

# Integrated Power Center 2 (IPC2)

Prefabricated gear to accelerate your construction schedule and deploy faster

Ideally suited for projects having both 480Y/277V and 208Y/120V requirements, the efficient, space-saving design of Square D™ by Schneider Electric™ Integrated Equipment means big value for you and your customer.

## Reduce equipment reorder

The sturdy enclosure adds extra protection against damage during transport.

Not having loose components that can go missing also saves reordering time.

## Easy to install

Enhanced design flexibility — top or bottom conduit entry/exit spaces available.

Panels and transformer are **factory installed and prewired** in a single enclosure, which means installation can take hours rather than days.

IPC2 Transformer Combo

## Save costs and time

Reduced material and handling costs — wiring between the internal components of the section (transformers, panels, individually mounted circuit breakers) is done at the factory, saving labor and eliminating the associated conduit, wire, and fittings, and significantly reducing the number of parts to store and handle on-site.

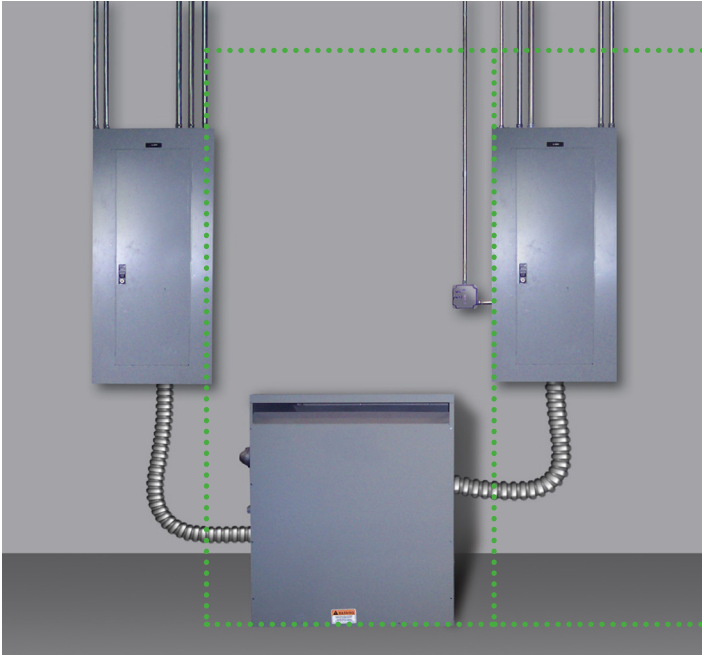

**Save an average of 30 hours per installation.** Labor costs with prefabricated equipment are a fraction compared to typical stick-built panel and transformer installations.

## Typical small project installation comparison

Stick-built electrical equipment

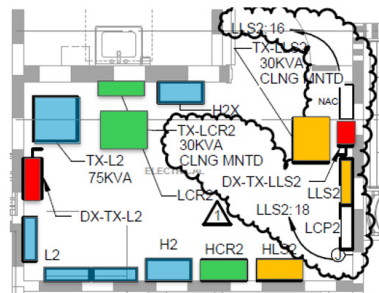

IPC2 transformer combo

## The integrated equipment advantage

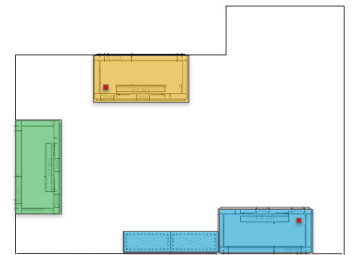

- Installs 80 – 90% faster, complete projects ahead of schedule.
- Saves 40% in electrical room wall space with smaller footprint.
- Reduced materials and handling.
- Lower installation and material costs.
- UL 891 listed.
- Less trips to the warehouse.
