supply	G1/2 (1/2 NPSM compatible)
Inlet Temperature Range	32-110°F(0-42°C)
Ambient Temperature	32-104°F(0-40°C)
Humidty	Max. 90% RH
Flow Rate	0.11 gpc* - max 20 second On-Demand** (0.11 gpc = 0.35 gpm x 20/60 sec) Equipped with 0.35 gpm flow control
Warranty	Three years

NOTE

Following the federal mandate for water efficiency outlined in the Environmental Protection Act of 1992, faucets can be rated for water consumption based on two categories: Flow Rate and Water Consumption. TOTO uses the water consumption standard because it is the most accurate method of measuring water use. TOTO faucets also comply with the CALGreen Guideline of water usage.

Water Saving

On-Demand [20 sec.] faucet (0.11gpc)

Federal Standard (0.25gpc) –56% less

CAL Green (0.20gpc) – 45% less

*Gallons per cycle (gpc) is the amount of water per usage cycle .

**On-demand refers to the way in which the water is dispersed (i.e.; water is only dispersed when the sensor is activated by the user as needed).

Elkay ezH2O Bottle Filling Station & Versatile Bi-Level ADA Cooler Filtered Non-Refrigerated Light Gray
Model LZSTLDDWSLK

PRODUCT SPECIFICATIONS

Elkay ezH2O® Bottle Filling Station & Versatile Bi-Level ADA Cooler, Filtered Non-Refrigerated Light Gray. Features shall include Antimicrobial, Filtered, Green Ticker™, Hands Free, Laminar Flow, Real Drain, Visual Filter Monitor. Furnished with Flexi-Guard ® Safety Bubbler. Electronic Bottle Filler Sensor with Electronic Front and Side Bubbler Pushbar activation. Product shall be Wall Mount (On Wall), for Indoor applications, serving 2 station(s). Unit shall be certified to UL 399 and CAN/CSA C22.2 No. 120. Unit shall be lead-free design which is certified to NSF/ANSI 61 & 372 (lead free) and meets Federal and State low-lead requirements.

Special Features:	Antimicrobial, Filtered, Green Ticker™, Hands Free, Laminar Flow, Real Drain, Visual Filter Monitor
Finish:	Light Gray Granite
Power:	115V/60Hz
Bubbler Style:	Flexi-Guard ® Safety Bubbler
Activation by:	Electronic Bottle Filler Sensor with Electronic Front and Side Bubbler Pushbar
Mounting Type:	Wall Mount (On Wall)
Chilling Capacity:	Non-refrigerated
Full Load Amps	1.1
Rated Watts:	15
Dimensions (L x W x H):	36-3/4" x 19" x 39-1/16"
Approx. Shipping Weight:	82 lbs.
Installation Location:	Indoor
No. of Stations Served:	2

Special Note: Installs with stainless steel back panel (1000004920); accessory to enhance design & ease of installation.

- Visual Filter Monitor: LED Filter Status Indicator for when filter change is necessary.
- Filter is certified to NSF 42 and 53 for lead, cyst, particulate, chlorine, taste and odor reduction. 3,000 gal. capacity.
- Green Ticker: Informs user of number of 20 oz. plastic water bottles saved from waste.
- Laminar flow provides clean fill with minimal splash.
- Silver Ion Antimicrobial protection on key plastic components to inhibit the growth of mold and mildew.
- Real Drain System eliminates standing water.

IMPORTANT!
INSTALLER PLEASE NOTE :

This water cooler has been designed and built to provide water to the user which has not been altered by materials in the cooler waterways. The grounding of electrical equipment such as telephone, computer, etc. to water lines is a common procedure. The grounding may be in the building but may also occur away from the building. This grounding can cause electrical feedback into a water cooler creating an electrolysis which creates a metallic taste or causes an increase in the metal content of the water. This condition is avoidable by installing the cooler using the proper materials as shown below.

NOTICE

This water cooler must be connected to the water supply using a dielectric coupling. The cooler is furnished with a non-metallic strainer which meets this requirement. The drain trap which is provided by the installer should also be plastic to completely isolate the cooler from the building plumbing system.
Bottle filler unit on bracket attached to wall by 6 holes (as shown). Water and electrical will connect through pre-punched hole in basin.
These products are designed to operate on 20 psi to 105 psi supply line pressure. Simultaneous operation of both bubblers on a bi-level unit may not be possible depending on water supply pressure. If simultaneous operation is desired, please ensure a minimum of 65 psi supply.

Model(s) MLP200

PRODUCT SPECIFICATIONS

In-wall Carrier for Bi-level On-wall Bottle Fillers, Coolers & Fountains. Overall dimensions are 38-1/2" x 2-11/16" x 44-1/8". Made of Galvanized Steel.

Material:	Galvanized Steel
Finish:	Black (BK)
Dimensions:	38-1/2" x 2-11/16" x 44-1/8"
Shipping Weight:	54 lbs.

Special Note: For use with bi-level on-wall bottle fillers, coolers & fountains.

- Universal design provides extra support when mounting on-wall bi-level models.
- System can be installed in as little as a 2" x 4" wall.
- Constructed of heavy-gauge steel supporting up to 500 lbs.
- Secures directly to a variety of load-bearing surfaces.
- Adjustable height setting allows for adult or child ADA installation.
- Built in the USA.

Included with Product: **Mounting Carrier Assembly**

Florestone
Models 80 / 81 / 82 / 83
Terrazzo Mop Receptors

JS-1
(or equal product)

Architect's Specifications

Furnish and install mop receptor as manufactured by Florestone Products Co. Shoulder shall be not less than 4" high inside and not less than 1¾" wide. (For high wall model specify: "Not less than 9" high inside and not less than 1¾" wide"). Galvanized, bonderized steel flange will extend at least one inch above shoulder on one, two or three sides for installation against stud wall (specify choice). Stainless steel protective cap to be cast integral on all four exposed sides. Drain body shall be brass, cast integral and shall provide for a non-caulked connection (lead caulked optional) not less than one inch deep to a two or three inch pipe (specify 2" or 3"). Mop sinks with 3" drains are supplied with a rubber seal for use on ABS, PVC or steel pipe. Receptor shall be manufactured of tan and white marble chips cast in white portland cement to produce a compressive strength of not less than 3000 PSI, seven days after casting. Terrazzo surface shall be ground and polished with all air holes and/or pits to be grouted and excess removed and sealed to resist stains and moisture. Receptor will be reinforced with 16 gauge wire.

Note: Terrazzo is not designed to be used with anything that is over 130 degrees Fahrenheit.

Note:
Specify 6" or 12" height.
Specify 2" or 3" drain size (3" standard).
Specify Model Number and size.
Specify Right Hand or Left Hand where applicable.

SPEAKMAN®

Commander® Utility Sink Faucet

JS-1
(or equal product)

MODELS:

- SC-5811: Polished chrome plated utility sink
- SC-5811-RCP: Rough polished chrome plated utiltiy sink

FEATURES:

- Chrome plated cast brass construction
- Cast brass nozzle with 3/4" hose thread and pail hook
- Integral stops allow water shut off for servicing
- Brass vacuum breaker to prevent backflow
- 1/4 turn ceramic cartridges to ensure drip-free performance
- Vandal-resistant cross handles with color-coded indexes
- 9" from finished wall to nozzle outlet
- 8" fixed centers with adjustable threaded brass wall flanges allows 1/4" +/- adjustments
- 1/2" -14 NPT female inlets (supply lines not included)
- Brass top brace assembly with wall flange and mounting screws

HANDLE/HOSE ADD-ONS:

- A-4WRIST: 4" wrist blade handle kit
- A-5H: 5' vinyl hose with wall hook

SAFETY ADD-ONS:

- SEF-9200: Eyesaver® Drench Hose Attachment

FAUCET ADD-ONS:

- A-CK: Check valves in swivel assembly

STANDARDS:

- ASME A112.18.1/CSA B125.1 certified
- ASSE 1001 certified

WARRANTY:

LAKEWELL™ SERVICE SINK
ENAMELED CAST IRON

LAKEWELL™ SERVICE SINK

- Enameled cast iron (inside only enameled)
- Supplied with wall hanger and rim guard
- Available with plain back or drilled back for faucet

☑ **7692.008** With drilled back 2 holes on 8" centers and rim guard

❑ **7692.000** With plain back and rim guard (no faucet hole drilling)

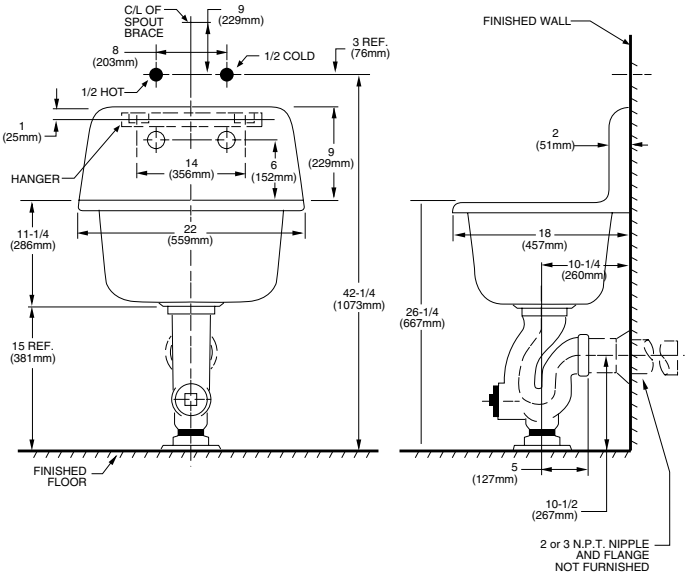
Available Components:

❑ **8379.018** Rim Guard

Nominal Dimensions:
559 x 457mm
(22" x 18")

Bowl sizes:
18-1/2" (470mm) wide
14-1/8" (359mm) front to back
10-1/2" (267mm) deep

Compliance Certifications -
Meets or Exceeds the Following Specifications:
• ASME A112.19.1 for Cast Iron Plumbing Fixtures



To Be Specified:
- ❑ Faucet: 8340.235 exposed yoke wall-mount utility faucet
- ❑ Faucet: 8340.243 same as above with vacuum breaker
- ❑ Faucet: 8341.076 same as above with vacuum breaker and stops in shank
- ❑ Alternative Faucet
- ❑ Trap Standard: 7798.030 cast iron "P" trap standard to wall and strainer for 3" iron pipe
- ☑ Trap Standard: 7798.020 cast Iron "P" trap standard to wall and strainer for 2" iron pip

NOTES:
PROVIDE SUITABLE REINFORCEMENT FOR ALL WALL SUPPORTS. FITTING AND TRAP STANDARD NOT INCLUDED AND MUST BE ORDERED SEPARATELY.

IMPORTANT: Dimensions of fixtures are nominal and may vary within the range of tolerances established by ANSI Standard A112.19.2. These measurements are subject to change or cancellation. No responsibility is assumed for use of superseded or voided pages.

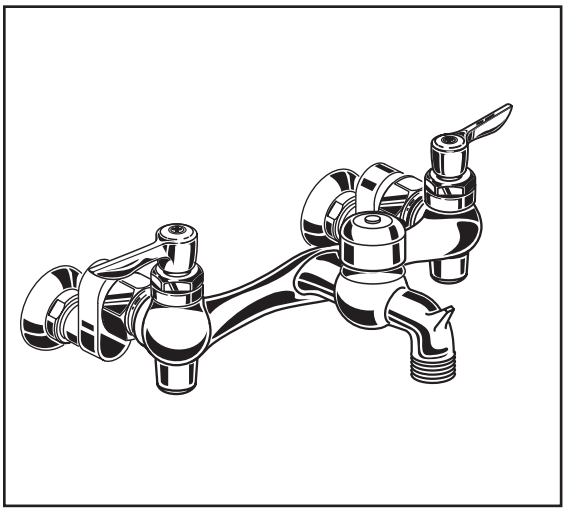
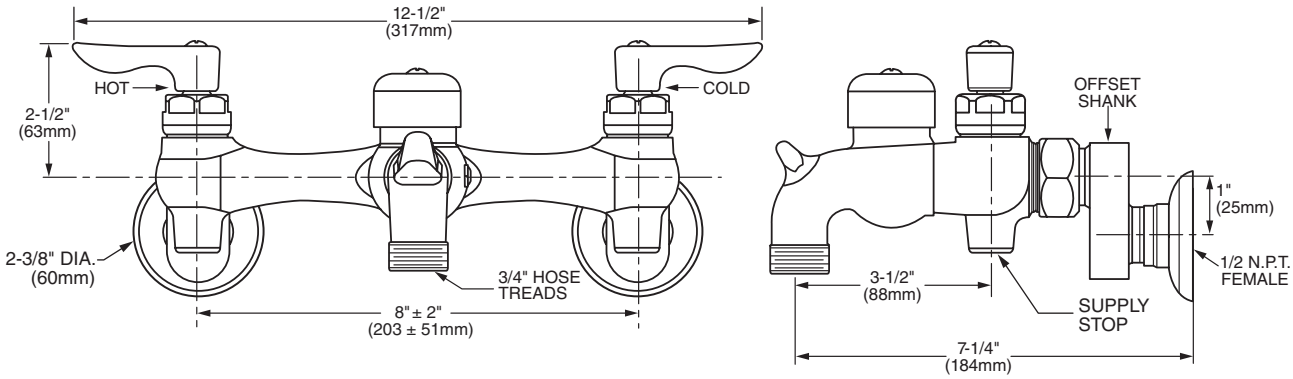
EXPOSED YOKE WALL-MOUNT UTILITY FAUCET

WITH VACUUM BREAKER AND OFFSET SHANKS



MODEL NUMBER:

☑ **8351.076 Exposed Yoke Wall-Mount Utility Faucet**
3" Cast brass spout with vacuum breaker. Ceramic disc valves. Integral supply stops. Offset shanks with integral check valves. Vandal-resistant metal lever handles. Bucket hook. 3/4" Threaded hose end. 1/2" NPT female inlets. Adjustable centers-to-centers: 6" - 10" (152mm - 254mm).



GENERAL DESCRIPTION:

Cast brass body. Metal lever handles with hot and cold indicators and vandal-resistant screws. 1/4 turn ceramic disc valve cartridges. Vacuum breaker prevents back flow. Integral supply stops. Offset shanks with integral check valves to prevent cross-flow. Spout with bucket hook and threaded hose end. 1/2" female inlets with adjustable centers from 6" to 10" (152mm to 254mm).

PRODUCT FEATURES:

Cast Brass Construction: Durable - Excellent in high use applications.

Ceramic Disc Valve Cartridges: Assure a lifetime of drip-free performance.

Integral Supply Stops: Permits easy and convenient access.

Offset Shanks with Integral Check Valves: Adjustable rough-in from 6" to 10" (152mm to 254mm).

Vacuum Breaker: Prevents back flow.

Choice of Finishes: Available in Polished Chrome (002) or Rough Chrome (004).

SUGGESTED SPECIFICATION

Exposed yoke wall-mount utility faucet shall feature a cast brass body with integral stops. Cast brass spout with bucket hook and vandal-resistant metal lever handles. Offset shanks with integral check valves to prevent cross-flow, provide adjustable rough-in from 6" - 10" (152mm to 254mm). Shall feature a vacuum breaker to prevent back flow. Shall also feature 1/4 turn washerless ceramic disc valve cartridges. Fitting shall be American Standard Model # 8351.076.___.

SPECIFICATIONS

SINKS
(or equal product)

Elkay Lustertone Classic Stainless Steel 25" x 22" x 5-1/2" Single Bowl Drop-in ADA Sink
Model(s) LRADQ252255

PRODUCT SPECIFICATIONS

Elkay Lustertone™ Classic Stainless Steel 25" x 22" x 5-1/2", Single Bowl Drop-in ADA Sink. Sink is manufactured from 18 gauge 304 Stainless Steel with a Lustrous Satin finish, Rear Center drain placement, and Bottom only pads.

Installation Type:	Drop-in
Material:	304 Stainless Steel
Special Features:	Quick-Clip Mounting System
Finish:	Lustrous Satin
Gauge:	18
Sound Deadening:	Bottom only pads
Number of Bowls:	1
Sink Dimensions:	25" x 22" x 5-1/2"
Bowl 1 Dimensions:	21" x 15-3/4" x 5-1/8"
Drain Size:	3-1/2" (89mm)
Drain Location:	Rear Center
Minimum Cabinet Size:	30"
Mounting Hardware:	Included for 3/4" (19mm) countertop
Template Included:	No
Cutout Template #:	1000001188

Template is available for download at elkay.com. CAD software will be required to open the template.

Cutout Dimensions for Drop-in Installation:
24-3/8" x 21-3/8" (619mm x 543mm) with 1-1/2" (38mm) corner radius

KOHLER Faucets

SINKS
(or equal product)

Forté®
Kitchen Sink Faucet
K-10415

Features
- KOHLER ceramic disc valves exceed industry longevity standards for a lifetime of durable performance.
- Single lever handle is simple to use and makes adjusting water temperature easy.
- Temperature memory allows faucet to be turned on and off at the temperature set during prior usage.
- 1.5 gpm (5.7 lpm) maximum flow rate at 60 psi (4.14 bar).

Material
- Premium metal construction for durability and reliability.
- KOHLER finishes resist corrosion and tarnishing.

Installation
- For single-hole installation.
- Flexible supply lines simplify installation.

SL9100ADA

Self Latching Sliding Door Lock

For ADA Sliding Door Applications

- Single Action Egress Sliding Door Lock
- ADA Accessibility features
- Deadbolt for extra security
- 2 1/2" or 2 3/4" backset standard

Inside

Outside

Open Position
SL9100ADA features a barrier free surface when door is in the open position.

Complete Lockset
SL9100ADA is offered complete and includes:
Set of 7200L levers/escutcheons
ADA thumb turn and Emergency Release trim where applicable

The **SL9100ADA** Series feature a self latching bolt that is projected when push button actuator contacts strike.

Single Action Egress: To open door, grasp lever and pull. This will simultaneously retract deadbolt and latch while sliding door open. Lock features no protrusions or snags when in the open position.

SL9100ADA Series is available with 7200L Series levers. Accurate can custom manufacture other lever designs or supply the lock for use with other manufacturers' trim, please call for assistance.

SL9100ADA
Self Latching Sliding Door Lock

Series/Function	Description
SL9122ADA	Store Door Lock Latch bolt by lever either side. Deadbolt by key either side. No Emergency Egress.
SL9124ADA	Dormitory, Entrance or Storeroom Latch bolt by lever either side. Deadbolt by key outside, thum bturn inside. A turn of inside lever retracts latch and deadbolt simultaneously, automatically unlocking outside lever.
SL9125ADA	Passage Latch bolt by lever either side
SL9134ADA	Hotel/Motel Latch bolt by lever inside and key outside. Outside lever always rigid. Deadbolt by thumb turn inside. A turn of inside lever retracts latch and deadbolt simultaneously.
SL9139ADA	Privacy Latch bolt by lever either side. Deadbolt by thumb turn and emergency coin turn outside. A turn of inside lever retracts latch and deadbolt simultaneously, automatically unlocking outside lever.
SL9139ADA-i	Privacy x Indicator Latch bolt by lever either side. Dead bolt by thumb turn and emergency coin turn with indicator outside. A turn of inside lever retracts latch and deadbolt simultaneously, automatically unlocking outside lever.
SL9145ADA	Classroom Latch bolt by key outside and lever either side unless outside lever is locked by key.
SL9153ADA	Entrance/Office Latch bolt by key outside and lever either side unless outside lever is locked by thumb turn or key. Key or thumb turn locks or unlocks outside lever.
SL9159ADA	Storeroom Latch bolt by lever inside and key outside. Outside lever always rigid.

SL9100ADA is offered complete (includes lock body, a pair of 7200L levers and ADA thumb turn/ER trim when applicable).
Cylinder not included.

Recommended cylinder lengths	1 3/8" thick door	1 3/4" thick door	2 1/4" thick door
Cylinder one side only	1"	1 1/8"	1 1/4"
Cylinder x cylinder	1"	1"	1 1/8"

MADE IN USA

CRL-Blumcraft PA100 and PA110 Series Panic Handles

BLUMCRAFT
A DIVISION OF C.R. LAURENCE CO., INC.

- UL, ULC, and ANSI/BHMA Certified
- For 1/2" or 3/4" (12 or 19 mm) Tempered Glass Doors
- Wide Selection of Exterior Fixed Handles
- Available in Polished and Brushed Stainless, Satin and Polished Brass, and Oil Rubbed Bronze
- Custom Finishes Available By Special Order
- Custom Sizes Ship Within One to Two Weeks

CRL-Blumcraft manufactures a complete line of Panic Handles designed with the 'all-glass' door in mind. These elegant tubular devices give you maximum viewing area and a contemporary look when used on 1/2" or 3/4" (12 or 19 mm) tempered glass doors.

The most popular of these Panics is our PA100 Series. They provide a solution to the strict Americans With Disabilities Act (A.D.A.) Codes that confront every manufacturer and installer of 'all-glass' doors.

The interior portion of the device is a slender 1-1/4" (32 mm) tube stretching across the door and then gently turning upwards to the top of the door, eliminating any interference at the lower half of the door, which must remain clear of obstructions to pass A.D.A. demands.

The operating mechanism is completely concealed within the tube, and retracts a roller latch bolt at the top of the door when pushed gently. Complementing the sleek interior look, we offer a large selection of exterior pull handles that can be as simple as a horizontal handle (Model PA100A) to one that mirrors the interior device (Model PA100D).

All PA100 Series Panic Handles come with a 'dogging' feature that allows you to lock the device in the open position by simply sliding a lever, giving free access during business hours. They also can be used in conjunction with an Electric Strike, allowing for remote keyless entry. For your convenience, Custom Headers are available with all strike hardware installed.

When A.D.A. Codes are not a concern, we also offer our PA110 Series Panic Handles. These Panics are of the same sleek design as the PA100 Series, except they stretch across the door and then bend downward to the bottom of the door, latching at the floor or threshold.

They operate just like the PA100 Series Panics, and have the same 'dogging' feature. Strikes are available for either threshold or no threshold applications providing secure, accurate latching every time.

All of our PA100 and PA110 Panic Handles go through rigorous testing before they leave our manufacturing facility, ensuring that a high quality, dependable Panic will serve your customer for years to come.

Most importantly, they are all UL305, ULC-S132-07, and ANSI/BHMA A156.3-2008, Grade 1 Certified. No other Panic of this type can make this claim, and that puts CRL-Blumcraft Panic Handles a step ahead of all the rest.

For more information on our PA100 and PA110 Series Panic Handles, contact CRL Technical Sales, or visit our web site at **crlaurence.com**.

PG&E Door only

Features

Extra Heavy Duty Cylindrical Lever Locksets
CL3300 Series

Features

Non-Handed

Door Thickness
1 3/4" (44mm) - 2" (51mm) standard.
Optional: 2"(51mm) - 2 1/4" (57mm); see How to Order, page 10.

Backset
2 3/4" (70mm) standard.
Optional: 3 3/4" (95mm) and 5" (127mm); see How to Order, page 10.

Lock Chassis
Steel, zinc dichromated for corrosion resistance.

Front
Wrought brass or bronze, 2 1/4" (57mm) x 1 1/8" (29mm). Accommodates flat doors and doors beveled 1/8" (3mm) in 2" (51mm).
Optional: rounded corners; see How to Order, page 10.

Latchbolt
Brass, chrome plated, 1/2" (13mm) throw .
Optional: 3/4" (19mm) throw deadlocking fire latch for pair of doors; see How to Order,
page 10.

Auxiliary Latchbolt
Deadlocking latchbolt prevents manipulation when door is closed.

Strike
Wrought brass or bronze, ANSI curved lip standard, 4 7/8" (124mm) x 1 1/4" (32mm) x 1 1/4" (32mm) lip to center.
Optional strikes, lip lengths and ANSI wrought strike box available; see How to Order, page 10.

Cylinder
Brass, 6-pin L4 keyway, 0-bitted standard.

Keying Features Available
Master keying
Construction master keying
Visual key control
Concealed key control
Interchangeable core (IC)
High security
High security IC (not available with CL3329)

Keys
Two nickel silver standard.

Warranty
Five-year limited.

Certification/Compliance

ANSI
Meets A156.2 Series 4000, Grade 1.
Meets A117.1 Accessibility Code.

Federal
Meets FF-H-106C.

California State Reference Code
(Formerly Title 19, California State Fire Marshal Standard)
All levers with returns comply; levers return to within 1/2" (13mm) of door face.

UL/ULC
All locks with 1/2" (13mm) throw latchbolt listed for A label and lesser class 4' x 10' single doors. All locks with 3/4" (19mm) throw latchbolt listed for A label and lesser class 8' x 10' pairs of doors. Letter F and UL symbol on latch front indicate listing.

Finishes

BHMA 605	Bright Brass
BHMA 606	Satin Brass
BHMA 611	Bright Bronze
BHMA 612	Satin Bronze
BHMA 613	Dark Oxidized Satin Bronze, oil rubbed
BHMA 625	Bright Chromium Plated
BHMA 626	Satin Chromium Plated

Zinc levers are plated to match BHMA finish.

Functions

Extra Heavy Duty Cylindrical Lever Locksets - CL3300 Series

Outside / Inside	Series/ Function	Type	ANSI No. Series 4000	Function Description
 PG&E Door only	CL3310	Passage or Closet	F75	- Latchbolt by lever either side. - Both levers always free.
	CL3320	Privacy Bedroom or Bathroom	F76	- Throw-off latchbolt by lever closing door or by turning inside lever. - Outside lever locked by push button. (Lever handle is free wheeling in locked position.) - Outside lever unlocked by emergency release tool outside, by rotating inside lever or by closing door. - Inside lever always free.
	CL3329	Hotel or Motel	F93	- Throw-off latchbolt by lever inside or by key outside. - Push button shuts out all keys except emergency key, and projects occupancy indicator in face of cylinder. (Lever handle is free wheeling in locked position.) - Push button released by turning inside lever or by closing door.* - Outside lever always locked. - Inside lever always free.
	CL3332	Institutional or Utility	F87	- Deadlocking latchbolt by key either side. (Lever handle is free wheeling in locked position.)
	CL3340	Patio or Privacy	F77	- Throw-off latchbolt by lever closing door or by turning inside lever. - Outside lever locked by push button. (Lever handle is free wheeling in locked position.) - Inside lever always free. - Should not be used in rooms that have no other entrance.
	CL3351	Entrance or Office	F81/F82	- Deadlocking latchbolt by lever either side, except when turn button locks outside lever. Pushing turn button in locks outside lever, requiring use of key outside to unlock. (Lever handle is free wheeling in locked position.) - Turning inside lever unlocks outside lever. - Pushing in and turning button locks outside lever, requiring key at all times. Turning inside lever does not unlock outside lever until button is manually turned to unlocked position. - Inside lever always free.
	CL3355	Classroom	F84	- Deadlocking latchbolt by lever either side, except when key outside locks outside lever. (Lever handle is free wheeling in locked position.) - Outside lever unlocked by key outside. - Inside lever always free.
	CL3357	Storeroom or Closet	F86	- Deadlocking latchbolt by key in outside lever or by rotating inside lever. (Lever handle is free wheeling in locked position.) - Inside lever always free.
	CL3361	Entrance or Office	F82	- Deadlocking latchbolt by lever either side, except when push button locks outside lever. - Push button released by turning inside lever or by key in outside lever. (Lever handle is free wheeling in locked position.) - Closing door does not release push button. - Inside lever always free.

 Indicates optional interchangeable core available; see How to Order, page 11.

 Indicates free wheeling lever in locked position.

*Unless push button has been fixed in locked position by spanner key (furnished). When push button is fixed by spanner key, lock is operable only by emergency key or by display key.

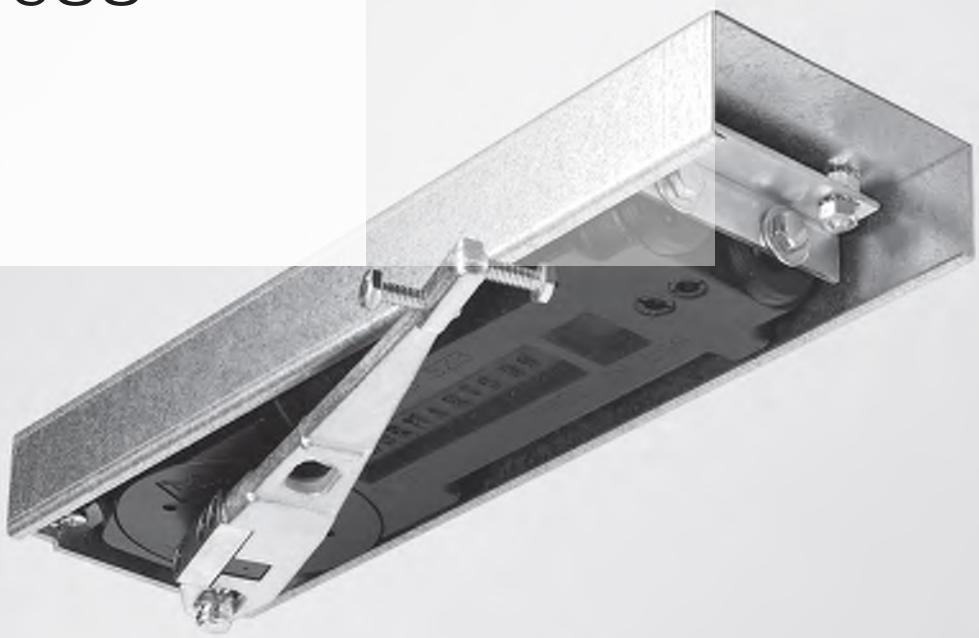
RTS88



Overhead Concealed Door Closer

DORMA RTS88 OVERHEAD CONCEALED DOOR CLOSER

Invisible door control — Dependable and easy to install

Architects are often challenged to design buildings that are both beautiful and functional, down to the last detail. The DORMA RTS88 overhead concealed door closer offers the perfect solution for those who prefer the aesthetic advantages of a concealed door closer.

The RTS88 is designed to give lasting, dependable service where surface applied units and other types of closers are not suitable, or would interfere with the architectural design. The RTS88 may be easily installed in wood, aluminum, or hollow metal doors and frames, for single and double-acting doors. Contractors appreciate the RTS88 closer, because the majority of door and frame preparation is done prior to installation of the unit, resulting in less on-site machining. The RTS88 is also an excellent replacement closer for problem entrances encountering vandalism of surface applied closers.

The RTS88 Series overhead concealed door closer has a compact body size which fits into a 1-3/4" × 4" header for aluminum frames and is also easily adaptable to wood and hollow metal frame configurations.

Openings fitted with the RTS88 are capable of 90° or 105° maximum opening door swing, trim conditions permitting. Sweep and latch closing speeds are controlled by two noncritical temperature compensating valves to insure constant closing speeds even under the most extreme temperature conditions. A built-in pressure relief valve protects the closer from abuse due to forced closing. A cushion at 90° or 105°, depending on the model selected, helps protect the door, frame, and adjoining structure.

CONTENTS

DORMA USA quality and environmental management systems in Reamstown, PA and Steeleville, IL are certified to ISO 9001:2008 and ISO 14001:2004.

NOTE: Always use an auxiliary stop in conjunction with RTS88 installations.

The RTS88 may be used on doors weighing up to a maximum of 250 lb (interior) or 200 lb (exterior), including all hardware. The closer may be used on exterior doors up to a maximum 3'-6" width and interior doors up to a maximum 4' width.

A complete line of accessories is available for wood, aluminum, and hollow metal applications, both single and double-acting center hung doors, and hinged or offset pivoted single-acting doors.

Other accessories include cover plates for wood, aluminum, and hollow metal frames, and extended spindles for increased clearances at the top of the door. Optional hold open units are available, effective at either 90° or 105°.

Specifications—DORMA RTS88 Series overhead concealed door closer for both single and double-acting doors. The RTS88 will consist of a steel cam, rollers, and springs housed in a compact cast iron body. Closers will be capable of being installed in minimum 1-3/4" × 4" headers. RTS88 will have maximum door opening to 90° or 105°, trim conditions permitting. Sweep and latch speed will be controlled by two noncritical adjustment valves from 90° or 105° to closed. Built-in pressure relief valve will protect the closer from abuse caused by forced closing. A cushion at 90° or 105° will be provided to help protect the door and frame. The RTS88 closer will be available with hold open at 90° or 105°, or without hold open. The RTS BFI and BFE are available with 105° hold open only. Optional extended spindle will be available in 3/16" integral length or 1-3/16" add-on length. Accessories will be available for single and double-acting doors as well as independently hung installations for wood, aluminum, and hollow metal doors and frames.

The RTS88 BFI meets the 5 lb maximum opening force requirement for interior 3'-0" wide center hung single or double-acting doors.

Both the RTS88 BFI and RTS88 BFE are suited for easy retrofit of Jackson, Rixson 608, and similar style closers. The RTS88 BFI and RTS88 BFE are available in 105° NHO and 105° HO only.

Cover Plate Finishes (Steel or Wood Frame)
Standard Sprayed Finishes
Aluminum: 689.
Bronze: 691 (Dull), 690 (Statuary), or 695 (Dark Duranodic).

Bright Bronze: 611 (Bright), 612 (Satin), or 613 (Oxidized Satin Oil Rubbed).
Nickel: 618 (Bright) or 619 (Satin).
Chrome: 625 (Bright) or 626 (Satin).

Cover Plate Finishes (Aluminum Frame)
Standard Sprayed Finishes
Aluminum: 689.
Bronze: 695 (Dark Duranodic).
Black: 693.

Warranty[1]: For details, refer to **Limited Warranty Policy** in the current DORMA Price List.

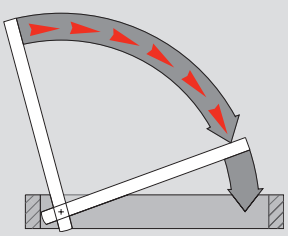
1. Details of DORMA's Limited Warranty Policy may be found in the Limited Warranty Policy section of our current price list. Expressly excluded is warranty for improper installation or misuse of the product. Overtravel or shock loading of the cushion bumper in the RTS88 closer, at the limit of door travel, constitutes misuse and/or improper installation. Always use an auxiliary stop with RTS88 closer installations.

Technical Details

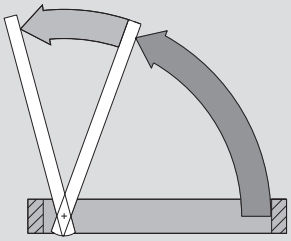
- Compact closer body is designed to fit into headers as small as 1-3/4" × 4".
- Closer body is non-handed.
- One closer for both single-acting or double-acting doors.
- Accommodates maximum door weight of 250 lb (interior) or 200 lb (exterior), including all hardware.
- A pressure relief valve protects closer from damage caused by forced closing.
- An integral cushion limits door swing to 90° or 105°. An auxiliary stop must always be installed in conjunction with RTS88.
- A mechanical backcheck slows down the door prior to contact with the cushion.
- Closing speeds are controlled by two non-critical adjustment valves. Sweep area is from 105° to 20°. Latch area is from 20° to 0°.
- Thermostatic valves insure constant closing speeds under varying temperatures.
- The standard RTS88 is furnished without hold open. Optional single point mechanical hold open is available at 90° or 105°.
- The RTS88 BFI and RTS 88 BFE are available in 105° NHO and 105° HO only.
- The RTS88 offers a cast-iron body along with heavy-duty ball bearings at the spindle.
- Steel cam and roller assembly is coupled to dual steel pistons.
- Mounting brackets are available to install closer into aluminum or wood headers.
- Packages are available for side load, end load, and offset slide arm applications. For independently hung doors with 8812 slide arm, the maximum degree of opening and hold open angle may vary slightly.
- No. 8532 steel header mounting channel is specifically designed to install the RTS series closer into open-throat steel header sections. Normally, the mounting channel is installed in the header prior to shipment to the job site.
- No. 8521E add-on spindle extension is available for special applications where additional clearance is required between the closer body and the door.
- Cover plates are available for virtually any type header material.
- No. 8820J conversion bracket is available for replacement of existing overhead concealed closers with the RTS88.

Technical Details

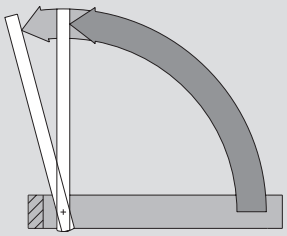
Dual Speed Closing—Sweep and latch closing speeds are controlled by two non-critical adjustment valves. Sweep area is from 105° to 20°. Latch area is from 20° to 0°.



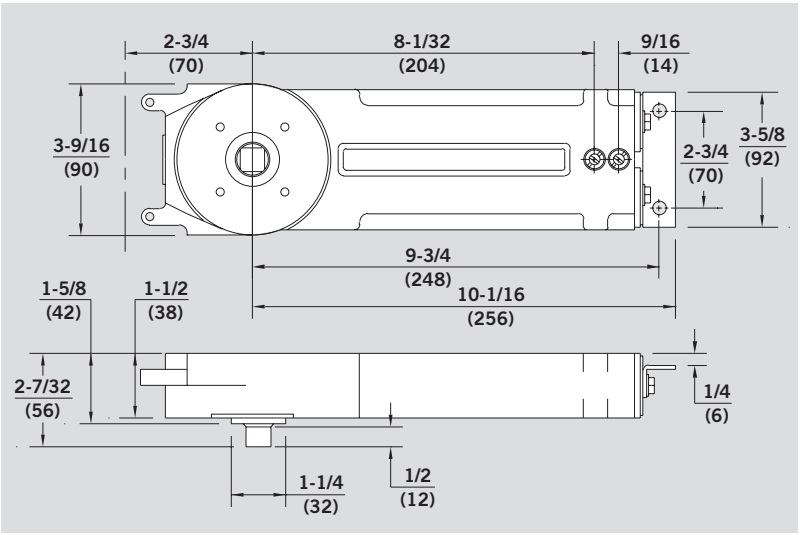
Backcheck—A mechanical backcheck slows the door prior to contact with the cushion.



Cushion—An integral cushion is available at 90° or 105°. Always use an auxiliary stop in conjunction with RTS88 installations.



RTS88 Closer Dimensions



Comparison Chart RTS88 Series

Size Selector Chart RTS88 Series

Maximum Door Width

Interior	Exterior	Closer Size
to 3'-0"	to 2'-6"	2*
over 3'-0" to 3'-6"	over 2'-6" to 3'-0"	3
over 3'-6" to 4'-0"	over 3'-0" to 3'-6"	4

* Size (2) is available for 90° cushion or cushion/hold open only. For 105° applications, substitute the RTS88 BFE for the door ranges shown.

Note:
The listed door widths and recommended sizes are for average conditions. In the case of tall or heavy doors or where doors are subject to wind or draft conditions, the larger closer should be selected and used in conjunction with an auxiliary stop.

Size Selector Chart RTS88 BFI/BFE

Door Width

Interior	Exterior	Lightest Opening Force
3'-0" ♿	—	RTS88 BFI*
—	3'-0"	RTS88 BFE*

♿ The RTS88 BFI meets 5 lb interior maximum opening force on 3'-0" wide center hung doors. The RTS88 BFE has the lightest exterior maximum opening force (8.5 lb) on 3'-0" wide center hung doors.

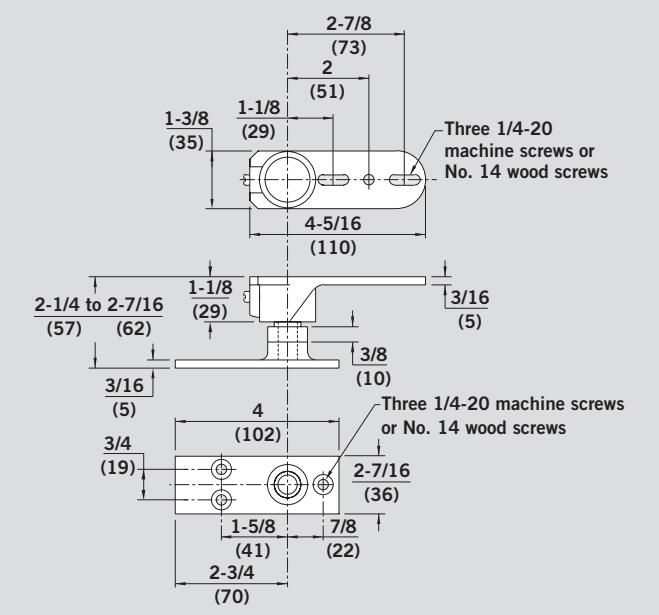
* Available for 105° cushion only or cushion/hold open only.

REDUCED OPENING FORCE INSTALLATIONS CAUTION:
Manual door closers, including closers certified to meet ANSI/BHMA A156.4, when installed and adjusted to conform to ADA or other reduced opening force requirements, may not provide sufficient power to reliably close and latch a door.

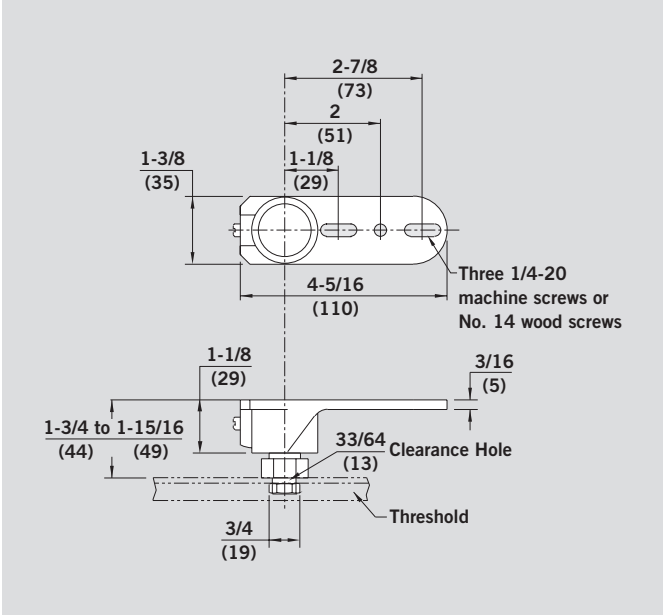
Refer to catalog for Low Energy Operator to meet reduced opening force requirements without affecting closing power.

ACCESSORIES

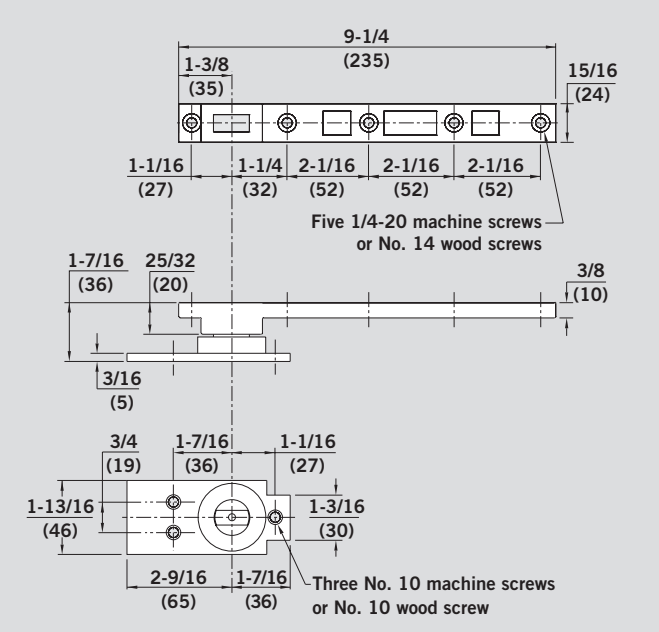
Pivots



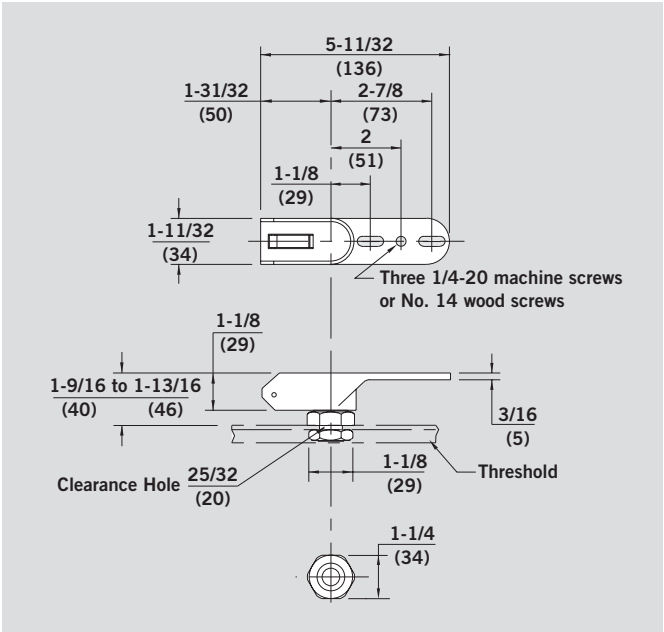
No. 8570 — Adjustable side load floor pivot set for bottom door rail channel depth of 1-15/16". Base can be shortened for 1-9/16" bottom door rail channel depth. Bottom door clearance is adjustable from 5/16" to 1/2". Maximum weight capacity is 200 lb.



No. 8572 — Adjustable side load threshold pivot set for bottom door rail channel depth of 1-9/16". Bottom door clearance is adjustable from 3/16" to 3/8". Maximum weight capacity is 200 lb.

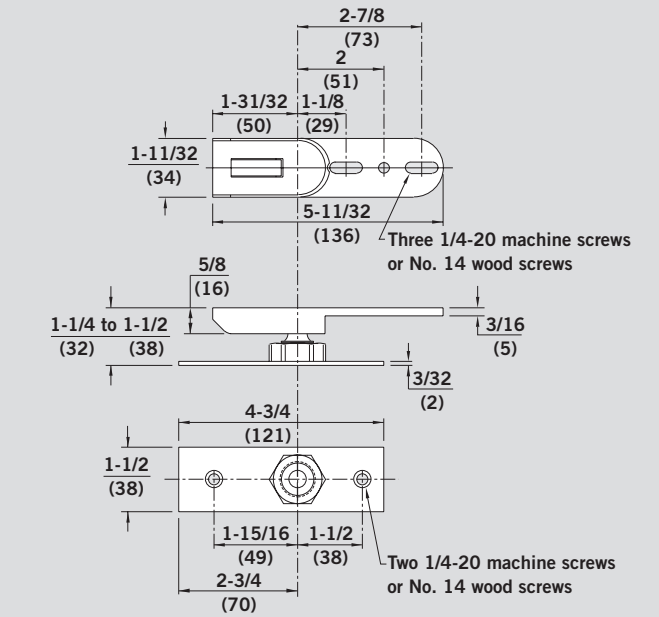


No. 7471K/7421 — Side load floor pivot set. Requires a 1-1/8" mortise depth. Provides a bottom door clearance of 5/16". Weight capacity when used with RTS Series closer is 250 lb. Recommended for wood doors or any door weighing in excess of 200 lb.

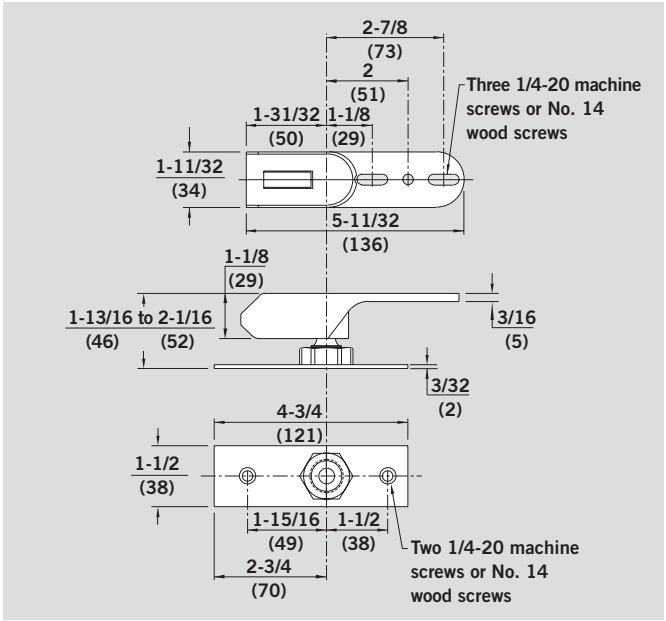


No. 8856 — Adjustable end load threshold pivot set for bottom door rail channel depth of 1-3/8". Bottom door clearance is adjustable from 3/16" to 7/16". Maximum weight capacity is 200 lb.

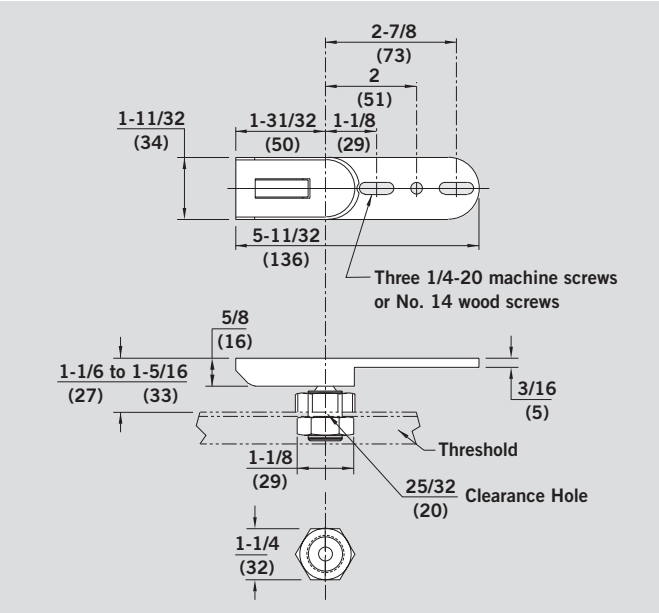
Pivots



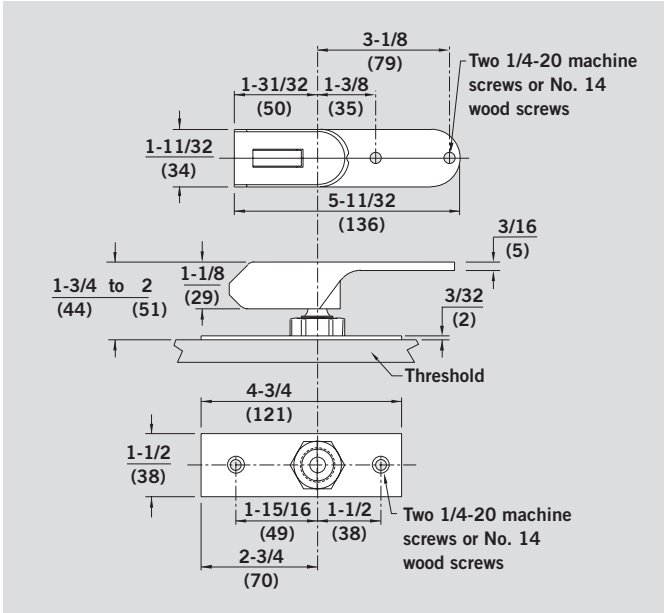
No. 8852 — Adjustable end load floor pivot set for bottom door rail channel depth of 7/8". Bottom door clearance is adjustable from 3/8" to 5/8". Maximum weight capacity is 200 lb.



No. 8853 — Adjustable end load floor pivot set for bottom door rail channel depth of 1-9/16". Bottom door clearance is adjustable from 1/4" to 1/2". Maximum weight capacity is 200 lb.



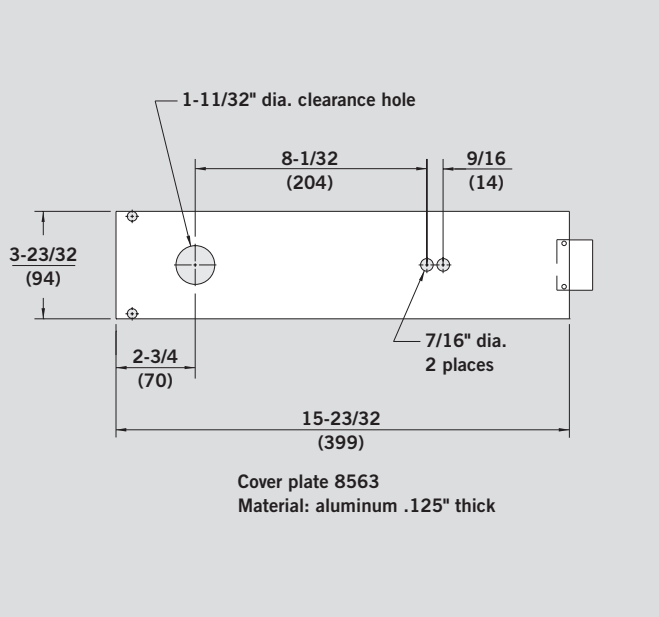
No. 8855 — Adjustable end load threshold pivot set for bottom door rail channel depth of 7/8". Bottom door clearance is adjustable from 3/16" to 7/16". Maximum weight capacity is 200 lb.



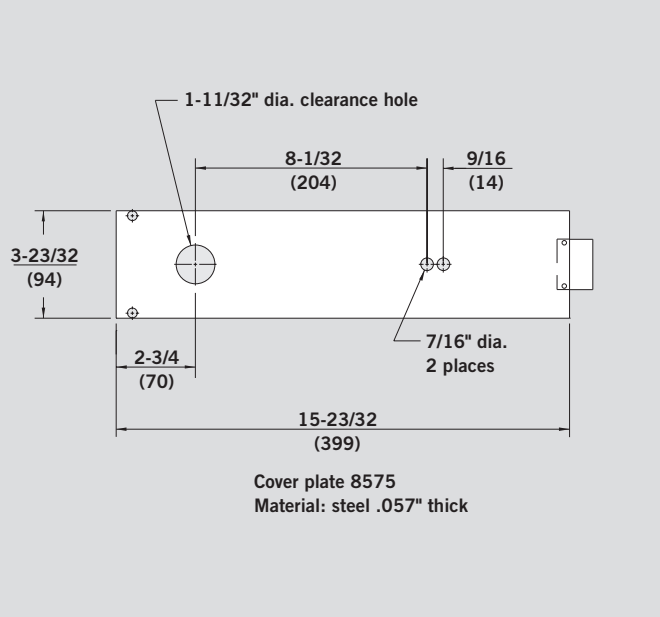
No. 8857 — Adjustable end load threshold pivot set for bottom door channel depth of 1-9/16". Bottom door clearance is adjustable from 3/16" to 7/16". Maximum weight capacity is 200 lb.

ACCESSORIES

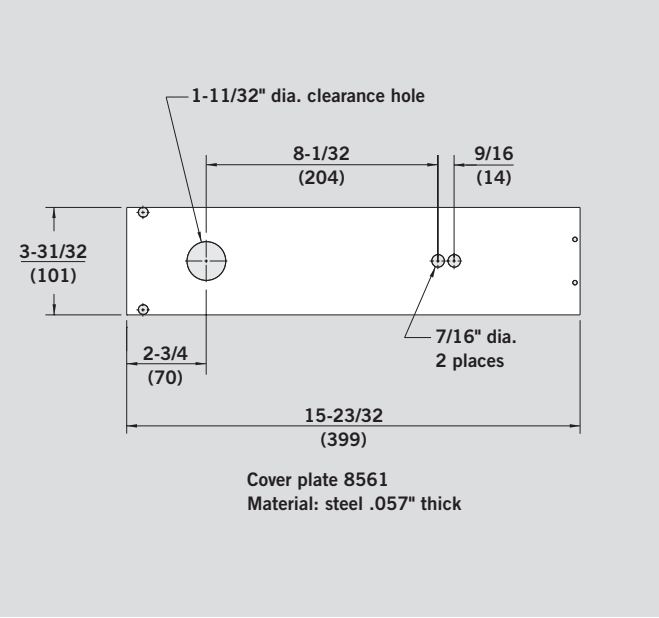
Cover Plates



No. 8563 — Cover plate for RTS Series closer when installed in aluminum header.

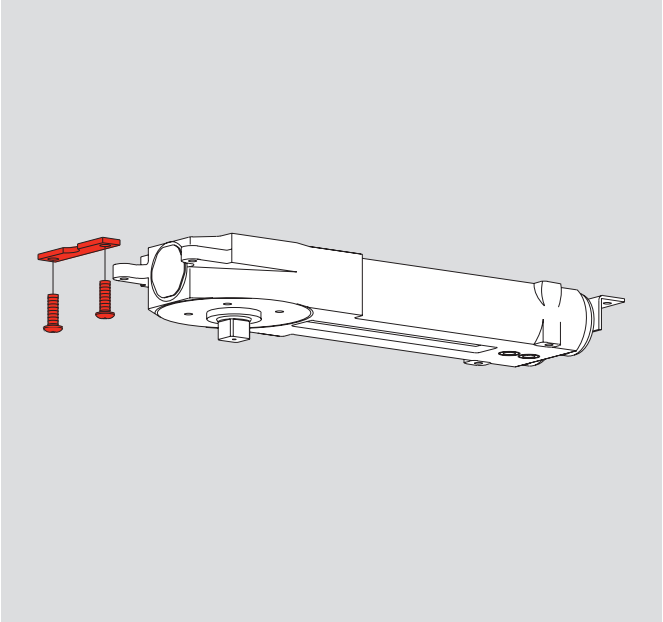


No. 8575 — Cover plate for RTS Series closer when installed in steel header.

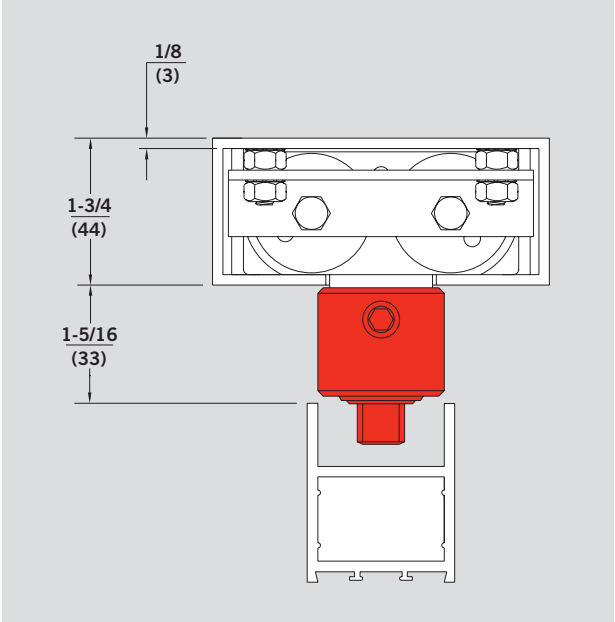


No. 8561 — Cover plate for RTS Series closer when installed in wood header.

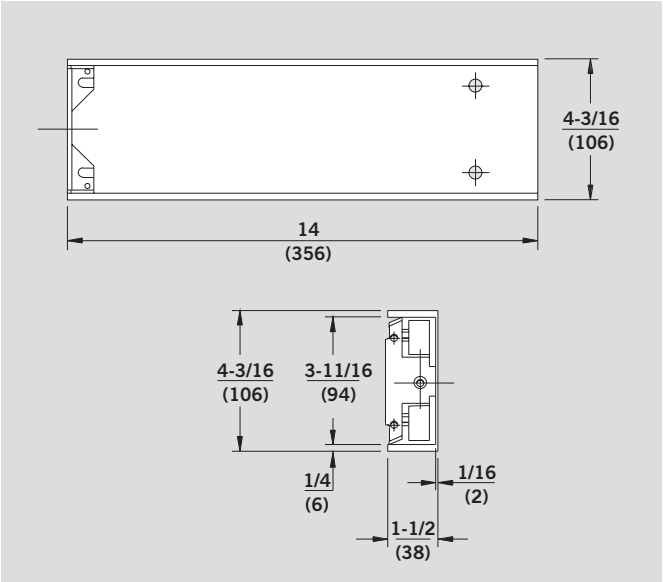
Miscellaneous Accessories



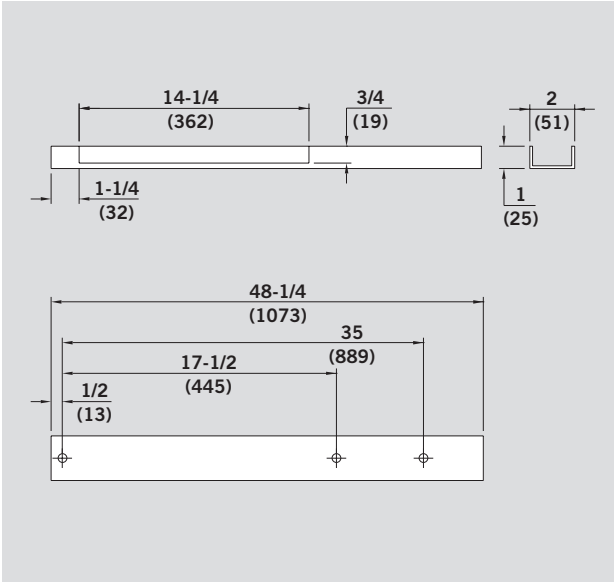
No. 8820J — Conversion bracket for replacement of existing overhead concealed closers. Utilizes existing side jamb mounting bracket to anchor RTS Series closer.



No. 8521E — Add-on spindle extension increases distance between closer and door by 1-3/16" (30 mm).



No. 8532 — Steel header mounting channel. Provides reinforcement required to install the RTS Series closer in an open-throat header.



No. 8511 — Offset slide arm cover. Conceals No. 8812 slide arm when door is in the closed position. The extruded aluminum cover is 48-1/4" long and is field-sized as required. Specify hand.

100 Series Concealed Overhead Door Holders/Stops

100 Series Heavy-Duty

Glynn-Johnson offers a complete line of overhead door holders and stops, accommodating virtually all openings with solutions for even the most complex door control problems. These concealed holders and stops provide the most attractive and reliable heavy-duty door control available.

Glynn-Johnson 100 series holders and stops provide the most reliable and versatile concealed overhead door control. They are designed for installation on virtually all types of doors mounted on conventional type butt hinges, pivots, continuous hinges, swing clear hinges and numerous other specialty hinges. When used in conjunction with many surface-applied door closers, 100 series holders and stops provide the most effective control for entrance doors and vestibule doors of all types, as well as heavy or often used interior doors. Templates provided allow for variable mounting positions, ranging from 85° - 110° of opening.

Five Models:
- 100H Series Hold-Open Model
- 100HP Series Internal Hold-Open Model
- 100F Series Friction Hold-Open Model
- 100S Series Stop-Only Model
- 100SE Series Special Stop-Only Model

Six Sizes:
- Each model comes in six sizes.
- Simple
- Standardized

Three Options:
- ADJ—Adjustable Jamb Bracket
- CJ—Jamb Bracket for use with LCN5030 Closer
- SOC—Pin-in-Socket Security Screw Package

Unmatched Convenience:
- Non-handed
- Improved Compatibility with Door Closers
- Single/Double-Acting Doors
- Interior/Exterior Applications
- Reduced Door Prep
- Durable
- Improved Corrosion Resistance
- Function Conversion Kits are Available.

Materials and Finishes:
In Heavy Gauge Brass or 300 Series Stainless Steel, these models offer the broadest range of finishes in the industry, complementing any design and offering the highest resistance to corrosion. Available in the following finishes:

Finishes	Description
US3	Polished Brass
US4	Satin Brass
US10	Satin Bronze
US10B	Oil Rubbed Bronze
US32	Polished Stainless Steel
US32D	Satin Stainless Steel
SP4	Powder Coat Brass
SP10	Powder Coat Bronze
SP28	Powder Coat Aluminum
SP313	Powder Coat Dark Bronze
SPBLK	Powder Coat Black

Models

These models provide a wide range of optional features, and are ideal for use on entrance and vestibule doors, large doors, doors opened frequently, or doors subject to abuse. These models are also furnished with an offset-style jamb bracket.

Designed for heavy-duty applications, 100 series models will provide long-lasting protection to doors, frames, hinges, related hardware and surrounding walls or obstructions.

100H Series Hold-Open

(Suffix H) The Hold-Open function should be used where it is desired to hold a door open at a predetermined position for short or long periods of time, permitting an unobstructed traffic flow through the opening.

These models are both selective and adjustable, featuring the most reliable Hold-Open mechanism available. They feature a control knob which protrudes from the face of the door and turns the Hold-Open function on or off. Set in the inactive position, the unit acts as a stop and shock absorber. The tension on the Hold-Open mechanism can be adjusted using an allen wrench to offset air currents or other exterior conditions. The Hold-Open tension adjustment is located in the bottom of the track in the top of the door.

100HP Series Internal Hold-Open

These models provide a Hold-Open unit with the Hold-Open mechanism built into the channel, thus reducing the door prep. The 100HP have a preset Hold-Open force that is not adjustable. The Hold-Open feature is not selectable in these units, so the doors are always held open.

100F Series Friction Hold-Open

(Suffix F) Friction Hold-Open models provide an alternative holding method, ideal for heavy patient room doors, closet doors or similar applications where multiple Hold-Open positions are desired. The friction tension is adjusted using an allen wrench and an open end wrench. The friction tension adjustment is located on the top of the slider in the channel.

100S Series Stop-Only

(Suffix S) When the Hold-Open function is not required, the Stop-Only function provides the same effective door control minus the Hold-Open feature. The Stop-Only model may be used on fire doors.

100SE Series Special Stop-Only

(Suffix SE) When Stop-Only models are used in conjunction with single point Hold-Open electronic door closers, they may be ordered without the shock-absorbing mechanism. Used as an auxiliary stop with these closers, they will prolong the life of the closer. The stop location is adjusted using an allen wrench on the stop block located in the channel.

Note: Caution should be used when using this option in other applications, as the elimination of the shock-absorbing spring can put added stress on door and frame if used improperly.

Application Information

UL Classification

The 100 series Stop-Only models are classified by Underwriters Laboratories (UL) as Miscellaneous Fire Door Accessories. This classification applies to use on either Hollow Metal Fire Doors or Wood Fire Doors. Where Wood Door manufacturer's listing allows for the cutout required for installation, concealed overhead stops may be used on those wood fire doors. These units may be used on doors of any rating. As a reminder, the Miscellaneous Fire Door Accessories (GVUX) section is defined by UL as: "Miscellaneous fire door accessories are intended in the individual Listings. The accessories have been investigated to determine that when installed in accordance with the manufacturer's instructions, the accessories do not adversely affect the fire rating of the fire door and/or fire door frames."

Dead Stop Templating:

If a wall or similar obstruction is in place at 110° or less opening angle (i.e. doors that open back-to-back), Dead Stop Templating should be used. This includes all Hold-Open, Friction and Stop-Only models, except when the "SE" Option is used. The Dead Stop position is reached when the shock-absorbing spring is fully compressed, the initial degree of opening will be 5° to 7° less than the Dead Stop opening.

Example: If the holder is templated to 100° Dead Stop, the door will hold open somewhere between 93° and 95°, but no further than 100°.

Note: Do not use dead-stop templating on the 100SE Series since there is no shock-absorbing spring.

Environmental Considerations:

Environmental factors should always be considered when specifying overhead holders and stops. Doors that are positioned on a building's exterior or subject to corrosive conditions should be equipped with a holder constructed primarily of stainless steel or brass materials. For interior applications, steel is acceptable, though brass substrates generally provide a more attractive architectural-grade finish.

Function Conversion Kits

- FK100F—Converts a 100H or 100S unit into a 100F unit. To order specify FK100F.
- FK100H—Converts a 100F or 100S unit into a 100H unit. To order specify FK100H.
- No kit is needed to convert a 100H or 100F unit into a 100S unit.

Options

Suffix ADJ (Adjustable Jamb Bracket):

An additional option on the 100 series is the adjustable jamb bracket, which allows the degree of Hold-Open or Stop angle to be adjusted after installation. Suffix "ADJ" is available in all functions, but only in sizes 3, 4, 5 & 6. ADJ jamb bracket requires additional frame prep. The ADJ option cannot be added to an existing unit, it must be factory ordered.

Suffix CJ (Closer Jamb Bracket):

Provides a special jamb bracket needed for 100 series units used with LCN5030 closers. These special jamb brackets are handed, so handing will need to be specified when ordering the "CJ" option, CJLH for a left hand door and CJRH for a right hand door. The CJ option cannot be added to an existing unit, it must be factory ordered.

Suffix SOC (Pin-in-Socket Security Screw Package):

A screw package with pin-in-socket screws for mounting the jamb bracket to the frame is provided instead of the standard screw package.

100 Series Concealed Overhead Door Holders/Stops

Stainless Steel material, change 0 to 5 (i.e. C51511)

BHMA

All 100 series models are designed for heavy-duty applications and far exceed BHMA cycle test and force test requirements for Grade 1 holders and stops.

The template information on this page is for reference only and is not intended to serve as an installation template. For complete dimensional information, refer to Glynn-Johnson template book.

90 Series Surface Overhead Door Holders/Stops

90 Series Heavy-Duty

Glynn-Johnson 90 series holders and stops are the most rugged models available for heavy-duty applications. The channel is surface-mounted to the door, most often with sex bolts, and the jamb bracket is surface mounted to the jamb, requiring minimal door and frame preparation.

These versatile units can be used in conjunction with most surface-applied door closers. The provided templates allow for variable mounting positions, ranging from 85º to 110º Hold-Open/Stop angle. These templates are designed for installation in almost all types of doors, including doors with conventional butt-type hinges or specialty hinges.

Four Models:
- 90H Series Hold-Open Model
- 90S Series Stop-Only Model
- 90F Series Friction Hold-Open Model
- 90SE Series Special Stop-Only Model

Five Sizes:
- Simple
- Standardized
- Each model is available in five sizes

Three Options:
- J—Angle Jamb Bracket
- SHIM—Blade Stop Shim Kits
- SOC—Pin-in-Socket Security Screw Package

Unmatched Convenience:
- Non-Handed
- Improved Compatibility with Door Closers
- Single-Acting Doors
- Interior/Exterior Applications
- Durable
- Easy to Install
- Improved Corrosion Resistance
- Function Conversion Kits Available

Materials and Finishes:
In 300 series Stainless Steel, Brass and Steel substrates, these models are available in the largest selection of finishes in the industry. Stainless Steel models offer the highest resistance to corrosion. Available in the following finishes:

Finish	Description
US3	Polished Brass
US4	Satin Brass
US10	Satin Bronze
US10B	Oil Rubbed Bronze
US32	Polished Stainless Steel
US32D	Satin Stainless Steel
SP4	Powder Coat Brass
SP10	Powder Coat Bronze
SP28	Powder Coat Aluminum
SP313	Powder Coat Dark Bronze
SPBLK	Powder Coat Black
652	Chrome-like Coating

Models

Glynn-Johnson 90 series door holders and stops provide long-lasting protection for doors, frames and hardware. All models incorporate a heavy-duty channel/slide-arm design and offset jamb bracket. This unique design allows for simple field modification of functions, should user requirements change.

90H Series Hold-Open

(Suffix H) Hold-Open models provide a convenient method of holding the door open at a predetermined position for short or long periods of time, permitting an unobstructed traffic flow through the opening. The Hold-Open function can easily be turned on or off by simply rotating the serrated knob on the bottom of the channel. This knob engages the Hold-Open mechanism, allowing the door to be held open at a predetermined position ranging from 85º to 110º. When the knob is flipped over, it acts as a stop and shock absorber.

The tension on the Hold-Open mechanism can be adjusted using a phillips screwdriver to offset air currents or other exterior conditions. The Hold-Open tension adjustment is located on the top of the slider in the channel.

90S Series Stop-Only

(Suffix S) When the Hold-Open function is not a requirement, Stop-Only models provide a reliable method of door control. Stop-Only models provide the same shock-absorbing capability as Hold-Open models. The Stop-Only model may be used on fire doors.

90F Series Friction Hold-Open

(Suffix F) Friction Hold-Open models are ideal for patient room doors, wardrobe and closet doors or similar applications where multiple Hold-Open positions are desired. The friction tension can be adjusted through the top of the channel using an allen wrench. The friction tension adjustment is located on the top of the slider in the channel.

90SE Series Special Stop-Only

(Suffix SE) When Stop-Only models are used in conjunction with single-point, Hold-Only electronic door closers, the Stop-Only function may be ordered without the shock-absorbing mechanism. Used as an auxiliary stop, these models prolong the life of the closer. The stop location is adjusted using an allen wrench on the stop block located in the channel.

Note: Caution should be taken when using this option in other applications, as the elimination of the shock-absorbing spring can put added stress on the door and frame.

Application Information

UL Classification

The 90 series Stop-Only models are classified by Underwriters Laboratories (UL) as Miscellaneous Fire Door Accessories. This classification applies to use on either Hollow Metal Fire Doors or Wood Fire Doors. These units may be used on doors of any rating. As a reminder, the Miscellaneous Fire Door Accessories (GVUX) section is defined by UL as: "Miscellaneous fire door accessories are intended in the individual Listings. The accessories have been investigated to determine that when installed in accordance with the manufacturer's instructions, the accessories do not adversely affect the fire rating of the fire door and/or fire door frames."

Dead-Stop Templating:

Dead-stop templating is recommended for applications where a wall or similar obstruction is placed at an opening angle of 110º or less (i.e., doors that open back-to-back). Dead-stop templating can be applied to Hold-Open, Stop-Only and Friction models. The Dead-Stop position is the point at which the shock-absorbing spring is fully compressed. Therefore, when Dead-Stop Templating is used, the initial degree of opening will be 5º to 7º less than the Dead-Stop opening.

Example: If the holder is templated to a 100º Dead Stop, the door will hold open at an angle between 93º and 95º but no further than 100º

Note: Do not use dead-stop templating on the 90SE Series since there is no shock-absorbing spring.

Environmental Considerations:

Environmental factors should always be considered when specifying overhead holders and stops. Doors that are positioned on a building's exterior or subject to corrosive conditions should be equipped with a holder constructed primarily of stainless steel or brass materials. For interior applications, steel is acceptable, though brass substrates generally provide a more attractive architectural-grade finish.

Function Conversion Kits

- FK90H—Converts a 90F or a 90S unit into a 90H unit. To order specify FK90H.
- FK90F—Converts a 90H or a 90S unit into a 90F unit. To order specify FK90F.
- FK90SE—Converts a 90H, 90F or a 90S unit into a 90SE unit. To order specify FK90SE–Finish.
- No kit is needed to convert a 90H or 90F unit into a 90S unit.

Options

Suffix J (Angle Jamb Bracket):

An angle jamb bracket is available for converting standard models to hinge-side or flush transom mounting. The angle jamb bracket affixes to the standard jamb bracket. If ordered with the unit add suffix J. If needed separately order 90J by finish needed.

Suffix SOC (Pin-in-Socket Security Screws):

A screw package with pin-in-socket screws for mounting the door bracket and the jamb bracket is provided instead of the standard screw package.

Suffix SHIM (Blade Stop Shims):

Shim kits are available in 3 sizes
90 SHIM1 is a 1/4" Shim Kit
90 SHIM2 is a 1/2" Shim Kit
90 SHIM3 is a 3/4" Shim Kit

If ordered with overhead, add suffix SHIM (1, 2 or 3). If needed separately order 90 SHIM (1, 2 or 3)–Finish.

Options:
- **ADJ** Adjustable Jamb Bracket
- **CJLH** Special Jamb Bracket for LCN 5030 Closer, LH Door
- **CJRH** Special Jamb Bracket for LCN 5030 Closer, RH Door
- **SOC** Pin-in-Socket Security Screws

Meets ANSI A156.3 Type 25.
UL Listed 3 Hour Fire Doors 8'0" x 10'0"

FB31P Top and Bottom Bolts (Pair)

- Fully Automatic—inactive door is latched, bolts are extended when active door closes, door is unlatched, bolts retract when active door is opened.
- Low Actuation Forces—Top Bolt Has No Spring Tension.
- Fits standard ANSI A115.4 Door Frame Preparations.
- Non-handed.
- Bolt throw is 3/4" with a 7/8" vertical adjustment.
- Bolt backset is 3/4"
- Standard Rod Length is 12", which is measured from the center of the flush bolt body to the bolt tip. Optional rod lengths available for top bolt only on non-fire rated openings—18", 24", 36" and 48.

DP1 or DP2 optional dust proof strike available, see page C11.

FB31T Top Bolt Only
FB31B Bottom Bolt Only

Meets ANSI A156.3 Type 25.
UL Listed 3 Hour Fire Doors 8'0" x 8'0"

FB32 Top Bolt with Auxiliary Fire Latch

- FB32 Model with Auxiliary Fire Latch eliminates the bottom bolt and is UL Listed for Fire Doors.

FB33 Top Bolt with Auxiliary Fire Latch and Retrofit Plate

- FB33 Model with Auxiliary Fire Latch eliminates the bottom bolt and includes a retrofit plate to cover existing bottom bolt prep. UL Listed for Fire Doors.

COR

Series Bar Coodinators

- The COR Series Coordinators are designed for use on pairs of doors when one door needs to close before the other.
- All COR units function easily. The active door lever, located nearest to the active stop, holds the active door open until the trigger mechanism is released by the closing of the inactive leaf.
- All COR units may not function correctly with swingclear hinges.
- All COR units are equipped with an adjustable override feature which allows the active door to close under extreme pressure.
- All COR units are compatible with Flush Bolts.
- The COR Series is available in five sizes for variable door opening widths.
- The COR Series does not cover the entire length of the stop, so a FL filler bar can be provided to maintain architecturally clean lines.
- COR Series Coordinator Channels and FL fillers are made of aluminum.
- Optional Filler Bars: FL20 - 20", FL32 - 32" and FL44 - 44", available to maintain clean line.
- Optional Mounting Brackets available: MB1, MB2, MB1F, MB2F, MB3F, MB1V, MB2V, and MB3V for other stop applied hardware.

Meets ANSI/BHMA A156.3, Type 21A.
UL Listed for installation on labeled frame.

For Openings Where Doors Are Same Size

Coordinator Number	Length of Channel	For Opening Widths	Common Applications
COR32	32"	34" - 52"	Pair of 2'0" Doors
COR42	42"	52" - 72"	Pair of 2'6" Doors
COR52	52"	62" - 92"	Pair of 3'0" Doors
COR60	60"	70" - 108"	Pair of 3'6" Doors
COR72	72"	84" - 132"	Pair of 4'0" Doors

For Openings Where Doors Are Unequal Size

The coordinator length should equal the active door width plus approximately 1/2 the inactive door width. The coordinator must be 6" longer than the active door width and shorter than the overall frame opening between stops.

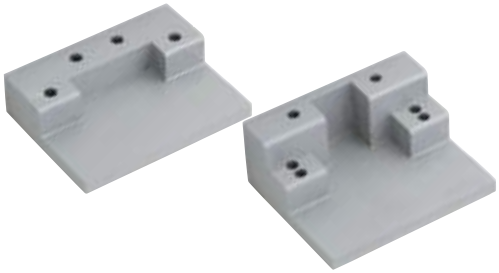
MB1and MB2



Mounting Brackets

- Allows stop mounted hardware to be properly installed without damaging the COR coordinator, such as a parallel arm closer or a non-fire-rated surface vertical rod strike.
- Stop mounted hardware will need to be lowered to compensate for the height of the coordinator and mounting bracket.
- MB mounting brackets are made of aluminum

Product	Jamb Depth	Stop Width	Dimensions
MB1	4-3/4" Min.	Over 2-1/2"	4" W x 3" D x 15/16" T
MB2	4-3/4" Min.	Up to 2-1/2"	4" W x 3-1/4" D x 1-5/8" T

MB1V

MB2V

MB3V

Fire Rated Mounting Brackets

- Allows for fire-rated stop mounted hardware to be properly installed without damaging the COR Coordinators, such as fire-rated surface vertical rod exit device strikes.
- Latch will need to be lowered to compensate for the height of the coordinator and mounting bracket.
- MB-V are designed for Von Duprin 8827-F soffit latch.
- Mounting brackets are made of steel.

Product	Jamb Depth	Stop Width	Dimensions
MB1F	5"	1-1/2" - 2-1/4"	4" W x 3" D x 1-5/8" T
MB1V	5"	1-1/2" - 2-1/4"	4" W x 3" D x 1-5/8" T
MB2F	5-7/8"	2-3/8" - 3-1/4"	4"W x 4" D x 1-5/8"T
MB2V	5-7/8"	2-3/8" - 3-1/4"	4"W x 4" D x 1-5/8"T
MB3F	6-7/8"	Over 3-3/8"	4"W x 3-1/2" D x 1"T
MB3V	6-7/8"	Over 3-3/8"	4"W x 3-1/2" D x 1"T

How to Order COR and Accessories

COR 52 US28 FL20 D 36"

COR Size:
32, 42, 52, 60, 72

Finishes:
US28, US26D, 315AN

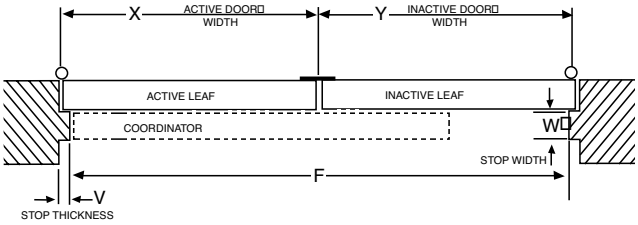
Filler Bar (if desired):
FL20, FL32, FL44

Vertical Rod Exit Device Cutout Type (if applicable):
A, B, C, D, E, F, G
If other Vertical Rod Exit Device not listed on chart, from page C16, include information as shown on page C16.

Active Door Size – Required for ALL Vertical Rod Exit Device Applications

To determine the size COR you need:

1. Start with the active door width (X).
2. Next consider the overall frame opening between stops (F).
3. Preferably, the coordinator would equal the active door width (X) + approximately 1/2 inactive door width (Y). The coordinator must be 6" longer than the active door width (X) and less than the overall frame opening between stop (F).



Examples:

- Pair of 30" Doors, 5/8" Stops
  Active Door Size, X = 30"
  Overall Frame Opening between Stops, F = 58-3/4"
  Recommended Coordinator: COR42

- Pair of 36" Doors, 5/8" Stops
  Active Door Size, X = 36"
  Overall Frame Opening between Stops, F = 70-3/4"
  Recommended Coordinator: COR52

- 36" Active Door, 18" Inactive door, 5/8" Stops
  Active Door Size, X = 36"
  Overall Frame Opening between Stops, F = 52-3/4"
  Recommended Coordinator: COR42

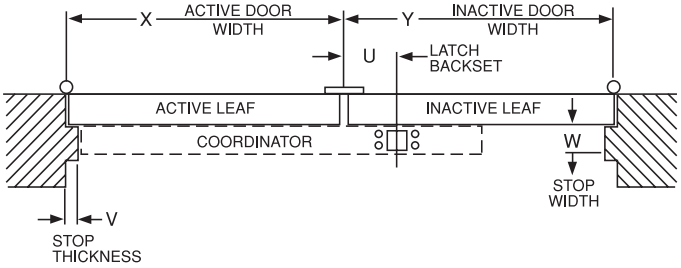
- 48" Active Door, 24" Inactive Door, 5/8" Stops
  Active Door Size, X = 48"
  Overall Frame Opening between Stops, F = 94-3/4"
  Recommended Coordinator: COR60

Special Factory Preparation for Use with Vertical Rod Exit Devices

Coordinators may need to be prepared at the factory for use with some surface or concealed vertical rod exit devices. (See Chart below)

If the exit device is not listed the following information is needed.

1. Exit Device Manufacturer and Model No.
2. Active Door Size, "X"
3. Inactive Door Size, "Y"
4. Exit Device Backset, "U"
5. Stop Width, "W"
6. Stop Thickness if other than 5/8", "V"



Exit Device Manufacturer	Exit Device Number	Device Backset	Maximum Active Door	Coordinator Size Needed	Coordinator Cutout Type	Mounting Bracket Needed

Meets ANSI/BHMA A156.4 C07131

7215
7215F 3/4" Offset Pivot

- Handed
- Top, header mount
- Bottom, jamb mount
- Use with 1-3/4" minimum door thickness, with 1/8" bevel in 2"
- Maximum door load 500 pounds
- Vertical adjustment range 3/16", with positive locking
- WP - optional weather resistant bottom pivot is modified for improved corrosion resistance. Available in US26D (626) or US32D (630) only.

Optional 7215-7226-7227 or 7215F-7226F-7227F Intermediate Pivot (handed) for each additional 100 pounds or doors over 7'. See page A47.
Optional 7215PT Power Transfer, non-load bearing. See page A49

7215 - Ul Listed 20 minute fire doors
7215F - UL Listed 3 hour fire doors

FS18S
FS18L Floor Stops

- Security Door Stops designed for use in high vandalism areas.
- Molded from black flame resistant, resilient material around a heavy-duty stud.
- Once grouted in concrete, leaves no exposed fasteners to be tampered with or removed.
- Ideal for jail or security cell areas where floor mounted stops are required.
- FS18L also ideal for concrete wall applications.

Dimensions

FS18S Height: 1-1/2"
FS18S Diameter: 2"
FS18S Stud Length: 2-1/2"

FS18L Height: 3-1/2"
FS18L Diameter: 2"
FS18L Stud Length: 2-1/2"

FS434 Floor Stop

- Burnished wrought steel.
- For undercut doors up to 1-1/2".
- Packed with screws and plastic anchors.
- Replaceable soft, resilient gray rubber.

Dimensions

Overall Height: 2-5/8"
Base Size: 1-1/2" W x 2-3/4" L

SR64 Door Silencer

- For use on metal frames featuring pneumatic design that, once installed, forms an air pocket to absorb shock and reduce noise of door closing.
- Tamper-proof once installed on the frame.
- Proper installation also eliminates door rattle and provides constant tension for door latches or locks.

Packed in bags of 100.
Grey Available in bulk pack of 2500.
Each bag has an installation tool included.

Dimensions

Diameter: 1/2”

Thickness: 1/8”

Finishes

GRY, TAN

Meets ANSI/BHMA 156.16, L03021

SR65 Door Silencer

- For use on wood frames, also feature pneumatic design to cushion shock and absorb noise.
- To prevent removal, a small brad should be driven into stop strip and through stem of silencer, as shown in the detail.

Packed in bags of 100.

Dimensions

Height: 3/4”

Diameter: 3/8”

Thickness: 1/8”

Finishes

GRY

SR66 Door Silencer

- Self Adhesive Rubber Silencers.
- Economical installation requires no drilling of frames.

Packed two sheets of 50 (100 minimum).

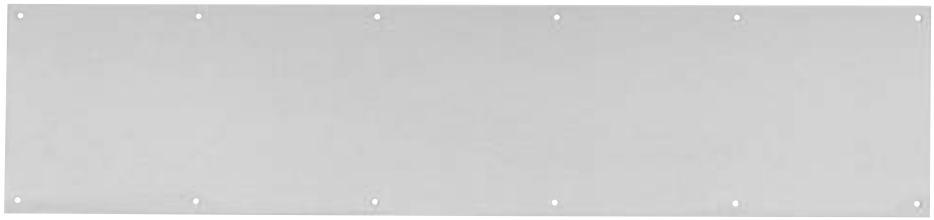
8400 Series Protection Plates

- Door protection plates are available in .050" thick brass, stainless steel or aluminum; and 1/8" thick high impact polyethylene in clear or black.
- Bevel edge options; specify B4E for all four edges.
- Mounting screw pack furnished standard, 16 screws per pack. Optional screw packs are available for TEK or TORK screw heads. Refer to the following chart for ordering.
- Specify NMH for no mounting holes. (Not available on 8402)
- Specify NMH-A for no mounting holes with adhesive. (Not available on 8402)
- Specify CS for counter sunk mounting holes.
- Specify ERS prepped with extra row of screws.

Kickplate Gasket Tape Tape is recommended when using a brass plate on a metal door to reduce tarnishing from electrolytic oxidation. One tape pack will cover an the perimeters of a 8" x 34" kickplate. Order 8401 Gasket Tape.



8400 Protection Plate
8402 (UL)* Protection Plate

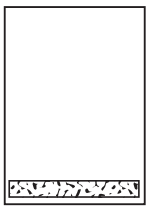
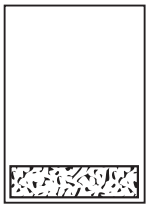
Residential Grade Kickplates available Carded only, finishes PA28, PA3, PA619, PA716, B3, B505, B619, B716



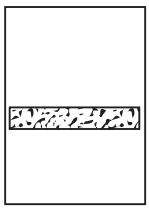
Mop Plates

- Protect the bottom of the pull side of door subject to cleaning and mopping procedures.
- Size Ranges:4" to 6" high, 22" to 48" wide



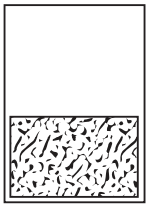
Kick Plates

- Protect the bottom of the push side of doors subject to scuffing from foot traffic.
- Recommended for all doors subject to normal use (especially doors using a closer).
- Size Ranges: 8" to 24" high, 22" to 48" wide



Stretcher Plates

- Protect doors at specific areas where consistent contact is made by stretchers, service carts or other equipment.
- Usually applied to push side of doors.
- Specify "B4E" Option for beveled edges.
- Size Ranges: 6" to 8" high, 22" to 48" wide



Armor Plates

- Protect lower half of doors from abuse by hard carts, trucks and rough usage.
- Usually applied to push side of single doors and both sides of double acting doors.
- Size Ranges: 26" to 48" high, 22" to 48" wide

Meets ANSI/BHMA A156.1
A8133 – Steel
A5133 – Stainless Steel

Long Door Pulls

Offered in two Models:

9264 Offset
9266 Straight

- Heavy 1-1/4" Round Brass or Stainless Steel
- Round or Flat Tip
- 316 Stainless Steel
- 1-3/4″, 2″ or 2-1/4″ Door Thickness
- Round Tip Standard
- Flat Tip Optional

Dimensions

Length: 36" / 20" CC
72" / 56" CC
Diameter: 1-1/4"
Projection: 2-3/4"

Special Lengths Available

18" and 24"
Custom lengths available from 36" to 144"

Finishes

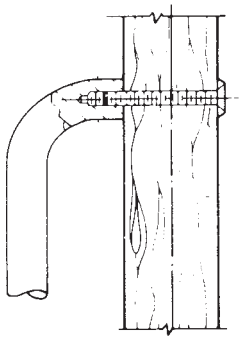
Ives Number	US3	US4	US10B	US32	US32D
BHMA	605	606	613	629	630

Note: A middle position bracket is required for pulls over 8 feet.

Mounting

- All mounting hardware is for standard 1-3/4" door.
- Consult Customer Service if other than standard.

Type Standard Mount

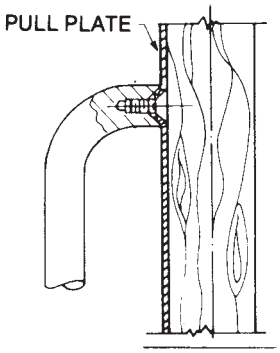


Standard Mounting

- (2) 3/8-16 x 2-1/4" brass, flat head machine screws; plate to match.
- (2) 3/8-16 countersunk washers; plated to match

Note: 8102HD and 8105 have (2) 5/16-18 x 2-1/2" machine screws
-Options: (2) 5/16 countersunk washers

Type G Mount



Concealed Pull Plate Mounting

Available only for 8302, 8303, 8311 Pull Plates.

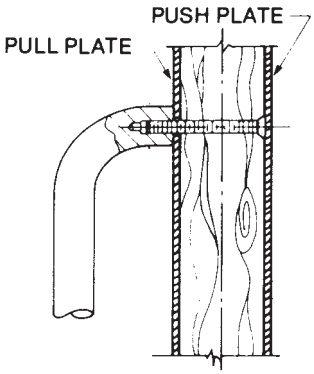
- (2) 3/8-16 x 5/8" steel flat head machine screws; zinc plated.

Pull mounts directly onto plate.

Plate is attached to door by 6 screws.

Note: 8302 has (2) 5/16-19 x 5/8" steel flathead zinc plated screws

Type F Mount



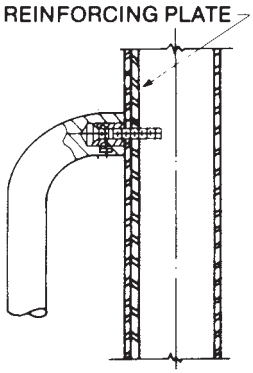
Wood Doors
Concealed Pull Mounting With Push Plate

- (2) 2-1/4" steel flat head machine screws; zinc plated.

Available only for 8102HD, 8103HD, 8105, 8111, 8302, 8303, 8305 and 8311. Plate on opposite side of door must be ordered separately.

Note: 8102HD, 8302 will have 5/16-18
8105, 8111, 8305, 8311 will have 1/4-20
8103HD, 8303 will have 3/8-16"

Type H-I-L Mount



Reinforced Hollow Metal Door
Concealed Pull Mounting

Available only for 8102, 8103, 810EZ or wood door pulls, 8302, 8303 pull plates and 9264, 9265, 9266 and 9267 long door pulls.

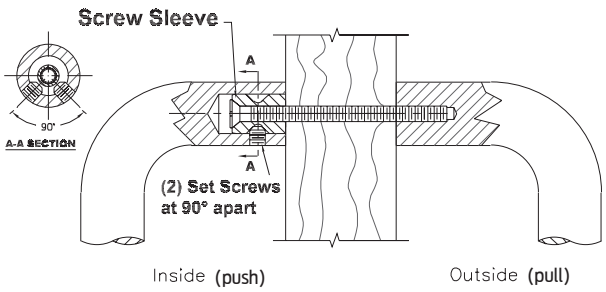
- (2) Steel screw sleeves; zinc plated.
- (2) Steel countersunk trim head machine screw; zinc plated for reinforced metal door.
- (2) Steel countersunk trim head steel metal screw; zinc plated for wood doors.

Note: 8102HD and 8302 will have 5/16-18"
8103HD, 8103EZHD, 8303 will have 3/8-16

Mounting for 8103EZ, 8190, 9100, 9103EZ, 9190 and 9264, 9265, 9266 and 9267 long door pulls.

- All mounting hardware is for standard 1-3/4" door.
- Consult Customer Service if other than standard.

Type J/N Mount



Back to Back "Two-Anchor"

Wood or Metal Door

Available only for 8103EZHD, 8190HD, 9100HD push/pull combinations and 9264, 9265, 9266 and 9267 long door pulls.

- (2) 3/8-16 x 2-3/4" steel countersunk trim head machine screws with (4) set screws for maximum anchoring force.
- (2) Steel screw sleeves; zinc plated.

Type NS-Standard Push/Pull Mounting

Type N & Standard

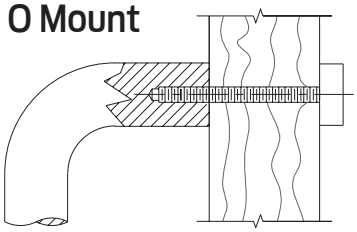
Pushbar to Pull

- (1) 3/8 - 16 X 3"steel countersunk trim head machine screws with (2) set screws.
- (1) steel screw sleeve, zinc plated.

Free End Pushbar & Pull

- (2) 3/8 - 16 X 2-1/4" brass, oval head mach screws; plated to match.
- (2) No. 14 countersunk washers; plated to match.

Type O Mount



Decorative Blind Thru - Bolt

Wood or Metal Door

Available only for 8103EZHD, 8190HD and 9100HD Series Push/Pull Combinations.

- (2) 3/8-16 x 2-1/4" blind thru - bolts; plated to match.

Type NO Push/Pull Mounting

Type N & Type O

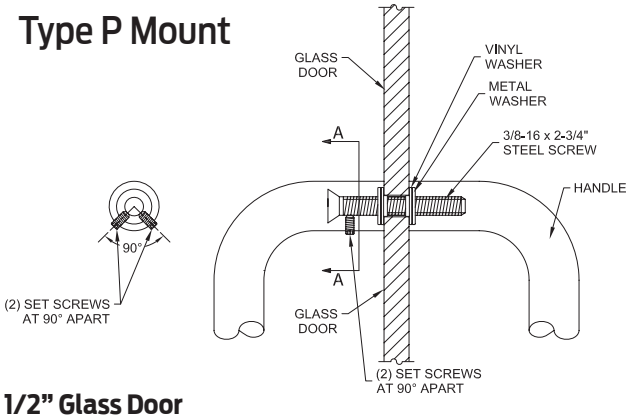
Pushbar to Pull

- (1) 3/8 -16 X 3"steel countersunk trim head machine screws with (2) set screws.
- (1) steel screw sleeve, zinc plated.

Free End Pushbar & Pull

- (2) 3/8 - 16 X 2-1/4" blind thru-bolts; plated to match.

Type P Mount



1/2" Glass Door

Available only for 8103EZHD, 8190HD, 9100HD, 9265 and 9266 long door pulls.

- (2) 3/8-16 x 2-1/4" steel countersunk trim head machine screws with (4) set screws for maximum anchoring force.
- (2) Steel screw sleeves; zinc plated
- (2) Metal and Vinyl washers

FS439 Universal Dome Floor Stop

224XY Full Mortise - Door Edge Protector

UL10C certified
Meets ANSI 156.26 for 150 lbs and 300 lbs.

- For 1 3/4" Doors
- Door Edge Protector
- Patented center loaded, interlocking bearing design
- Non Handed for custom cut lengths
- 1/16" door inset
- 48" Maximum Door Width
- Beveled or Square Edge Doors
- Frame guidance lip is extended further for retrofit applications to cover existing heavy weight architectural hinge preps
- For doors weighing up to 450 pounds without reinforcing, 600 pounds with reinforcing
- For lead-lined application consult factory for engineering specials

Standard lengths 83", 85", 95", 119"

Standard Mounting Hardware

12-24 x 3/4" Steel Self Drilling / Self Tapping Phillips Head Screw

Finishes

Clear Anodized (US28), Dark Bronze Anodized (313AN)
Custom Anodizing and Painting are available, consult factory

Options:

HT	Hospital Tip
EPT	Electric Power Transfer
TWP CON	Electrical Through Wire Panel with Allegion Connect

Optional Mounting Hardware:

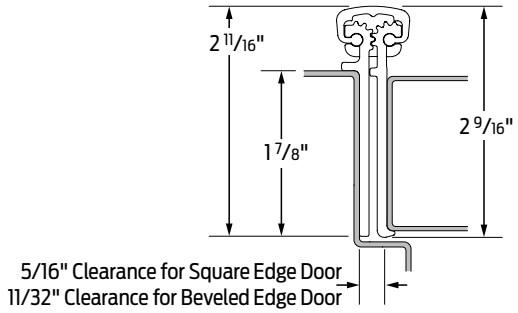
TEK/WD	1/2 Self Drill, Self Tap 1/2 Wood
WD	Wood Door and Frame

Available Accessory Kits:

Security Screws - Hollow Metal
Security Screws - Wood
Thread Forming Screws

For Single Door Applications

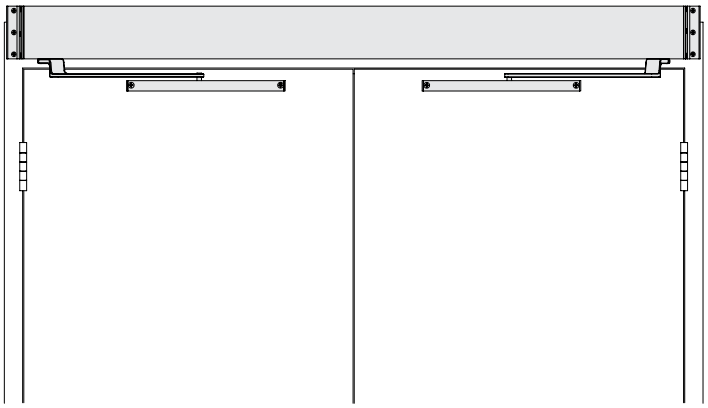
For pairs of doors see chart and general information



9550 SERIES

FEATURES

OPERATOR MOUNTS
SIMULTANEOUS PAIR, SURFACE MOUNT
***PULL SIDE**
PUSH SIDE
DOUBLE EGRESS



**PULL SIDE mount shown*

The 9550 SENIOR SWING by LCN is an ADA door operator that is a two-in-one swing door operator. SENIOR SWING operators when activated, opens doors automatically for wheelchair access, yet allows for manual operation for regular pedestrian traffic.

- Push 'N Go permits non-switch activation.
- Power Boost provides additional latching force.
- Electromechanical unit with microprocessor control.
- Digital keypad for easy setup.
- Meets International Building Code requirements and ANSI A156.19.
- UL approved for fire doors.

- 9550 Series operator is shipped with motor gearboxes, control box, arms, header, and mounting hardware. Actuators available separately, see pages 122-137.
- Simultaneous pair, surface mounted.
- Meets ADA requirements (power mode only).
- Handed product.
- Pull, Push or Double Egress applications available.
- 72″ header length is standard. Specify other length 52″ to 98″. Consult factory regarding this option.
- Adjustable hold open period of 2 to 32 seconds in automatic or manual mode.

9550 Series is fully compliant with UL 325 & UL 1998 and meets the provisions of ANSI A156.19. The 9550 Series is UL listed for fire-rated applications. The 9550 Series also meets the provisions of the Americans with Disabilities Act.

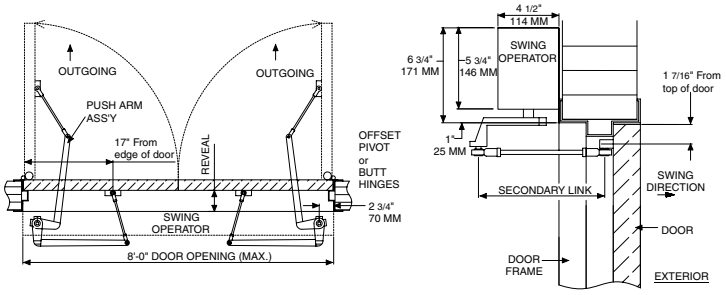
LCN 9550 SERIES

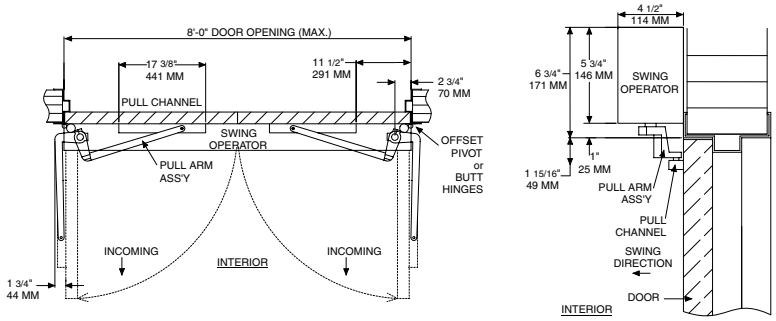
TOP JAMB SIMULTANEOUS PAIR (OFFSET PIVOT/BUTT HINGE, CENTER PIVOT, PUSH) MOUNTING

Consult factory for all balanced door installations.



TOP JAMB SIMULTANEOUS PAIR (OFFSET PIVOT/ BUTT HINGE, CENTER PIVOT, PULL) MOUNTING

NOTE: Cannot be used with swing clear hinges, pocket pivots or balanced doors.



MAXIMUM OPENING

Template allows 90 degree power opening and 90 degree manual opening.

- **Butt Hinges** should not exceed 5″ (127 mm) in width.
- **Reveal for push** installations should not exceed 10″ (254 mm) for REGULAR ARM and 20″ (508 mm) for LONG ARM.
- **Reveal for pull** installations should not exceed 4″ (102 mm).
- **Reveal** for double egress installations should not exceed 4″ (102 mm).
- **Head Frame** minimum 1-3/4″ (44 mm). Face frame 6-3/4″ (171 mm) total operator clearance.
- **Top Rail** minimum 2-3/4″ (70 mm).
- **Opening & Closing Time** are variable by adjustments to the electronic control box. Maximum hold open time adjustable up to approximately 32 seconds.
- **System Diagram** see "AUTOMATIC OPERATORS" section pages 53 for typical system wiring and page 56 for electrical data.

Contact LCN Product Support for installation assistance.

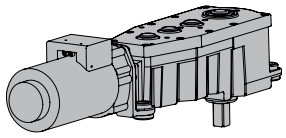
9550 SERIES

MOTOR GEARBOX

MOTOR GEARBOX – SENIOR SWING, 9550-3454
Driving mechanism for operator. Provides 15 lbs opening force. Handed.

3454



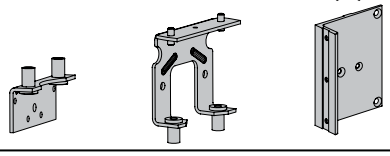
MOUNTING BRACKETS

MOUNTING BRACKET – 2-3/4˝, 9550-275
Motor gearbox mounting bracket for 2-3/4˝ offset pivot or butt hinge installations. Front bracket.

REAR MOUNT BRACKET, 9550-3018
Motor gearbox mounting bracket. Rear bracket.

ANGLED BRACKET, 9550-334-1
Mounting bracket for surface applications. (Includes 2 mounting brackets).

275 3018 334-1 (2)

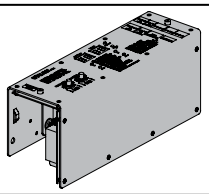


CONTROL BOXES

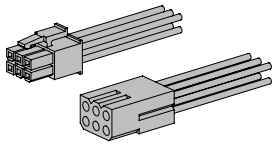
CONTROL BOX – SENIOR SWING, 9550-3462
Electronic controlling device for Senior Swing.

COMPANION CABLE, 9550-982
Cable that allows one control box to run two motor gear boxes. Companion cable. For use with Senior Swing.

3462



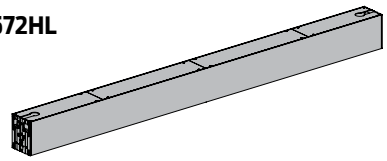
982



HEADERS

HEADER, 9550-3572HL
Standard, mounting header. Pair door, two operators. Specify length 52˝ to 98˝ maximum.

3572HL



END CAPS

HEADER ENDCAPS, 9550-334
End cap with openings for wiring.

END DRESS PLATE, 9550-334-2
Metal finish end cap.

334 334-2

ARMS

STANDARD ARM ASSEMBLY, 9550-3077PLCM
Handed arm. (Includes 3077 regular arm assembly, 3038 track, and 3034 track roller).

REGULAR ARM ASSEMBLY, 9550-3077
Handed arm. (Includes 77 main arm assembly and 79 linkage assembly).

REGULAR LONG ARM ASSEMBLY, 9550-3077L
Handed arm. (Includes 77 main arm assembly and 79LR linkage assembly).

STANDARD ARM, 9550-3077T
Handed arm. Track roller not included.

MAIN ARM, 9550-77
Handed arm attaches to motor gearbox.

LINKAGE ASSEMBLY – 15″, 9550-79
Threaded rod attaches to door. Extends from main arm.

LINKAGE ASSEMBLY – 32″, 9550-79LR
Threaded long rod attaches to door. Extends from main arm. Used for reveal 10″ to 20″.

TRACKS

TRACK 9550-3038
Standard non-handed track.

TRACK END CAP 9550-73
Black plastic end caps.

ROLLER, 9550-3034
Quiet low friction roller assembly.

INSTALLATION ACCESSORIES

SPINDLE PLATE – 2-3/4″, 9550-11A
Hides bottom of motor gearbox. Completes header box. Cutout allows for motor gearbox shaft. For 2-3/4″ offset pivot or butt hinge installations.

FILLER PLATE BLANK, 9550-12
Completes length of header box. (Specify length).

MOUNTING PLATE, 9550-18
Optional mounting plate for standard hollow metal door frames. Specify length 55-1/2″ to 101-1/2″ maximum when using angle brackets. Specify length 52″ to 98″ maximum when using dress plates.
NOTE: The length of a universal 18 plate will need to be ordered 3-1/2″ longer than the supplied header when using angle brackets.

SEM SERIES

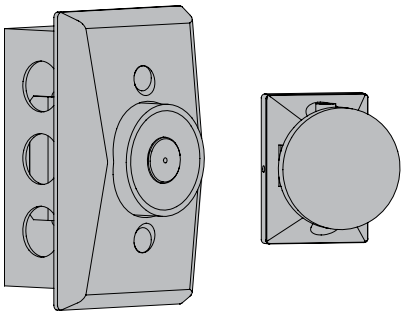
SEM 7840 MAGNET

Die cast housing, low profile recessed wall mount.

2″ (51 mm) x 4″ (102 mm) x 1-1/2″ (38 mm).

NOTE: Outlet box not included.

SEM 7840



SEM FEATURES

- Tri-voltage design with 35 lbs. of holding force.
- Now available armature extensions from LCN (see page 11).
- SEM 7840 magnets are shipped with die cast housing, cover, armature and WMS screw pack.
- SEM 7840 available in Aluminum and Dark Bronze finishes only.
- Suitable for use in pocket door installations.
- UL listed for smoke barrier or labeled fire doors.

Total Projection = 2-5/8″ (67 mm)

Dimensions apply for both SEM 7840

AUTOMATIC OPERATOR ACTUATORS & ACCESSORIES

8310 Series 36″ x 6″ Full Length Actuators

FULL LENGTH ACTUATOR (FLA), 8310-836T
Hardwired low voltage actuator with stainless steel touch plate with 36″ x 6″ ac va on surface. Blue handicap symbol conforms with most accessibility codes. Added "PUSH TO OPEN" lettering for enhanced identification. Designed to meet California building codes and increase accessibility for wheelchair bound entrants. Can easily be mounted to any flat surface or a bollard post.

FULL LENGTH ACTUATOR (FLA), 8310-836TW
Same as the 8310-836T with a built in wireless transmitter and 3v battery. Use in conjunction with 8310-865 Receiver (not included).

RECEIVER, 8310-865
Receiver, Wireless, 1 Channel, w/Sequencing Feature. Used in conjunction w/ Wireless Actuators & Transmitter(s).

TRANSMITTER, 8310-844
Transmitter, Wireless, 1 Channel, 9v Battery included. Used to convert standard actuators to wireless. Requires 8310-865 Receiver. Recommended for exterior application with 8310-836T.

FLA BOLLARD POST 8310-866FLA
A powder coated steel 42″ x 4″ x 6″: Bollard Post, mounting base pre prepped for the 8310-836T. Includes 8310-866 CAP, 2 mounting screws & spacer for installation.

FLA BOLLARD MOUNT KIT 8310-3836T
36″ x 6″ Actuator with 8310-866FLA Bollard for wired applications.

FLA BOLLARD MOUNT 8310-3836TW
36″ x 6″ Actuator with 8310-866FLA Bollard and 8310-844 wireless Transmitter. Transmitter requires 8310-865 Receiver (not included).

- 4040XP closer includes 4040XP-62PA shoe required for parallel arm mounting
- Optional

4040XP-3049L
Long hold-open arm
- Non-handed
- Includes LONG HEAD AND TUBE, 4040XP-3048L for top jamb mount
- Optional

4040XP-3077EDA
Extra duty arm
- Non-handed
- Features forged, solid steel main and forearm for potentially abusive installations
- Optional

4040XP-3049EDA
Hold-open extra duty arm
- Handed
- Parallel arm features forged, solid steel main and forearm for potentially abusive installations
- Hold-open function is adjusted at the shoe
- Optional

4040XP-3077EDA/62G
Extra duty arm with 62G
- Non-handed
- Features forged, solid steel main and forearm for potentially abusive installations
- 62G shoe provides additional blade stop clearance
- Optional

4040XP-3049EDA/62G
Hold-open extra duty arm with 62G
- Handed
- Features forged, solid steel main and forearm for potentially abusive installations
- 62G shoe provides additional blade stop clearance. Hold-open function is adjusted at the shoe
- Optional

4040XP-3077CNS
Cush-N-Stop® Arm
- Non-handed
- Features solid forged steel main arm and forearm with stop in soffit shoe.
- Optional

4040XP-3049CNS
HCUSH arm
- Non-handed
- Hold-open function with templated stop/hold-open points
- Handle controls hold-open function
- Optional

4040XP-3077SCNS
Spring CUSH arm
- Non-handed
- For potentially abusive applications features solid forged steel main arm and forearm with spring loaded stop in the soffit shoe
- Optional

Arms

4040XP-3049SCNS
Spring HCUSH arm

- Non-handed
- For potentially abusive applications features solid forged steel main arm and forearm with spring loaded stop in the soffit shoe
- Handle controls hold-open function
- Optional

Installation accessories

4040XP-18
Plate
- Required for hinge side mount where top rail is less than 3 3/4″ (95 mm)
- Requires minimum 2″ (51 mm) minimum top rail

4040XP-18G
Plate
- Locates top jamb mounted closer flush with top of head frame face in flush ceiling condition
- Requires 1 3/4″ (44 mm) minimum head frame

4040XP-18TJ
Plate
- Centers top jamb mounted closer vertically on head frame where face is less than 3 1/2″ (89 mm). Plate requires 1 3/4″ (44 mm) minimum head frame

4040XP-18PA
Plate
- Required for parallel arm mounting where top rail is less than 5 1/2″ (140 mm), measured from the stop
- Requires 2″ (51 mm) minimum top rail

4040XP-62PA
PA shoe
- Required for parallel arm mounting

4040XP-30
CUSH shoe support
- Provides anchorage for fifth screw used with CUSH arms, where reveal is less than 3 1/16″ (78 mm)
- Optional

4040XP-61
Blade stop spacer
- Required to lower parallel arm shoe to clear 1/2″ (13 mm) blade stop
- Optional

4040XP-419
PA flush panel adapter
- Provides horizontal mounting surface for parallel arm shoe on single rabbeted or flush frame
- Optional

Installation accessories

4040XP-62A
Auxiliary shoe
- Requires a top rail of 7″ (178 mm)
- Shoe replaces -62PA for parallel arm mounting of regular arm with overhead holder/stop
- Optional

4040XP-54
Snap-on cover clip
- Used to secure 4040XP-72 plastic cover to cylinder body

Fasteners

Self-reaming and tapping screws included standard

Fastener pack options

TBSRT	TB[1] with self-reaming and tapping screws
WMS	Wood and machine screw
TBWMS	TB[1], wood and machine screw
TORX	TORX machine screw
TBTRX	TB[1] and TORX machine screw

1 Specify door thickness if other than 1 3/4"

SCHLAGE

PS906

6 amp power supply

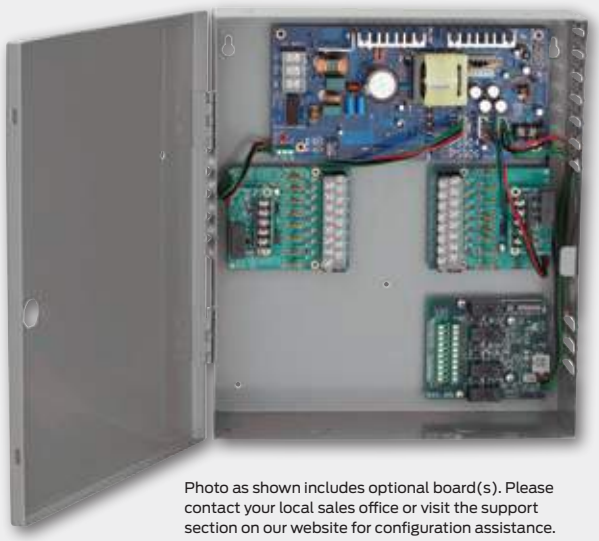

Photo as shown includes optional board(s). Please contact your local sales office or visit the support section on our website for configuration assistance.

Overview

The Schlage comprehensive line of power supplies and option boards was designed to address the changing needs of the access control market.

Installation is simplified by utilizing a flat mounting design and polarized locking connectors for option boards. This design eliminates the need for racks and side connectors. The flat mounting of the option boards also provides for easier access to the terminal blocks for connection of electrified devices (such as electrified strikes, electromagnetic locks, card readers, etc.).

Common to the line of PS900 Series power supplies is a constant output rating at both 12v and 24v settings, universal 120 VAC to 240 VAC input, and polarized option board connectors. New fire alarm interface board mounting allows outputs to be configured as switched (power cut) or unswitched (power continues) when signal is provided.

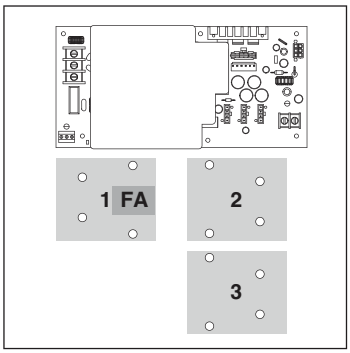
Features and benefits

- 6A @ 12/24 VDC constant output, field selectable with jumper
- Provides low-voltage, Class 1, filtered and regulated power (Class 2 when used with 900-8P option board)
- Universal 120-240 VAC, fused primary input
- Three polarized option board connectors eliminate need for racks and side connectors
- AC input and DC output monitoring circuit with LED indicators
- Externally visible AC input indicator with isolated SPDT contacts
- High-voltage protective cover for AC circuitry (not shown)
- Battery back-up board auto-selects voltage
- Optional Fire Alarm plug-in board available
- UL 294, ULC-S318, RoHS, and FCC Part 15 certified

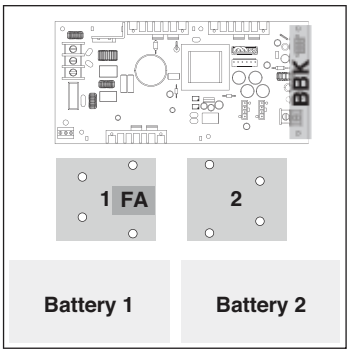
Configuration options

Available option board, fire alarm and battery backup connection locations:

PS906 without battery backup



PS906 with battery backup



Exit device support

Von Duprin QEL	Up to 8[1]
Von Duprin EL	None
Falcon EL	None

1. Requires the use of two 900-4RL option boards

PS906 power supply specifications

Specification	Description
Input voltage	120/240 VAC, 50/60 Hz, universal input
Output voltage	6A @ 12 or 24 VDC Field selectable with jumper Switching supply, 5% regulation, 240mVpp max ripple
Enclosure	Grey/baked enamel 14"x 12"x 4" (H x W x D) Eight ½" x ¾" knockouts NEMA Grade 1 Hinged cover with lock down screws
Operating temperature	32º - 120ºF (0º - 49ºC)
Certifications	ANSI/UL 294 ULC-S318 RoHS FCC Part 15 Class 1 (Class 2 when used with 900-8P option board)
Battery backup (install on main board)	900-BB: Battery backup board only 900-BBK: Battery backup kit (backup board plus battery pack)
Available option boards	900-FA: Plug-in fire alarm (must be installed on option board) 900-2RS*: 2 Relay option board capable of individual or sequential operation for single and pair door applications 900-4R*: 4 Relay option board 900-4RL*: 4 Relay option board with integrated logic and individual or sequential operation capability for controlling security interlocks, auto operators and time delay function 900-8F*: Fused, 8 zone option board 900-8P*: PTC, 8 zone option board
AC primary fuse size	6.3A, 250v, 5 x 20 mm
Battery fuse size	7.5A 32v ATO blade style
DC output protection	Overload protection - current limited foldback circuit
Indicators	LED indicators: - AC input (visible on outside of enclosure) - DC output Isolated SPDT contacts to monitor AC power status
Weight (power supply)	Approx. 9.0 lbs
Weight (each battery)	4.0 lbs
AC input termination	3 position terminal block with protective cover Wire capacity: 10 AWG max.
DC output termination	2 position terminal block Wire capacity: 12 AWG max.
Option board connectors	3
Fire alarm board connector	Yes (requires connection on option board)
Keylock	Optional
Accessories	900-BAT: Backup battery pack

* Compatible with plug-in fire alarm board (900-FA)

About Allegion

Allegion (NYSE: ALLE) is a global pioneer in safety and security, with leading brands like CISA®, Interflex®, LCN®, Schlage® and Von Duprin®. Focusing on security around the door and adjacent areas, Allegion produces a range of solutions for homes, businesses, schools and other institutions. Allegion is a $2 billion company, with products sold in almost 130 countries. For more, visit **www.allegion.com.**

SCHLAGE

Grade 1, mortise locks

L Series

Overview

The Schlage® L Series has long been the benchmark for Grade 1 mortise locks. Beyond strength and security – it offers flexibility to meet most needs. Fifty mechanical functions include ten that can be field configured from one universal lock case and ten electrified functions are regularly used as part of electronic access control systems. L Series locks have the ability to suite across electronic, tubular, exit trim, and multi-point locks to integrate seamlessly into any environment. The series features an array of security options including 180-degree visibility status indicators and support for multiple keyway families and cylinder types including Primus® XP high-security cylinders.

B	Less core
BDC	Disposable SFIC construction core
H	Refundable SFIC construction core

Specifications

Chassis	
Case material	CRS with zinc dichromate plating
Case size	L9000 Series: 4 7/16" x 6 1/16" x 1"(113 mm x 154 mm x 25 mm) L400 Series: 4 7/16" x 3 5/8" x 1"(113 mm x 92 mm x 25 mm)
Spacing	Knob or lever to cylinder: 3 7/8" (98 mm); Knob or lever to thumbturn hub: 2 11/16" (68 mm)
Door thickness	Standard: 1 3/4" (44 mm) Optional: 1 3/8" (35 mm) to 2 1/2" (64 mm) Over 2 1/2" (64 mm) door ranges vary by function. Specify door thickness if other than 1 3/4" and position in door EE, EI, EO, ED

Trim	
Handing	L9000 Series: Field-reversible without disassembly L400 Series: Non-handed
Lever/knob	Lever designs: forged brass or bronze and cast stainless steel Knob designs: heavy-duty wrought brass, bronze or stainless steel
Rose/ escutcheon	L full face and concealed: Cold-forged brass, bronze and stainless steel N full face: Heavy wrought reinforced brass, bronze and stainless steel Roses: A ,B, C: wrought brass or bronze and stainless steel; AVA and MER: forged brass
Combinations	Available with knob both sides, lever both sides, or knob/lever combinations. Roses cannot be combined with escutcheons.

Latch	
Backset	2 3/4" (70 mm) only
Armor	L9000 Series Standard: 1 1/4" x 8" x 7/32" (32 mm x 203 mm x 6 mm) Optional: 1 1/16" x 8" x 7/32" (27 mm x 203 mm x 6 mm) L400 Series: Standard: 1 1/4" x 5 9/16" x 7/32"(32 mm x 141 mm x 6 mm)
Latch	3/4" (19 mm) throw stainless steel latch with anti-friction tongue
Deadbolt	1" (25 mm) throw stainless steel deadbolt
Strike	L9000 Series Standard: ANSI curved lip strike 1 1/4" x 4 7/8" (32 mm x 124 mm) x 1 3/16" (30 mm) lip to center with dust box Optional: Extended lip strike options (7/8", 1", 1 1/2", 1 3/4", 2") L400 Series Standard: 1 1/8" x 3 1/2" (29 mm x 89 mm) with dust box Optional: 1 1/4" x 4 7/8"(32 mm x 124 mm) with dust box

Specifications

Keying	
Cylinder format	6-pin Conventional mortise cylinder (standard); also available in concealed mortise cylinder, FSIC, SFIC and 7-pin SL cylinder formats plus less cylinder options.
Keyway	Patented Everest 29 S123 (standard); also available in open, restricted, and Primus XP security levels with available master keying and construction keying.
Wired electrified	
Input voltage	12V or 24V DC for L909X
Operating mode	Fail Safe or Fail Secure via switch on chassis
Current draw	0.23 amps maximum; 0.01 amps holding
Request to Exit	Rating: 3A @ 125V AC/2A @ 30V DC. Available on all L909X and L949X electrified functions. Also available option for the following mechanical functions: L9010/50/56/70/71/80 and L9453/56/58/65/66/80/85.
Latch bolt monitor	Available on all L909x and L949x electrified and L9010/25/26/50/56/70/71/80/82 and L9453/56/65/66/80/85 mechanical functions.
Door position sensor	Internal available on L909x electrified and L9010/80/82 mechanical functions; external available on all functions.
Deadbolt monitor	Available on L949x electrified and L9453/56/57/58/80/85/86/96 mechanical functions
Warranty	
	3 year limited mechanical and 1 year limited electromechanical
Certifications	
ANSI/BHMA	L/LV9000: ANSI/BHMA A156.13-2017 Series 1000, Grade 1 operation and security; with FSIC Grade 2; with SFIC Grade 3 L400: ANSI/BHMA A156.36, Grade 1
ICC	Complies with ICC A117.1 Accessible and Usable Buildings and Facilities
UL/cUL	Mechanical: UL 10C and CAN/ULC-S104 3 hour fire listed; all locks listed for A label single doors, 4' x 10' and pairs 8' x 10' Electrified: UL/ULC listed for single-point locking applications; UL listed for 3-hour fire door (except L9076 and L9077)
CA Fire Code	All levers with a return to door of 1/2" (64 mm) or less comply
FL Building Code	Miami-Dade NOA's and Florida Building Commission listings
Federal	BAA compliant, all functions

SCHLAGE

Grade 1 cylindrical locks

ND Series

Overview

The Schlage® ND Series is ANSI/BHMA Grade 1 certified and performs beyond the Grade 1 standards. The lock withstands 3,100 in-lb. of abusive lever torque, as well as 1,600 lbs. of offset lever pull for protection against pry bar attacks. The lock is not only strong from attacks, but it also shows nearly zero droop or wobble after 16 million cycles.

All ND Series locks come in 10 finishes, nine lever designs and use an ANSI 161 door preparation, commonly used with cylindrical locks. They are ideal for all new construction and retrofit applications.

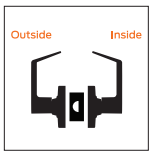
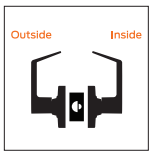
Mechanical non-keyed functions



Schlage ND10
ANSI F75

Passage latch

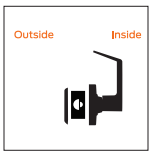
- Both levers always unlocked.
- Available with Request to Exit (RX) function.



Schlage ND12
ANSI F89

Exit lock

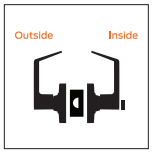
- Outside lever always fixed.
- Inside lever always free for immediate egress.
- Available with Request to Exit (RX) function.



Schlage ND25
ANSI -

Exit lock

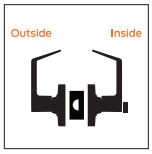
- Blank plate outside.
- Inside lever always free for immediate egress.



Schlage ND30
ANSI -

Patio lock

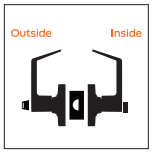
- Push button locking.
- Turning inside lever or closing door releases button, preventing a lock-out.
- Inside lever always free for immediate egress.



Schlage ND40
ANSI F76

Bath/bedroom privacy lock

- Push-button locking.
- Unlocked from outside with a small screwdriver.
- Turn inside lever or close door to release button.
- Inside lever always free for immediate egress.



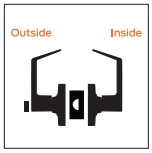
Schlage ND44
ANSI -

Hospital privacy lock

- Push-button locking.
- Unlocked from outside by turning emergency turn-button.
- Turn inside lever or close door to release button.
- Inside lever always free for immediate egress.

Key | Pushbutton | Turn/push button | Springlatch | Deadlatch

Mechanical non-keyed functions



Schlage **ND45**
ANSI **-**

Time out lock with Vandlgard

- Pushing and holding outside button disengages inside spindle, allowing inside lever to free-wheel without retracting latch.
- Release of outside button allows free egress from inside.

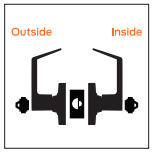
Schlage **ND170**
ANSI **-**

Single dummy trim

- Dummy trim for one side of door.
- Used for door pull or as matching inactive trim.

Key | Pushbutton | Turn/push button | Springlatch | Deadlatch

Mechanical keyed functions



Schlage ND93
ANSI F88

Vestibule lock with Vandlgard

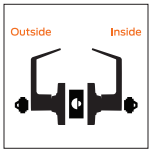
- Latch retracted by key from outside when outside lever is disengaged by key in inside lever.
- Vandlgard allows outside spindle to disengage from latch when locked.
- Inside lever always free for immediate egress.

Available with an optional indicator rose that clearly identifies key rotation direction for rapid lockdown. 626 finish only.

Schlage ND94
ANSI F84

Classroom lock with Vandlgard

- Outside lever disengaged and unlocked by key.
- Vandlgard allows outside spindle to disengage from latch when locked.
- Inside lever always free for immediate egress.

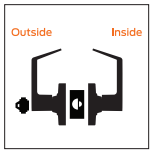


Schlage ND95
ANSI -

Classroom security lock

- Key in either lever locks or unlocks outside lever.
- Vandlgard allows outside spindle to disengage from latch when locked.
- Inside lever always free for immediate egress.

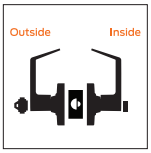
Comes standard with an indicator rose that clearly identifies key rotation direction for rapid lockdown. 626 finish only. Other finishes receive a standard rose.



Schlage ND96
ANSI F86

Storeroom lock with Vandlgard

- Outside lever always disengaged.
- Entrance by key only.
- Vandlgard allows outside spindle to disengage from latch when locked.
- Inside lever always free for immediate egress.
- Available with Request to Exit (RX) function.



Schlage ND97
ANSI F90

Corridor lock with Vandlgard

- Locked or unlocked by key from outside.
- Push-button locking from inside.
- Turning inside lever or closing door releases button.
- When outside lever is locked by key it can only be unlocked by key.
- Vandlgard allows outside spindle to disengage from latch when locked.
- Inside lever always free for immediate egress.

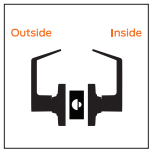
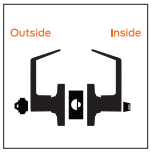
Wired electrified functions



Schlage ND12EL
ND12EU
ANSI -

Keyless electrified exit

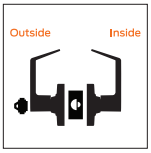
- Outside lever continuously locked (EL) or unlocked (EU) by 12-24V DC.
- EL is fail safe (power fail unlocks outside lever).
- EU is fail secure (power fail locks outside lever).
- Inside lever always free for immediate egress.
- Available with Request to Exit (RX) function.



Schlage ND80EL
ND80EU
ANSI -

Electrified storeroom

- Outside lever continuously locked (EL) or unlocked (EU) by 12-24V DC.
- EL is fail safe (power fail unlocks outside lever).
- EU is fail secure (power fail locks outside lever).
- Key outside serves as mechanical override.
- Inside lever always free for immediate egress.
- Available with Request to Exit (RX) function.



Schlage ND96EL
ND96EU
ANSI -

Electrified storeroom with Vandlgard

- Adds Vandlgard to ND80EL/EU.
- Vandlgard allows outside spindle to disengage from latch when locked, limiting the ability of vandals to apply excessive force to the chassis.
- Available with Request to Exit (RX) function.

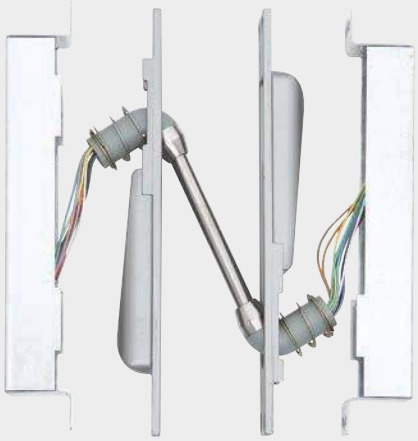
Electrical power transfer



Overview

Electric power transfer provides a means of transferring electrical power from a door frame to the edge of a swinging door. The units are completely concealed when the door is in the closed position, and are ideally suited for installations involving abuse or heavy traffic.

Two models are available; EPT-2, two 18 gauge wires and EPT-10, ten 24 gauge wires.

Features and benefits

- UL Listed for use on fire doors
- UL listed as Miscellaneous Door Accessory
- Ball-and-socket joint construction provides cut and pinch protection for wiring
- Built for heavy traffic and high abuse openings

Door applications

- Up to 5" butt hinges – 180° swing.
- 5 1/2" butt hinges – 130° swing.
- 6" butt hinges – 110° swing.
- 3/4" offset pivots – 180° swing.

Not for use with swing clear hinges, center-hung pivots, pocket pivots or balanced doors.

Door applications shown are for 1 3/4" door thickness, for all other applications contact Technical Support to confirm compatibility.

Finishes

- SP28 (sprayed aluminum)
- SP313 (sprayed duranodic)

Dimensions

Housing	9" X 1 1/4 X 1 5/8 (229mm X 32mm X 38mm)
EPT-2	Two 18 gauge wires, up to 2 AMPS @ 24VDC, with a 16 AMPS maximum surge
EPT-10	Ten 24 gauge wires, up to 1 AMPS @ 24VDC, with a 16 AMPS maximum surge
PNT-1	5/32" tubing

To order, specify

- **EPT-2, EPT-10 or PNT-1.**
- **Finish, SP28 or SP313.**

About Allegion

Allegion (NYSE: ALLE) is a global pioneer in safety and security, with leading brands like CISA®, Interflex®, LCN®, Schlage® and Von Duprin®. Focusing on security around the door and adjacent areas, Allegion produces a range of solutions for homes, businesses, schools and other institutions. Allegion is a $2 billion company, with products sold in almost 130 countries. For more, visit **www.allegion.com.**

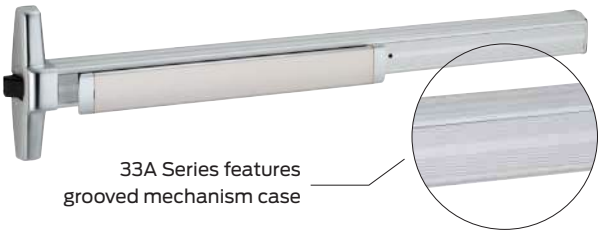
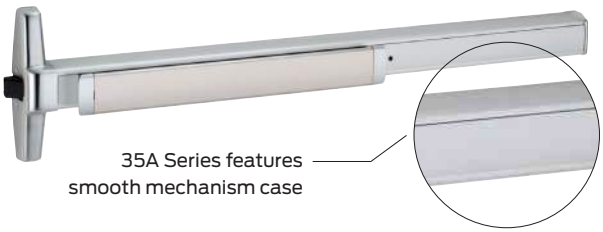
Exit devices

33A/35A Series





Overview

The 33A/35A Series is a narrow stile push pad device popular for its vast application coverage. With many field configurable and upgradeable solutions available, it's easy to enhance the functionality of an existing device. Mechanical and electronic options include quiet electric latch retraction, delayed and controlled egress, concealed vertical cables and security indicators. It's one way Von Duprin® protects its customers' investments long into the future.

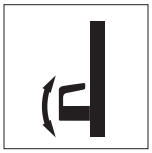
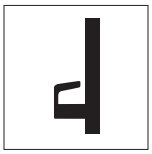
- 1 ¼" mortise cylinder
- Handed, reversible lever
- Electrified lever operation available



LBE Lever, blank escutcheon

- Always operable (no cylinder)



LDT Lever, dummy trim

- Pull when dogged

T Thumbturn

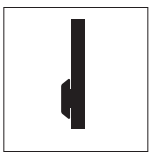
- Key locks and unlocks
- 1 ¼" mortise cylinder

TBE Thumbturn, blank escutcheon

- Blank escutcheon always operable (no cylinder)

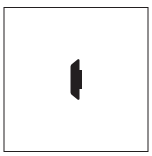
TL Turn lever

- Key locks and unlocks (use with DT trim)
- 1 ¼" mortise cylinder



TLBE Turn lever, blank escutcheon

- Blank escutcheon always operable (no cylinder, use with DT trim)



TLOP Turn lever, optional pull

Electromechanical device options

Switches

LX **Latchbolt monitoring**

LX-LC **Latchbolt monitoring, low current**
- Signals use of an opening
- SPDT switch to monitor latch bolt
- 2 A maximum @ 24VDC; below 50 mA @ 24VDC for low current option

RX **Request to exit**

RX-LC **Request to exit - low current**

RX-2 **Double request to exit - 2 RX switches**

WP-RX **Waterproof request to exit**
- Signals use of an opening
- SPDT switch to monitor pushpad
- 2 A maximum @ 24VDC; below 50 mA @ 24VDC for low current option

LX-RX **Request to exit/latchbolt monitoring combination**

LX-RX-LC **Request to exit/latchbolt monitoring combination, low current**
- 2 A maximum @ 24VDC; below 50 mA @ 24VDC for low current option

SS **Signal switch**
- Monitors pushpad and latchbolt
- Signals unauthorized use of an opening
- Switch makes latch bolt tamper-resistant
- Up to 2.0 A @ 24VDC

Latch retraction

EL **Electric latch retraction**
- Enables remote unlatching
- Alternative to manual dogging
- Voltage: 24VDC (continuous duty)
- Current: 16.0 A inrush / 0.3 A holding

QEL **Quiet electric latch retraction**

HD-QEL **Quiet electric latch retraction with hex dogging**
- Bolt retraction via switch
- Converts exit door to push-pull operation
- Voltage: 24VDC
- Current: 1.0 A inrush (0.5 sec.) / 0.14 A holding

Delayed egress

CX **Chexit delayed exit**
- Meets NFPA 101 requirements
- Self-contained controls, locking, alarm
- Input voltage: 24VDC
- Input current inrush: 1.25 A
- Input current holding: 390 mA
- Alarm relay and secure relay contact ratings: 24 VDC, 1 A

CX-RCM **Chexit remote module**
- Chexit for smaller doors that can not accommodate a standard Chexit device
- Size: 3.75” x 5.57” x 2.50”
- Input voltage: 24VDC
- Input current inrush: 1.25A
- Input current holding: 390mA
- Alarm relay and secure relay contact ratings: 24 VDC, 1 A

Miscellaneous

ALK **Alarm exit kit**
- Unauthorized opening triggers 85-decibel horn
- Set in armed or disarmed mode by key
- Assembly includes both a 24VDC input and external inhibit

CON **Allegion Connect**
- Common connectors to connect various door hardware all the way to the power supply

E360 **Electric locking and unlocking trim**
- Remains latched while unlocked
- Remote electrical control
- Voltage: 24VDC (Continuous Duty)
- Current: 0.22 amps

[1] For 3349A/3549A devices, LX switch monitors trim input or electric dogging of EL/QEL devices. LX switch does not monitor latchbolt condition.

Mechanical device options

Dogging

CD — **Cylinder dogging, panic only**

LD — **Less dogging**

CDSI — **Cylinder dogging with indicator**
- Provides visible lock/unlock indicators showing whether device is dogged or undogged

HDSI — **Hex dogging with indicator**
- Provides visible lock/unlock indicators showing whether device is dogged or undogged

Environmental

PN — **Pneumatic latch retraction**
- For areas where electrical devices banned
- Special linkage for mechanical or pneumatic dogging

QM — **Quiet mechanical option**
- Provides damper-controlled relatching of device

INS — **Insulclad kits**
- Kits with longer fasteners or parts for Insulclad doors

AM — **Anti-microbial finish**

Weatherized

WH — **Weep holes**
- Drainage (weep) holes in mechanism case

California code

AX — **Accessible device**
- UL certified to meet new 5 lb. maximum operating force requirement
- Exceeds ANSI/BHMA requirements

Latches

PL — **Pullman latch**
- Latches are always extended
- Most commonly used in conjunction with electric strikes and LBR-less bottom rod application

Touch bar trim

RSS — **Red silk screen**
- Red silk-screened lettered touchbar trim

PUSH — **PUSH**
- Touchbar trim embossed PUSH

SG — **Safety glow**
- Self-illuminating touchpad
- Glows brightly during low or no light conditions

KN — **Knurled touchbar**
- Tactile warning applied to device

BRAILLE — **Braille**
- Vision impaired touchpad
- Raised letter and Braille

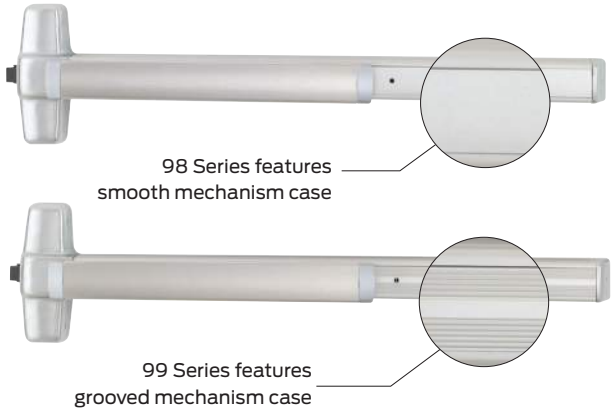
VON DUPRIN®

Exit device

98/99 Series

Overview

The 98/99 Series devices are heavy-duty push pads. The 98 Series has a smooth mechanism case, while the 99 Series has a grooved mechanism case. The 98/99 Series has been certified to the highest industry standards and are used in schools, hospitals and government buildings.



Device types

Rim device

75 Mortise lock device

27 Surface mounted vertical rod device [1]

47 Concealed vertical rod device, 5/16" throw [1]

48 Concealed vertical rod device, 5/8" top, 1 1/2" bottom throw

47WDC Concealed vertical rod wood door device [1]

49 Concealed vertical cable device [2]

50WDC Concealed vertical cable wood door device

57 Three-point latch device

[1] Also available less bottom rod (LBR)
[2] Also available less bottom latch (LBL)

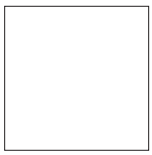
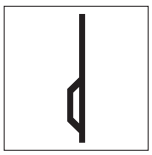
Trim functions



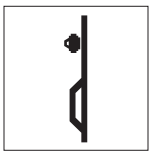
EO **No outside trim**

- Exit only



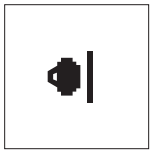
DT **Dummy trim**

- Pull when dogged (not recommended for fire device)



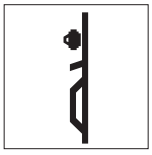
NL **Night latch**

- Key retracts latchbolt
- Rim and 1 ¼" mortise cylinder



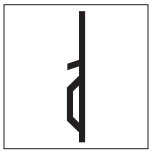
NLOP **Night latch**

- Key retracts latchbolt, pull required



TP **Thumbpiece**

- Key locks and unlocks
- Rim and 1 ¼" mortise cylinder



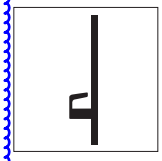
TPBE **Thumbpiece, blank escutcheon**

- Blank escutcheon always operable (no cylinder, use with DT trim)

L **Lever**

K **Knob**

- Key locks and unlocks
- Rim and 1 ¼" mortise cylinder
- Handed, reversible lever
- Electrified lever operation available



LDT **Lever, dummy trim**

KDT **Knob, dummy trim**

- Pull when dogged

LNL **Lever, night latch**

KNL **Knob, night latch**

- Key retracts latchbolt
- Rim and 1 ¼" mortise cylinder
- Handed, reversible lever

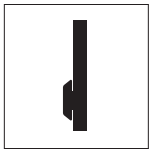
LBE[1] **Lever, blank escutcheon**

KBE **Knob, blank escutcheon**

- Always operable (no cylinder)

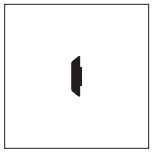
TL **Turn lever**

- Key locks and unlocks (use with DT trim)
- 1 ¼" mortise cylinder



TLBE **Turn lever, blank escutcheon**

- Blank escutcheon always operable (no cylinder, use with DT trim)



TLOP **Turn lever, optional pull**

HL **Hospital latch**

- Key locks and unlocks
- 1 ¼" mortise cylinder

Electromechanical device options

Switches

LX **Latchbolt monitoring**

LX-LC **Latchbolt monitoring, low current**
- Signals use of an opening
- SPDT switch to monitor latch bolt
- 2 A maximum @ 24VDC; below 50 mA @ 24VDC for low current option

RX **Request to exit**

RXLC **Request to exit - low current**

RX2 **Double request to exit - 2 RX switches**

WP-RX **Waterproof request to exit**

RX-AUX **RX to RX-2 conversion**
- Signals use of an opening
- SPDT switch to monitor pushpad
- 2 A maximum @ 24VDC; below 50 mA @ 24VDC for low current option

LX-RX **Request to exit/latchbolt monitoring combination**

LX-RX-LC **Request to exit/latchbolt monitoring combination, low current**
- 2 A maximum @ 24VDC; below 50 mA @ 24VDC for low current option

SS **Signal switch**
- Monitors pushpad and latchbolt
- Signals unauthorized use of an opening
- Switch makes latch bolt tamper-resistant
- Up to 2.0 A @ 24VDC

Latch retraction

EL **Electric latch retraction**

SD-EL **Electric latch retraction with special center case dogging**
- Enables remote unlatching
- Alternative to manual dogging
- Voltage: 24VDC (continuous duty)
- Current: 16.0 A inrush / 0.3 A holding

QEL **Quiet electric latch retraction**

HD-QEL **Quiet electric latch retraction with hex dogging**

SD-QEL **Quiet electric latch retraction with special center case dogging**
- Bolt retraction via switch
- Converts exit door to push-pull operation
- Voltage: 24VDC
- Current: 1.0 A inrush (0.5 sec.) / 0.14 A holding

Delayed egress

CX **Chexit delayed exit**
- Meets NFPA 101 requirements
- Self-contained controls, locking, alarm
- Input voltage: 24VDC
- Input current inrush: 1.25 A
- Input current holding: 390 mA
- Alarm relay and secure relay contact ratings: 24 VDC, 1 A

CX-RCM **Chexit remote module**
- Chexit for smaller doors that can not accommodate a standard Chexit device
- Size: 3.75” x 5.57” x 2.50”
- Input voltage: 24VDC
- Input current inrush: 1.25A
- Input current holding: 390mA
- Alarm relay and secure relay contact ratings: 24 VDC, 1 A

Miscellaneous

ALK **Alarm exit kit**
- Unauthorized opening triggers 85-decibel horn
- Set in armed or disarmed mode by key
- Assembly includes both a 24VDC input and external inhibit

Electromechanical device options

CON — **Allegion Connect**

- Common connectors to connect various door hardware all the way to the power supply

E996 — **Electric locking and unlocking trim**

M996

- Remains latched while unlocked
- Remote electrical control
- Voltage: 24VDC (Continuous Duty)
- Current: 0.22 amps

E7500 — **Electric mortise lock device**

- Voltage: 12 or 24VDC
- Current: 0.60 amps @ 12VDC, 0.30 amps @ 24VDC

[1] For 98/9949 devices, LX switch monitors trim input or electric dogging of EL/QEL devices. LX switch does not monitor latchbolt condition.

Mechanical device options

Dogging

CD — **Cylinder dogging, panic only**

CD-CX — **Center case cylinder dogging for Chexit devices**

CI — **Cylinder dogging indicator**
- Battery-operated dogging indicator in cylinder format with red light visible from over 75 feet away

DI — **Dogging indicator**
- Battery-operated dogging indicator in hex format with red light visible from over 75 feet away

LD — **Less dogging**

SD — **Special center case dogging**
- Center case cylinder dogging

Classroom security

-2 — **Double cylinder**
- Inside key cylinder locks/unlocks outside trim

-2SI — **Double cylinder with security indicator**
- Inside key cylinder locks/unlocks outside trim with visible indicators that provide status of door

CDSI — **Cylinder dogging with indicator**
- Provides visible lock/unlock indicators showing whether device is dogged or undogged

HDSI — **Hex dogging with indicator**
- Provides visible lock/unlock indicators showing whether device is dogged or undogged

Environmental

PN — **Pneumatic latch retraction**
- For areas where electrical devices banned
- Special linkage for mechanical or pneumatic dogging

QM — **Quiet mechanical option**
- Provides damper-controlled relatching of device

INS — **Insulclad kits**
- Kits with longer fasteners or parts for Insulclad doors

AM — **Anti-microbial finish**

Weatherized

WH — **Weep holes**
- Drainage (weep) holes in mechanism case

WS — **Windstorm**
- Severe weather certified/tested
- FEMA and ICC compliant
- Tornado and hurricane tested

California code

AX — **Accessible device**
- UL certified to meet new 5 lb. maximum operating force requirement
- Exceeds ANSI/BHMA requirements

Latches

PL — **Pullman latch**
- Latches are always extended
- Most commonly used in conjunction with electric strikes and LBR-less bottom rod application

Mechanical device options

Touch bar trim

RSS — **Red silk screen**
- Red silk-screened lettered touchbar trim

PUSH — **PUSH**
- Touchbar trim embossed PUSH

SG — **Safety glow**
- Self-illuminating touchpad
- Glows brightly during low or no light conditions

KN — **Knurled touchbar**
- Tactile warning applied to device

BRAILLE — **Braille**
- Vision impaired touchpad
- Raised letter and Braille

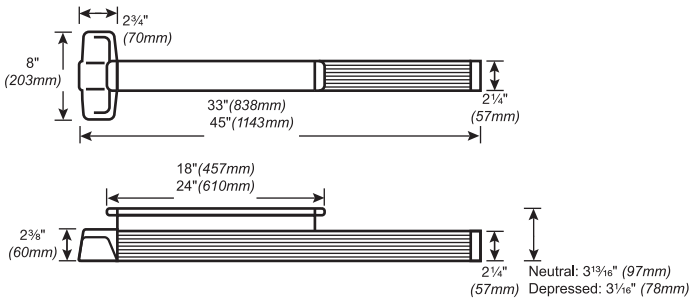
VON DUPRIN®

Exit device
98/99 Series

Specifications

Accessibility	▪ Force to depress push pad – AX device: 5 lbs – Standard device: 15 lbs ▪ Push pad projection – Neutral: 3 13/16" (97 mm) – Depressed: 3 1/16" (78 mm)
Certifications/ approvals	All Von Duprin 98/99 exit devices are ANSI/BHMA Certified. Please refer to the BHMA Certified Products Directory for specific listings.
Mounting height	39 13/16" (1011 mm) 39 11/16" (1008 mm) with mullion
Warranty	36 months from the date of placing the product in operation

Dimensions



013139, Rev. 11/2019

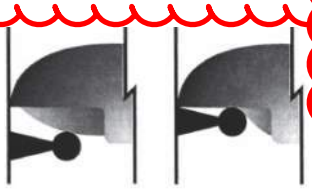
ALLEGION™

Mechanical options

AX Accessible device

The AX device is a UL certified exit device designed to meet the progressive requirements of the California Building Code for accessible openings. This device meets the 5 lbs of operating force requirement called for in chapter 11B-309.4. The AX device also exceeds ANSI/BHMA requirements. Available devices include: AX98/99, AX98/99-F, AX98/9949LBL, AX98/9949-F LBL, AX98/9949-F LBLAFL. Additionally, all AX devices will be shipped with a new UL label clearly stating “Meets California building Code (2013) Sec. 11B-309.4” and an “AX” identifier label on device center case. See images below for reference.

XP Extra performance



For increased security the XP98/99 Rim exit device has a static load force resistance of more than 2,000 pounds, twice that of standard rim exit devices. The two-piece latch bolt forms a 90° latch-to-strike contact. The “smart” latch changes shape when subjected to external forces. This design enables the exit door to withstand an external attack and remain secure. Additionally, the patented latch bolt design provides a greater, longer-lasting latch bolt to strike contact which is not easily affected by the twisting motion of a weakened frame, resulting in an opening that will remain strong.

With a door loaded to 250 pounds, XP98/99 requires less than 40 pounds of pressure to open, 25% less than the safety code requires.

XP98/99 is available for panic or fire exit hardware applications. Dimensions, finishes and trim options are equal to the standard 98/99 series rim exit device.

Note: The 909 strike is to be used for all applications.
The exception occurs with the use of fire rated double door applications, in this instance the 954 strike is required.

PA Pushpad armor

Built to absorb impact, the pushpad armor stands up to the wear and tear of demanding high-traffic areas. This composite accessory provides added support, while protecting the pushpad on the hinge side of the device. Available for 33A/35A and 98/99 series exit devices. See images below for reference.
