 - 3. All precast epoxy terrazzo finished surfaces to be sealed with a sealer approved by manufacturer.

2.4 MATERIALS

- A. Epoxy Resin.
- B. Aggregates: All aggregates to meet ASTM C-33 specifications, cleaned and properly graded to size. Aggregate shall be blended to meet individual project requirements.
- C. Marble chips, size to conform with NTMA gradation standards.
- D. Abrasive Inserts: Shall consist of silica carbide and black epoxy. Specify one to three lines.
- E. Caulks & Sealants:
 - 1. Urethane or Polyurethane Sealant. Refer to Section 079000
 - 2. Color to be selected by Architect from standard color pallet.

2.5 MISCELLANEOUS ACCESSORIES

- A. Anchoring Devices:
 - 1. Precast Terrazzo: Provide mechanical anchoring devices as recommended by fabricator for proper anchorage and support of units for conditions of installation and support.
- B. Patching and Fill Material: Terrazzo manufacturer's resinous product approved and recommended by manufacturer for application indicated.
- C. Cleaner: Liquid neutral chemical cleaner, with pH factor between 7 and 8, of formulation recommended by sealer manufacture for type of precast terrazzo used and complying with NTMA requirements.
- D. Sealer: Colorless, slip and stain-resistant penetrating sealer with pH factor between 7 and 8, that does not affect color or physical properties of precast terrazzo surface. Flash point (ASTM D56): 80 degrees F, Minimum.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and areas, with Installer present, for defects in existing work and compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions, including levelness tolerances, have been corrected.

3.2 PREPARATION

- A. Clean substrates of substances, including oil, grease, and curing compounds, that might impair terrazzo bond. Provide clean, dry, and neutral substrate for terrazzo application.

3.3 PRECAST TERRAZZO INSTALLATION

- A. Install precast terrazzo units using method recommended in writing by NTMA and manufacturer unless otherwise indicated.
 - 1. Set in full bed of epoxy thinset per manufacturer's written requirements.
 - 2. Set accurately as shown on Shop Drawings.
 - 3. Alignment shall be straight and true, and not vary by more than 1/8 inch in length, height, or width.
 - 4. Fasten to substrate as shown on Drawings.
 - 5. Fill joints using manufacturer's recommended sealant.
- B. Do not install units that are chipped, cracked, discolored, or improperly finished.
- C. Seal joints between units with joint compound matching precast terrazzo matrix or joint sealant as shown on Drawings.

3.4 REPAIR

- A. Cut out and replace terrazzo areas that evidence lack of bond with substrate. Cut out terrazzo areas in panels defined by strips and replace to match adjacent terrazzo, or repair panels according to NTMA's written recommendations, as approved by Architect.

3.5 CLEANING AND PROTECTION

- A. Cleaning:
 - 1. Remove grinding dust from installation and adjacent areas.
 - 2. Wash surfaces with cleaner according to NTMA's written recommendations and manufacturer's written instructions; rinse surfaces with water and allow them to dry thoroughly.
- B. Sealing:

1. Seal surfaces according to NTMA's written recommendations.
2. Apply sealer according to sealer manufacturer's written instructions.

C. Protection:

1. Upon completion, the work shall be ready for final inspection and acceptance by owner or owner agent.
2. General Contractor shall protect the finished work from the time the terrazzo contractor completes the work.

END OF SECTION

SECTION 096813

TILE CARPETING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes modular, carpet tile.
- B. Related Requirements:
 - 1. Section 072616 "Concrete Vapor Treatment."
 - 2. Section 079200 "Joint Sealants".
 - 3. Section 096513 "Resilient Base and Accessories" for resilient wall base and accessories installed with carpet tile.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include manufacturer's written data on physical characteristics, durability, and fade resistance.
 - 2. Include installation recommendations for each type of substrate.
- B. Shop Drawings: Show the following:
 - 1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet tiles.
 - 2. Carpet tile type, color, and dye lot.
 - 3. Type of subfloor.
 - 4. Type of installation.
 - 5. Pattern of installation.
 - 6. Pattern type, location, and direction.
 - 7. Pile direction.
 - 8. Type, color, and location of insets and borders.
 - 9. Type, color, and location of edge, transition, and other accessory strips.
 - 10. Transition details to other flooring materials.
- C. Samples: For each of the following products and for each color and texture required. Label each Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.
 - 1. Carpet Tile: Full-size Sample.
 - 2. Exposed Edge, Transition, and Other Accessory Stripping: 12-inch- long Samples.

- D. Product Schedule: For carpet tile. Use same designations indicated on Drawings.
- E. LEED Submittals:
 - 1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Product-Specific EPD.
 - b. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - c. MRc4 - Material Ingredients, Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer.
- B. Product Test Reports: For carpet tile, for tests performed by a qualified testing agency.
- C. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For carpet tiles to include in maintenance manuals. Include the following:
 - 1. Methods for maintaining carpet tile, including cleaning and stain-removal products and procedures and manufacturer's recommended maintenance schedule.
 - 2. Precautions for cleaning materials and methods that could be detrimental to carpet tile.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Carpet Tile: Full-size units equal to 5 percent of amount installed for each type indicated, but not less than 10 sq. yd.

1.7 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who is certified by the International Certified Floorcovering Installers Association at the Commercial II certification level.
- B. Fire-Test-Response Ratings: Where indicated, provide carpet tile identical to those of assemblies tested for fire response according to NFPA 253 by a qualified testing agency.
- C. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.

1. Build mockups at locations as determined by Architect. Allow approximately 100 square feet of installation for each carpet type. Once installation is approved, it may become part of the finished work.
2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Comply with CRI 104.

1.9 FIELD CONDITIONS

- A. Comply with CRI 104 for temperature, humidity, and ventilation limitations.
- B. Environmental Limitations: Do not deliver or install carpet tiles until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at occupancy levels during the remainder of the construction period.
- C. Do not install carpet tiles over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive and concrete slabs have pH range recommended by carpet tile manufacturer.

1.10 WARRANTY

- A. Special Warranty for Carpet Tiles: Manufacturer agrees to repair or replace components of carpet tile installation that fail in materials or workmanship within specified warranty period.
 1. Warranty does not include deterioration or failure of carpet tile due to unusual traffic, failure of substrate, vandalism, or abuse.
 2. Failures include, but are not limited to, more than 10 percent edge raveling, snags, runs, dimensional stability, loss of face fiber, and delamination.
 3. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. PS EPD: Products specified under this section shall have a Type III Product Specific EPD.
- B. Flooring: All flooring provided under this spec section shall be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third party certification.

2.2 PERFORMANCE REQUIREMENTS

- A. Floor covering material shall comply with the requirements of ASTM E648 and have a specific optical density smoke rating not to exceed 450 per ASTM E662.

2.3 MANUFACTURERS

- A. Tile carpeting:
 - 1. Basis-of-Design: Refer to Section 090000.

2.4 INSTALLATION ACCESSORIES

- A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet tile manufacturer.
- B. Metal Edge/Transition Strips: Extruded aluminum with mill finish of profile and width shown, of height required to protect exposed edge of carpet, and of maximum lengths to minimize running joints. Provide metal edge/transition strips from Schlueter.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting carpet tile performance. Examine carpet tile for type, color, pattern, and potential defects.
- B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F710 and the following:
 - 1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by carpet tile manufacturer.
 - 2. Subfloor finishes comply with requirements specified in Section 033000 "Cast-in-Place Concrete" for slabs receiving carpet tile.
 - 3. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. General: Comply with CRI 104, Section 6.2, "Site Conditions; Floor Preparation," and with carpet tile manufacturer's written installation instructions for preparing substrates indicated to receive carpet tile installation.
- B. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, depressions, and protrusions in substrates. Fill or level cracks, holes and depressions 1/8 inch wide or wider and protrusions more than 1/32 inch unless more stringent requirements are required by manufacturer's written instructions.
- C. Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet tile manufacturer.

- D. Clean metal substrates of grease, oil, soil and rust, and prime if directed by adhesive manufacturer. Rough sand painted metal surfaces and remove loose paint. Sand aluminum surfaces, to remove metal oxides, immediately before applying adhesive.
- E. Broom and vacuum clean substrates to be covered immediately before installing carpet tile.

3.3 INSTALLATION

- A. General: Comply with CRI 104, Section 14, "Carpet Modules," and with carpet tile manufacturer's written installation instructions.
- B. Installation Method: As recommended in writing by carpet tile manufacturer.
- C. Maintain dye lot integrity. Do not mix dye lots in same area.
- D. Cut and fit carpet tile to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet tile manufacturer.
- E. Extend carpet tile into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
- F. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.
- G. Install pattern parallel to walls and borders.

3.4 CLEANING AND PROTECTION

- A. Perform the following operations immediately after installing carpet tile:
 - 1. Remove yarns that protrude from carpet tile surface.
 - 2. Vacuum carpet tile using commercial machine with face-beater element.
- B. Protect installed carpet tile to comply with CRI 104, Section 16, "Protecting Indoor Installations."
- C. Protect carpet tile against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet tile manufacturer.

SECTION 097200

WALL COVERINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Vinyl wall covering.

1.3 PREINSTALLATION MEETINGS

- A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include data on physical characteristics, durability, fade resistance, and fire-test-response characteristics.
 - 2. Factory finishes applied to actual door face materials, approximately 8 by 10 inches, for each material and finish. For each wood species and transparent finish, provide set of three Samples showing typical range of color and grain to be expected in finished Work.
 - 3. Frames for light openings, 6 inches long, for each material, type, and finish required.
- B. Shop Drawings: Show location and extent of each wall-covering type. Indicate pattern placement seams and termination points.
- C. Samples for Initial Selection: For each type of wall covering.
- D. Samples for Verification: For each type of wall covering and for each color, pattern, texture, and finish specified, full width by 36 inches long in size.
 - 1. Wall-Covering Sample: From same production run to be used for the Work, with specified treatments applied.
 - a. Show complete pattern repeat.
 - b. Mark top and face of fabric.

E. LEED Submittals:

1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Product-Specific EPD.
 - b. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.

1.5 INFORMATIONAL SUBMITTALS

- A. Product Test Reports: For each wall covering, for tests performed by a qualified testing agency.
- B. Manufacturer's written application instructions for all products used in installation.

1.6 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For wall coverings to include in maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials, from the same production run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Wall-Covering Materials: For each type, color, texture, and finish, full width by length to equal to 5 percent of amount installed.

1.8 QUALITY ASSURANCE

- A. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and to set quality standards for installation, for each type of wall covering on each substrate required. Comply with requirements in ASTM F1141 for appearance shading characteristics.
 1. Build mockups for each type of wall covering on each substrate required. Comply with requirements in ASTM F1141 for appearance shading characteristics.
 2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
 3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.9 FIELD CONDITIONS

- A. Environmental Limitations: Do not deliver or install wall coverings until spaces are enclosed and weathertight, wet-work in spaces is complete and dry, work above ceilings is complete, and HVAC system is operating and maintaining ambient temperature and humidity conditions at levels intended for occupants after Project completion during the remainder of the construction period.

- B. Lighting: Do not install wall covering until lighting that matches conditions intended for occupants after Project completion is provided on the surfaces to receive wall covering.
- C. Ventilation: Provide continuous ventilation during installation and for not less than the time recommended by wall-covering manufacturer for full drying or curing.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. PS EPD: Products specified under this section shall have a Type III Product Specific EPD.

2.2 PERFORMANCE REQUIREMENTS

- A. Fire-Test-Response Characteristics: As determined by testing identical wall coverings applied with identical adhesives to substrates in accordance with test method indicated below by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - a. Flame-Spread Index: 25 or less.
 - b. Smoke-Developed Index: 50 or less.
 - 2. Fire-Growth Contribution: No flashover and heat and smoke release when tested in accordance with NFPA 265 and NFPA 286.

2.3 MANUFACTURERS

- A. Vinyl wallcovering:
 - 1. Basis-of-Design: DesignTex, or equal, as required to match the Architect's samples.

2.4 WALL GRAPHICS

- A. Provide custom graphics incorporating digital art provided by Architect printed onto backing media manufactured by DesignTex, or equal.
- B. Backing Media: DesignTex Substrate DW11, or equal; PVC-free wall covering with type II performance characteristics and a smooth matte finish. 30% of total product weight is post-consumer waste fiber.
 - 1. Contents: Synthetic Latex, coating pigments and additives, post-consumer waste cellulose fiber, virgin wood pulp.
 - 2. Width: 52-inches, with 52-inch maximum print area.
 - 3. Print Technology: UV Curable Inkjet.
 - 4. Fire Rating: ASTM W-84 Class A.
- C. Adhesive: Type recommended by manufacturer of Wall Covering and the same as used in test to determine flame spread rating.

2.5 ACCESSORIES

- A. Adhesive: Mildew-resistant, nonstaining, strippable adhesive, for use with specific wall covering and substrate application indicated and as recommended in writing by wall-covering manufacturer.
 - 1. Wall Sealer: Provide a gypsum board sealer, recommended by the Wall Covering manufacturer in conformance with Section 099100 "Painting and Coating".
- B. Primer/Sealer: Mildew resistant, complying with requirements in Section 099100 "Painting and Coating" and recommended in writing by primer/sealer and wall-covering manufacturers for intended substrate.
- C. Seam Tape: As recommended in writing by wall-covering manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation surfaces being true in plane and vertical and horizontal alignment, maximum moisture content, and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Comply with manufacturer's written instructions for surface preparation.
- B. Clean substrates of substances that could impair bond of wall covering, including dirt, oil, grease, mold, and mildew.
- C. Prepare substrates to achieve a smooth, dry, clean, structurally sound surface free of flaking, unsound coatings, cracks, and defects.
 - 1. Gypsum Board: Apply primer/sealer as recommended in writing by primer/sealer manufacturer and wall-covering manufacturer.
 - 2. Painted Surfaces:
 - a. Check for pigment bleeding. Apply primer/sealer to areas susceptible to pigment bleeding as recommended in writing by primer/sealer manufacturer.
 - b. Sand gloss, semigloss, and eggshell finishes with fine sandpaper.
- D. Remove hardware and hardware accessories, electrical plates and covers, light fixture trims, and similar items.
- E. Acclimatize wall-covering materials by removing them from packaging in the installation areas not less than 24 hours before installation.

3.3 INSTALLATION OF WALL COVERING

- A. Comply with wall-covering manufacturers' written installation instructions applicable to products and applications indicated. Fully bond wall covering to substrate. Remove air bubbles, wrinkles, blisters, and other defects
 - 1. Cut wall-covering strips in roll number sequence. Change the roll numbers at partition breaks and corners.
 - 2. Install strips in same order as cut from roll.
 - 3. For solid-color, even-texture, or random-match wall coverings, reverse every other strip.
 - 4. Install wall covering without lifted or curling edges and without visible shrinkage.
 - 5. Match pattern 72 inches above the finish floor.
 - 6. Install seams vertical and plumb at least 6 inches from outside corners and 3 inches from inside corners unless a change of pattern or color exists at corner. Horizontal seams are not permitted.
 - 7. Trim edges and seams for color uniformity, pattern match, and tight closure. Butt seams without overlaps or gaps between strips.
 - 8. Fully bond wall covering to substrate. Remove air bubbles, wrinkles, blisters, and other defects.

3.4 CLEANING

- A. Remove excess adhesive at seams, perimeter edges, and adjacent surfaces.
- B. Use cleaning methods recommended in writing by wall-covering manufacturer.
- C. Replace strips that cannot be cleaned.
- D. Reinstall hardware and hardware accessories, electrical plates and covers, light fixture trims, and similar items.

END OF SECTION

This Page Left Intentionally Blank

SECTION 098316
ACOUSTICAL PANELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes:
1. Acoustical wall panels.
 2. Acoustical ceiling panels.
- B. Related Requirements:
1. Section 092216 "Non-Structural Metal Framing" for wall backing.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product including:
1. Preparation instructions and recommendations.
 2. Storage and handling requirements and recommendations.
 3. Installation methods.
- B. Selection Samples: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns.
- C. Samples for Verification: For each finish product specified, two samples, minimum size 6 inches square representing actual product, color, and patterns.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Ceiling suspension-system members.
 2. Structural members to which suspension systems will be attached.
 3. Method of attaching hangers to building structure.
 - a. Furnish layouts for cast-in-place anchors, clips, and other ceiling attachment devices whose installation is specified in other Sections.
 4. Carrying channels or other supplemental support for hanger-wire attachment where conditions do not permit installation of hanger wires at required spacing.
 5. Size and location of initial access modules for acoustical panels.
 6. Items penetrating finished ceiling and ceiling-mounted items including the following:

- a. Lighting fixtures.
 - b. Diffusers.
 - c. Grilles.
 - d. Speakers.
 - e. Sprinklers.
 - f. Access panels.
 - g. Perimeter moldings.
7. Show operation of hinged and sliding components covered by or adjacent to acoustical panels.
8. Minimum Drawing Scale: 1/4 inch = 1 foot.
- B. Qualification Data: For testing agency.
- C. Product Test Reports: For each acoustical panel ceiling, for tests performed by manufacturer and witnessed by a qualified testing agency.
- D. Evaluation Reports: For each acoustical panel ceiling suspension system and anchor and fastener type, from ICC-ES.
- E. Field quality-control reports.
- 1.5 QUALITY ASSURANCE
- A. Manufacturer Qualifications: Minimum 5 years experience manufacturing similar products.
- B. Installer Qualifications: Minimum 2 years experience installing similar products.
- C. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.
- 1. Finish areas designated by Architect.
 - 2. Do not proceed with remaining work until workmanship is approved by Architect.
 - 3. Refinish mock-up area as required to produce acceptable work.
- 1.6 PRE-INSTALLATION MEETINGS
- A. Convene minimum two weeks prior to starting work of this section.
- 1.7 CLOSEOUT SUBMITTALS
- A. Maintenance Data: For finishes to include in maintenance manuals.
- 1.8 MAINTENANCE MATERIAL SUBMITTALS
- A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
- 1. Acoustical Ceiling Units: Full-size panels equal to 2 percent of quantity installed.
 - 2. Suspension-System Components: Quantity of each exposed component equal to 2 percent of quantity installed.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Deliver and store products in manufacturer's unopened packaging bearing the brand name and manufacturer's identification until ready for installation.
- B. Handling: Handle materials to avoid damage.

1.10 FIELD CONDITIONS

- A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's recommended limits.

1.11 SEQUENCING

- A. Ensure that products of this section are supplied to affected trades in time to prevent interruption of construction progress.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

2.2 MANUFACTURERS

- A. Sound Absorptive Panel (AWP-1):
 - 1. Basis-of-Design: Autex "Quietspace" or equal. Provide where shown on Drawings.
 - 2. Material: 100 percent recycled Non-woven needle-punched polyester (100 percent PET) containing not less than 45 percent post-consumer recycled material.
 - 3. Composition: Constructed from 100% polyester fibers, thermally bonded to form the structure of the panel.
 - 4. Dimensions: Panel 48" x 96"
 - 5. Panel Color: As selected by Architect
 - 6. Thickness: 0.98 inch
 - 7. Weight: 7.54 oz/sf
 - 8. Fastness to Light: ASTM 5036
 - 9. Color: As selected by Architect.
 - 10. Topping Layer Finish: As selected by Architect
 - 11. Sound Absorption: Minimum Noise Reduction Coefficient per Acoustical Report.
 - 12. VOC Concentration: 0.01 mg/m³.
 - 13. Fire Rating (0.98 inches (25 mm): ASTM E-84 Class A, FS: 0 - SD: 10.

2.3 ACOUSTICAL SEALANT

- A. Acoustical Sealant: As specified in Section 079200 "Joint Sealants."

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, including structural framing to which acoustical panel ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage and with requirements for installation tolerances and other conditions affecting performance of acoustical panel ceilings.
- B. Examine acoustical panels before installation. Reject acoustical panels that are wet, moisture damaged, or mold damaged.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Clean surfaces thoroughly prior to installation.
- B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.
- C. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders unless otherwise indicated and comply with layout shown on reflected ceiling plans.
- D. Layout openings for penetrations centered on the penetrating items.

3.3 INSTALLATION

- A. Install acoustical panel ceilings according to ASTM C636/C636M, seismic design requirements, and manufacturer's written instructions.
 - 1. Fire-Rated Assembly: Install fire-rated ceiling systems according to tested fire-rated design.

3.4 PROTECTION

- A. Protect installed products until completion of project.
- B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 099100

PAINTING AND COATING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SYSTEM DESCRIPTION

- A. General: Paint every surface, except as otherwise shown or as follows:
- B. Surfaces Not to be Painted:
 - 1. Factory-finished items specified in various Sections.
 - 2. Prefinished wall, ceiling, and floor coverings.
 - 3. Painting specified elsewhere and included in respective Sections, including but not necessarily limited to, shop priming.
 - 4. Code-Required Labels: Keep equipment identification and fire rating labels free of paint.
 - 5. Surfaces concealed in walls and above ceilings except as specifically indicated otherwise.
 - 6. Ducts, piping, conduit, and equipment concealed in walls and ceilings, unless specifically indicated otherwise.

1.3 SUBMITTALS

- A. Product Data: Submit for Architect's action. Submit manufacturer's literature and installation instructions for each material and accessory, clearly notating specified requirements.
- B. Samples: Submit for Architect's action. Furnish sufficient samples to establish full range of colors and textures for materials exposed in the finished Work. Label samples to indicate product and location in the Work. Samples will be reviewed for appearance only. Compliance with other requirements is the responsibility of the Contractor.
 - 1. Opaque Colors and Finishes: Submit samples, using materials accepted for Project, of each color and paint finish selected with texture to simulate actual conditions. Prepare three samples, 8-1/2 inches by 11 inches, with required number of paint coats clearly visible.
 - 2. Transparent and Stained Finishes: Prepare samples on species and quality of wood to be used in the Work. Resubmit as requested until acceptable sheen, color, and texture are achieved. Label and identify each sample as to location and application.
- C. Quality Assurance/Quality Control Submittals: Submit for Architect's information.
 - 1. Certificates:
 - a. Document Review: Submit a written statement signed by the Contractor and the Applicator stating that the Contract Documents, shop drawings and product data have been reviewed with qualified manufacturer representatives. The statement shall certify that selected materials are proper, compatible with contiguous materials and adequate for the application shown.

b. Installer's Qualifications

D. LEED Submittals:

1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - b. MRc4 - Material Ingredients, Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

1.4 QUALITY ASSURANCE

- A. Qualified Installer: Installer to have 5 years' experience in the installation of specified materials on comparable projects. The firm shall have the approval of the materials manufacturer.
- B. Regulatory Requirements: Comply with applicable requirements of the laws, codes, and regulations of Authorities Having Jurisdiction (AHJs), including the Air Quality Management District. Obtain necessary approvals from AHJs.
- C. Visual Mock-Up(s): As directed by the Architect, apply on actual wall surfaces where designated, samples of each and any color selected for final review.
 1. On at least 100 square feet of surface as directed, provide full-coat finish samples until required sheen, color and texture are obtained.
 2. Duplicate painted finishes of prepared samples.
 3. Simulate finished lighting conditions for review of in-place work.
- D. Labeling: Include following on label of each container:
 1. Manufacturer's name and product name.
 2. Generic type of paint.
 3. Manufacturer's stock number.
 4. Color.
 5. Instructions for reducing, where applicable.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Packing, Shipping, Handling, and Unloading: Deliver material in sealed containers with labels legible and intact.
- B. Storage and Protection:
 1. Store only acceptable Project materials on Project site.
 2. Restrict storage to paint materials and related equipment.

1.6 PROJECT/SITE CONDITIONS

- A. Comply with manufacturer's recommendations as to environmental conditions under which coatings and coating systems can be stored and applied.

- B. Do not apply finish in areas where dust is being generated.

1.7 MAINTENANCE

- A. Extra Materials: At completion of Work, deliver to Owner extra stock of paint of one gallon of each color used of each coating material used. Tightly seal and clearly label containers.

1.8 WARRANTY

- A. General Warranty Requirements are specified in 01 78 36 - Warranties. Minimum 2-Year warranties per 01 78 36 shall be provided for all installed material and equipment unless more stringent requirements are noted in this section. Standard Manufacturer Warranties shall be provided where they exceed minimum warranty requirements.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section shall have either a Type III Product Specific EPD or the company shall be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section shall be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 018113 Sustainable Design Requirements. In addition, all paints and coatings shall be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third party certification.

2.2 MANUFACTURERS

- A. General: Sherwin Williams, Kelly Moore, Benjamin Moore, Vista, PPG or equal.
- B. Substitutions: For consideration, accompany substitution request, with manufacturer's data and current statement from a recognized independent testing agency stating that each substitution for finish coat is equal to or better than specified product.

2.3 MATERIALS

- A. General: Materials selected for each paint system shall be products of the same manufacturer, and shall be compatible with each other. Materials selected shall be products of the manufacturer's highest quality line.
- B. Unsuitability of Specified Products: Claims concerning unsuitability of any materials specified will not be entertained, unless such claim is made in writing to the Architect before Work is started.

2.4 COLORS AND SHEENS

- A. Mixing: Deliver paints and stains ready mixed to Project site.
- B. Provide Flat sheen at ceiling locations, unless otherwise noted. Provide eggshell sheen at wall locations and wood, unless otherwise noted. Provide semi-gloss sheen at metal substrates, unless otherwise noted.

2.5 PAINT SYSTEMS

- A. Schedule: Only major areas are scheduled. Treat miscellaneous and similar items and areas within room or space with similar system.
- B. Number of Coats: Where number of coats is specified, it is only as a minimum requirement. Apply additional coats, at no additional cost to Owner, if necessary to completely hide base material, produce uniform color, and provide satisfactory finish result.
- C. Systems Specifications: These specifications are a guide and are meant to establish procedure and quality. Confer with Architect to determine exact finish desired.
- D. Acceptance of Final Colors: Do not apply final coats of paint for interior systems until colors have been accepted by Architect.
- E. Exterior Painting Systems:
 - 1. High Performance Polyurethane Enamel Coating System:
 - a. Prime Coat: Shop-applied under other applicable Sections.
 - 1) Touch up shop primer where needed with Ameron Amerlock VOC.
 - 2) Touch up shop primer Sherwin-Williams Macopoxy 646-100 Fast Cure Epoxy (B58-620) as a primer.
 - b. Finish Coats:
 - 1) Ameron Amershield VOC
 - 2) Tnemec's Series 1075 (1074) Endura-Shield, semi-gloss (gloss) sheen, 5 mils dry film thickness.
 - 3) Sherwin-Williams Water-Based Acrolon 100 Polyurethane, 5 mils dry film thickness.
 - 2. Galvanized Steel, Zinc-Rich Painted Steel, and Aluminum:
 - a. Prime Coat:
 - 1) KM 5725 DTM Acrylic Primer/Finish.
 - 2) Vista 4800 Metal Pro Primer.
 - 3) Sherwin-Williams Pro Industrial Pro-Cryl Universal Primer, (B66-310 Series).
 - b. Body Coat:
 - 1) KM 5885 DTM High Performance Acrylic Semi-Gloss.
 - 2) Vista 7000 Acriglo 100% Acrylic Semi-Gloss.
 - 3) Sherwin Williams, Pro Industrial Acrylic Semi-gloss, (B66W651).
 - c. Finish Coat:
 - 1) KM 5885 DTM High Performance Acrylic Semi-Gloss.
 - 2) Vista 7000 Acriglo 100% Acrylic Semi-Gloss.
 - 3) Sherwin Williams, Pro Industrial Acrylic Semi-gloss, (B66W651).
- F. Interior Painting Systems:
 - 1. Gypsum Board:
 - a. Prime Coat:

- 1) KM 971 Acry-Plex Low VOC Interior PVA Primer Sealer.
 - 2) Vista 1100 Hi-Build PVA Primer.
 - 3) Sherwin-Williams Pro Mar 200 Zero VOC Primer (B28W2600).
- b. Body Coat:
- 1) KM 1010 Premium Professional Low VOC Interior Eggshell Finish; KM 1010 Premium Professional Low VOC Interior Eggshell.
 - 2) Vista 7500 Acriglo 100% Acrylic Eggshell Finish; KM 1520 Enviro-Coat Low VOC Interior Semi-Gloss Enamel / Vista 7500 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - 3) Sherwin-Williams Pro Mar Zero VOC Interior Eg-shel (B20-2600 Series) or Sherwin-Williams Pro-Mar 200 Zero VOC Semi-gloss Enamel (B31-2600 Series).
- c. Finish Coat:
- 1) KM 1010 Premium Professional Low VOC Interior Eggshell Finish; KM 1010 Premium Professional Low VOC Interior Eggshell.
 - 2) Vista 7500 Acriglo 100% Acrylic Eggshell Finish; KM 1520 Enviro-Coat Low VOC Interior Semi-Gloss Enamel / Vista 7500 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - 3) Sherwin-Williams Pro Mar Zero VOC Interior Eg-shel (B20-2600 Series) or Sherwin-Williams Pro-Mar 200 Zero VOC Semi-gloss Enamel (B31-2600 Series).
2. Metal:
- a. Prime Coat:
- 1) Shop-applied under other applicable Section.
 - a) Touch up with KM 5725 DTM Acrylic Primer/Finish (if compatible).
 - b) Touch up with Vista 9600 Protec Primer (if compatible).
 - c) Touch up with Sherwin-Williams Pro Industrial Pro- Cryl Universal Primer (B66-1300 Series).
- b. Body Coat:
- 1) KM 5885 DTM High Performance Acrylic Semi-Gloss.
 - 2) Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - 3) Sherwin-Williams Pro-Mar 200 Zero VOC Semi-gloss Enamel (B31-2600 Series).
- c. Finish Coat:
- 1) KM 5885 DTM High Performance Acrylic Semi-Gloss.
 - 2) Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - 3) Sherwin-Williams Pro-Mar 200 Zero VOC Semi-gloss Enamel (B31-2600 Series).
3. Concrete:
- a. Prime Coat:
- 1) KM 247 Acry-Shield Masonry Primer
 - 2) Vista 4000 Uniprime II Masonry Primer
 - 3) Sherwin-Williams Loxon Exterior Acrylic Masonry Primer (LX02W0050 Series).
- b. Body Coat:
- 1) KM: Not applicable.
 - 2) Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - 3) Sherwin-Williams A-100 Exterior Exterior Latex Flat (A6-150 Series)
- c. Finish Coat:
- 1) KM 1200 Premium Professional 100% Acrylic Exterior Flat.
 - 2) Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - 3) Sherwin-Williams A-100 Exterior Exterior Latex Flat (A6-150 Series)

4. Wood:
 - a. Enamel:
 - 1) Prime Coat:
 - a) KM 973 Acry-Plex Low VOC Interior Enamel Undercoat.
 - b) Vista 4200 Terminator II Wood Primer.
 - c) Pro Mar 200 Zero VOC Primer (B28W2600).
 - 2) Body Coat:
 - a) KM 1050 Premium Professional Low VOC Interior Semi-Gloss Enamel.
 - b) Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - c) Sherwin-Williams Pro-Mar 200 Zero VOC Semi-gloss Enamel (B31-2600 Series).
 - 3) Finish Coat:
 - a) KM 1050 Premium Professional Low VOC Interior Semi-Gloss Enamel.
 - b) Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - c) Sherwin-Williams Pro-Mar 200 Zero VOC Semi-gloss Enamel (B31-2600 Series).
 - b. Clear Finish:
 - 1) Prime Coat:
 - a) Old Masters Penetrating Stain.
 - b) Minwax PS Wood Stain 250.
 - 2) Body Coat:
 - a) Old Masters Clear Polyurethane.
 - b) Minwax Fast Dry Poly Varnish.
 - 3) Finish Coat:
 - a) Old Masters Clear Polyurethane.
 - b) Minwax Fast Dry Poly Varnish.

G. Miscellaneous Interior Painting Systems:

1. Ductwork at Grilles and Diffusers: Apply to visible interior surfaces of ductwork.
 - a. Body Coat:
 - 1) KM 5725 DTM Acrylic Primer/Finish.
 - 2) Vista 9600 Protec DTM.
 - 3) Sherwin-Williams Pro Industrial Multi-Surface Acrylic Eg-shel (B66-1560 Series).
 - b. Finish Coat:
 - 1) KM 5725 DTM Acrylic Primer/Finish.
 - 2) Vista 9600 Protec DTM.
 - 3) Pro Industrial Multi-Surface Acrylic Eg-shel (B66-1560 Series).
2. Exposed Non-Insulated Pipes and Ductwork: Including conduit.
 - a. Prime Coat:
 - 1) KM 5725 DTM Acrylic Primer/Finish.
 - 2) Vista 9600 Protec Primer DTM.
 - 3) Sherwin-Williams Pro Industrial Multi-Surface Acrylic Eg-shel (B66-1560 Series).
 - b. Body Coat:
 - 1) KM 1010 Premium Professional Interior Low VOC Eggshell Enamel or KM 1050 Premium Professional Interior Low VOC Semi-Gloss Enamel.
 - 2) Vista 7500 Acriglo 100% Acrylic Eggshell Enamel or Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - 3) Sherwin Williams: Not applicable.
 - c. Finish Coat:
 - 1) KM 1010 Premium Professional Interior Low VOC Eggshell Enamel or KM 1050 Premium Professional Interior Low VOC Semi-Gloss Enamel.

- 2) Vista 7500 Acriglo 100% Acrylic Eggshell Enamel or Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - 3) Sherwin-Williams Pro Industrial Multi-Surface Acrylic Eg-shel (B66-1560 Series) or Pro Industrial Multi-Surface Acrylic Semi-gloss (B66-1550 Series).
3. Factory Finished Equipment: Satisfactorily refinish surfaces damaged before, during, or after installation as directed.
 - a. KM 1050 Premium Professional Low VOC Interior Semi-Gloss Enamel.
 - b. Vista 7000 Acriglo 100% Acrylic Semi-Gloss Enamel.
 - c. Pro Industrial Multi-Surface Acrylic Semi-gloss (B66-1550 Series).
 4. Finish Hardware: Specified with USP finish under Section 087000, paint as specified for metal. Color and gloss to match doors and frames as applicable, unless otherwise specified.
 5. Plywood Backing: In Telephone and Electric Closets; provide one coat
 - a. KM 1010 Premium Professional Low VOC Interior Eggshell Enamel.
 - b. Vista 7500 Acriglo 100% Acrylic Eggshell Enamel.
 - c. Sherwin-Williams Pro-Mar 200 Zero VOC Eg-shel (B20-2600 Series).
- H. Pipe Identification:
1. General: Per ANSI A13.1; buried pipe, electrical conduit, and pipe in concealed spaces such as furred spaces and shafts not included.
 2. Color Scheme: ANSI Z53.1 in combination with legend and flow markers; intermittent displays. Locate and space as specified for legend and flow markers. Safety colors as specified under applicable mechanical Section.
 3. Legend: Stencil letters of colors, type, and sizes per ANSI A13.1. Tags for identification of pipes less than 3/4 inch overall outside diameter, including valves and fittings; provided under applicable mechanical Section.
 4. Flow Markers: Provide each type with appropriate size arrows to indicate flow direction in pipe; same color as legend.
 5. Visibility: Locate legend and flow markers for easy visibility from operating floor; space not over 20 feet with at least one per room.

PART 3 - EXECUTION

3.1 GENERAL

- A. Manufacturer's Instructions: Prepare substrates, apply primers and apply the work, including components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified. Examine the areas to receive the Work and remedy detrimental conditions.

3.2 SURFACE PREPARATION

- A. General: Remove scale, dirt, dust, grit, rust, wax, grease, efflorescence, loose material, and other foreign matter detrimental to proper adhesion of paint.
- B. Cementitious Surfaces:
 1. General: Remove oil, grease, loose particles, bond breaker coating and other foreign materials.

2. Cracks: Greater than 1/32-inch-wide; rout out to not less than 1/4-inch-wide and 1/4-inch-deep; fill groove with gun grade sealant and cap with buttering grade sealant. Cracks less than 1/32-inch-wide; cap with buttering grade sealant. Repair minor cracks and holes; roughen when necessary to assure good adhesion.
3. Alkali Conditions: Test surfaces for presence of alkali. If present, neutralize as recommended by paint manufacturer, after drying remove precipitate by brushing. Do not paint if pH is above 12.

C. Gypsum Board:

1. Narrow, Shallow Cracks and Small Holes: Fill with spackling compound.
2. Deep, Wide Cracks and Deep Holes: Rake out, dampen with clear water, and fill with thin layers of gypsum board joint compound.
3. Curing: Allow to dry.
4. Sanding: Sand smooth after drying; do not raise nap of paper on gypsum board.

D. Metals:

1. Chipped or Abraded Areas in Shop Coatings: Touch-up using appropriate primer.
2. Galvanized Surfaces: Apply a wash coat of Jasco's Prep 'n' Prime. Allow to dry completely.
3. Stainless Steel: Scarify surfaces before applying prime coat.

E. Wood:

1. General: If required, sandpaper surfaces smooth before applying primer. Thoroughly clean knots; apply thin coat of knot sealer over surfaces shown to receive opaque finish. Old chipped paint at wood flagpole and similar items shall be properly scraped and sanded prior to priming.
2. Back Priming: Back prime surfaces installed against cementitious surfaces; give particular attention to sealing cross-grained surfaces.
3. Puttying:
 - a. General: Fill nail holes, cracks, and other depressions flush with putty after prime coat application. Allow putty to dry; sandpaper smooth before applying body coat.
 - b. For Opaque Finish: Linseed oil type putty.

F. Protection:

1. General: Properly protect floors and other adjacent work by drop cloths or other suitable coverings. In areas scheduled for painting, maintain wrappings and factory-applied protection provided by other trades.
2. Hardware and Other Obstructions: Remove or protect factory finished items such as hardware, plates, lighting fixtures, grilles, and similar items placed prior to painting. Reposition or remove protection upon completion of each space. Equipment adjacent to surfaces requiring paint disconnected, moved, reset, and reconnected by respective trades.
3. Fire Precautions: At end of each work day, place in metal containers or remove from premises, solvent soaked cloths, waste, and other materials which constitute a fire hazard.

- G. Moisture Content: Do not apply initial coating until moisture content of surface is within limitations recommended by paint manufacturer.

3.3 APPLICATION

- A. General: Apply paint per manufacturer's instructions and as specified. Thoroughly stir paint and keep at uniform consistency during application. Apply paint evenly, free from drops, ridges, waves, laps, and brush marks; finished surface uniform in sheen, color, and texture. Apply succeeding coats to unscarred and completely integral base coats; slightly vary color of

undercoats to distinguish them from preceding coat. Allow sufficient time between coats to assure proper drying. Sandpaper smooth interior finishes between coats.

- B. Prime Coat: Do not thin primers in excess of manufacturer's printed directions. Apply by brush, unless otherwise specified, within 8 hours after cleaning.
- C. Body and Finish Coats: Do not thin; apply by brush, roller or spray.
- D. Drying Time: Comply with recommendations of product manufacturer for drying time between succeeding coats.
- E. Moldings and Ornaments: Leave clean and true to details with no undue amount of paint in corners and depressions.
- F. Edges of Paint: Where adjoining other materials or colors, make clean and sharp with no overlapping.
- G. Refinishing: Refinish entire wall where portion of finish is deemed not acceptable.
- H. Precaution: Do not paint over fusible links, UL labels, or sprinkler heads.
- I. Exposed Plumbing and Mechanical Items: Finish items without factory finish such as conduits, pipes, access panels, and items of similar nature to match adjacent wall and ceiling surfaces, unless otherwise directed.

3.4 CLEANING

- A. General: Touch up and restore finish where damaged. Remove spilled, splashed, or spattered paint from surfaces. Do not mar surface finish of item being cleaned.
- B. Storage Space: Leave clean and in condition required for equivalent spaces in Project.

END OF SECTION

This Page Left Intentionally Blank

SECTION 099600

HIGH PERFORMANCE COATINGS

PART 1 - GENERAL

1.1 SUMMARY

- A. Work Included: High Performance Coatings, complete as shown and specified.
- B. Related Sections:
 - 1. Section 051213 "Architecturally Exposed Structural Steel."
 - 2. Section 0844130 "Glazed Aluminum Curtain Walls and Entrances."

1.2 SUBMITTALS

- A. General: Submit the following in conjunction with submittals required for substrates, specified in other Sections.
 - B. Product Data: Submit for Architect's action. Submit manufacturer's literature, specifications and application instructions describing the general properties of each material and accessory to be used in the Work.
 - C. Samples: Provide in accordance with Section 052100 "Structural Steel", Section 055000 "Metal Fabrications", and other Sections that reference this Section. Label samples to indicate product and location in the Work. Samples will be reviewed for color and appearance only. Compliance with other requirements is the responsibility of the Contractor.
 - D. Quality Assurance/Quality Control Submittals: Submit for Architect's information.
 - 1. Certificates:
 - a. Document Review: Submit a written statement signed by the Contractor and the Applicator stating that the Contract Documents, shop drawings and product data have been reviewed with qualified manufacturer representatives. The statement shall certify that selected materials are proper, compatible with contiguous materials and adequate for the application shown.
 - b. Applicator Qualifications.
- A. LEED Submittals:
- 1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Product-Specific EPD.

- b. MRc4 - Material Ingredients, Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

1.3 QUALITY ASSURANCE

- A. Qualified Applicator: Applicator to have 5 years experience in the installation of specified materials on comparable projects. The firm shall have the approval of the materials manufacturer.
- B. Regulatory Requirements: Comply with applicable requirements of the laws, codes, and regulations of Authorities Having Jurisdiction (AHJs). Obtain necessary approvals from AHJs.

1.4 WARRANTY

- A. Warranty for Fluoropolymer Coatings on Aluminum and Steel: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied finishes within specified warranty period.
 - 2. Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
 - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
 - 3. Warranty Period: 20 years from date of Substantial Completion.
- B. Warranty for Coating on Exterior Steel Substrates: Submit for Owner's documentation. Warranty shall be for a 15 year period, signed by the Contractor, manufacturer, and installer, against the loss of film integrity, chalking, fading, non-uniformity, corrosion and the overall performance of color of the resinous coatings. Make repairs and replacements upon notification of defects.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section shall have Type III Product Specific EPD.
- B. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section shall be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 018113 Sustainable Design Requirements. In addition, all paints and coatings shall be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third party certification.

2.2 SYSTEMS

- A. Color and Sheen: Match Architect's sample.
- A. Shop-Applied Fluoropolymer Coatings at Aluminum and Coil Coatings at Steel: High-Performance Organic Finish: 3 -coat fluoropolymer finish complying with AAMA 2605, AAMA 620 or AAMA 621, and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
- B. Coatings for Interior Steel:
 - 1. Surface Preparation: SSPC-SP6.
 - 2. Shop Primer: Tnemec 27WB Typoxy. Apply at 3.0 to 5.0 mils DFT. Or PPG PAINTS Multiprime 4160. Apply at 2.5-3.0 mils DFT.
 - 3. Touch all damaged or bare spots per SSPC-SP 15 (feather-in all edges) and spot prime with Tnemec 27WB at 3.0-4.0 mil DFT.
 - 4. Finish Coat, applied in Field:
 - a. Steel Stairs: Tnemec 1029 Endurathone low semi-gloss. Apply at 2.0 – 3.0 mils DFT. Or PPG Paints Devflex 4216HP Low Semi-Gloss at 2.0-4.0 mils DFT.
- C. Coatings for Exposed Steel at Exterior. Provide two-coat system from one manufacturer, over galvanized steel. Provide the following, or equal:
 - 1. Galvanized Steel, as specified in other Sections.
 - 2. Field Applied Intermediate Coat: Tnemec Series 1075. 2.5 mils DFT. OR PPG Paints Corafon ADS Epoxy Primer 573 at 3.0-5.0 mils DFT for BARE Steel. PPG Paints Corafon ADS Epoxy Primer 510 at 2-0-4.0 mils DFT for Steel previously coated with PVDF.
 - 3. Field Applied Finish Coat: Tnemec 1072 V Fluoronar. 2-3 mils DFT. OR PPG Paints Corafon ADS Intermix Fluoropolymer Finish at 1.8-2.2 mils DFT. ** Metallic or Mica Colors in EXTERIOR applications must also have a Barrier Coat of ADS564.
- D. Coatings for Exposed Ferrous at Exterior OPTION 2; A 2 Coat System for Solid Colors.
 - 1. Field Applied PPG Paints Amercoat 68HS Zinc Rich Primer. 2-5 mils DFT.
 - 2. Field Applied PPG Paints PSX-805 Polysiloxane Satin Finish 3-6 mils DFT.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.

3.2 COATINGS FIELD APPLICATION

- A. General: Use applicator and techniques best suited for substrates and type of material being applied. Apply materials at not less than recommended spreading rate to establish a total dry film thickness as indicated or, if not indicated, as recommended.
- B. Mix materials thoroughly before application to produce a mixture of uniform density; strain if necessary, before using. Do not mix surface film into material. If necessary, remove surface film and re-strain material before using. Do not adulterate ready-mixed materials except in accordance with the manufacturer's printed instructions. Use only approved thinners and only within recommended limits.
- C. Apply materials with care to a uniform and proper film thickness, showing no runs, holidays, sags, crawls or other defects. Apply with a minimum of brush marks. Finish surfaces shall be uniform in sheen, color and texture.

END OF SECTION

SECTION 099646

INTUMESCENT PAINTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes surface preparation and application of fire-retardant intumescent paint to interior and exterior items and surfaces.
- B. Related Sections:
 - 1. Section 099100 "Painting and Coating" for primers and finish coats that may be used with intumescent paint finishes.
 - 2. Section 051200 "Structural Steel Framing"

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
 - 1. Product List: Cross-reference to coating system and locations of application areas. Use same designations indicated on Drawings and in schedules. Include manufacturer's recommended spreading rate for each separate coat for each type of substrate indicated.
- B. Samples for Initial Selection: For each intumescent paint finish indicated.
- C. Samples for Verification: For each type of coating system and each color and gloss of intumescent paint finish indicated.
 - 1. Submit Samples steel, not less than 8 inches square.
 - 2. Step coats on Samples to show each coat required for system.
 - 3. Label each coat of each Sample.
 - 4. Label each Sample for location and application area.
- D. LEED Submittals:
 - 1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

- a. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
- b. MRc4 - Material Ingredients, Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

1.4 INFORMATIONAL SUBMITTALS

- A. Material Test Reports: For each intumescent paint.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that are from same production run (batch mix) as materials applied and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Quantity: Furnish an additional 5 percent of each color applied, but not less than of each material and color applied.

1.6 QUALITY ASSURANCE

- A. Source Limitations: Obtain each paint system from single source from single manufacturer or provide a system approved in writing by intumescent paint manufacturer.
- B. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Flame-Spread Index: 25 or less.
 - 2. Smoke-Developed Index: 450 or less.
- C. Mockups: Apply benchmark Samples of paint system indicated and of each color and finish selected to verify preliminary selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Architect will select one actual substrate of each type to represent surfaces and conditions for application of coating.
 - 2. Apply benchmark Samples after permanent lighting and other environmental services have been activated.
 - 3. Final approval of color selections will be based on benchmark Samples.
 - a. If preliminary color selections are not approved, apply benchmark Samples of additional colors selected by Architect at no added cost to Owner.
- D. Preinstallation Conference: Conduct conference at Project site.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 45 deg F.
 - 1. Maintain containers in clean condition, free of foreign materials and residue.
 - 2. Remove rags and waste from storage areas daily.

1.8 PROJECT CONDITIONS

- A. Apply waterborne intumescent paints only when temperatures of surfaces to be painted and ambient air temperatures are between 50 and 90 deg F.
- B. Allow wet surfaces to dry thoroughly and to attain temperature and conditions specified before starting or continuing coating operation.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section shall have either a Type III Product Specific EPD or the company shall be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section shall be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 018113 Sustainable Design Requirements. In addition, all paints and coatings shall be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third party certification.

2.2 INTUMESCENT PAINT MATERIALS, GENERAL

- A. Material Compatibility:
 - 1. Provide materials for use within each paint system that are compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
 - 2. For each material or coat, provide products and spreading rates recommended in writing by intumescent paint manufacturer for use on substrate indicated. Comply with requirements for fire-retardant coating classification and surface-burning characteristics indicated.
- B. Colors and Gloss: As selected by Architect from manufacturer's full range.

2.3 INTERIOR AND EXTERIOR, PIGMENTED, INTUMESCENT PAINT SYSTEM

- A. Primer: Intumescent paint manufacturer's recommended primer compatible with substrate and other materials indicated.
 - 1. Products: Provide the following, or equal:
 - a. At interior locations:
 - 1) Basis-of-Design: Contego International Inc. "Contego Original Formula Reactive Fire Barrier Intumescent (RFB)"; primer as approved by Contego.
 - b. At exterior locations:
 - 1) Basis-of-Design: Akzo Nobel "Interchar 212"; primer as approved by Akzo Nobel.
- B. Topcoat/Overcoat: Water-based, latex-type, pigmented, fire-inert, protective-finish coating that will not affect fire-retardant class of intumescent coating. Topcoat to be approved by intumescent paint manufacturer.
- C. Provide thickness of intumescent paint as required to meet fire rating shown on the Drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions, with Applicator present, for compliance with manufacturer's requirements for surface treatments, shop-primed surfaces, maximum moisture content, and other conditions affecting performance of the Work.
- B. Do not apply when relative humidity exceeds 80% or the surface to be coated is less than 50 degrees F or less than 15 degrees F above the forecasted dew point.
- C. Verify suitability of substrates, including surface conditions, and compatibility with existing finishes and primers.
- D. Begin coating application only after unsatisfactory conditions have been corrected and surfaces are dry.

3.2 PREPARATION

- A. Comply with manufacturer's written instructions applicable to substrates and coating systems indicated.
- B. Remove hardware and hardware accessories, plates, machined surfaces, light fixtures, and similar items already installed that are not to be coated. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and coating.
 - 1. After completing coating operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.

- C. Clean substrates of substances, including dirt, oil, grease, and incompatible paints and encapsulants, that could impair bond of coatings. Do not coat surfaces if surface moisture content or alkalinity exceeds that permitted in manufacturer's written instructions.
 - 1. Remove incompatible primers, and reprime substrate with compatible primers as required to produce coating systems indicated.
 - 2. Perform cleaning and coating application so dust and other contaminants from cleaning process will not fall on wet, newly coated surfaces.
 - 3. Exterior system: Properly prepare steel by commercial blast cleaning & priming on the same day.

3.3 APPLICATION

- A. General: Apply intumescent paints according to manufacturer's written instructions and to comply with requirements for fire-retardant coating classification.
 - 1. Use equipment and techniques best suited for substrate and type of material being applied.
 - 2. Coat surfaces behind movable items the same as similar exposed surfaces.
 - 3. Apply each coat separately according to manufacturer's written instructions.
 - 4. Finish doors on faces with intumescent finish. Paint tops, bottoms, and side edges with fire-inert finish.
- B. Apply coatings to prepared surfaces as soon as practical after preparation and before subsequent surface soiling or deterioration.
- C. Apply coatings to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and color breaks.
 - 1. Pigmented Finishes: If undercoats or other conditions show through pigmented topcoat/overcoat, apply additional coats until cured film has a uniform paint finish, color, and appearance.

3.4 CLEANING AND PROTECTION

- A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.
- B. After completing coating application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.
- C. Protect work of other trades against damage from coating application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Architect, and leave in an undamaged condition.
- D. At completion of construction activities, touch up and restore damaged or defaced coated surfaces.

3.5 FIELD QUALITY CONTROL

- A. Special Inspections: Owner will engage a qualified special inspector to perform the following special inspections:
 - 1. Test and inspect as required by the CBC, 1704.13.
- B. Perform the tests and inspections of completed Work in successive stages. Do not proceed with application of intumescent painting for the next area until test results for previously completed applications of intumescent painting show compliance with requirements. Tested values must equal or exceed values as specified and as indicated and required for approved fire-resistance design.
- C. Intumescent painting will be considered defective if it does not pass tests and inspections.
 - 1. Remove and replace intumescent paint that does not pass tests and inspections, and retest.
 - 2. Apply additional intumescent paint, per manufacturer's written instructions, where test results indicate insufficient thickness, and retest.
- D. Prepare test and inspection reports.

3.6 PAINT SYSTEM SCHEDULE

- A. Prime Coat: If required and approved by intumescent paint manufacturer.
- B. Fire-Retardant Intumescent Coating: Minimum one coat to comply with requirements for fire-retardant coating classification and surface-burning characteristics indicated.
- C. Topcoat/Overcoat: Apply if required or recommended and approved by intumescent paint manufacturer.

END OF SECTION

SECTION 101100
VISUAL DISPLAY SURFACES

PART 1 – GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Magnetic plastic laminate markerboards.
 - 2. Magnetic porcelain enamel markerboards.
 - 3. Cork tackboards.
 - 4. Hardware and accessories for complete installation.

- B. Related Sections: Requirements that relate to this section are included but not limited to the section below.
 - 1. Section 06 1000 “Rough Carpentry” for wood blocking and grounds.

1.2 ADMINISTRATIVE REQUIREMENTS

- A. Pre-installation Meetings:
 - 1. Pre-Installation Conferences: Contractor to conduct meetings at site with installer and all other trades involved prior to fabrication and start of Work. Familiarize installer with conditions at site and related Work.

1.3 ACTION SUBMITTALS

- A. Product Data: Manufacturer’s technical data and installation instructions.

- B. Shop Drawings: Dimensioned elevations, sections, and details.

- C. Samples:
 - 1. Board: 5 inches x 8 inches, full thickness, illustrating each color and finish.
 - 2. Sections of typical trim members and dimensioned elevations. Show anchors, grounds, reinforcement, accessories, layout, and installation details.

- D. Samples:
 - 1. Initial Selection: Furnish manufacturer’s complete color selection showing full range of colors and finish characteristics.
 - 2. Verification: Furnish materials to be used with labels indicating colors, finish characteristics, and locations of the Work. Samples will be reviewed for color and appearance only.
 - a. Board: 5 inches x 8 inches, full thickness, illustrating each color and finish.
 - b. Sections of typical trim members and dimensioned elevations. Show anchors, grounds, reinforcement, accessories, layout, and installation details.

1.4 CLOSEOUT SUBMITTALS

- A. Manufacturer's cleaning and maintenance instructions covering both routine (daily or weekly) and long-term (yearly or longer) operations.
- B. Extended warranty.

1.5 WARRANTY

- A. Porcelain-Enamel Markerboards: Furnish manufacturer's 20-year written warranty agreeing to replace boards that do not retain their original writing and erasing qualities, that become slick and shiny, or that exhibit crazing, cracking, or flaking, provided manufacturer's instructions with regard to handling, installation, protection, and maintenance have been followed.

1.6 QUALITY ASSURANCE

- A. Regulatory Requirements: Comply with all applicable requirements of the laws, codes, ordinances and regulations authorities having jurisdiction. Obtain necessary approvals from all such authorities.
- B. Qualifications:
 - 1. Contractor: Contractor is responsible for quality control of the Work.
 - 2. Manufacturer: A firm experienced in successfully producing work similar to that indicated for this Project, with a record of successful in-service performance, and with sufficient production capacity to produce required units without causing delay in the Work.
 - 3. Installer: An installer trained in the use of the materials and equipment to be employed in the Work.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Deliver and Acceptance Requirements: Deliver materials in manufacturer's original packaging with label indicating pertinent information identifying the item.
- B. Storage and Handling Requirements: Store materials in accordance with manufacturer's instructions in a protected dry location off ground. Do not open packaging nor remove labels until time of installation.

1.8 PROJECT CONDITIONS

- A. Ambient Conditions: Proceed with the Work in accordance with manufacturer's requirements and instructions and any agreements or restrictions of the Pre-Construction Conference.
- B. Project Conditions: Field measure at location of the Work prior to preparation of the shop drawings. Include measurements of adjacent construction to which the Work must fit. Coordinate construction to ensure that actual opening dimensions correspond to fabricated dimensions of the Work.
 - 1. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with fabrication of products without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to guaranteed dimensions.

PART 2 – PRODUCTS

2.1 DESCRIPTION

- A. Design Requirements:
 - 1. Provide work in compliance with specified standards, performance requirements, material selections, and requirements of this and related sections.
- B. Performance Requirements:
 - 1. Fire Performance Characteristics: Provide fabric-faced tackboards with surface burning characteristics indicated below, as determined by testing assembled materials composed of facings and backings identical to those required in this section, in accordance with ASTM E 84, by a testing organization acceptable to authorities having jurisdiction.
 - a. Flame Spread: 25 or less.
 - b. Smoke Developed: 10 or less.

2.2 MATERIALS – GENERAL

- A. Single Source Responsibility:
 - 1. Obtain materials from a single manufacturer for each different product required.
- B. Sustainable Requirements:
 - 1. Provide materials to comply with the requirements of Division 01 Section “Sustainability Requirements”.

2.3 PORCELAIN MARKER BOARDS

- A. Basis-of-Design: Refer to Finish Schedule as shown on Drawings.
 - 1. Marker tray: Full length aluminum marker tray with ends filed smooth and one set of 4 pens and eraser for each board.
 - 2. Mounting: At top and bottom edges, provide manufacturer’s recommended mounting angle clips at 24 inches on center, or at studs, and spotting adhesive behind all boards.

2.4 TACK BOARDS

- A. Basis-of-Design: Refer to Finish Schedule as shown on Drawings.
 - 1. Mounting: At top and bottom edges, provide manufacturer’s recommended mounting angle clips at 24 inches on center, or at studs, and spotting adhesive behind all boards.

2.5 PROJECTABLE BOARDS

- A. Basis-of-Design: Refer to Finish Schedule as shown on Drawings.
 - 1. Mounting: At top and bottom edges, provide manufacturer’s recommended mounting angle clips at 24 inches on center, or at studs, and spotting adhesive behind all boards.

2.6 ALUMINUM TRIM AND ACCESSORIES

- A. Aluminum Trim: Slip-on type; 6063-T5 alloy extrusions of at least 0.062 inch wall thickness.
 - 1. Finish: Clear anodized, AA designation M12C22A31.
 - 2. Provide trim in single lengths wherever possible, otherwise keep joints to a minimum.

PART 3 – EXECUTION

3.1 EXAMINATION

- A. Verification of Conditions: Examine and correct conditions of area to receive the Work prior to installation.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General: Install system in accordance with manufacturer's printed installation instructions, submittals, applicable industry standards, and governing regulatory requirements for the Work.

3.3 CLEANING

- A. At the end of each work day, remove unused materials, debris and containers from the site.
- B. Construction Waste Management:
 - 1. At the end of each work day, recycle or dispose of unused material, debris and containers in accordance with Division 01 Section "Construction Waste Management and Disposal."

3.4 PROTECTION

- A. Protect the Work so it will not deteriorate or be damaged. Remove protection at time of Substantial Completion.

END OF SECTION

SECTION 101400
SIGNAGE

PART 1 - GENERAL

1.1 SUMMARY

- A. The work included under this section consists of furnishing all products, materials, finishes, supplies, equipment, tools and transportation, and performing all labor and services necessary for, required in connection with, or properly incidental to furnishing and installing signage as described in this section of the specifications, shown on the accompanying drawings, or reasonably implied therefrom, except as hereinafter specifically excluded.\
- B. Work Summary:
 - 1. Create final production artwork and layouts for each sign face.
 - 2. Furnish materials and labor associated with fabricating and finishing all signs.
 - 3. Provide packaging and transportation of all signs to the project site.
 - 4. Furnish material and labor required for installation of signage.
 - 5. All code required signage shall be field inspected per CBC 11B-703.1.1.2
- C. Alternates
 - 1. Provide separate pricing for alternate designs shown on sheet W3.4. These alternate designs substitute for signs with the same sign type designation shown on sheets W3.1-W3.3. Quantities and locations are the same.

1.2 SUBMITTALS

- A. Color Samples: Submit three sets of 6"x6" samples of each color for approval. See design drawings for colors and materials.
- B. Product Data Sheets. Supply product data sheets for all products used in the manufacture and installation of signage.
- C. Contractor shall be responsible for the structural design of freestanding signs, internal illumination, and methods for fastening and installation.
- D. Applicable Standards and Publications: Unless otherwise specified or shown, signage shall conform to the following standards and publications:
- E. ANSI A-117.1 and the Americans with Disabilities Act (ADA).
- F. ATBCB Design Guidelines for Signage in relation to the Americans with Disabilities Act.
- G. California Building Code (CBC), 2019, Sections 11B-216 and 11B-701-703.
- H. California Grade 2 Braille shall be used whenever Braille symbols are specifically required. Refer to CBC Section 11B-703.
- I. ANSI A-117.1 and the Americans with Disabilities Act (ADA).
- J. ATBCB Design Guidelines for Signage in relation to the Americans with Disabilities Act.

- K. California Building Code (CBC), 2019, Sections 11B-216 and 11B-701-703.
- L. California Grade 2 Braille shall be used whenever Braille symbols are specifically required. Refer to CBC Section 11B-703.
- M. Contractor shall be responsible for the quality of materials and workmanship of any firm acting as the Contractor's subcontractor.
- N. Welding, where required, shall be in accordance with procedures specified in American Welding Society Standards using procedures, materials, and equipment of the type required for the work.

1.3 GUARANTEE

- A. At a minimum, the Contractor shall warrant that all work installed under this Contract is free of defect and will remain in good working order for a period of one year for all surface improvements and five years for all underground work. If warranties specified elsewhere in these documents are for a longer period of time than that specified in this section, the longer warranties shall apply.
- B. Manufacturer's Standard Product Warranties:
 - 1. Plastic Elements: Manufacturer's warranty against yellowing, cracking, crazing, or other visible and performance defects for a period of 5 years from the date of installation.
 - 2. Paint Coating: Acrylic polyurethane coating manufacturer's 5-year warranty against defects in materials.

PART 2 - CODE REQUIRED SIGNAGE

2.1 TYPES OF SIGNS

- A. Room Identification: Interior and exterior signs identifying permanent rooms and spaces shall comply with CBC Sections 11B-703.1, 11B-703.2, 11B-703.3 and 11B-703.5. Where pictograms are provided as designations of permanent rooms and spaces, the pictograms shall comply with CBC Section 11B-703.6 and shall have text descriptors complying with CBC Sections 11B-703.2 and 11B-703.5.
- B. Egress Signage: Signs for means of egress shall comply with CBC Section 11B-216.4.
- C. Directional & Informational: Signs that provide direction to or information about interior and exterior spaces and facilities of the site shall comply with CBC Section 11B-703.5.
- D. Toilet Room Signage: Signage for toilet rooms shall comply with CBC 11B-216.8.
- E. Assistive Listening Systems: Signage for assistive listening systems shall comply with CBC 11B-216.10

- 2.2 RAISED CHARACTERS: Raised characters shall comply with CBC Section 11B-703.2 and shall be duplicated in Braille complying with CBC Section 11B-703.3. Raised characters shall be installed in accordance with CBC Section 11B-703.4.
- 2.3 BRAILLE. Braille shall be contracted (Grade 2) and shall comply with CBC Sections 11B-703.3 and 11B-703.4.
- 2.4 INSTALLATION HEIGHT AND LOCATION. Signs with tactile characters shall comply with CBC Section 11B-703.4.
- 2.5 VISUAL CHARACTERS. Visual characters shall comply with CBC Section 11B-703.5.
- 2.6 PICTOGRAMS. Pictograms shall comply with CBC Section 11B-703.6.
- 2.7 SYMBOLS OF ACCESSIBILITY. Symbols of accessibility shall comply with CBC Section 11B-703.7.
- 2.8 BACKGROUNDS: All sign backgrounds to have a non-glare finish.

PART 3 - PRODUCTS

3.1 MATERIALS

- A. Acrylic Sheet. Cast methyl methacrylate monomer plastic conforming to ASTM D788, Sign Grade; "Plexiglas SQ" by Altuglas or equal, unless otherwise recommended by fabricator. Sizes and thicknesses as shown.
- B. Silicone adhesive to be Dow Corning or approved equal, clear unless otherwise specified.
- C. Adhesive tapes to be 3M or approved equal.
- D. Paint products to be low VOC Matthews Acrylic Polyurethane or approved equal in colors specified. All finishes to be non-glare. Provide primer as recommended by coating manufacturer for each type of substrate.
- E. Screen-printing enamel to be Nazdar or approved equal.
- F. Engraving substrate to be Rowmark or approved equal. www.rowmark.com
- G. Aluminum Sheet and Plate: ASTM B209, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with at least the strength and durability properties of Alloy 5005-H32.
- H. Vinyl opaque film with pressure-sensitive adhesive backing, suitable for exterior applications, to be 3M or approved equal.

- I. Sealant: As required to prevent light and water leakage. No exposed sealant shall be allowed except as indicated on the reviewed shop drawings.
- J. LED lighting components to be Bitro Group or approved equal. Light color temp to be warm white, 2,700°K to 3,000°K.

PART 4 - EXECUTION

4.1 GENERAL

- A. Form work to required shapes and sizes, with true curve lines and angles. Provide necessary flanges, lugs and brackets for assembly of units. Use concealed fasteners whenever and wherever possible.
- B. Shop fabricate so far as practicable. Joints shall be fastened flush to conceal reinforcement or welded where thickness or section permits.
- C. Contact surfaces of connected members must be assembled so joints will be tight and practically unnoticeable, with minimal use of filling compound.
- D. Signs shall have fine, even texture and be flat and sound. Lines and miters sharp, arises
- E. unbroken, profiles accurate and ornament true to pattern. Plane surfaces to be smooth flat and without oil-canning, free of rack and twist. Restore texture to filed or cut areas.
- F. Level or straighten wrought work. Members shall have sharp lines and angles and smooth surfaces.
- G. Extruded members to be free from extrusion marks. Square turns and corners sharp, curves true.
- H. Form joints exposed to weather to exclude water.
- I. Finish hollow signs with matching material on all faces, tops, bottoms and ends. Edge joints shall be tightly mitered to give appearance of solid material.
- J. All painted surfaces shall be properly primed. Finish coating of paint to have complete coverage with no light or thin applications allowing substrate or primer to show. Finished surface shall be smooth, free of scratches, gouges, drips, bubbles, thickness variations, foreign matter and other imperfections.
- K. Movable parts, including hardware, are be cleaned and adjusted to operate as designed without binding or deformation of members. Doors and covers shall be centered in openings or frames. All contact surfaces fit tight and even without forcing or warping components.
- L. All fasteners to be non-corrosive.
- M. Security head screw to be used for all fasteners. Contractor to coordinate type of security screws used with campus facilities department.

4.2 CUTTING & FINISHING

- A. All materials shall be cut with proper equipment using sharp blades. Shapes shall have square corners, straight edges and shall be sized as shown in the design drawings. Blade/cutter marks and scratches will not be accepted.
- B. Materials shall be prepared and primed according to product manufacturer's instructions before painting.
- C. Finishes shall be applied according to product manufacturer's instructions, then properly cured and protected after application.

4.3 APPLICATION OF GRAPHICS

- A. All graphics shall be cut, etched and/or printed to comply with the specified typeface and graphic shapes. Graphics and type shall be clean and crisp without deformation of characters, ticks, gaps or irregularities.
- B. Finished surfaces shall be protected from damage during application of graphics.

4.4 PACKAGING

- A. Completed signs shall be packed for shipment to the project site to protect from damage.
- B. Pre-assemble items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for re-assembly and coordinated installation.

PART 5 - INSTALLATION

5.1 GENERAL

- A. Protect products against damage during field handling and installation. Protect adjacent existing and newly placed construction, landscaping and surrounding wall and/or building finishes as necessary to prevent damage during installation. Paint and touch up any exposed fasteners and connecting hardware to match color and finish of surrounding surface.
- B. All exterior signs to be staked by contractor for owner's approval prior to sign installation or excavation.
- C. Contractor will be responsible for verifying that, at each sign location, there are no utility lines that will be affected by installation of signs. Any damage during installation of signs to utilities will be the sole responsibility of the Contractor to correct and repair.

- D. Furnish inserts and anchoring devices which must be set in concrete or other material for installation of signs. Provide setting drawings, templates, instructions and directions for installation of anchorage devices, which may involve other trades.
- E. Mount signs in proper alignment, level and plumb. When exact position, angle, height or location is in doubt, contact Designer for clarification.
- F. Remove or correct signs or installation work Owner determines as unsafe or as an unsafe condition.

5.2 CLEANING & ADJUSTING

- A. Return items that cannot be refinished in the field to the shop. Make required alterations and refinish entire unit or provide new units.
- B. Verify gaskets and flanges interface properly to provide a lightproof installation at monument sign.
- C. After installation, clean soiled sign surfaces according to manufacturer's instructions. Protect from damage until acceptance by University.
- D. At completion of sign installation, clean exposed sign surfaces. Clean and repair any adjoining surfaces and landscaping that became soiled or damaged as a result of installation of signs.

5.3 PUNCHLIST & PROJECT CLOSEOUT

- A. Sign contractor shall review all installed work with the Client or Client's representative and make all required punchlist corrections. Once complete, the sign contractor shall back-check all punchlist items and receive Client's final approval of installation.

5.4 RECORD DOCUMENTS

- A. As-Built Drawings
- B. The Contractor shall submit to the University's Representative, 10 calendar days after Final Completion, fully updated As-built Drawings and Shop Drawings for review.
- C. The As-Built Drawings and Shop Drawings shall be in PDF format. Email is acceptable.

END OF SECTION

SECTION 102113
TOILET COMPARTMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SECTION INCLUDES

- A. Solid Color Reinforced Composite (SCRC) Substrate.
 - 1. Toilet partitions.
 - 2. Urinal privacy screens.
- B. Related Requirements:
 - 1. Section 055000 - Metal Fabrications.
 - 2. Section 061000 - Rough Carpentry.
 - 3. Section 093300 - Tiling.
 - 4. Section 095123 - Acoustical Ceilings.
 - 5. Section 102813 - Toilet Accessories for toilet tissue dispensers, grab bars, purse shelves, and similar accessories mounted on toilet compartments.

1.3 SUBMITTALS

- A. Submit under provisions of Section 01 30 00 - Administrative Requirements.
- B. Product Data: Manufacturer's data sheets on each product to be used, including:
 - 1. Preparation instructions and recommendations.
 - 2. Storage and handling requirements and recommendations.
 - 3. Installation methods.
- C. USA Certificate of Origin: Manufacturer shall supply with first submittal, an example of their Certificate of Origin declaring toilet compartments are wholly manufactured and assembled specifically in the United States, including city and state locations. A notarized Certificate of Origin shall be provided with closeout documents.
- D. Shop Drawings: Submit manufacturer's shop drawings for each product specified, including the following:
 - 1. Plans, elevations, details of construction and attachment to adjacent construction.
 - 2. Show anchorage locations and accessory items.
 - 3. Verify dimensions with field measurements prior to final production of toilet compartments.
- E. Selection Samples: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns.

- F. Verification Samples: For each finish product specified, two samples, minimum size 6 inches (150 mm) square representing actual product, color, and patterns.

1.4 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Minimum 10 year experience manufacturing similar products.
- B. Installer Qualifications: Minimum 2 year experience installing similar products.
- C. Single Source Requirements: To the greatest extent possible provide products from a single manufacturer.
- D. Accessibility Requirements: Comply with requirements applicable in the jurisdiction of the project, including but not limited to ADA and ICC/ANSI A117.1 requirements as applicable.
- E. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.
 - 1. Finish areas designated by Architect.
 - 2. Do not proceed with remaining work until workmanship is approved by Architect.
 - 3. Refinish mock-up area as required to produce acceptable work.

1.5 PRE-INSTALLATION MEETINGS

- A. Convene minimum two weeks prior to starting work of this section.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver and store products in manufacturer's unopened packaging bearing the brand name and manufacturer's identification until ready for installation.
- B. Handling: Handle materials to avoid damage.

1.7 PROJECT CONDITIONS

- A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's recommended limits.

1.8 SEQUENCING

- A. Ensure that products of this section are supplied to affected trades in time to prevent interruption of construction progress.

1.9 WARRANTY

- A. **Manufacturer's Warranty:** Manufacturer's standard 25 year limited warranty for panels, doors, and stiles against breakage, corrosion, delamination, and defects in factory workmanship. Manufacturer's standard 1 year guarantee against defects in material and workmanship for stainless steel door hardware and mounting brackets.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. **Basis of Design Products:** Based on the quality and performance requirements of the project, specifications are based on the products of Bobrick Washroom Equipment, Inc. 2092G.67P Sierra Series toilet compartments. Location of manufacturing shall be the United States.
- B. Requests for substitutions will be considered in accordance with provisions of Section 016000 - Product Requirements.

2.2 SOLID COLOR REINFORCED COMPOSITE (SCRC) SUBSTRATE (Bobrick SierraSeries)

- A. **Solid Color Reinforced Composite (SCRC) Toilet Partitions: Bobrick SierraSeries.**
 - 1. **Design Type:**
 - a. **Maximum Height.**
 - 1) Door Height: 96"
 - 2) Divider Panel Height: 108"
 - 3) Floor Clearance: 1" AFF
 - 2. **Privacy Style Partitions:** No sightlines with gap-free interlocking doors and stiles routed 0.300 inches (7.6 mm) from the edge to allow for 0.175 inch (4.4 mm) overlap to prevent line-of-sight into the toilet compartment. Privacy strips fastened or adhered onto the partition material are not acceptable.
 - 3. **Mounting:**
 - a. **Floor-Mounted, overhead-braced with satin finish, extruded anodized aluminum headrails, 0.065 inch (1.65 mm) thick with anti-grip profile.**
 - 1) Stile Maximum Height: TBD by manufacturer
- B. **Solid Color Reinforced Composite (SCRC) Urinal Screens: Bobrick SierraSeries.**
 - 1. **Mounting Configuration:**
 - a. **Wall-Hung.**
 - 1) Screen Height: 48 inches (122 cm) with 12 inches (30 cm) floor clearance.

- C. Materials: Solid color reinforced composite (SCRC) material for stiles, panels, doors, and screens with Bobrick GraffitiOff coating, thermoset and integrally fused into homogenous piece; high density polyethylene (HDPE), high density polypropylene not acceptable.
1. Composition: Dyes, organic fibrous material, and polycarbonate/phenolic resins.
 2. Surface Treatment: Non-ghosting, graffiti resistant surface integrally bonded to core through a manufacturing steps requiring thermal and mechanical pressure.
 3. Edges: Same color as the surface.
 4. Color:
 - a. To be selected by the architect from Bobrick standard color offering.
 5. Acceptable SCRC Products: Or manufacturer approved equal.
 - a. Ultimate Corian System by Shower Shapes.
 - b. WilsonArt Gibraltar Material.
 - c. WilsonArt EarthStone Material.
- D. Performance Requirements:
1. Graffiti Resistance (ASTM D 6578): Passed cleanability test; 5 staining agents.
 2. Scratch Resistance (ASTM D 2197): Maximum load value exceeds 10 kilograms.
 3. Impact Resistance (ASTM D 2794): Maximum impact force exceeds 30 inch-pounds.
 4. Smoke Developed Index (ASTM E 84): Less than 450.
 5. Flame Spread Index (ASTM E 84): Less than 75.
 6. National Fire Protection Association/International Building Code Interior Wall and Ceiling Finish: Class B.
- E. Finished Thickness:
1. Stiles and Doors: 3/4 inch (19 mm).
 2. Panels and Screens: 1/2 inch (13 mm).
- F. Stiles: Floor-Anchored stiles furnished with expansion shields and threaded rods.
1. Leveling Devices: 7 gauge, 3/16 inches (5 mm) thick, corrosion-resistant, chromate-treated, double zinc-plated steel angle leveling bar bolted to stile; furnished with 3/8 inch (10 mm) diameter threaded rods, hex nuts, lock washers, flat washers, spacer sleeves, expansion anchors, and shoe retainers.
 2. Stile Shoes: One-piece, 22 gauge (0.8 mm), 18-8, Type 304 stainless steel, 4 inch (102 mm) height; tops with 90 degree return to stile. One-piece shoe capable of adapting to 3/4 inch (19 mm) or 1 inch (25 mm) stile thickness and capable of being fastened (by clip) to stiles starting at wall line.
- G. Anchors: Expansion shields and threaded rods at floor connections as applicable. Threaded rods secured to supports above ceiling as applicable. Supports above ceiling furnished and installed as Work of Section 05 50 00 - Metal Fabrications.

- H. Hardware: Chrome-plated "Zamak", aluminum, extruded plastic hardware not acceptable.
1. Compliance: Operating force of less than 5 lb (2.25 kg).
 2. Emergency Access: Hinges, door latch allow door to be lifted over keeper from outside compartment on inswing doors.
 3. Materials: 18-8, Type 304, heavy-gauge stainless steel with satin finish.
 4. Latch: At doors to accessible compartments, latch shall be of flip-over style, sliding, or which otherwise does not require user to grasp or twist.
 5. Door pull: Comply with CBC Section 11B-404.2.7 shall be placed on both sides of the door.
 6. Doorstops: Prevents inswinging doors from swinging out beyond stile; on outswing doors, doorstop prevents door from swinging in beyond stile.
 7. Fastening: Hardware secured to door and stile by through-bolted, theft-resistant, pin-in-head Torx stainless steel machine screws into factory-installed, threaded brass inserts. Fasteners secured directly into core not acceptable.
 - a. Threaded Brass Inserts: Factory-installed; withstand direct pull force exceeding 1500 lb (680 kg) per insert.
 8. Clothes Hooks: Projecting no more than 1-1/8 inch (29 mm) from face of door.
 9. Occupancy Indicator Latches: All doors to receive occupancy indicator latches. Constructed of 304 stainless steel. At wheelchair and ambulatory stalls, operable parts shall be operated with one hand and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate operable parts shall be 5 pounds (22.2 N) maximum.
 10. Locking: Door locked from inside by sliding door latch into keeper.
 11. Hinge Type:
 - a. Standard.
 - 1) Balanced, with field-adjustable cam to permit door to be fully closed or partially open when compartment is unoccupied.
 12. Mounting Brackets:
 - a. Full-Height.
 - 1) Mounting Brackets: 18 gauge (1.2 mm) stainless steel and extend full height of panel.
 - 2) Mounting Brackets: Provided at ceiling to seal off the gap between divider panel and ceiling.
 - 3) U-Channels: Secure panels to stiles.
 - 4) U-Channels: To seal off gap between divider panel and floor. Panel to slide into.
 - 5) Angle Brackets: Secure stiles-to-walls and panels to walls.
 - 6) Bobrick 1001375 flat strip bracket to be installed opposite door swing to block the gap between headrail and ceiling.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Prepare substrates including but not limited to blocking and supports in walls and ceilings at points of attachment using methods recommended by the manufacturer for achieving the best result for the substrates under the project conditions.
1. Inspect areas scheduled to receive compartments for correct dimensions, plumbness of walls, and soundness of surfaces that would affect installation of mounting brackets.
 2. Verify spacing of plumbing fixtures to assure compatibility with installation of compartments.
- B. If preparation is the responsibility of another installer, notify Architect in writing of deviations from manufacturer's recommended installation tolerances and conditions.

- C. Do not proceed with installation until substrates have been properly prepared with blocking and supports in walls and ceilings at points of attachment and deviations from manufacturer's recommended tolerances are corrected. Commencement of installation constitutes acceptance of conditions.

3.2 INSTALLATION

- A. Install products in strict compliance with manufacturer's written instructions and recommendations, including the following:
 1. Verify blocking and supports in walls and ceilings has been installed properly at points of attachment.
 2. Verify location does not interfere with door swings or use of fixtures.
 3. Use fasteners and anchors suitable for substrate and project conditions.
 4. Install units rigid, straight, plumb, and level.
 5. Conceal evidence of drilling, cutting, and fitting to room finish.
 6. Test for proper operation.

3.3 ADJUSTING, CLEANING AND PROTECTION

- A. Adjust hardware for proper operation after installation. Set hinge-cam on in-swinging doors to hold doors open when unlatched. Set hinge cam on out-swinging doors to hold unlatched doors in closed position.
- B. Touch-up, repair or replace damaged products.
- C. Clean exposed surfaces of compartments, hardware, and fittings.

END OF SECTION

SECTION 102123

GREEN SCREEN CURTAINS AND TRACK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Green screen curtains and track systems.
- B. Related Sections:
 - 1. Section 092216 "Non-Structural Metal Framing".
 - 2. Section 092900 "Gypsum Board Assemblies".
 - 3. Section 095113 "Acoustical Panel Ceilings".

1.3 QUALITY ASSURANCE

- A. Provide cubicle curtains, track, and hardware from a firm that has specialized in the fabrication and installation of such work for at least five (5) years in projects of similar size and scope.
- B. Provide cubicle curtains, track, and hardware as complete units produced by a single manufacturer, including the necessary mounting brackets, hardware, fittings, fastenings, and installation.
- C. Installation shall be performed by an authorized manufacturer's representative experienced in the installation and maintenance of such assemblies.

1.4 SUBMITTALS

- A. Manufacturer's Data: Include durability, laundry temperature limit, fade resistance, and fire-test response characteristics for each type of curtain fabric indicated.
- B. Shop drawings: Submit drawings and a schedule showing layout and cubicle configurations, sizes of curtains, number of carriers, anchorage details, and conditions requiring accessories. Indicate dimensions taken from field measurements. Include details on blocking above ceiling and in walls.
- C. Verification Samples: Submit Full-size units of each type of the following products:
 - 1. Cubicle Curtains: Submit 12-inch square swatch (memo) samples illustrating fabric color, pattern repeat, and weave for each fabric specified.
 - 2. Curtain Track: Submit sample assembly not less than 4 inches long included a full-size carrier, end cap, and pull out.
- D. Maintenance Instructions: Submit manufacturer's printed instructions for cleaning and maintenance of the products.

1.5 DELIVERY STORAGE AND HANDLING

- A. Subcontractor shall not install cubicle tracks or curtains until spaces are enclosed and weatherproof, wet work in spaces is complete and dry, work above ceiling is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for project when occupied for its intended use.
- B. Inspect materials at delivery to assure that specified products have been received and are free of damage.
- C. Field measurements: Verify dimensions by field measurements before fabrication. Schedule with construction progress to avoid delaying the Work.

1.6 WARRANTY

- A. Provide a written warranty agreeing to repair or replace fabric curtains, hardware or materials due to faulty workmanship or installation for a period of one (1) year.

PART 2 - GENERAL

2.1 PERFORMANCE REQUIREMENTS

- A. Fabrics shall withstand a maximum temperature of 160 degrees F.
- B. Curtains shall conform to NFPA 701 Fire Tests for Flame and Resistant Textiles and Films, and California Title 19 regulations.
 - 1. Identify fabrics with appropriate markings of applicable testing and inspecting agency.

2.2 MANUFACTURER

- A. Basis-of-Design Track: ModoMed, 5505 36h Street SE, Grand Rapids, MI 49512; 800-258-8871; custsvc@modomed.com, or equal (no known equal).
- B. Basis-of-Design Curtain: Angler, Gradus Group LLC; 212-594-2120; anglerlights.com, or equal (no known equal).

2.3 MATERIALS

- A. Curtains: Provide (2), 10 x 24 chromakey curtains, fasten clips to 24' horizontal dimension of curtain at 6 inches on center.
 - 1. Manufacturer/Mill: As selected by Architect
 - 2. Color: To be determined.
 - 3. Fabric Width: To be determined.
- B. Curtain Track:
 - 1. Cube Care Classic Track System.
 - a. Material: Extruded 6063 aluminum 0.06 wall thickness; satin anodized aluminum finish.

- b. Dimensions: 3/4 inches high by 1-3/8 inches wide
 - c. Length: Required for installation as shown on Drawings.
 - d. Provide straight and bent sections as indicated on drawings.
 - e. Provide factory fabricated curved track with 12-inch radius bends.
 - 1) Curve shall be 90 degrees, 2 feet by 2 feet, color: grey
 - f. Finish: Satin coat anodized aluminum.
2. Track Accessories:
- a. Splices: Aluminum Splices to join track sections and curves. (Part No. CCA14).
 - b. End Caps: Aluminum, (Part No. CCA13).
 - c. Nylon Wheel Carriers: 2.5 carriers per linear foot
 - d. Pull Out: Aluminum, provide one per each configuration (Part No. CCA12)
 - e. Optional: Provide Nickel-plated curtain tie back, 48" long chain (Part No. CCTB02.)
3. Suspended Track System: Utilizes Suspended Track Assembly in addition to Classic Track and Accessories.
- a. Provide Suspended Track assembly attached to ceiling every 48"
 - b. Classic Ceiling Bracket: Aluminum (Part No. CCST01).
 - c. Classic Extension Tubing: Aluminum, size to be determined per field conditions (Part No. CCST02-X)
 - d. Classic Socket: Aluminum, (Part No. CCST03)
 - e. Classic Wall Mount Bracket: Aluminum, (Part No. CCST04)
 - f. Support Riser: Aluminum, Cubicle Curtain Track Heavy Duty Riser.
4. Heavy Duty Tarp Clip: Provide for curtain to carrier attachment:
- a. Basis-of-Design: 610 EasyKlip Midi Tarp and Banner Clip; www.curtain-tracks.com

PART 3 - GENERAL

3.1 EXAMINATION

- A. Examine substrates, adjoining construction and conditions under which the work is to be installed. The work shall not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install all materials level and plumb, according to manufacturer's written instructions.
- B. Surface Mounted Track: Fasten surface-mounted tracks at intervals of not less than 24 inches. Fasten support at each splice and tangent point of each corner. Center fasteners in track to ensure unencumbered carrier operation. Attach track to ceiling as follows:
 - 1. Mechanically fasten to suspended ceiling grid with spacer.
 - 2. Mechanically fasten to suspended ceiling grid with screws.
- C. Suspended Track Mounting: Install track with suspended supports at intervals of not more than 84 inches. Fasten support at each splice and tangent point of each corner. Secure ends of track to wall with flanged fittings or brackets.
- D. Track Accessories: Install end caps, splices, pull outs, carriers, and other accessories as required for a secure and operational installation.

- E. Curtain Carriers: Provide curtain carriers adequate for 6-inch spacing along the full length of the curtain.
- F. Curtains: Hang curtains on each curtain track. Test for smooth operation of carriers.

3.3 PROTECTION

- A. Protect installed products until the completion of the project.
- B. Touch-up, repair, or replace damaged products before Substantial Completion.
- C. Remove debris and clean surfaces per manufacturer's instructions upon completion.

END OF SECTION

SECTION 102213
WIRE MESH PARTITIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Wire mesh partitions and gates at IT Delivery Cage.

1.3 DEFINITIONS

- A. Intermediate Crimp: Wires pass over one and under the next adjacent wire in both directions, with wires crimped before weaving and with extra crimps between the intersections.
- B. Lock Crimp: Deep crimps at points of the intersection that lock wires securely in place.

1.4 ADMINISTRATIVE REQUIREMENTS

- A. Pre-installation Meetings:
 - 1. Pre-Installation Conferences: Contractor to conduct meetings at site with installer and all other trades involved prior to fabrication and start of Work. Familiarize installer with conditions at site and related Work.

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. Shop Drawings:
 - 1. Include plans, elevations, sections, details, anchorage, and attachments to other work.
 - 2. Provide location template drawings for items supported or anchored to permanent construction
- C. Samples for Initial Selection: Furnish manufacturer's complete color selection showing full range of colors and finish characteristics for units with factory-applied color finishes.

D. Samples for Verification: Furnish materials to be used with labels indicating colors, finish characteristics, and locations of the Work. Samples will be reviewed for color and appearance only. Furnish the following.

- a. Wire Mesh: 6 inch x 6 inch sample in color selected.
- b. Frame: 6 inch length in color selected.

E. LEED Submittals:

1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

- a. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.

1.6 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer.
- B. Welding certificates.

1.7 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For wire mesh partition hardware to include in maintenance manuals.
- B. Record drawings.

1.8 QUALITY ASSURANCE

- A. Regulatory Requirements: Comply with all applicable requirements of the laws, codes, ordinances and regulations authorities having jurisdiction. Obtain necessary approvals from all such authorities.
- B. Qualifications:
 1. Contractor: Contractor is responsible for quality control of the Work.
 2. Manufacturer: A firm experienced in successfully producing work similar to that indicated for this Project, with a record of successful in-service performance, and with sufficient production capacity to produce required units without causing delay in the Work.
 3. Installer: An installer trained in the use of the materials and equipment to be employed in the Work.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Deliver wire mesh items in manufacturer's original packaging, with label identifying item, to provide protection during transit and project-site storage. Use vented plastic.
- B. Inventory wire mesh partition door hardware on receipt, and provide secure lockup for wire mesh partition door hardware delivered to Project site.
 - 1. Tag each item or package separately with identification, and include basic installation instructions with each item or package.
- C. Storage and Handling Requirements: Store materials in accordance with manufacturer's instructions in a protected dry location off ground. Do not open packaging nor remove labels until time of installation.

1.10 FIELD CONDITIONS

- A. Field Measurements: Verify actual dimensions of construction contiguous with wire mesh units by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Basis-of-Design: Cisco-Eagle Welded Wire Security Cages, or equal. Details to be determined.

2.2 MATERIALS – GENERAL

- A. Single Source Responsibility:
 - 1. Obtain materials from a single manufacturer.
 - 2. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

2.3 MATERIALS

- A. Wire Mesh Partitions:
 - 1. Thickness: 0.189 inch.
 - 2. Weight: 2.939 lbs/sq. ft.
 - 3. Maximum sheet size: 48 inches x 120 inches.
 - 4. Open area: 6 percent.
 - 5. Material: _____.
- B. GATES
 - 1. To be determined.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine floors for suitable conditions where wire mesh items will be installed.
- C. Examine walls to which wire mesh items will be attached for properly located blocking, grounds, and other solid backing for attachment of support fasteners.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Coordinate and Furnish: Anchorages, setting drawings, diagrams, templates, instructions, and directions for installation of items having integral anchors embedded in concrete or masonry construction. Coordinate delivery of such items to the project site.

3.3 WIRE MESH PARTITIONS ERECTION

- A. Anchor wire mesh partitions to floor with 3/8-inch- diameter postinstalled expansion anchors at 12 inches o.c. through anchor clips located at each post and corner. Shim anchor clips as required to achieve level and plumb installation.
 - 1. Anchors may be set with power-actuated fasteners instead of postinstalled expansion anchors if indicated on Shop Drawings.
- B. Provide seismic supports and bracing as indicated or, if not indicated, as recommended by manufacturer and as required for stability, extending and fastening members to supporting structure.

3.4 ADJUSTING AND CLEANING

- A. Remove and replace defective work, including framing that is warped, bowed, or otherwise unacceptable.

END OF SECTION

SECTION 102600

WALL AND DOOR PROTECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Corner guards.
 - 2. Wall protection panels.

1.3 ACTION SUBMITTALS

- A. Product Data: Include construction details, material descriptions, impact strength, fire-test-response characteristics, dimensions of individual components and profiles, and finishes for each impact-resistant wall protection unit.
- B. Shop Drawings: For each impact-resistant wall protection unit showing locations and extent. Include sections, details, and attachments to other work.
 - 1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Initial Selection: For each type of impact-resistant wall protection unit indicated.
 - 1. Include similar Samples of accent strips and accessories involving color selection.
- D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below. Include Samples of accent strips to verify color selected.
 - 1. Wall and Corner Guards: 12 inches long. Include examples of joinery, corners, end caps, top caps, and field splices.
- E. LEED Submittals:
 - 1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.

- b. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
- c. MRc4 - Material Ingredients, Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Material Certificates: For each impact-resistant plastic material, from manufacturer.
- C. Material Test Reports: For each impact-resistant plastic material.
- D. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For each impact-resistant wall protection unit to include in maintenance manuals.
 - 1. Include recommended methods and frequency of maintenance for maintaining optimum condition of plastic covers under anticipated traffic and use conditions. Include precautions against using cleaning materials and methods that may be detrimental to plastic finishes and performance.

1.6 MATERIALS MAINTENANCE SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Wall-Guard Covers: Full-size plastic covers of maximum length equal to 2 percent of each type, color, and texture of units installed, but no fewer than two, 8-foot- long units.
 - 2. Corner-Guard Covers: Full-size plastic covers of maximum length equal to 2 percent of each type, color, and texture of units installed, but no fewer than two, 4-foot- long units.
- B. Include mounting and accessory components. Replacement materials shall be from same production run as installed units.

1.7 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer.
- B. Source Limitations: Obtain impact-resistant wall protection units from single source from single manufacturer.

- C. Product Options: Drawings indicate size, profiles, and dimensional requirements of impact-resistant wall protection units and are based on the specific system indicated. Refer to Section 014000 "Quality Requirements."
 - 1. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.
- D. Surface-Burning Characteristics: Provide impact-resistant, plastic wall protection units with surface-burning characteristics as determined by testing identical products per ASTM E 84, NFPA 255, or UL 723 by UL or another qualified testing agency.
- E. Regulatory Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines and ICC/ANSI A117.1.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Store impact-resistant wall protection units in original undamaged packages and containers inside well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.
 - 1. Maintain room temperature within storage area at not less than 70 deg F during the period plastic materials are stored.
 - 2. Keep plastic sheet material out of direct sunlight.
 - 3. Store plastic wall protection components for a minimum of 72 hours, or until plastic material attains a minimum room temperature of 70 deg F.
 - a. Store corner-guard covers in a vertical position.
 - b. Store wall-guard covers in a horizontal position.

1.9 PROJECT CONDITIONS

- A. Environmental Limitations: Do not deliver or install impact-resistant wall protection units until building is enclosed and weatherproof, wet work is complete and dry, and HVAC system is operating and maintaining temperature at 70 deg F for not less than 72 hours before beginning installation and for the remainder of the construction period.

1.10 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of impact-resistant wall protection units that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures.
 - b. Deterioration of plastic and other materials beyond normal use.
 - 2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section shall have either a Type III Product Specific EPD or the company shall be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. Ceilings, Walls, Thermal and Acoustic Insulation: All ceilings, thermal insulation, acoustic insulation, products provided under this specification section shall be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third party certification.

2.2 MATERIALS

- A. Stainless-Steel Sheet: ASTM A240.
- B. Vinyl: Chemical and stain resistant polyvinyl chloride with impact modifiers.
- C. Adhesive: As recommended by wall protection manufacturer.

2.3 CORNER GUARDS

- A. Surface-Mounted, Stainless Steel Corner Guards:
 - 1. Basis-of-Design: Refer to Finish Schedule on Drawings.
- B. Surface-Mounted Vinyl Corner Guards:
 - 1. Basis-of-Design: Refer to Finish Schedule on Drawings.

2.4 WALL PROTECTION PANELS

- A. Stainless Steel.
 - 1. Basis-of-Design: Refer to Finish Schedule on Drawings.
- B. Engineered PETG.
 - 1. Basis-of-Design: Refer to Finish Schedule on Drawings.

2.5 FABRICATION

- A. Fabricate impact-resistant wall protection units to comply with requirements indicated for design, dimensions, and member sizes, including thicknesses of components.
- B. Assemble components in factory to greatest extent possible to minimize field assembly. Disassemble only as necessary for shipping and handling.

- C. Fabricate components with tight seams and joints with exposed edges rolled. Provide surfaces free of wrinkles, chips, dents, uneven coloration, and other imperfections. Fabricate members and fittings to produce flush, smooth, and rigid hairline joints.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and wall areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. For impact-resistant wall protection units attached with adhesive, verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Complete finishing operations, including painting, before installing impact-resistant wall protection system components.
- B. Surface preparation: Prior to installation, clean substrate to remove dirt, debris and loose particles. Perform additional preparation procedures as required by manufacturer's instructions.
- C. Protection: Take all necessary steps to prevent damage to material during installation as required in manufacturer's installation instructions.

3.3 INSTALLATION

- A. General: Install impact-resistant wall protection units level, plumb, and true to line without distortions and in strict accordance with the manufacturer's recommendations using approved adhesive. Do not use materials with chips, cracks, voids, stains, or other defects that might be visible in the finished Work.
 - 1. Adhere corner guards in accordance with manufacturer's recommendations, unless otherwise shown.
 - 2. Temperature at the time of installation must be between 65-75°F and be maintained for at least 48 hours after the installation to allow for proper adhesive set-up.
 - 3. Relative humidity shall not exceed 80%.
 - 4. Do not expose wall covering to direct sunlight during or after installation. This will cause the surface temperature to rise, which in turn will cause bubbles and delamination.
 - 5. Provide splices, mounting hardware, anchors, and other accessories required for a complete installation.
 - a. Provide anchoring devices to withstand imposed loads.

- b. Where splices occur in horizontal runs of more than 20 feet, splice aluminum retainers and plastic covers at different locations along the run, but no closer than 12 inches.
- c. Adjust end and top caps as required to ensure tight seams.

3.4 CLEANING

- A. Immediately after completion of installation, clean plastic covers and accessories using a standard, ammonia-based, household cleaning agent.
- B. Remove excess adhesive using methods and materials recommended in writing by manufacturer.
- C. Protect installed materials to prevent damage by other trades. Use materials that may be easily removed without leaving residue or permanent stains.

END OF SECTION

SECTION 102813
TOILET ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

- 1. Washroom accessories.

B. Related Sections:

- 1. Section 102113 "Toilet Compartments."

C. Coordination:

- 1. Contractor shall provide thicker partitions where recessed accessories are indicated to be installed.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include the following:

- 1. Construction details and dimensions.
- 2. Anchoring and mounting requirements, including requirements for cutouts in other work and substrate preparation.
- 3. Material and finish descriptions.
- 4. Features that will be included for Project.
- 5. Manufacturer's warranty.
- 6. Product Schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required.
- 7. Identify products using designations indicated.

B. LEED Submittals:

- 1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.

1.4 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For toilet and bath accessories to include in maintenance manuals.

1.5 QUALITY ASSURANCE

- A. Source Limitations: For products listed together in the same Part 2 articles, obtain products from single source from single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.6 COORDINATION

- A. Coordinate accessory locations with other work to prevent interference with clearances required for access by people with disabilities, and for proper installation, adjustment, operation, cleaning, and servicing of accessories.
- B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section shall have either a Type III Product Specific EPD or the company shall be listed in the industry group responsible for the Industry Wide Externally Verified EPD.

2.2 MATERIALS

- A. Stainless Steel: ASTM A 666, Type 304, 0.031-inch minimum nominal thickness unless otherwise indicated.
- B. Galvanized-Steel Mounting Devices: ASTM A 153/A 153M, hot-dip galvanized after fabrication.
- C. Fasteners: Screws, bolts, and other devices of same material as accessory unit and tamper-and-theft resistant where exposed, and of galvanized steel where concealed.

2.3 PUBLIC-USE WASHROOM ACCESSORIES

- A. Refer to Schedule on Drawings.

2.4 FABRICATION

- A. General: Fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with full-length, continuous hinges. Equip units for concealed anchorage and with corrosion-resistant backing plates.
- B. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to Owner's representative.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights indicated.
- B. Grab Bars: Install to withstand a downward load of at least 250 lbf , when tested according to ASTM F 446.

3.2 ADJUSTING AND CLEANING

- A. Adjust accessories for unencumbered, smooth operation. Replace damaged or defective items.
- B. Remove temporary labels and protective coatings.
- C. Clean and polish exposed surfaces according to manufacturer's written recommendations.

END OF SECTION

This Page Left Intentionally Blank

SECTION 104400

FIRE PROTECTION SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Fire-protection cabinets for the following:
 - a. Fire extinguisher and cabinets.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Show door hardware, cabinet type, trim style, and panel style. Include roughing-in dimensions and details showing recessed-, semirecessed-, or surface-mounting method and relationships of box and trim to surrounding construction.
 - 2. Show location of knockouts for hose valves.
- B. Shop Drawings: For fire-protection cabinets.
 - 1. Include plans, elevations, sections, details, and attachments to other work.
- C. Samples for Verification: For each type of exposed finish required, prepared on samples 6 by 6 inches square.

1.4 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For fire-protection cabinets to include in maintenance manuals.

1.5 COORDINATION

- A. Coordinate size of fire-protection cabinets to ensure that type and capacity of fire extinguishers, fire hoses, hose valves, and hose racks indicated are accommodated.
- B. Coordinate sizes and locations of fire-protection cabinets with wall depths.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Source Limitations: Obtain fire-protection cabinets, accessories, and fire extinguishers from single source from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

- A. Fire-Rated Fire-Protection Cabinets: Listed and labeled to comply with requirements in ASTM E814 for fire-resistance rating of walls where they are installed.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.3 FIRE-PROTECTION CABINET

- A. Provide rated fire extinguisher cabinets at fire rated partitions.
- B. Cabinet Type: Suitable for hose, rack, valve, and extinguisher.
- C. Manufacturers: Provide cabinet from Larsens Manufacturing, Potter Roemer, or equal.
- D. Cabinet Construction: Nonrated.
- E. Cabinet Material: Cold-rolled steel sheet.
 - 1. Shelf: Same metal and finish as cabinet.
- F. Recessed Cabinet:
 - 1. Trimless with Hidden Flange: Flange of same metal and finish as box overlaps surrounding wall finish and is concealed from view by an overlapping door.
- G. Cabinet Trim Material: Steel sheet.
- H. Door Material: Steel sheet.
- I. Door Style: Flush opaque panel, frameless, with no exposed hinges.
- J. Door Hardware: Manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.
 - 1. Provide projecting lever handle with cam-action latch.
 - 2. Concealed hinge.
- K. Accessories:

1. Mounting Bracket: Manufacturer's standard steel, designed to secure fire extinguisher to fire-protection cabinet, of sizes required for types and capacities of fire extinguishers indicated, with plated or baked-enamel finish.
2. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Coordinate type and location with Owner to match Building Standards.

L. Materials:

1. Cold-Rolled Steel: ASTM A1008/A1008M, Commercial Steel (CS), Type B.
 - a. Finish: Baked enamel, TGIC polyester powder coat, HAA polyester powder coat, epoxy powder coat, or polyester/epoxy hybrid powder coat, complying with AAMA 2603.
 - b. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - c. Color: As selected by Architect from manufacturer's full range.

2.4 FABRICATION

- A. Fire-Protection Cabinets: Provide manufacturer's standard box (tub) with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated.
 1. Weld joints and grind smooth.
 2. Miter corners and grind smooth.
 3. Provide factory-drilled mounting holes.
 4. Prepare doors and frames to receive locks.
 5. Install door locks at factory.
- B. Cabinet Doors: Fabricate doors according to manufacturer's standards, from materials indicated and coordinated with cabinet types and trim styles.
 1. Fabricate door frames with tubular stiles and rails and hollow-metal design, minimum 1/2 inch thick.
 2. Fabricate door frames of one-piece construction with edges flanged.
 3. Miter and weld perimeter door frames and grind smooth.
- C. Cabinet Trim: Fabricate cabinet trim in one piece with corners mitered, welded, and ground smooth.

2.5 GENERAL FINISH REQUIREMENTS

- A. Comply with NAAMM's AMP 500, "Metal Finishes Manual for Architectural and Metal Products," for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces of fire-protection cabinets from damage by applying a strippable, temporary protective covering before shipping.
- C. Finish fire-protection cabinets after assembly.

- D. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine roughing-in for hose valves and racks and cabinets to verify actual locations of piping connections before cabinet installation.
- B. Examine walls and partitions for suitable framing depth and blocking where recessed cabinets will be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Prepare recesses for recessed fire-protection cabinets as required by type and size of cabinet and trim style.

3.3 INSTALLATION

- A. General: Install fire-protection cabinets in locations and at mounting heights indicated or, if not indicated, at heights acceptable to authorities having jurisdiction.
- B. Fire-Protection Cabinets: Fasten cabinets to structure, square and plumb.
 - 1. Fasten mounting brackets to inside surface of fire-protection cabinets, square and plumb.
- C. Identification:
 - 1. Apply lettering at locations indicated. Coordinate with Owner to match building standards.

3.4 ADJUSTING AND CLEANING

- A. Remove temporary protective coverings and strippable films, if any, as fire-protection cabinets are installed unless otherwise indicated in manufacturer's written installation instructions.
- B. Adjust fire-protection cabinet doors to operate easily without binding. Verify that integral locking devices operate properly.
- C. On completion of fire-protection cabinet installation, clean interior and exterior surfaces as recommended by manufacturer.
- D. Touch up marred finishes, or replace fire-protection cabinets that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by fire-protection cabinet and mounting bracket manufacturers.

- E. Replace fire-protection cabinets that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

SECTION 105123

PLASTIC-LAMINATE-CLAD LOCKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Wood lockers with plastic-laminate-faced wood doors.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for lockers.
- B. Shop Drawings: For lockers. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Show details full size.
 - 2. Show locations and sizes of furring, blocking, and hanging strips, including concealed blocking and reinforcement specified in other Sections.
 - 3. Show locations and sizes of cutouts and holes for items installed in lockers.
 - 4. Show locker fillers, trim, base, sloping tops, and accessories.
 - 5. Show locker numbering sequence.
- C. LEED Submittals:
 - 1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc3 - Sourcing of Raw Materials – Forestry Stewardship Council (FSC) Certified Wood: For all wood products designated in this specification as “FSC certified,” provide vendor invoices with the vendor’s Chain-of-Custody (COC) number and identify each FSC certified product on a line-item basis. If FSC wood products are modified off-site by an architectural woodworker or millworker, the woodworker shall have an FSC COC number.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For adjusting, repairing, and replacing locker doors and latching mechanisms to include in maintenance manuals.

1.6 QUALITY ASSURANCE

- A. Manufacturer Qualifications: A qualified manufacturer that is certified for chain of custody by an FSC-accredited certification body.
- B. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
- C. Source Limitations: Obtain lockers and accessories from single source from single manufacturer.
- D. Regulatory Requirements: Where lockers are indicated to comply with accessibility requirements, comply with the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA) and Architectural Barriers Act (ABA) Accessibility Guidelines for Buildings and Facilities." and ICC/ANSI A117.1.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Do not deliver lockers until painting and similar operations that could damage lockers have been completed in installation areas. If lockers must be stored in other-than-installation areas, store only in areas where environmental conditions are same as that in final installation location and comply with requirements specified in "Project Conditions" Article.

1.8 PROJECT CONDITIONS

- A. Environmental Limitations: Do not deliver or install lockers until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature between 60 and 90 deg F and humidity conditions between 25 and 55 percent during the remainder of the construction period.
- B. Field Measurements: Verify actual dimensions of concealed framing, blocking, and reinforcements that support lockers by field measurements before fabrication.

1.9 COORDINATION

- A. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of work specified in other Sections to ensure lockers can be supported and installed as indicated.

- B. Hardware Coordination: Distribute copies of approved hardware schedule specified in Section 087100 "Door Hardware" to fabricator of lockers; coordinate Shop Drawings and fabrication with hardware requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Clothes Locker: 15 inches deep by 12 inches wide; 3 high arrangement.
 - 1. Basis-of-Design Product: Hollman Laminate Lockers or equal.
- B. Color as selected by Architect from manufacturer's standards.

2.2 MATERIALS

- A. Forest Certification: Fabricate lockers with wood produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."
- B. Composite Wood Products: Products shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- C. Thermoset Decorative Overlay for interior of lockers: Surface of thermally fused, melamine-impregnated decorative paper complying with LMA SAT-1 for application over particleboard or medium-density fiberboard.
- D. High-Pressure Decorative Laminate for Exterior of Lockers: NEMA LD 3, grades as follows:
 - 1. Horizontal Surfaces: Grade HGS.
 - 2. Postformed Surfaces: Grade HGP.
 - 3. Vertical Surfaces: Grade VGS.
- E. Adhesives: Adhesives shall not contain urea formaldehyde.
- F. Furring, Blocking, Shims, and Hanging Strips: Softwood or hardwood lumber, kiln dried to less than 15 percent moisture content.
- G. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage.
 - 1. Provide nonferrous-metal or hot-dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as indicated on Drawings.
 - 2. Provide toothed-steel or lead-expansion sleeves for drilled-in-place anchors.

2.3 LOCKER HARDWARE

- A. General: Provide manufacturer's standard locker hardware complying with the requirements in this Section.

- B. Butt Hinges: 2-3/4-inch, five-knuckle steel hinges; back mounted.
 - 1. Provide two hinges for doors 36 inches high and less.
 - 2. Provide three hinges for doors more than 36 inches high.
- C. Accessible Handle: Metal, fixed, graspable lever handle and rose trim; surface mounted.
- D. Shelf Rests: BHMA A156.9, B04013.
- E. Exposed Hardware Finishes: Unless otherwise indicated, provide finish that complies with BHMA A156.18 for BHMA finish number indicated.
 - 1. Satin Chromium Plated: BHMA 626 for brass or bronze base; BHMA 652 for steel base.

2.4 DOOR LOCKS

- A. General: Fabricate lockers to receive locking devices. Provide one locking device for each locker door unless otherwise indicated. Locks to be digital re-programmable.

2.5 LOCKER ACCESSORIES

- A. Hooks: Manufacturer's standard, ball-pointed aluminum or steel; finished to match other locker hardware. Attach hooks with at least two fasteners.
 - 1. Provide one double-prong ceiling hook and two single-prong wall hooks for each bottom compartment of top-modified lockers.
- B. Number Plates: 1-1/2-inch-diameter, etched, embossed, or stamped, aluminum plates with black numbers and letters at least 1/2 inch high. Identify lockers in sequence indicated on Drawings.

2.6 FABRICATION

- A. Fabricate each locker with shelves, an individual door and frame, an individual top, a bottom, and a back, and with common intermediate uprights separating compartments.
 - 1. Fabricate lockers to dimensions, profiles, and details indicated.
 - 2. Ease edges of corners of solid wood members to 1/16-inch radius.
- B. Fabricate components square, rigid, without warp, and with finished faces flat and free of scratches and chips. Accurately machine components for attachments in factory. Make joints tight and true.
 - 1. Fabricate lockers using manufacturer's standard construction with joints made with dowels, dados, or rabbets. Dado side panels to receive shelving except where indicated to be adjustable.
 - 2. Fabricate lockers with joints that are dadoed or rabbeted, glued full length, and stapled. Dado side panels to receive shelving except where indicated to be adjustable.
 - 3. Join drawer subfronts, backs, and sides with manufacturer's standard glued joints.
- C. Accessible Lockers: Fabricate as follows:
 - 1. Locate bottom shelf no lower than 15 inches above the floor.

2. Where hooks, coat rods, or additional shelves are provided, locate no higher than 48 inches above the floor.
- D. Complete fabrication, including assembly, finishing, and hardware application, to maximum extent possible, before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.
1. Trial fit assemblies at fabrication shop that cannot be shipped completely assembled. Install dowels, screws, bolted connectors, and other fastening devices that can be removed after trial fitting. Verify that various parts fit as intended and check measurements of assemblies against field measurements indicated on Shop Drawings before disassembling for shipment.
- E. Shop cut openings, to maximum extent possible, to receive hardware, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.
- F. Attach PVC edging to panels by thermally fusing edging to panels after panel fabrication.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine walls, floors, and support bases, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting locker installation.
- B. Verify that furring is attached to concrete and masonry walls that are to receive lockers.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Condition lockers to average prevailing humidity conditions in installation areas before installation.
- B. Before installing lockers, examine factory-fabricated work for completeness and complete work as required, including removal of packing.

3.3 INSTALLATION

- A. Assemble knocked-down lockers with manufacturer's standard fasteners, with no exposed fasteners on face frames.
- B. Install lockers level, plumb, and true; use concealed shims.
- C. Connect groups of lockers together with manufacturer's standard fasteners, through predrilled holes, with no exposed fasteners on face frames. Fit lockers accurately together to form flush, tight, hairline joints.

- D. Install lockers without distortion so doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings, providing unencumbered operation. Complete installation of hardware and accessory items as indicated.
 - 1. Installation Tolerance: No more than 1/8 inch in 96-inch sag, bow, or other variation from a straight line. Shim as required with concealed shims.
 - 2. Scribe and cut corner and filler panels to fit adjoining work using fasteners concealed where practical. Repair damaged finish at cuts.
- E. Attach sloping-top units to lockers, with end panels covering exposed ends.
- F. Install number plates after lockers are in place.
 - 1. Attach number plate on each locker door, near top, centered, with at least two screws with finish matching number plate.

3.4 ADJUSTING, CLEANING, AND PROTECTING

- A. Clean, lubricate, and adjust hardware. Adjust doors to operate easily without binding.
- B. Protect lockers from damage, abuse, dust, dirt, stain, or paint. Do not permit use during construction.
- C. Touch up marred finishes, or replace lockers that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by locker manufacturer.

END OF SECTION

SECTION 105613
METAL STORAGE SHELVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Four-post metal storage shelving.

1.3 PERFORMANCE REQUIREMENTS

- A. Structural Performance for Four-Post Metal Storage Shelving: Capable of withstanding the loads indicated according to MH 28.1.
- B. Seismic Performance: Metal storage shelving shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1. Seismic Component Importance Factor: Refer to Structural Drawings.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, construction details, material descriptions, dimensions of individual components and profiles, and finishes for metal storage shelving.
- B. Shop Drawings: For customized metal storage shelving. Include plans, elevations, sections, details, and attachments to other work. Include installation details of connectors, lateral bracing, and special bracing.
- C. Samples for Verification: For the following components, of size indicated below:
 - 1. Vertical Posts: 12 inches tall.
 - 2. Shelves: Full size, but not more than 24 inches wide by 12 inches deep.
 - 3. Connectors for Shelf to Post: Full size.
 - 4. Shelf-Label Holders: Full size.
- D. Product Schedule: For metal storage shelving. Use same designations indicated on Drawings.

1.5 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified professional engineer.
- B. Seismic Qualification Certificates: For metal storage shelving, accessories, and components, from manufacturer.
- C. Product Certificates: For each type of metal storage shelving from manufacturer.

1.6 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For metal storage shelving to include in maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials from same production run that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Shelves: Full-size units equal to 5 percent of amount installed for each type indicated, but no fewer than five shelves.

1.8 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
- B. Source Limitations: Obtain metal storage shelving from single source from single manufacturer.
- C. Preinstallation Conference: Conduct conference at Project site.

1.9 PROJECT CONDITIONS

- A. Environmental Limitations: Do not deliver or install metal storage shelving until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.10 COORDINATION

- A. Coordinate sizes and locations of blocking and backing required for installation of metal storage shelving attached to wall and ceiling assemblies.
- B. Coordinate locations and installation of metal storage shelving that may interfere with ceiling systems including lighting, HVAC, speakers, sprinklers, access panels, electrical switches or outlets, and floor drains.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.
- B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B.
- C. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with G60 (Z180) zinc (galvanized) or A60 (ZF180) zinc-iron-alloy (galvannealed) coating.
- D. Floor Anchors: Galvanized-steel, post-installed expansion anchors, power-actuated fasteners or threaded concrete screws. Provide number per unit recommended by manufacturer unless additional anchors are indicated in calculations.
- E. Wall Anchors: Manufacturer's standard, galvanized-steel anchors designed to secure metal storage shelving to adjacent wall. Provide one per shelving unit for each shelving unit adjacent to a wall unless additional anchors are indicated in calculations.

2.2 FOUR-POST METAL STORAGE SHELVING

- A. Open Four-Post Metal Storage Shelving: Factory-formed, field-assembled, freestanding system, designed for shelves to span between and be supported by corner posts, with shelves adjustable over the height of shelving unit. Fabricate initial shelving unit with a post at each corner. Fabricate additional shelving units similarly, so each unit is independent. Provide fixed top and bottom shelves, adjustable intermediate shelves, and accessories indicated.
 - 1. Basis-of-Design Product: Subject to compliance with requirements, provide bulk storage racks, or comparable product, by:
 - a. Global Industrial or equal.
 - 2. Load-Carrying Capacity per Shelf: _____ lb.
 - 3. Posts: Fabricated from hot-rolled steel; in manufacturer's standard shape; with perforations at 2 inches o.c. to receive shelf-to-post connectors.
 - a. Steel Thickness, Nominal: 18 gauge unless otherwise indicated on Drawings.
 - b. Post Base: Adjustable steel floor plate, drilled for floor anchors.
 - c. Post Cap: Nylon or plastic.
 - 4. Bracing: Manufacturer's standard, single diagonal cross bracing at ends; as required for stability, load-carrying capacity of shelves, and number of shelves.
 - 5. Shelf Quantity: Three shelves per shelving unit in addition to top and bottom shelf.
 - 6. Shelf-to-Post Connectors: Manufacturer's standard boltless connectors.
 - 7. Base: Open, with exposed post legs
 - 8. Overall Unit Width: 48 inches.
 - 9. Overall Unit Depth: 24 inches.
 - 10. Overall Unit Height: 72 inches.
 - 11. Finish: Baked enamel.
 - a. Color and Gloss: As selected by Architect from manufacturer's full range.

2.3 FABRICATION

- A. Shop Fabrication: Prefabricate shelving components in shop to greatest extent possible to minimize field fabrication; temporarily preassemble shelving components where necessary to ensure that field-assembled components fit together properly. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- B. Fabricate metal storage shelving square and rigid, with posts plumb and true and shelves flat and free of dents or distortion. Fabricate connections to form a rigid structure, free of buckling and warping.
 - 1. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges.
 - 2. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Locate joints where least conspicuous.
 - 3. Build in straps, plates, brackets, and other reinforcements as needed to support shelf loading.
 - 4. Cut, reinforce, drill, and tap metal fabrications to receive hardware, fasteners, and similar items.
- C. Form metal in maximum lengths to minimize joints. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.
- D. Form edges and corners free of sharp edges or rough areas. Fold back and crimp exposed edges of unsupported sheet metal to form a 1/2-inch- wide hem on the concealed side; ease edges of metal plate to radius of approximately 1/32 inch. Shear and punch metals cleanly and accurately. Remove burrs.
- E. Weld corners and seams continuously to develop strength, minimize distortion, and maintain the corrosion resistance of base metals. At exposed locations, finish welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface. Weld before finishing components to greatest extent possible. Remove weld spatter and welding oxides from exposed surfaces before finishing.

2.4 GENERAL FINISH REQUIREMENTS

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.5 STEEL FINISHES

- A. Surface Preparation: Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning" or SSPC-SP 8, "Pickling."
- B. Baked-Enamel or Powder-Coat Finish: Manufacturer's standard baked-on finish consisting of prime coat and thermosetting topcoat. Comply with coating manufacturer's written instructions for cleaning, pretreatment, application, and minimum dry thickness.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine floors for suitable conditions where metal storage shelving will be installed.
- C. Examine walls and ceilings to which metal storage shelving will be attached for properly located blocking, grounds, or other solid backing for attachment of support fasteners.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Vacuum finished floor and wet mop resilient flooring over which metal storage shelving is to be installed.

3.3 INSTALLATION

- A. Install metal storage shelving level, plumb, square, rigid, true, and with shelves flat and free of dents or distortion. Make connections to form a rigid structure, free of buckling and warping.
 - 1. Install exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible.
 - 2. Install braces, straps, plates, brackets, and other reinforcements as needed to support shelf loading and as required for stability.
 - 3. Adjust post-base bolt leveler to achieve level and plumb installation.
 - 4. Anchor shelving units to floor with floor anchors through floor plate. Shim floor plate to achieve level and plumb installation.
 - 5. Install seismic restraints.
 - 6. Connect side-to-side and back-to-back shelving units together.
 - 7. Install shelves in each shelving unit at spacing indicated on Drawings or, if not indicated, at equal spacing.
 - a. Four-Post Metal Storage Shelving: Install four clips, one at each post, for support of each shelf; with clips fully engaged in post perforations.

3.4 ERECTION TOLERANCES

- A. Erect four-post metal storage shelving to a maximum tolerance from vertical of 1/2 inch in up to 10 feet of height, not exceeding 1 inch for heights taller than 10 feet.

3.5 ADJUSTING

- A. Adjust metal storage shelving so that connectors and other components engage accurately and securely.

- B. Adjust and lubricate operable components to operate smoothly and easily, without binding or warping. Check and readjust operating hardware.
- C. Touch up marred finishes or replace metal storage shelving that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by metal storage shelving manufacturer.
- D. Replace metal storage shelving that has been damaged or has deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

SECTION 108113

BIRD CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SECTION INCLUDES

- A. Bird control devices of the following type(s):
 - 1. Bird wire.

1.3 SUBMITTALS

- A. Product Data: Include details of dimensions, profiles, and finishes.
- B. Shop Drawings: Provide details of connection of control devices to storefront system and flashings where required by Drawings.
- C. Samples: Submit 12-inch long sample of bird control material.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Provide storage to keep shipping boxes dry, clean and undamaged. Do not stack or place other packaging on the shipping boxes.
- B. Keep product in original packaging until time of installation.

1.5 PROJECT CONDITIONS

- A. Field Measurements: Verify installation surfaces by field measurements before fabrication and indicate measurements on Shop Drawings.
 - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish surface dimensions and proceed with fabricating bird control devices without field measurements. Coordinate construction to ensure that actual surface dimensions correspond to established dimensions.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. BirdMaster Bird Control Systems.
 - 2. Bird Barrier America, Inc.
 - 3. Bird B Gone.

4. Nixalite of America, Inc.

2.2 MATERIALS

- A. Wires: 316 stainless steel, 0.041-inch (1mm) diameter, full-hard spring temper, 250,000 lbs. / in. (44,645 kg/cm) tensile strength.
- B. Base Strip: 316 stainless steel, 0.25-inch wide x 0.02-inch-thick (6.3mm x 0.5mm), fully annealed.

2.3 COMPONENTS

- A. Bird Control at Ledge of new Café Window: Bird B Gone
 - 1. Product: Bird Wire 2000 Stainless Steel Post and Wire system, or approved equal.

2.4 ACCESSORIES

- A. Anchorage Devices: Stainless steel mounting clips, anchors, nails and hardware recommended by manufacturer for type of substrate to receive bird control units.
- B. Finish: Natural stainless steel finish.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify surfaces are ready for installation. Do not proceed until unsatisfactory conditions have been corrected.
- B. Clean installation surfaces thoroughly. Remove all bird droppings and related refuse. Surface must be clean and dry before installation.
- C. Verify all surface finishing is complete before installation of bird control devices. Do not apply any surface finishes to installed control devices or mounting hardware.
- D. Remove or relocate all plants or foliage that overhang installation surfaces.

3.2 INSTALLATION

- A. Install bird control devices in accordance with manufacturer's written installation instructions.
- B. Install number of rows as shown on Drawings.
- C. Gaps in the bird control coverage are not permitted.
- D. Fasten bird control devices to the surface with mounting hardware recommended by the manufacturer. Follow hardware spacing guidelines and installation procedures supplied by manufacturer.
- E. Inspect finished installation and make adjustments as required to conform to manufacturer's recommendations.

END OF SECTION

SECTION 108211

PRE-ENGINEERED SECURITY GATES AND SCREENS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Coiled wire grilles and screens
- B. Related Sections:
 - 1. Section 055000 - Metal Fabrications.
 - 2. Section 061000 - Rough Carpentry.

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Coordination: Coordinate field measurements and fabrication schedule with progress of construction to avoid construction delays.
- B. Preinstallation Meetings: Conduct meetings including Contractor, Architect, fabricator, installer and other subcontractors whose work involves coiled wire fabric to confirm project requirements, framing and support conditions, mounting surfaces and manufacturer's installation requirements.
- C. Sequencing: Ensure that utility connections are achieved in an orderly and expeditious manner.

1.4 SUBMITTALS

- A. See Section 013000 - Administrative Requirements, for submittal procedures.
- B. Product Data: Submit manufacturer's data sheets on each product used, including preparation instructions, storage and handling requirements, and installation methods.
- C. Shop Drawings: Submit detailed shop drawings for fabrication and installation, including plans and elevations, detailed sections, materials, finishes, fittings, hardware, anchorages, fastening details, and manufacturer's technical and descriptive data.
 - 1. Provide setting diagrams and templates for anchorages and hardware being installed by others.
 - 2. Indicate distinction between factory-assembled and field-assembled work on shop drawings.
 - 3. Materials or fabrications that are indicated to comply with design loadings, include material and safety factor properties, and other information necessary for structural analysis.

- D. Samples: Submit samples for color verification of each specified finish, at least 6 inch long.
- E. Certificates: Submit certificates signed by manufacturers of coiled wire products certifying that products furnished comply with requirements.
- F. Delegated Design Submittals: Submit comprehensive structural analysis of overall design for specified loads prepared by qualified professional engineer.
- G. Designer's Qualification Statement.
- H. Manufacturer's Qualification Statement.
- I. Installer's Qualification Statement.
- J. Warranty Documentation: Submit manufacturer warranty and ensure that forms have been completed in Owner's name and registered with manufacturer.
- K. Submit "Final Installation Contractor Checklist" to ensure warranty requirements have been met; see CCD website for copy of checklist.

1.5 QUALITY ASSURANCE

- A. Designer Qualifications: Perform structural design under direct supervision of a Professional Engineer; Professional Structural Engineer experienced in design of this type of work and licensed in the State in which the Project is located.
- B. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section, with not less than ten years experience.
- C. Installer Qualifications: Company specializing in performing work of the type specified and with at least five years experience.

1.6 MOCK-UPS

- A. See Section 01 4000 - Quality Requirements for additional requirements.
- B. Provide mock-up of coiled wire fabric system (if required) for evaluation of desired appearance, performance, application and workmanship; size of mock-up not to exceed 50 sq. ft.
 1. Locate where directed by Architect; as indicated on drawings.
 2. Mock-up may; or may not remain as part of the Work.
 3. Do not proceed with remaining work until mock-up is approved by Architect.
 4. Modify mock-up as required to produce acceptable work.
 5. Retain mock-up during construction as quality standard.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to project site in manufacturer's original, unopened packaging, with labels clearly identifying manufacturer and material.
- B. Exercise care not to scratch, mark, dent, or bend metal components during delivery, storage, and installation.

- C. Store materials indoors, protected from moisture, humidity, and extreme temperature fluctuations until ready for installation.

1.8 FIELD CONDITIONS

- A. Verify dimensions of actual openings by field measurements before fabrication; provide recorded measurements on shop drawings.

1.9 WARRANTY

- A. See Section 017800 - Closeout Submittals, for additional warranty requirements.
- B. Correct defective work within a one year period after Date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Guardian Grade Coiled Wire Grilles and Screens Manufacturers:
 1. Cascade Coil Drapery, Inc, dba Cascade Architectural: PO Box 3707, 19505 SW 90th Court, Tualatin, OR 97062; (800) 999-2645; info@cascadecoil.com; www.cascade-architectural.com.

2.2 GUARDIAN GRADE COILED WIRE GRILLES AND SCREENS SYSTEMS

- A. Provide guardian grade coiled wire grilles and screens system with attachment method, materials, weaves, and finish as indicated; manufacturer and contractor to engineer and fabricate components and assemblies as required for installation in accordance with manufacturer's Custom Architectural System.
 1. Attachment Method: Motorized custom curved track system with threaded rod brackets. Motor platform to be suspended above the track in the ceiling.
 2. Fabricoil Guardian Grade Coiled Wire Fabric Weaves:
 3. Aluminum: 5/16-inch thick, 14 gage wire.
 4. Factory Finishes: Powder Coated – Color TBD, powder coatings tested in accordance with [ASTM D3451](#).
 5. Fullness: 3 percent.

2.3 PERFORMANCE REQUIREMENTS

- A. Structural Requirements: Guardian grade coiled wire fabric systems capable of withstanding applied loads and stresses within designated limits and under conditions as indicated on drawings.
 1. Provide coiled wire fabric and attachment system components in accordance with applicable building code to withstand dead and live loads.
 2. Provide coiled wire fabric systems capable of accommodating expansion and contraction of metal components without causing undue stress, buckling, opening of joints, and distortion.

3. Provide structural framing and hardware of coiled wire fabric systems capable of withstanding loads and maintain deflection limitations in accordance with applicable building codes when systems are fully installed.

2.4 COMPONENTS

- A. Wire Attachment: Stainless steel, Type 304; Stainless steel, Type 316; Copper clad steel.
- B. Pipes: Hot-dipped galvanized steel; Stainless steel, Type 304; Stainless steel, Type 316.
- C. Tubes: Hot-dipped galvanized steel; Stainless steel, Type 304; Stainless steel, Type 316.
- D. Plates: Hot-dipped galvanized steel; Stainless steel, Type 304; Stainless steel, Type 316.
- E. Angles: Hot-dipped galvanized steel; Stainless steel, Type 304; Stainless steel, Type 316.
- F. Wire Ropes: Stainless steel, Type 304; Type 316; or Type.
- G. Wire Rope Swages: Stainless steel, Type 304; Type 316; or Type.
- H. Adjustable Mid-Span Tube Couplers: Stainless steel, Type 304; Type 316.
- I. Rings: Stainless steel, Type 304; Type 316.
- J. Fasteners: Nuts, bolts, washers, and machine screws; stainless steel, Type 304; Type 316.
- K. Stainless Steel: Comply with ASTM A666.
- L. Galvanized Steel Sheet: Hot-dipped galvanized steel sheet, ASTM A653/A653M, Structural Steel (SS) or Forming Steel (FS); Structural Steel (SS); Forming Steel (FS, with G60/Z180; G90/Z275; G115/Z350 coating; continuous coil-coated on exposed surfaces with specified finish coating, and manufacturer's standard panel back coating.
- M. Aluminum Coated Steel Sheet: Aluminum-zinc alloy-coated steel sheet, ASTM A792/A792M, Commercial Steel (CS) or Forming Steel (FS); Commercial Steel (CS); Forming Steel (FS); with AZ50/AZM150; AZ55/AZM165; AZ60/AZM180 coating; continuous coil-coated on exposed surfaces with specified finish coating, and manufacturer's standard panel back coating.
- N. Steel Plate Base: Factory-welded, ASTM A1003/A1003M.

2.5 FABRICATION

- A. Tolerances: Verify field dimensions prior to start of shop fabrication.
- B. Fabricate steel and stainless steel components in accordance with manufacturer's requirements and the following:
 1. Comply with requirements indicated for metal materials, thickness, design, and details of construction; fabricate metal accurately and without any burrs.
 2. Provide welded connections in compliance with American Welding Society (AWS) standards for recommended practice in shop welding.
 3. Provide welds located behind finished surfaces that are without distortion or discoloration of exposed side.

4. Provide components that are accurately cut, drilled and/or tapped to receive coiled wire fabric, hardware, fasteners, and accessories.
- C. Shop fabricate components in accordance with requirements indicated on drawings and specified performance requirements.
- D. Shop fabricate hardware, interconnected parts, and assemblies to eliminate necessity for any field cutting adjustments.
- E. Coordinate system requirements, dimensions and spacing of attachment components to ensure required factory drilled holes in supporting framework are properly located.
- F. Provide exposed joints that are butt, flush, and hairline.
- G. Fabricate exterior connections that will be exposed to weather in a manner that prevents water from entering interior portions of structure, in accordance with Architect.
- H. Upon completion of fabrication, clean and prepare applicable coiled wire fabric system in accordance with ASTM A380/A380M.

2.6 ACCESSORIES

- A. Fasteners: Comply with ASTM F593 for stainless steel or ASTM A307 for carbon steel, sizes to suit installation conditions.
- B. Anchors and Inserts: Corrosion resistant; type, size, and material required for loading and installation as indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Prior to start of installation, verify that existing conditions are acceptable for installation of coiled wire fabric and attachment systems in accordance with manufacturer's installation instructions.
- B. Coordinate with setting diagrams, plans, templates, and drawings to ensure that proper installation of necessary anchors and supporting devices has been completed.
- C. Ensure that supporting system for coiled wire fabric has been properly prepared for attachment of framework, hardware, anchors, wire rope, and transfer of calculated loading.
- D. Where existing conditions are responsibility of another installer, notify Architect of unsatisfactory conditions prior to proceeding.
- E. Coordinate with appropriate entity to correct any unsatisfactory conditions.
- F. Start of this work indicates acceptance of areas and conditions as satisfactory by installer.

3.2 PREPARATION

- A. Verify inventory of system components to ensure required components are available for installation; inspect components for damage and replace damaged components as necessary.
- B. Verify that alignment, support dimensions, and tolerances are correct.
- C. Verify that necessary structural framing is installed prior to mounting coiled wire fabric attachment system components.
- D. Verify that support framing and other surfaces to receive coiled wire fabric and attachment systems are clean and free of obstructions.

3.3 INSTALLATION

- A. Install in accordance with manufacturer's written installation instructions.
- B. Attach coiled wire fabric to structural framing using applicable hardware provided by manufacturer as indicated on approved shop drawings.
- C. Provide necessary anchorage devices and fittings to securely fasten to on-site construction; including additional knife plates, embeds, framework, blocking, threaded rods, and anchors.
- D. Provide for separation of dissimilar materials using bushings, grommets, or washers to prevent electrolytic corrosion.
- E. Upon completion of final adjustments, provide tamper-resistant lock-tight material at mechanical fittings.
- F. Provide for tension in coiled wire fabric as indicated on drawings, or as necessary to remove slack.
- G. Coiled Wire Fabric Attachment System:
 - 1. Install coiled wire fabric attachment system components in accordance with approved shop drawings.
 - 2. Install attachment system assemblies based on manufacturer's dimensions.
 - 3. Install joints that accommodate for expansion and contraction of metal components without causing undue stress, buckling, joint fatigue and/or distortion.
 - 4. Install structural blocking at wall locations used for mounting of attachment system.
 - 5. Install coiled fabric mounting hardware onto attachment systems as indicated on approved shop drawings for specified attachment system; attach with approved fasteners and techniques to ensure that framing members are horizontal and parallel to grade or slab, and straight to within 1/16 inch in 4 feet.
 - 6. Install attachment system plumb, level, square, and rigid without having any kinks or sags in coiled wire fabric.
- H. Coiled Wire Fabric:
 - 1. Install coiled wire fabric in accordance with approved shop drawings.
 - 2. Install coiled wire fabric based on manufacturer's dimensions.
 - 3. Install joints that accommodate for expansion and contraction of metal components without causing undue stress, buckling, joint fatigue and/or distortion.
 - 4. Install coiled wire fabric mounting hardware onto coiled wire fabric as indicated on approved shop drawings for specified attachment system; attach with approved fasteners

and techniques to ensure that sections are horizontal and parallel to grade or slab, and straight to within 1/16 inch in 4 feet.

5. Install coiled wire fabric infill with attachment system plumb, level, square, and rigid without having any kinks or sags.

3.4 CLEANING

- A. Remove temporary protective coverings of adjacent work areas, and clean installed materials prior to Date of Substantial Completion.
- B. In heavy traffic areas, establish cleaning program to pressure wash or hand-wash coiled wire fabric and attachment system on a monthly basis prior to Date of Substantial Completion.
- C. Clean coiled wire fabric system components with mild detergent and water applied with wet wrap and wiped with clean dry rag; abrasive cleaners are not permitted.
- D. Remove from project site and legally dispose of construction debris associated with this work.
- E. See Section 017419 - Construction Waste Management and Disposal, for additional requirements.

3.5 PROTECTION

- A. Provide protection of installed coiled wire grilles and screens and finished surfaces to ensure they are without damage until Date of Substantial Completion.
- B. Touch-up, repair or replace damaged products before Date of Substantial Completion.
- C. Replace defective or damaged components as directed by Architect.

END OF SECTION

SECTION 113100

PANTRY APPLIANCES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Contractor furnished and installed residential grade appliances.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated, include rated capacities, operating characteristics, dimensions, furnished accessories, finishes for each appliance, and manufacturer's catalog cuts of equipment with model numbers and optional accessories to be provided clearly marked.
- B. Samples: For each exposed product and for each color and texture specified, in manufacturer's standard size.
- C. Product Schedule: Use same designations indicated on Drawings.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Product Certificates: For each type of appliance, from manufacturer.
- C. Field quality-control reports.
- D. Warranties: Sample of special warranties.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For each residential appliance to include in operation and maintenance manuals.

- B. Service agreement.
- C. Warranty certificates, including manufacturer's operating and maintenance instructions.

1.6 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer for installation and maintenance of units required for this Project.
- B. Regulatory Requirements: Comply with the following:
 - 1. NFPA: Provide electrical appliances listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - 2. ANSI: Provide gas-burning appliances that comply with ANSI Z21 Series standards.
- C. Accessibility: Where residential appliances are indicated to comply with accessibility requirements, comply with the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines and ICC/ANSI A117.1 Insert requirement.

1.7 WARRANTY

- A. Special Warranties: Manufacturer's standard form in which manufacturer agrees to repair or replace residential appliances or components that fail in materials or workmanship within standard warranty period.

PART 2 - PRODUCTS

2.1 APPLIANCES

- A. General:
 - 1. Where model numbers scheduled are not current, provide equal features on a current model as acceptable to City.
 - 2. The color of all appliances will be stainless steel, except as otherwise noted.
 - 3. Appliances shall be Energy Star Rated, where applicable. Refer to Schedule found on the Drawings.
- B. Basis-of-Design: To be Determined.

2.2 GENERAL FINISH REQUIREMENTS

- A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances, power connections, and other conditions affecting installation and performance of residential appliances.
- B. Examine roughing-in for piping systems to verify actual locations of piping connections before appliance installation.
- C. Examine walls, ceilings, and roofs for suitable conditions where microwave ovens with vented exhaust fans will be installed.
- D. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

- A. General: Comply with manufacturer's written instructions.
- B. Built-in Equipment: Securely anchor units to supporting cabinets or countertops with concealed fasteners. Verify that clearances are adequate for proper functioning and that rough openings are completely concealed.
- C. Freestanding Equipment: Place units in final locations after finishes have been completed in each area. Verify that clearances are adequate to properly operate equipment.
- D. Utilities: Comply with plumbing and electrical requirements.

3.3 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
 - 1. Perform visual, mechanical, and electrical inspection and testing for each appliance according to manufacturers' written recommendations. Certify compliance with each manufacturer's appliance-performance parameters.
 - 2. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
 - 3. Operational Test: After installation, start units to confirm proper operation.
 - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and components.

- C. An appliance will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain residential appliances.

END OF SECTION

SECTION 115123
LIBRARY STACK SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
1. Library shelving.
 2. Accessories.
- B. Related Sections:
1. Section 066116 "Solid Surfacing Fabrications" for end panels of Library Stack Systems.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for library stack systems and accessories.
- B. Shop Drawings:
1. Include plans, elevations, sections, and details.
 2. Show clear-aisle widths from face of units.
 3. Show location to column grids from center of shelving units.
 4. Detail fabrication and installation of library stack systems including methods of anchoring to building structure at locations recommended by manufacturer and as required for seismic restraint.
- C. Samples for Verification: For the following products, one of each, in manufacturer's standard sizes:
1. Flat shelving.
 2. Each type of specialized shelving.
 3. End panels.
 4. Top panels.

D. LEED Submittals:

1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - b. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.

- 1.4 MRc4 - Material Ingredients, Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

INFORMATIONAL SUBMITTALS

 - A. Qualification Data: For Installer.
 - B. Sample Warranty: For manufacturer's special warranty.

- 1.5 CLOSEOUT SUBMITTALS
 - A. Maintenance Data: For library stack systems to include in maintenance manuals.

- 1.6 MAINTENANCE MATERIAL SUBMITTALS
 - A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Shelf Units: Five percent of quantity installed for each size and type indicated, but no fewer than 10 units.

- 1.7 QUALITY ASSURANCE
 - A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

- 1.8 WARRANTY
 - A. Special Warranty: Manufacturer agrees to repair or replace components of library stack systems that fail in materials or workmanship within specified warranty period.
 1. Failures include, but are not limited to, the following:
 - a. Deterioration of metals, metal finishes, and other materials beyond normal wear.
 2. Warranty Period: [Five] <Insert number> years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section shall have either a Type III Product Specific EPD or the company shall be listed in the industry group responsible for the Industry Wide Externally Verified EPD.

2.2 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Library stack systems shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

2.3 SHELVING

- A. Mobile Shelving:
 - 1. Basis-of-Design: MJ Industries "Concealed Canaster Mobile Shelving" or the following equal alternates:
 - a. MJ Industries "Concealed Canaster Mobile Shelving".
 - b. Ross McDonald Co.
 - c. Or equal.
- B. Cantilever Shelving: Shelving designed for library use and consisting of full end, top, and back panels, with end panels made to receive adjustable shelves in slots or to receive clips to support adjustable shelves.
 - 1. Basis-of-Design: Estey Designer Series by Tennsco or the following equal alternates:
 - a. Or equal.

2.4 GENERAL FINISH REQUIREMENTS

- A. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.5 STEEL FINISHES

- A. Baked-Enamel: Manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat to achieve a minimum dry film thickness of 2 mils (0.05 mm).
 - 1. Color and Gloss: Custom as selected by Architect.

2.6 ACCESSORIES

- A. Floor Anchors: Galvanized steel, post-installed expansion anchors, power-actuated fasteners, or threaded concrete screws as required to securely attach stack system.
- B. Wall Anchors: Manufacturer's standard galvanized-steel anchors.
- C. Top Bracing: Minimum 1- by 1-3/4-inch (25- by 44-mm) transverse struts, 0.048-inch- (1.22-mm-) thick steel channels, welded or bolted to top of stack units and securely fastened to structure.
- D. Bookstops: Match stacks.
- E. End Panels: Custom-fabricated, as specified in Section 064023 "Interior Architectural Woodwork."
 - 1. Provide 3-Form Chroma end panels 1 inch thick, color: Ghost.
- F. Accessories: To be specified through manufacturer's shop drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances, location of framing and reinforcements, and other conditions affecting performance of library stack systems.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Clean finished floor over which shelving is to be installed.

3.3 INSTALLATION

- A. Install library stack systems at locations indicated on Drawings and according to manufacturer's written instructions.
- B. Starter/Adder Units: Connect groups together with standard fasteners according to manufacturer's written instructions, using concealed fasteners where possible.
- C. Enclosure Panels: Install end panels with concealed fasteners.
- D. Level and plumb bookstack units to a tolerance of 1/8 inch in 96 inches (3 mm in 2438 mm).
- E. Filler Panels: Install corner and intermediate wall filler panels where indicated to fill gaps at abutting shelving units.

- F. Install type of shelves at locations indicated and at spacing indicated or, if not indicated, at equal spacing in each unit.
- G. Mark the reference section on each shelf or group of shelves.

3.4 ANCHORAGE

- A. Bookstack Anchorage: Install bookstacks using floor anchors, wall anchors, or top bracing in locations recommended by manufacturer and as indicated on Shop Drawings.

3.5 CLEANING AND PROTECTING

- A. Repair or remove and replace defective work as directed on completion of installation.
- B. Clean finished surfaces, touch up as required, and remove or refinish damaged or soiled areas to match original factory finish, as approved by Architect.
- C. Protect installed products from damage during remainder of the construction period.

END OF SECTION

This Page Left Intentionally Blank

SECTION 122413
ROLLER WINDOW SHADES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

- 1. Manually-operated roller shades with single rollers
- 2. Motor-operated roller shades with single rollers.
- 3. Solar Depth Penetration Automation for motor-operated roller shades.

B. Related Requirements:

- 1. Section 061000 "Rough Carpentry" for wood blocking and grounds for mounting roller shades and accessories.
- 2. Section 079200 "Joint Sealants" for sealing the perimeters of installation accessories for light-blocking shades with a sealant.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

- 1. Include styles, material descriptions, construction details, dimensions of individual components and profiles, features, finishes, and operating instructions for roller shades.

B. Shop Drawings: Show fabrication and installation details for roller shades, including shadeband materials, their orientation to rollers, and their seam and batten locations.

- 1. Plan drawings showing location of each shade.
- 2. Details of all shade types.
- 3. Motor-Operated Shades: Include details of installation and diagrams for power, signal, and control wiring.

C. Samples for Verification: For each type of roller shade.

- 1. Shadeband Material: Not less than 10 inches square. Mark inside face of material if applicable.

2. Roller Shade: Full-size operating unit, not less than 16 inches wide by 36 inches long for each type of roller shade indicated.
3. Installation Accessories: Full-size unit, not less than 10 inches long.

D. Roller-Shade Schedule: Use same designations indicated on Drawings.

E. LEED Submittals:

1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - b. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer.
- B. Product Certificates: For each type of shadeband material, signed by product manufacturer.
- C. Product Test Reports: For each type of shadeband material, for tests performed by manufacturer and witnessed by a qualified testing agency.

1.5 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For roller shades to include in maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Roller Shades: Full-size units equal to 5 percent of quantity installed for each size, color, and shadeband material indicated, but no fewer than two units.

1.7 QUALITY ASSURANCE

- A. Installer Qualifications: Fabricator of products.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Deliver roller shades in factory packages, marked with manufacturer, product name, and location of installation using same designations indicated on Drawings.

1.9 FIELD CONDITIONS

- A. Environmental Limitations: Do not install roller shades until construction and finish work in spaces, including painting, is complete and dry and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- B. Field Measurements: Where roller shades are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operating hardware of operable glazed units through entire operating range. Notify Architect of installation conditions that vary from Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

PART 2 - PRODUCTS

2.1 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section shall have either a Type III Product Specific EPD or the company shall be listed in the industry group responsible for the Industry Wide Externally Verified EPD.

2.2 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - 1. Basis-of-Design: Draper, Inc. or one of the following approved equals:
 - a. _____.
 - b. _____.
 - c. Or equal.
- B. Source Limitations: Obtain roller shades from single source from single manufacturer.

2.3 MANUALLY-OPERATED SHADES WITH SINGLE ROLLERS

- A. Shadebands:
 - 1. WS-2:
 - a. Product: "Phifer Shearweave".
 - b. Openness Factor by Elevation:
 - 1) South and West: 1%.
 - 2) East: 3%
 - 3) North: 5%
 - c. Colors and Patterns: As selected by Architect from manufacturer's full range.
 - 2. WS-4:
 - a. Product: Room Darkening, "Phifer Shearweave SW7500".
 - b. Colors and Patterns: As selected by Architect from manufacturer's full range.
 - 3. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.
 - a. Type: Enclosed in sealed pocket of shadeband material.

- B. Chain-and-Clutch Operating Mechanisms: With continuous-loop bead chain and clutch that stops shade movement when bead chain is released; permanently adjusted and lubricated.
 - 1. Bead Chains: Stainless steel.
 - a. Loop Length: Full length of roller shade.
 - b. Limit Stops: Provide upper and lower ball stops.
- C. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.
 - 1. Roller Drive-End Location: As indicated on Drawings.
 - 2. Direction of Shadeband Roll: Regular, from back of roller.
 - 3. Shadeband-to-Roller Attachment: Manufacturer's standard method.
- D. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated.
- E. Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.
- F. Installation Accessories:
 - 1. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.
 - a. Height: Manufacturer's standard height required to enclose roller and shadeband assembly when shade is fully open, but not less than [6 inches (152 mm)] [5 inches (127 mm)] [4 inches (102 mm)] [height indicated on Drawings] <Insert dimension>.
 - b. Provide pocket with lip at lower edge to support acoustical ceiling panel.
 - 2. Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed.
 - 3. Installation Accessories Color and Finish: As selected from manufacturer's full range.

2.4 MOTOR-OPERATED SHADES WITH SINGLE ROLLERS

- A. Shadebands:
 - 1. WS-1 and WS-3: Light-filtering Fabric, PVC-free material.
 - a. Product: Draper, Inc. "Phifer Shearweave".
 - b. Openness Factor by Elevation:
 - 1) South and West: 1%.
 - 2) East: 3%
 - 3) North: 5%
 - c. Shadeband Material Flame-Resistance Rating: Comply with NFPA 701. Testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

2. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.
- B. Shade Motor and Control System:
1. Intelligent Technology Motor - 110 VAC motor with built-in low voltage controller with 3-wire pig tail and data cable. No external motor controls are required. Available with optional three prong plug. Tubular motor concealed inside each shade roller tube.
 2. Quiet Intelligent Technology Motor - 110 VAC quiet motor with built-in low voltage controller with 3-wire pig tail and data cable. Motor operates at 38 Db measured 3 feet from the motor. Available with optional three prong plug. Tubular motor concealed inside each shade roller tube.
 3. Motor Characteristics:
 - a. Motor lifting capacity shall be a minimum of 4 Nm torque or greater for line voltage motors without the need for any external mechanical components (springs).
 - b. Intelligent motors shall be available with wired and wireless communication options.
 - c. Intelligent motors shall be rated for both interior and exterior applications.
 4. Each motor shall be capable of being positioned at fully-up, fully-down or any position between 0-100 percent in 0.5 percent increments.
 5. Each motor shall be UL, CUL recognized, and meet CSA standards.
 6. Motors shall have factory-assigned individual unique addresses and can be individually configurable over the network without needing to physically access motor.
 7. Motor shall have an onboard communication port for bi-directional communication allowing for status updates, configuration and operation from a PC with the applicable system software.
- C. A scalable shading system, with a system-wide master controller, comprised of intelligent motors and controls utilizing RS485 shall have the ability to:
1. Network Characteristics:
 - a. Manage the intelligent motors and controls on a RS485 network.
 - b. Manage unique addresses for each intelligent motor.
 - c. Allow the operation of both AC Line Voltage Motors and DC Low Voltage motors on a single common intelligent shade network without requiring gateway devices.
 - d. Allow for upper and lower limits to be pre-set by shade manufacturer and adjustable on site via handheld device or PC, without the need to access the roller assembly or external mechanical limit wheels or buttons.
 - e. Allow for intelligent keypads, schedules, motor grouping and virtual switches to be configurable and managed from its own internal IP network, from the building's internal network, or remotely over the internet.
 - f. Provide an isolated RS485 communication bus input for sensor information to ensure motor and keypad data integrity
 - g. Include integrated IP networking infrastructure hardware to allow for stand-alone operation, separated from building IP network.
 - h. Be comprised of multiple bus segments, with each segment up to 4000 feet long with up to 255 devices.
 - i. Expand system capacity from one bus segment to multiple through the use of repeaters or IP Sub Controllers.
 - j. Allow for each motor to automatically align itself to a referenced shade position upon receiving a command from the network.
 2. Automated direction of system components
 - a. Provide two methods of automated sun based control.
 - 1) Methods:
 - a) Solar Entrance Depth Management: Automatic management of light entrance into the building space. Move solar shading system based

- on the following user defined parameters, including but not limited to the following:
- i. Building location, precise longitude/latitude.
 - ii. Window's cardinal direction.
 - iii. Time of year.
 - iv. Time of day.
 - v. Size of window.
 - vi. Allowable distance of sunlight entrance into the space.
 - vii. Portion of window that should be un-shaded at all times.
 - viii. Shade position if light level drops below programmed threshold.
 - ix. Sun position based on astronomic time clock with programmable offset.
- b) Solar Entrance Depth Management shall provide for on and off delays to account for momentary changes of cloud cover.
 - c) Solar Entrance Depth Management shall provide for override timers to turn sun control on and off at a programmable time.
- b. Perform astronomic and real-time scheduled events.
3. Provide a graphical user interface (GUI) for motor commissioning and system configuration.
 - a. Allow for the auto discovery of motors, intelligent keypads and weather sensors present on the Network.
 - b. Allow visual identification and assignment of motor location to specific window location within a building.
 - c. Have a graphical user interface allowing for "drag and drop" programming of the system.
 4. Exterior Roof mounted brightness sensor shall provide real time measurement of ambient light level to determine sunny and overcast conditions.
 5. Occupant Control: Provide the following for occupant control of shades:
 - a. Wall Switch: 6 button RS 485 switch to control 1 group up/stop/down and 3 presets.
 - b. Color: As selected by Architect from manufacturer's full range.
 6. Limit Switches: Adjustable switches interlocked with motor controls and set to stop shades automatically at fully raised and fully lowered positions.
- D. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.
1. Roller Drive-End Location: Right side of inside face of shade.
 2. Direction of Shadeband Roll: Regular, from back of roller.
 3. Shadeband-to-Roller Attachment: Manufacturer's standard method.
- E. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated.
- F. Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.

- G. Installation Accessories: Provide for both surface-mounted and recessed installations, as shown on Drawings.
1. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.
 2. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners. Shop-applied finish to match Architect's sample.

2.5 ROLLER-SHADE FABRICATION

- A. Product Safety Standard: Fabricate roller shades to comply with WCMA A 100.1, including requirements for flexible, chain-loop devices; lead content of components; and warning labels.
- B. Unit Sizes: Fabricate units in sizes to fill window and other openings as follows, measured at 74 deg F:
1. Between (Inside) Jamb Installation: Width equal to jamb-to-jamb dimension of opening in which shade is installed less 1/4 inch per side or 1/2-inch total, plus or minus 1/8 inch. Length equal to head-to-sill or -floor dimension of opening in which shade is installed less 1/4 inch, plus or minus 1/8 inch.
 2. Outside of Jamb Installation: Width and length as indicated, with terminations between shades of end-to-end installations at centerlines of mullion or other defined vertical separations between openings.
- C. Shadeband Fabrication: Fabricate shadebands without battens or seams to extent possible except as follows:
1. Vertical Shades: Where width-to-length ratio of shadeband is equal to or greater than 1:4, provide battens and seams at uniform spacings along shadeband length to ensure shadeband tracking and alignment through its full range of movement without distortion of the material.
 2. Railroaded Materials: Railroad material where material roll width is less than the required width of shadeband and where indicated. Provide battens and seams as required by railroaded material to produce shadebands with full roll-width panel(s) plus, if required, one partial roll-width panel located at top of shadeband.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 ROLLER-SHADE INSTALLATION

- A. Install roller shades level, plumb, and aligned with adjacent units according to manufacturer's written instructions.
 - 1. Opaque Shadebands: Located so shadeband is not closer than 2 inches to interior face of glass. Allow clearances for window operation hardware.

3.3 ADJUSTING

- A. Adjust and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.

3.4 CLEANING AND PROTECTION

- A. Clean roller-shade surfaces after installation, according to manufacturer's written instructions.
- B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure roller shades are without damage or deterioration at time of Substantial Completion.
- C. Replace damaged roller shades that cannot be repaired, in a manner approved by Architect, before time of Substantial Completion.

END OF SECTION

SECTION 124816

ENTRANCE FLOOR GRILLES

PART 1 - GENERAL

1.1 SUMMARY

- A. Work Included: Entrance mats and frames, complete, as shown and specified. Provide entrance mats and frames at entrances to building as shown on plan.
- B. Work Specified Elsewhere:
 - 1. Setting of Frames in Concrete Slab: Section 033000.

1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation occurs in the referenced standards, it shall be considered mandatory. In the event of conflict, the more stringent standard or requirement shall govern.
 - 1. American Society for Testing and Materials (ASTM)
 - a. ASTM A276 "Stainless Steel Bars and Shapes".
 - b. ASTM A479 "Stainless Steel Bars and Shapes for Use in Boilers and Other Pressure Vessels".
 - c. ASTM A666 "Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar".

1.3 SUBMITTALS

- A. Samples:
 - 1. Frame: 12-inch-long piece of specified extrusion.
 - 2. Floor Mat: 12-inch-square corner sample of specified type and color.
- B. Product Data: Manufacturer's specifications, data, and installation instructions.
- C. Shop Drawings: Submit shop drawings and coordination drawings. Provide details of intersections at 1/4 inch scale.
- D. LEED Submittals:
 - 1. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

- a. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
- b. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.

1.4 PRODUCT HANDLING

- A. General: Deliver, store, and handle materials per manufacturer's recommendations.

PART 2- PRODUCTS

2.1 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section shall have either a Type III Product Specific EPD or the company shall be listed in the industry group responsible for the Industry Wide Externally Verified EPD.

2.2 MANUFACTURERS

- A. Entrance floor grilles:
 - 1. Basis-of-Design: Hendrick Architectural Products, Inc. or equal.

2.3 MATERIALS:

- A. Stainless Steel Foot Grille: 1 1/8 in. depth. No. 4 finish.
- B. Stainless Steel Material: ASTM A666, type 316.
- C. Stainless Steel Angles: ASTM A276 or ASTM A479.
- D. Provide hidden lock down to secure the foot grille in place.
- E. Recessed Frame Assembly: 3 in. deep recess in Type 316 stainless steel with 1/8 in. exposed surface.
 - 1. Profile bar: Model T16.

2.4 FABRICATION

- A. Shop fabricate entrance mats and frames to greatest extent possible. Unless otherwise noted, provide each entrance mats as a single unit. Do not exceed manufacturer's recommendations for maximum size for cleaning capability.
- B. Fabricate frame members in single lengths, unless otherwise recommended by manufacturer. Where joints occur, they shall be hairline joints. Splice joints with straight connecting pins, hidden from view.

PART 3- EXECUTION

3.1 GENERAL

- A. Manufacturer's Instructions: Prepare substrates and install the work, including components and accessories, in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified. Examine the areas to receive the Work and remedy detrimental conditions. Coordinate with other trades as required.
- B. Clean and protect Entrance Mats and Frames in accordance with manufacturer's recommendations. Installation shall be per expansion anchors and button head cap screws at bottom of entrance grate assembly.
- C. In case of damage, repair Entrance Mats and Frames in accordance with manufacturer's recommendation. If repair is not acceptable to Owner, provide new assemblies.

This Page Left Intentionally Blank

SECTION 142123

MACHINE ROOM-LESS TRACTION PASSENGER ELEVATORS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes two new machine room-less electric gearless traction passenger elevators, including but not limited to:
1. Where a component, device, system or part of the equipment is referred to in the singular, such reference shall not limit the quantity furnished and shall apply to any and all of such devices or parts as may be required for a complete installation.
 2. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
 3. Respondent must clearly identify any and all exceptions, clarifications or other variations from contract documents, citing the affected requirement by version date, sheet or section, paragraph or detail and page, providing the proposed substitution, alternative or economic credit represented in their response, prominently and conspicuously displayed with underline or highlight, adjacent to or referenced in their offer pricing.
 4. Error in or conflict among requirements not specifically identified in the response shall be resolved by application of the most stringent and/or beneficial to the owner, at the sole determination of the architect.
- B. Related work required by other trades:
1. Hoistway and Pit
 - a. Proper construction for code compliant hoistway, pit and machine room.
 - b. Wall blockouts and fire rated closure for control and signal fixture boxes which penetrate walls, chases and openings.
 - c. Cutting and patching of hoistway walls for installation of hall fixtures.
 - d. Grouting under landing sills; repair or replacement of fireproofing.
 - e. Finish painting except as noted.
 - f. Protect open hoistways and entrances during construction per OSHA Regulations.
 2. Machine Room – Construction as required for Code approved enclosure.
 3. Electrical Service, Conductors, and Devices

- a. Lighting and GFCI convenience outlets in pits and machine room
- b. Three-phase mainline copper power feeder with true earthen grounding to terminals of each elevator controller in the machine room with protected, lockable “open” disconnecting means, having auxiliary contacts to allow Elevator Contractor to electronically interlock battery power lowering unit
- c. Single-phase copper power feeder to each elevator controller for car lighting and exhaust blower with individual protected, lockable “open” disconnecting means located in machine room
- d. Fire alarm initiating devices in each elevator lobby and each machine room to initiate firefighters’ return feature. Provide alarm initiating signal wiring from hoistway or machine room connection point to elevator controller terminals. Device in machine room and at top of hoistway to provide signal for general alarm and discrete signal for Phase II firefighters’ operation.
- e. Louvers, screens and gratings.
- f. Lighting, receptacles, switches and ventilation of pit, hoistway and machine room.
- g. Access ladders, guards and doors, including guardrails.
- h. Adequate and appropriate building structure for machines, safety/hoist beams, guide rail bracket attachment and support, buffers, landing sills and hoistway entrances.
- i. Adequate, convenient, secured on-site storage for tools and materials and lay-down staging space in proximity to hoistway.
- j. Appropriate analog telephone lines, jacks, wiring to and termination in elevator controller panels.
- k. Fire life/safety sensors, addressable initiating devices, fire extinguishers, signals and connections to appropriate elevator control contacts.
- l. Life safety or intercom interfaces and speakers for installation by elevator contractor.
- m. Assist with elevator installation of cameras, card readers or other security devices provided by others.

1.2 DEFINITIONS

- A. Definitions in ASME A17.1 apply to work of this Section.
- B. Defective Elevator Work: Operation or control system failure, including excessive malfunctions; performances below specified ratings; excessive wear; unusual deterioration or aging of materials or finishes; unsafe conditions; need for excessive maintenance; abnormal noise or vibration; and similar unusual, unexpected, and unsatisfactory conditions.

1.3 REFERENCES

Applicable Codes (Latest Edition):

- K. Earthquake provisions as required by local code.
- L. Local codes.
- M. Authorities having jurisdiction.

1.4 SUBMITTALS

- A. Product Data: Include capacities, sizes, performances, operations, safety features, finishes, and similar information. Include product data for the following:
 - 1. Door operator and related equipment
 - 2. Microprocessor controller
 - 3. Guide shoes
 - 4. Signal fixtures
- B. Shop Drawings: Show plans, elevations, sections, and large-scale details indicating machine room layout, lobby elevations, relationships with other construction, and locations of equipment and signals.
 - 1. Include scale layout of car operating panel and hall fixtures.

2. Include electrical requirements based on the speed and capacity specified to include maximum and average power demands. Design for planned electrical power supply.
 3. Include elevator equipment heat output for design of controller room cooling.
- C. Samples: For exposed finishes of cars, hoistway doors and frames, and signal equipment; 3-inch-square Samples of sheet materials; and 4-inch lengths of running trim members.
 - D. Operation and Maintenance Data: Provide Owner's Manuals with operation and maintenance instructions to include manufacturers contact information, manufacturer's reference and serial numbers, operating instructions, recommended spare parts lists, maintenance recommendations and schedules.
 - E. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction for normal, unrestricted elevator use.

1.5 QUALITY ASSURANCE

Approved Manufacturers: Elevator systems shall be one of the following, or equal:

- A. Otis Elevator Company – G20
- B. KONE, Inc. – MonoSpace 700
- C. Schindler – 5500
- D. ThyssenKrupp – Synergy Building Supported
- E. Mitsubishi - DiamondTrac

1.6 PERMIT, TESTING, AND INSPECTION

- A. Obtain and pay for permit, license, and inspection fee necessary to complete installation.
- B. Perform test required by governing authority in accordance with procedure described in ASME A17.2 Guide for Inspection of Elevators, Escalators, and Moving Walks in the presence of Authorized Representative.
- C. Supply personnel and equipment for tests and final performance review by Consultant, as required.

1.7 DOCUMENT AND SITE VERIFICATION

- A. In order to discover and resolve conflicts or lack of definition which might create problems, Contractor must review Construction Documents for compatibility with its product prior to submittal of quotation. Review structural, electrical, and mechanical plans for compatibility with Contractor's products. Purchaser will not pay for change to structural, mechanical, electrical, or other systems required to accommodate Contractor's equipment.

B. Site Condition Inspection:

1. Prior to delivery of equipment or beginning installation, examine hoistway and machine room areas. Verify no irregularities exist which affect execution of work specified.
2. Do not proceed with installation until work in place conforms to project requirements.

1.8 DESIGN CRITERIA

A. Provide equipment to fit within the spaces and structural conditions shown.

B. Performance:

1. Contract Speed: within 3% of the specified speed under any loading conditions
2. Floor-to-floor performance time: Measured from the start of doors closing at one floor until doors are $\frac{3}{4}$ open and the car is stopped at the next successive floor in either condition under any loading condition, based on 14'-0" floor height: 10.6 seconds
3. Door Open Time: From start of opening to fully opened: 2.3 seconds
4. Door Close Time: From start of closing to fully closed: 3.5 seconds
5. Door Dwell Times: Comply with accessibility requirements and provide separate adjustable timers for car and hall calls with initial settings as follows:
 - a. Hall Calls: 5.0 seconds
 - b. Car Calls: 5.0 seconds
 - c. Interrupted Door Beam: 1.0 seconds
6. Nudging: Adjustable with initial setting of 20 seconds. If doors fail to close after the set time, doors close at reduced speed and pressure and activate nudging buzzer
7. Leveling: Within 1/8-in. under any loading condition. Level into floor at all times, do not overrun floor and level back.

C. Operating Qualities: The Owner's Representative will judge riding quality of car and enforce the following requirements. Make all necessary adjustments.

1. Starting and stopping shall be smooth and comfortable. Slowdown, stopping and leveling shall be without jars or bumps.
 - a. Acceleration and deceleration: Maximum 4.0 ft. per second squared
 - b. Jerk: 8.0 feet per second cubed
 - c. Vertical Vibration: Maximum 30 mg

- d. Horizontal Vibration: Maximum 30 mg peak-to-peak measured at full speed for full travel in both directions
 2. Full Speed Ride: Free from vibration, shudder, bumps or sway.
 - D. Sound Control:
 1. Vibration: Sound isolate all equipment from building structure to prevent objectionable noise and vibration transmission to occupied building,
 2. Airborne Noise: Maximum acoustical output level of:
 - a. 85 dBA measured in machine room
 - b. 55 dBA measured in elevator car during all sequences of operation
 - c. 70 dBA measured in elevator lobbies
 - E. Motor Control: Operate at plus or minus 10% of normal feeder voltage plus or minus 3% of normal feeder frequency without damage or interruption of elevator service. Include protective devices to prevent damage resulting from over or under voltage conditions and loss or reversal of phase.
 - F. Control System: Operate hoist motor continuously at contract speed and load for a one-hour period, stopping at each floor for no more than 10 seconds per stop. Under the same conditions, the elevator system shall not adversely affect stability of voltage and frequency controls of emergency generator set or loads connected to emergency power bus during standby power operations.
 - G. Car Balance: Statically and dynamically balance elevator cars to minimize loading or roller guide wheels. Do not exceed 15-lb. maximum pressure on empty car.
- 1.9 NOISE AND VIBRATION CONTROL
 - A. Coordinate with other trades to avoid rigid contact between isolated equipment and the building structure.
 - B. Equipment Vibration Isolation:
 1. Hoist Machines - Mount in proper alignment on isolated bedplate or mountings utilizing resilient isolation material. Select isolation material so that the natural frequency does not exceed 40 Hertz. Bolts utilized for seismic restraint of the hoist machines shall not short-circuit the resilient isolation material.
 2. Solid State Power Conversion or Cabinets Containing Relays and Contractors – Mount on Mason Industries Model BR isolators, or equal, with a 0.2-inch static deflection, with hold down bolts and grommets to provide seismic restraint and to avoid short-circuiting the isolators.
 3. Deflector Sheaves - Provide resilient isolation materials including isolating grommets and washers at hold down bolts between deflector sheaves and the building structure.

- C. Provide filters on power conversion and regulation units to suppress acoustic noise. The A-weighted sound pressure level should not exceed 60 dB when measured three feet from the unit under all load conditions.

1.10 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, and handle materials, components, and equipment in manufacturer's protective packaging.
- B. Store materials, components, and equipment off of ground, under cover, and in a dry location. Handle according to manufacturer's written recommendations to prevent damage, deterioration, or soiling.

1.11 COORDINATION

- A. Coordinate installation of sleeves, block outs, and items that are embedded in concrete or masonry for elevator equipment. Furnish templates and installation instructions and deliver to Project site in time for installation.
- B. Coordinate sequence of elevator installation with other work to avoid delaying the Work.
- C. Coordinate locations and dimensions of other work relating to the elevator including pit ladder, and electrical service, electrical outlets, lights, and switches in pits, hoistway overhead machine space and controller room.

1.12 WARRANTY

- A. Material and workmanship of installation shall comply in every respect with Construction Documents. Correct defective material or workmanship which develops within one year from date of Substantial Completion of all work to satisfaction of the Purchaser and Consultant at no additional cost, unless due to ordinary wear and tear, or improper use or care by Purchaser.
- B. Defective is defined to include, but not be limited to: operation or control system failures, car performance below required minimum, excessive wear, unusual deterioration, or aging of materials or finishes, unsafe conditions, the need for excessive maintenance, abnormal noise, or vibration, and similar unsatisfactory conditions.

PART 2 - PRODUCTS

2.1 ELEVATORS

- A. Approved Manufacturers: Elevator systems shall be manufactured by one of those listed in Section 1.5, or equal:
- B. Elevator Description – EL 1 & 2
 - 1. Type: Gearless traction
 - 2. Machine Location: Upper hoistway, building supported
 - 3. Rated Load: 3500 lbs.

4. Platform Loading: Class A
5. Rated Speed: 350 fpm
6. Operation System: Duplex Selective Collective
7. Auxiliary Operations:
 - a. Emergency operation: Battery-powered Rescue Control
 - b. Earthquake Operation: Per CA code for location
 - c. Independent service Toggle switch in service cabinet
8. Stops & Openings: 3 levels, front-only openings
9. Car enclosure:
 - a. Inside Width: Manufacturer's standard for duty.
 - b. Inside Depth: Manufacturer's standard for duty.
 - c. Inside Height: 8'-0" (nominal)
 - d. Finishes: See Section 2.8
10. Hoistway Entrances:
 - a. Size: 3'-6" x 7'-0"
 - b. Type: Single-speed, side opening
 - c. Frames: Bolted construction
 - d. Finishes: See Section 2.9
11. Signal Fixtures:
 - a. Car Operating Panels: Main, swing-return type.
 - b. Other components: See Section 2.10

2.2 HOISTWAY EQUIPMENT

- A. Machines: Manufacturer's standard PMAC gearless machine with VVVF drive, designed to be mounted in the elevator hoistway.
 1. Provide means for absorbing regenerated power when elevator system is operating on standby power.

2. Provide line filters or chokes to prevent electrical peaks or spikes from feeding back into building power system.
 3. Provide bearing plates, anchors, angles, blocking, and templates required for installation and support of elevator equipment.
 4. Provide anti-friction bearings with easy access for lubrication.
 5. Mount motor, brake, and drive sheave in proper alignment on common frame. Machine armature, drive sheave, and brake disc to be dynamically balanced at place of manufacture at twice operating speed.
- B. Guiderails: Provide minimum 15 lb./ft. car and counterweight rails. Attach directly to building structure with brackets and non-corrosive shims and sliding rail clips. Install rails plumb and straight within 1/16-in. tolerance from top to bottom of the hoistway. Locate rail joints and fishplates to allow for building compression without interference with rail brackets.
- C. Car Frame: Welded or bolted steel channel construction.
- D. Counterweights: Provide welded or bolted frame with filler weights. Install blocking or shims to eliminate rattling for quiet travel. Provide blocking to allow for rope stretch without increasing overhead clearance.
- E. Guide Shoes: Roller type with three, spring-loaded, sound-reducing, rubber rollers per assembly, at top and bottom of car and counterweight frames. Include retainer plates between guide shoes and car frame to engage entire machined surface of guide rail. Minimum 6" diameter rollers for car guides and 3" diameter rollers for counterweight guides.
- F. Platform: Steel frame with steel or wood subfloor.
- G. Buffers: Provide spring return oil buffers including blocking, access ladders, and platforms
- H. Hoisting and Governor Ropes: Provide steel ropes or belt type suspension with adjustable shackles. Provide belt monitoring device as permanent installation to the elevator system.
- I. Compensation: Provide encapsulated type chain with dampening guides for quiet operation where required by elevator manufacturer

2.3 VIBRATION ISOLATORS

- A. Type PN - Ribbed Neoprene Pads from Mason Industries Type "W", or equal.
- B. Type RCA - Neoprene mounting with captive steel insert Mason Industries Type RCA, or equal.

2.4 SEISMIC RESTRAINTS

- A. General Properties:
 1. Restraints shall permit adjustment during installation to ensure sufficient clearance between vibration isolated element and rigid restraining device.

2. Restraints shall not be installed until vibration isolators have been loaded and adjusted to achieve the specific static deflection and clearances.

B. Seismic Restraint Description:

Restraining devices at all base supported vibration isolated equipment shall be separate components sized and installed to meet the general requirements specified above, may be built into the vibration isolator, or may be provided by anchor bolts which do not short-circuit the vibration isolator

2.5 OPERATING SYSTEMS

A. General: Provide a non-proprietary microprocessor-based control system as required to perform the functions of elevator motion, car operation, and door control

1. Include sleep mode that turns car lights and fan off when there is no demand; provide adjustable time period between normal operation and activation of sleep mode.
2. Include hardware required to connect, transfer, interrupt power, and protect motors against overloading. Properly shield each controller cabinet containing memory equipment from line pollution. Design system to accept reprogramming with minimum down time.

B. Operation of Individual Elevators:

1. Include hardware necessary to protect hoist motors and door operators.
2. Controllers containing memory equipment must be properly shielded from line feeder pollution.
3. Individual elevators shall operate on the basis of directional single cancellation collective automatic control in accordance with the following:
 - a. The control and indicating devices and supplementary service modes to be provided, together with the basic functioning of these and of power doors, door protective devices and similar items, are detailed in the relevant paragraphs of this specification.
 - b. Register calls from pushbuttons located at each floor and in each car. Slow cars and stop automatically at floors corresponding to the registered calls. Make stops at successive floors for each direction of travel irrespective of the order in which calls are registered except when bypassing hall calls to balance and improve overall service.
 - c. Provide "anti-nuisance service" whereby all car calls will be canceled if the load weighing device detects that an abnormal number of calls are registered given the number of passengers in the car. System using false call answering to accomplish this is not acceptable.

4. Fault Diagnostic System:
 - a. Provide a diagnostic system for microprocessor systems capable of determining faults most difficult to find. It shall constantly monitor the condition of all car computers. When variances occur from the normal mode, the change or fault shall be detected, the location of the elevator, time of day, number of times fault occurred, along with fault code message shall be stored on memory. This information shall be retrievable and shall be displayed on a CRT monitor in the machine room.
 - b. Provide required hardware such as keyboard or maintenance tool as specified under "Maintenance Data" and all necessary supporting documentation and materials required to perform diagnostic and restorative services.
 - c. The data link required to monitor all car computers shall be permanent. Installation requiring disconnect/reconnect of data line in order to retrieve specific car data is unacceptable.
- C. Duplex Automatic Operation: Provide duplex automatic operation that assigns calls on a real-time basis using estimated time of arrival. Each controller shall be equipped with a computer capable of dispatching cars to hall calls.
 1. Register calls from push buttons located at each floor and in each car. Slow cars and stop automatically at floors corresponding to the registered calls. Make stops at successive floors for each direction of travel irrespective of the order in which calls are registered except when bypassing hall calls to balance and improve overall service.
 2. Operate system to meet changing traffic conditions on a service demand basis. Include provisions for handling traffic which may be heavier in either direction, intermittent, or very light. As traffic demands change, automatically and continually modify group and car assignment to provide the most effective means to handle current traffic conditions.
- D. Battery-Powered Rescue Operation:
 1. Upon loss of normal power, provide controls to automatically move the car at inspection speed to the nearest landing based on the load in the car. If the car is at a floor, open the doors, and shut down. System includes rechargeable battery and automatic recharging system.
 2. Upon restoration of normal power, the elevator shall automatically resume normal operation.
- E. Other Operations:
 1. Load Weighing: provide means for weighing car passenger load. Control system to provide dispatching at main floor in advance of normal intervals when car is filled to capacity. Provide hall call by-pass when the car is filled to preset percentage of rated capacity and traveling in down direction. Field adjustment range: 10% - 100%.
 2. Independent Service: Provide controls for operation of each car from its pushbuttons only. Close doors by constant pressure on the desired destination floor button or door close button. Open doors automatically upon arrival at selected floor.

3. Door Hold Open: Provide push button in car operating panel to hold doors open for an adjustable period of 30-90 seconds to allow for loading and unloading of the elevator. Button to illuminate when Door Hold is activated. Door Hold time to be discontinued by activation of the door close or a floor push button.
- F. Earthquake Operation: Per Code requirements.
 - G. Firefighters' Service: Provide equipment and operation in accordance with Code requirements.
 - H. Automatic Car Stopping Zone: Stop car within 1/8" above or below the landing sill. Maintain stopping zone regardless of load in car, direction of travel, distance between landings, rope stretch or slippage.
 - I. Remote Monitoring and Diagnostics: Equip each controller with standard ports, interface boards, and drivers to accept maintenance, data logging, fault finding diagnostic and monitoring computers, keyboards, modems, and programming tools. The system shall be capable of driving remote color CRT monitors that continually scan and display the status of each car and call. Provide each group with a full, interactive elevator monitoring (EEMS) system located in elevator controller room.
 - J. Door Operation: Automatically open doors when car arrives at main floor. At expiration of normal dwell time, close doors. Reopen doors when car is designated for loading.
 - K. Standby Lighting and Alarm: Car mounted battery unit with solid-state charger to operate alarm bell and car emergency lighting. Battery to be rechargeable with minimum 5-year life expectancy. Include required transformer. Provide constant pressure test button in service compartment of car operation panel. Provide lighting integral with portion of normal car lighting system.
 - L. Security Systems
 1. Card Reader: Include provisions for card readers provided by others. Mount readers as directed, and cross connect from car pushbuttons to control module in machine room. Provide filler plate to match card slot size and car return panel finish, including direction of graining, where card slot or proximity reader cutout is not initially utilized. Elevator control systems shall facilitate system tracking of persons accessing secure floors via printout by passenger ID number, floor accessed, and time of entry.
 2. Security Camera: Include provisions security cameras provided by others. Mount cameras as directed and wire to controller room for interface control specified in other sections.

2.6 WIRING

- A. General: Use only copper conductors; run in metal conduit or galvanized duct. Provide 10% spare conductors in conduit, duct, and wire runs. No splices in wiring; connect wiring directly to terminal blocks in control cabinets or junction boxes. Tag spares inside controller cabinet.
- B. Traveling cables: provide lighting, communication, security systems, and control wiring circuits in traveling cables from controller room to car connection point. Include a minimum of four (4) spare pairs of shielded communication wires. Provide means to prevent cables from rubbing or chafing against hoistway, structural beams, elevator equipment, and the car.

- C. Work light and plug receptacle: provide work light on top of car with lamp guard and plug receptacle.
- D. Conduit: where provided use EMT type conduit. Include a flexible conduit to sound isolated equipment and components.
- E. Run 4 pairs of continuous un-spliced shielded twisted wires from emergency phone in car operating panel to elevator controller room junction box. Provide junction box as part of this section.

2.7 FINISH MATERIALS

- A. General: Provide the following materials for exposed parts of elevator car enclosures, car doors, hoistway entrance doors and frames, and signal equipment as indicated.
- B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, commercial steel, Type B, exposed, matte finish
- C. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, commercial steel, Type B, pickled
- D. Stainless-Steel Sheet: ASTM A 240/A 240M, Type 304. Satin finish directional polish finish (US 32D). Graining in longest dimension.
- E. Stainless Steel: ASTM A 240/A 240M, Type 304
 - 1. Satin Finish: No. 4 (US 32D), grain to run in the longest dimension
 - 2. Patterned Finish: 5WL by Rigidtex, or equal.
- F. Stainless-Steel Bars: ASTM A 276, Type 304
- G. Stainless-Steel Tubing: ASTM A 554, Grade MT 304
- H. Aluminum: Extrusions per ASTM B221; sheet and plate per ASTM B209
- I. Fire-Retardant Treated Particle Board Panels: Minimum 3/4" thick backup for natural finished wood and plastic laminate veneered panels, edged and faced as shown, provided with suitable anti-warp backing. In finished configuration, panels must meet ASTM E84 Class "I" rating with a flame-spread rating of 25 or less, registered with Local Authorities for elevator finish materials.
- J. Plastic Laminate: NEMA LD3.1, Fire-Rated Grade (GP-50), Type 7, 0.050" ±.005" thick, color and texture as follows:
 - 1. Exposed Surfaces: Premium grade equivalent to FRL, color and texture as selected by Architect.
 - 2. Concealed Surfaces: Manufacturer's standard color and finish
- K. Prime Painted Finish: Clean all metal surfaces receiving a baked enamel paint finish of oil, grease, and scale. Apply one coat of rust-resistant primer followed by a filler coat over uneven surfaces. Sand smooth and apply final coat of primer.

- L. Final Painted Finish: Manufacturer's standard baked enamel or powder coat finish: Prime finish per above. Unless specified "prime finish" only, apply and bake three additional coats of enamel in the selected solid color
- M. Manufacturers' Nameplates:
 - 1. Manufacturer's name plates and other identifying markings shall not be affixed on surfaces exposed to public view. This requirement does not apply to Underwriter's Laboratories and code required labels.
 - 2. Each major component of mechanical and electrical equipment shall have identification plate with the Manufacturer's name, address, model number, rating, and any other information required by governing codes.

2.8 CAR ENCLOSURES

- A. General: Provide painted steel enclosure with removable wall panels as specified
 - 1. Provide standard railings complying with ASME A17.1 on car tops where required by ASME A17.1.
 - 2. Provide finished car including materials and finishes specified.
- B. Materials and Finishes:
 - 1. Enclosure shell: Flush, hollow-metal construction; fabricated from cold-rolled steel sheet. Provide with factory-applied enamel finish; colors as selected by Architect from manufacturer's full range.
 - 2. Canopy: Sheet steel construction painted white. Attach to wall panels with continuous rubber gasket tape. Provide light-tight baffles.
 - 3. Ventilation:
 - a. Provide concealed vents at top and bottom of wall panels
 - b. Provide two-speed squirrel cage exhaust blower sound isolated from canopy, type OE by Man-D-Tech, or equal.
 - 4. Front Returns and Transoms: 14 gage no. 4 stainless steel
 - 5. Sound deadening: Spray on or tool applied to back of cab shell, 1/8-inch thick.
 - 6. Fabricate car with recesses and cutouts for signal equipment.
 - 7. Fabricate car door frame integrally with front wall of car.
 - 8. Doors: Flush, hollow-metal construction; fabricated from or clad with satin stainless steel, no 4 finish
 - 9. Sight Guards: Provide sight guards on car doors in matching finish.

10. Sills: Extruded aluminum
11. Side and Rear Wall Panels: Applied plastic laminate panels, removable from inside the car.
12. Reveals: Satin stainless-steel between panels
13. Base: Satin stainless-steel.
14. Finished Flooring: Architectural rubber flooring as selected by the Architect.
15. Ceiling: Satin stainless-steel with LED downlights.
16. Handrails: 1 ½" diameter at rear wall, satin stainless-steel finish.
17. Protection Pads: Provide permanently installed buttons and one complete set of full height pads for each car – 2 total sets. Provide for side and rear walls and front walls with cutouts for operating fixtures.

2.9 HOISTWAY ENTRANCES

- A. General: Provide manufacturer's standard horizontal-sliding, door-and-frame hoistway entrance assemblies complete with track systems, hardware, sills, and accessories, bearing 1 1/2-hour UL label.
 1. Provide frame size and profile to coordinate with hoistway wall construction.
 2. Where gypsum board wall construction is indicated, provide self-supporting frames with reinforced head sections.
- B. Materials and Fabrication: Provide manufacturer's standards, but not less than the following:
 1. Frames: Fabricate from 14-gauge material, bolted construction to form one-piece unit frame. Apply effective sound deadening on inside of frame.
 2. Doors: Flush, hollow-metal, sound deadened, from minimum 16-gauge material with 2 gibs per door panel. Construct doors to prevent rattling.
 3. Sight Guards: Provide sight guards on doors matching door edges
 4. Fascia, Toe Guards, Dust Covers: Provide minimum 16-gauge factory painted or galvanized sheet steel. Hanger covers to extend full width of door track.
 5. Sills: Provide full width of hoistway extruded aluminum sills.
 6. Sill Supports: Provide entire assembly of all angles, brackets, and fastenings to support sill connection to building structure.
 7. Finish:
 - a. Frames: Satin stainless steel #4 at first floor only; painted at typical floors.

- b. Doors: Satin stainless steel #4 at main floor only; painted at typical floors.

2.10 SIGNAL EQUIPMENT

- A. General: Provide hall-call and car-call buttons that light when activated and remain lit until call has been completed. Provide blue LEDs for all illuminated devices and adjustable tones for all audible devices. Locate and operate all devices in conformance with accessibility requirements.
- B. Car Operating Panels: Provide a single car operating panel. Panels shall be hinged and constructed of stainless steel #4 finish.
 - 1. Provide swing return type operating panel.
 - 2. Identify all devices including floor, alarm, door open, door hold open, and door close buttons with Braille /tactile symbols. Configure plates per local building code accessibility standards.
 - 3. Provide digital position indicator with direction of travel arrows located at the top of car operating panel.
 - 4. Provide push button and plates in an oval design. Push buttons to be fully illuminated over the face of the button. Locate floor buttons in rows with the highest buttons at 48-in. Locate emergency push-to-call and alarm button at 35-in.
 - 5. Provide minimum 3/4-in. diameter raised floor pushbuttons which illuminate to indicate car registration.
 - 6. Provide alarm button to ring bell located on the car. Illuminate button when actuated.
 - 7. Provide firefighters' locked box and devices as required by Code.
 - 8. Provide lockable service compartment with hairline flush door, key removable in locked position only. Door material and finish to match car operating panel faceplate. Inside surface of door shall contain an integral horizontal flush window for displaying the elevator operating permit. Include the following toggle type switches with function and operating positions identified by permanent signage or engraved legend:
 - a. Inspection switch
 - b. Light switch
 - c. Three-position fan switch
 - d. Constant pressure emergency light test button
 - e. 120-volt GFCI duplex outlet
 - f. Two-position switch to choose audible tones or voice annunciator
 - g. Stop switch

9. Provide engraved and black painted capacity and elevator number on service cabinet door.
- C. Emergency Communication System: Provide system that complies with ASME A17.1 and the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)."
1. On activation, system dials preprogrammed number of monitoring station and identifies elevator location to monitoring station.
 2. System provides two-way voice communication without using a handset and provides visible signals that indicate when system has been activated and when monitoring station has responded.
 3. System is contained in flush-mounted cabinet, with identification, instructions for use, and battery backup power supply.
- D. Voice Annunciator: Provide electronic system with easily programmable message using a female voice to announce car direction, floor location, and emergency instructions.
- E. Hall Push-Button Stations: Pushbutton design to match buttons in car operating panel. Provide Firefighters' Phase I devices and instruction in main floor hall station.
- F. Hall Position Indicators: Provide digital type indicator with car direction arrows at first floor only.
- G. Hoistway Access Switches: Provide new devices with satin stainless-steel faceplate in side jamb of entrance frames at top and bottom entrances.

2.11 DOOR OPERATING EQUIPMENT

- A. Door Operator: New, high speed, heavy duty, linear belt drive type machine capable of opening doors at no less than 2.5 fps. Reverse door direction upon interruption of infrared beams in no more than 2 ½-in. of movement. Provide solid state control with closed loop circuitry to constantly monitor and automatically adjust door operation based on velocity, position, and motor current. Maintain consistent, smooth, and quiet door operation at all floors, regardless of door weight or air pressure.
- B. Door Protection: Provide door reopening devices with uniform array of 40 or more microprocessor-controlled, infrared light beams projecting across full height of car entrance. Interruption of one or more of the light beams shall cause doors to stop and reopen.
- C. Nudging Feature: After car doors are prevented from closing for predetermined adjustable time, through activating door reopening device, a loud buzzer shall sound, and doors shall begin to close at reduced kinetic energy.

2.12 CONTROLLER ROOM EQUIPMENT

- A. General: Arrange equipment within the available controller space. Coordinate related electrical and mechanical work.
- B. Controller: As standard with approved manufacturer; overload relays in three legs of power circuit and in loop circuit; cabinets with NEMA-1 enclosures and doors arranged with locks or mechanical

latches. Provide permanently marked symbols or letters identical to those on wiring diagrams adjacent to each component.

1. The controller wiring shall be carried out in a neat and workmanlike manner in accordance with relevant requirements of National Electric Code.
2. All external connections to the equipment on each controller shall be made by means of approved cable thimbles and/or solder less cable lugs, depending on the current to be carried.
3. Condenser activated or dash pot timers, motors or incandescent globes for dampening acceleration and deceleration steps are unacceptable.
4. Main contactors or starter switches shall be horsepower rated and are not to be mounted directly to the steel cabinets, to ensure quiet operation of controllers.
5. The controllers must be properly shielded from line feeder pollution.

C. Solid State Power Conversion and Regulation Unit:

1. General:
 - a. All circuitry shall be as approved by the enforcing code. Operation shall be quiet, and the performance standards herein specified shall be provided.
 - b. Design system to control starting and stopping and to prevent damage to motor from over-load or excess current and to automatically disconnect power supply. Apply brake and bring car to rest in event of power failure or safety device operation.
 - c. Controllers shall not have failure modes which results in full power being applied to drive machine operation in event of phase reversal, phase failure or low voltage which might result in elevator malfunction.
2. Provide regenerative VVVF/AC drives that utilize IGBT converter/inverter and dynamic braking during overhauling condition
3. Design unit to limit current, suppress noise, and prevent transient voltage feedback into building power supply. Provide internal heat sink cooling fans for the power drive portion of the converter panels. Conform to IEEE standards 519-1992 for line harmonics and switching noise
4. Isolate unit to minimize noise and vibration transmission. Provide isolation transformers, filter networks, and choke inductors
5. Suppress solid-state converter noises, radio frequency interference, and eliminate regenerative transients induced into the mainline feeders or the building standby power generator
6. Supplemental direct-current power for the operation of hoist machine brake, door operator, dispatch processor, signal fixtures, etc., from separate static power supply

7. Provide a commutation fault protection system to shut off current flow in the event of unexpected high current, which may occur during power regeneration back into the AC line combined with a sudden loss of AC power.

2.13 SEISMIC RESTRAINTS

A. General Properties:

1. Restraints shall permit adjustment during installation to ensure enough clearance between vibration isolated element and rigid restraining device.
2. Restraints shall not be installed until vibration isolators have been loaded and adjusted to achieve the specific static deflection and clearances.

B. Seismic Restraint Description:

1. Restraining devices at all base supported vibration isolated equipment shall be separate components sized and installed to meet the general requirements specified above, may be built into the vibration isolator, or may be provided by anchor bolts which do not short-circuit the vibration isolator

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine elevator areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Examine hoistways, hoistway openings, pits, and machine rooms as constructed; verify critical dimensions; and examine supporting structure and other conditions under which elevator work is to be installed.
 1. For the record, prepare a written report, endorsed by Installer, listing dimensional discrepancies and conditions detrimental to performance or indicating that dimensions and conditions were found to be satisfactory.
 2. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General: Comply with manufacturer's written instructions and requirements of regulatory agencies. Make finished work strong, rigid, neat in appearance, and free from defects. Make plain surfaces smooth and free from warps and buckles. Apply molded members straight and true. Make connections between various members tight to eliminate vibrations.
- B. Welded Construction: Provide welded connections for installing elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustment, inspection, maintenance, and replacement of worn parts. Comply with AWS standards for workmanship and for qualifications of welding operators.
- C. Sound Isolation: Mount rotating and vibrating equipment on vibration-isolating mounts designed to minimize transmission of vibrations to structure and thereby minimize structure-borne noise from elevator system.

- D. Lubrication: Lubricate operating parts of systems, including ropes, as recommended by manufacturers.
- E. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with car. Where possible, delay final adjustment of sills and doors until car is operable in shaft. Reduce clearances to minimum, safe, workable dimension at each landing.
- F. Manufacturer's Nameplates: Including trademarks and other identifying symbols are not allowed on surfaces visible to the public.
- G. Graphics: Engrave on fixtures when visible to public; Helvetica Medium unless otherwise directed.
- H. Fasteners: Not permitted on surfaces exposed to public view except as specified. Where specified and shown, fasteners to be #10-32 tamper resistant security torx type, material and finish to match adjacent surface.
- I. Key Switches: Provide key switches from single manufacturer using same key design. Provide separate key for each switch unless otherwise specified.
- J. Set sills flush with finished floor surface at landing. Fill space under sill solidly with non-shrink, nonmetallic grout.

3.3 FIELD QUALITY CONTROL

- A. Acceptance Testing: On completion of elevator installation and before permitting use (either temporary or permanent) of elevators, perform acceptance tests as required and recommended by ASME A17.1 and by governing regulations and agencies.
- B. Operating Test: Load one elevator of each type to rated capacity and operate continuously for 30 minutes over full travel distance, stopping at each level and proceeding immediately to the next. Record temperature rise of elevator machine during 30-minute test period. Record failure to perform as required.
- C. Performance Testing: Provide personnel, test instruments, and equipment to assist Owner, Architect, and Consultant in making the following tests to assure workmanship and equipment comply with Contract Documents:
 - 1. Contract Speed
 - 2. Floor to floor time
 - 3. Vertical acceleration and deceleration
 - 4. Leveling accuracy
 - 5. Door operation
- D. Advise Owner, Architect, and authorities having jurisdiction in advance of dates and times tests are to be performed on elevators.

- E. Corrections: Replace or remedy defects and discrepancies at no cost to Owner

3.4 FINAL CLEANING AND PAINTING

- A. Clean hoistway and elevator equipment and remove all rust, filings, welding slag, rubbish, loose plaster, mortar drippings, extraneous construction materials, dirt, and dust, including walls, building beams, sill ledges, and divider beams.
- B. Restore all work areas and routes, including floors, walls, and ceilings, to their original condition.
- C. Clean down surfaces and areas which require final painting and finishing work. Cleaning includes removal of rubbish, broom cleaning of floors, removal of any loose plaster or mortar, dust, and other extraneous materials from finish surfaces, and surfaces that will remain visible after the work is complete.
- D. Paint machine room floor and pit floors with two coats of paint appropriate for these spaces.

3.5 FINAL REVIEW REQUIREMENTS

- A. Final review and evaluation of the finished work will be conducted by the Consultant. Notify the Consultant in writing no less than five (5) days prior to the elevators being ready for review. Provide all labor, materials, and equipment necessary to aid in this review and evaluation.
- B. The installation is considered ready for final review when all tests and inspections by AHJs and inspecting authorities have been completed, permits received, final adjusting of all equipment is finished, and elevators restored to regular operation.
- C. Consultant will provide a written punch-list identifying any performance or material deficiencies not in compliance with the specifications. Final Field Review and evaluation will include the following characteristics or conditions at a minimum:
 - 1. At Consultant's option, performance evaluation will be conducted under full load and no-load conditions
 - 2. At Consultant's option, perform a one-hour full load run test, stopping for 10 seconds at each landing, to verify heat rise of less than 50^o C. in motor winding.
 - 3. Floor to floor and door performance times
 - 4. Elevator speed
 - 5. Ride quality including starting, acceleration, full speed ride, deceleration, stopping, and noise level
 - 6. Door operation, noise level, and closing pressure
 - 7. Testing of specified features and operations
- D. Provide the consultant with a completed punch-list verifying that all punch-list items have been addressed and corrected. Consultant will conduct a back-check to verify

3.6 PURCHASER'S INFORMATION

- A. Owner's Manuals: Provide one neatly bound hard copy and one electronic copy of all manufacturer's information, parts lists, straight-line as-installed wiring diagrams, parts list, lubrication charts, operating instructions. Summary page at beginning of manual to identify and include specific information including complete manufacturer information, model, serial number, for each major component to include but not limited to controller, door operator, signal fixtures, guide shoes.
- B. Provide complete software for controller equipment installed.

3.7 PROTECTION

Temporary Use: Comply with the following requirements for elevator used for construction purposes:

- A. Provide car with temporary enclosure, either within finished car or in place of finished car, to protect finishes from damage.
- B. Provide strippable protective film on entrance and car doors and frames.
- C. Provide padded wood bumpers on entrance door frames covering jambs and frame faces.
- D. Provide other protective coverings, barriers, devices, signs, and procedures as needed to protect elevator and elevator equipment.
- E. Do not load elevators beyond their rated weight capacity.
- F. Engage elevator Installer to provide full maintenance service. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as necessary for proper elevator operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
- G. Engage elevator Installer to restore damaged work, if any, so no evidence remains of correction. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

END OF SECTION

SECTION 211313

WET-PIPE SPRINKLER AND STANDPIPE SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. This Section includes the following fire-suppression piping inside the building:
 - 1. Wet pipe sprinkler systems.
 - 2. Standpipe and hose connection system.
- B. Drawings supplied with this specification shall be used as a reference for the requirement and general location of system components.
- C. At the time of bid, all exceptions taken to these Specifications, variances from these Specifications and all substitutions of equipment specified shall be listed in writing and forwarded to Peralta Community College District (Owner). Any such exceptions, variances, or substitutions, which were not listed at the time of bid shall not be approved or considered.
- D. The Work includes all labor, materials, tools, transportation, temporary demolition, and temporary construction necessary to design, fabricate, install, test and flush a fully operational and code compliant automatic sprinkler system throughout the library building as indicated on the drawings that includes:
 - 1. Fire protection mains and risers.
 - 2. Electrically supervised indicating control valves.
 - 3. Check valves.
 - 4. Pressure gauges.
 - 5. Flow and supervisory switches.
 - 6. Overhead pipe, fittings, hangers and sprinklers.
 - 7. Inspector's test connections, main drains and auxiliary drains.
 - 8. Fire-stopping for all openings associated with this Work.
- E. The Work includes all fees and activities required to secure approvals for necessary State and Local permits.
- F. The Work includes preparing and submitting detailed Working Plans, Hydraulic Calculations and Product Data to for submittal to local officials for approval and permit.
- G. The Work includes performing field quality control activities.
- H. The Work includes documenting and submitting the results of integrity and functional testing.

- I. The Work includes performing overall system “Owner Demonstration” test(s) for the Owner’s approval.
- J. The Work includes performing overall system “Final Authority Acceptance” test(s) for Authority approval.
- K. The Work includes preparing and submitting Closeout Documentation including As-built Plans to the Owner.
- L. The Work includes training Owner’s facilities personnel on the operation of the system, required maintenance tasks and frequencies, and the locations of all spare tools and equipment, valves, flow switches, risers and equipment necessary to maintain and operate the sprinkler system.

1.3 DEFINITIONS

- A. Underground Service-Entrance Piping: Underground service piping below the building.

1.4 SYSTEM DESCRIPTIONS

- A. Wet-Pipe Sprinkler System: Automatic sprinklers are attached to piping containing water that is connected to a water supply. Water discharges immediately from sprinklers when they are opened. Sprinklers open when heat melts fusible link or destroys frangible device. Hose connections are included if indicated.

1.5 PERFORMANCE REQUIREMENTS

- A. Fire-suppression sprinkler system design shall be approved by authorities having jurisdiction.
 - 1. Margin of Safety for Available Water Flow and Pressure: 10 percent or 5 PSI, whichever is greater, including losses through water-service piping, valves, and backflow preventers.
 - 2. Sprinkler Occupancy Hazard Classifications:
 - a. All areas except those identified below: Light Hazard.
 - b. Storage Spaces, Mechanical Spaces, Porte Cocheres: Ordinary Hazard
 - 3. Minimum Density for Automatic-Sprinkler Piping Design:
 - a. Light-Hazard Occupancy: 0.10 gpm over 1500-sq. ft.
 - b. Ordinary Hazard: 0.15 gpm over 1500-sq. ft.
 - 4. Maximum Protection Area per Sprinkler (unless otherwise indicated as “extended coverage” on design drawings):
 - a. Light Hazard: 225 sq. ft.
 - b. Ordinary Hazard: 130 sq. ft.
 - 5. Total Combined Hose-Stream Demand Requirement: According to NFPA 13, unless otherwise indicated:

- a. Light Hazard: 100 gpm for 30 minutes.
 - b. Ordinary Hazard: 250 gpm for 60 to 90 minutes.
6. The standpipe system shall deliver 500 gpm at the two most hydraulically remote standpipe connections at a residual pressure of 100 psi. Each additional standpipe shall have a flow rate of 250 gpm at a residual pressure of 100 psi.

1.6 ORDER OF PRECEDENCE

- A. Should conflicts arise out of discrepancies between documents referenced in this specification, the most stringent requirement shall apply; however, should a level of stringency be indeterminable, the discrepancies shall be resolved as follows:
1. State and local codes shall take precedence over this specification.
 2. The National Fire Protection Association Standards shall take precedence over this specification.
 3. Drawing specific requirements as documented on the RFP drawing package.

1.7 SUBMITTALS

- A. Product Data: For the following:
1. Piping materials, including dielectric fittings, and sprinkler specialty fittings.
 2. Pipe hangers and supports.
 3. Valves, including listed fire-protection valves, unlisted general-duty valves, and specialty valves and trim.
 4. Sprinklers, escutcheons, and guards. Include sprinkler flow characteristics, mounting, finish, and other pertinent data.
 5. Hose connections, including size, type, and finish.
 6. Fire department connections, including type; number, size, and arrangement of inlets; caps and chains; size and direction of outlet; escutcheon and marking; and finish.
 7. Alarm devices, including electrical data.
- B. Shop Drawings: For wet-pipe sprinkler systems.
1. Include plans, elevations, sections, details, and attachment to other work.
 2. Include diagrams for power, signal, and control wiring.
- C. Coordination Drawings: Sprinkler systems, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Domestic water piping.
 2. Compressed air piping.
 3. HVAC hydronic piping.
 4. Items penetrating finished ceiling including the following:
 - a. Lighting fixtures.
 - b. Air outlets and inlets.

- D. Hydraulic supply report results.
- E. Approved Sprinkler Piping Drawings: Working plans, prepared according to NFPA 13, that have been approved by authorities having jurisdiction, including hydraulic calculations, if applicable.
- F. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 13. Include "Contractor's Material and Test Certificate for Aboveground Piping" and "Contractor's Material and Test Certificate for Underground Piping."
- G. Welding certificates.
- H. Field quality-control test reports.
- I. Operation and Maintenance Data: For sprinkler specialties to include in emergency, operation, and maintenance manuals.

1.8 AS-BUILT (RECORD) DRAWINGS

- A. On a daily basis the contractor's superintendent shall record as built conditions on a set of Shop Drawings maintained at the job site. Three sets of Shop Drawings reflecting as built conditions shall be available prior to and for use in the final acceptance test. Two weeks after the acceptance test and before final acceptance of the work, furnish three complete sets of as built drawings. The drawings shall be prepared on uniform sized sheets not less than 36 by 48 inches in size. In addition, provide a USB flash drive containing AutoCAD (Version to be coordinated with Owner) DWG and PDF format of all as built drawings and schematics. The drawings shall include:
 - 1. As built location of all devices and equipment.
 - 2. Riser diagram.
 - 3. All deviations from the project drawings and approved shop drawings.

1.9 QUALITY ASSURANCE

- A. Equipment and devices shall be labeled and listed for the intended use in the Underwriters Laboratories, Inc. (UL), UL FPED *Fire Protection Equipment Directory*.
- B. Electrical components, devices, and accessories shall be Listed and labeled as defined in NFPA 70, by a testing agency acceptable to authorities having jurisdiction.
- C. All materials and equipment shall be new and unused.
- D. All equipment shall be first quality and capable of complying with all requirements of this specification and shall have been in continuous production and in service in commercial applications for at least one year. Obsolete equipment shall not be used.
- E. Installer Qualifications:

1. Installer's responsibilities include designing, fabricating, and installing fire-suppression systems and providing professional engineering services needed to assume engineering responsibility. Installer shall base calculations on results of fire-hydrant flow test or hydraulic supply analysis.
 - a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified professional engineer.
 - b. Foreman: Provide proof of competence of both their company and the individual foreman that will be assigned to this project, in the area of installing automatic fire sprinkler systems for at least five (5) years and acceptable to Owner. Once assigned, the foreman shall not be changed without the approval of the Owner.
 - c. Service Organization: Capable of providing a service technician on-site within 4 hours of a request for on-site service.

- F. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.

- G. Fire-suppression-system equipment, specialties, accessories, installation, and testing shall comply with the following:
 1. NFPA 13, "Installation of Sprinkler Systems."
 2. NFPA 14, "Installation of Standpipe and Hose Systems."
 3. NFPA 24, "Installation of Private Fire Service Mains and Their Appurtenances."
 4. California Fire Code
 5. DSA Guidelines

1.10 COORDINATION

- A. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including light fixtures, HVAC equipment, and partition assemblies.
- B. Coordinate sprinkler installation with other portions of the Work to comply with NFPA 13 requirements for obstruction to sprinkler discharge.
- C. Coordinate pipe installation with other portions of the Work to facilitate proper pitch and accessibility for components installed.
- D. Coordinate with the Fire Alarm portion of the Work for the connection and testing of waterflow and valve supervisory switches.
- E. Coordinate sprinkler and pipe installation with other trades, etc.

1.11 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Sprinkler Cabinets: Finished, wall-mounting, steel cabinet with hinged cover, with space for minimum of six spare sprinklers plus sprinkler wrench. Include number of sprinklers

required by NFPA 13 and sprinkler wrench. Include separate cabinet with sprinklers and wrench for each type of sprinkler on Project.

1.12 WARRANTY

- A. Guarantee equipment installed to be free from defects in workmanship and inherent mechanical defects for a period of one (1) year from the date of substantial completion of the project.

PART 2 - PRODUCTS

2.1 STEEL PIPE AND FITTINGS

- A. Sprinkler piping shall be hydraulically calculated and sized, using actual C factors for the material used. These computer calculations shall be submitted for approval as a part of the shop drawing submittal.
- B. Standard-Weight, Black-Steel Pipe: ASTM A 53/A 53M, Type E, Grade B. Pipe ends may be factory or field formed to match joining method.
- C. Steel Pipe: Piping 2 ½" and smaller shall be Schedule 40 black steel. Piping larger than 2 ½" shall be Schedule 40 or Schedule 10 black steel.
- D. Black-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, standard-weight, seamless steel pipe with threaded ends.
- E. Uncoated-Steel Couplings: ASTM A 865/A 865M, threaded.
- F. Uncoated, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.
- G. Malleable- or Ductile-Iron Unions: UL 860.
- H. Cast-Iron Flanges: ASME 16.1, Class 125.
- I. Steel Welding Fittings: ASTM A 234/A 234M and ASME B16.9.
 - 1. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- J. Grooved-Joint, Steel-Pipe Appurtenances:
 - 1. Mechanical-T and -Cross Fittings: UL 213, ductile-iron housing with gaskets, bolts and nuts, and threaded, locking-lug, or grooved outlets.
 - 2. Grooved-Joint, Steel-Pipe Appurtenances:
 - 3. Pressure Rating: 175-psig minimum.
- K. Grooved-End-Pipe Couplings for Steel Piping: AWWA C606 and UL 213 rigid pattern, unless otherwise indicated, for steel-pipe dimensions. Include ferrous housing sections, EPDM-rubber gasket, and bolts and nuts.

- L. All fittings on suction side of pump shall be flanged; remaining pump room fittings may be flanged, screwed, grooved or welded as permitted by NFPA 20.
- M. Remaining fittings on steel pipe may be welded, screwed or grooved; galvanized fittings shall be used on galvanized pipe. The used of plain end fittings is prohibited.

2.2 SPRINKLER SPECIALTY FITTINGS

- A. Sprinkler specialty fittings shall be UL listed or FMG approved, with 175-psig minimum working-pressure rating and made of materials compatible with piping.
- B. Outlet Specialty Fittings:
 - 1. Mechanical-T and -Cross Fittings: UL 213, ductile-iron housing with gaskets, bolts and nuts, and threaded, locking-lug, or grooved outlets.
- C. Sprinkler Drain and Alarm Test Fittings: Cast- or ductile-iron body; with threaded or locking-lug inlet and outlet, test valve, and orifice and sight glass.
- D. Sprinkler Branch-Line Test Fittings: Brass body with threaded inlet, capped drain outlet, and threaded outlet for sprinkler.
- E. Sprinkler Inspector's Test Fitting: Cast- or ductile-iron housing with threaded inlet and drain outlet and sight glass.

2.3 UL LISTED FIRE-PROTECTION VALVES

- A. Valves shall be UL listed or FMG approved, with 175-psig minimum pressure rating.
- B. Ball Valves: Comply with UL 1091, except with ball instead of disc.
 - 1. NPS 1-1/2 and Smaller: Bronze body with threaded ends.
 - 2. NPS 2 and NPS 2-1/2: Bronze body with threaded ends or ductile-iron body with grooved ends.
 - 3. NPS 3: Ductile-iron body with grooved ends.
- C. Butterfly Valves: UL 1091.
 - 1. NPS 2 and Smaller: Bronze body with threaded ends.
 - 2. NPS 2-1/2 and Larger: Bronze, cast-iron, or ductile-iron body; wafer type or with flanged or grooved ends.
- D. Check Valves NPS 2 and Larger: UL 312, swing type, cast-iron body with flanged or grooved ends.
- E. Gate Valves: UL 262, OS&Y type.
 - 1. NPS 2 and Smaller: Bronze body with threaded ends.
 - 2. NPS 2-1/2 and Larger: Cast-iron body with flanged ends.

- F. Indicating Valves: UL 1091, with integral indicating device and ends matching connecting piping.
 - 1. NPS 2 and Smaller: Ball or butterfly valve with bronze body and threaded ends.
 - 2. NPS 2-1/2 and Larger: Butterfly valve with cast- or ductile-iron body; wafer type or with flanged or grooved ends.

2.4 UNLISTED GENERAL-DUTY VALVES

- A. Ball Valves NPS 2 and Smaller: MSS SP-110, 2-piece copper-alloy body with chrome-plated brass ball, 600-psig minimum CWP rating, blowout-proof stem, and threaded ends.
- B. Check Valves NPS 2 and Smaller: MSS SP-80, Type 4, Class 125 minimum, swing type with bronze body, nonmetallic disc, and threaded ends.
- C. Gate Valves NPS 2 and Smaller: MSS SP-80, Type 2, Class 125 minimum, with bronze body, solid wedge, and threaded ends.
- D. Globe Valves NPS 2 and Smaller: MSS SP-80, Type 2, Class 125 minimum, with bronze body, nonmetallic disc, and threaded ends.

2.5 SPECIALTY VALVES

- A. Sprinkler System Control Valves: UL listed or FMG approved, cast- or ductile-iron body with flanged or grooved ends, and 175-psig minimum pressure rating.
 - 1. Riser Check Valves: UL 193, designed for horizontal or vertical installation, with bronze grooved seat with O-ring seals, single-hinge pin, and latch design. Include trim sets for drain and pressure gauges.
- B. Automatic (ball drip) Drain Valves: UL 1726, NPS 3/4, ball-check device with threaded ends.

2.6 MANUAL CONTROL STATIONS

- A. Manual Control Stations: UL listed or FMG approved, hydraulic operation, with union, NPS 1/2 pipe nipple, and bronze ball valve. Include metal enclosure labeled "MANUAL CONTROL STATION" with operating instructions and cover held closed by breakable strut to prevent accidental opening.

2.7 SPRINKLERS

- A. Sprinklers shall be UL listed or FMG approved, with 175-psig minimum pressure rating.
- B. Sprinklers shall be of a type, style and specification as indicated on the drawings. Heads shall be heavy duty type and installed either exposed or concealed per Architect's design.
- C. Student toilet rooms shall be provided with concealed flush to ceiling style heads having a painted cover plate, per Architect's design.

D. Operating Element: Quick Response (QR) as indicated or required by application.

E. Sprinkler types, features, and options as follows:

1. Pendent sprinklers.
2. Upright sprinklers.
3. Sidewall sprinklers

F. Available Manufacturers

1. Star Sprinkler Inc.
2. Central Sprinklers Inc.
3. Viking.

2.8 FIRE DEPARTMENT CONNECTIONS

A. Two-Way, Exposed Fire Department Connection: UL 405, 175-psig minimum pressure rating; with corrosion-resistant-metal body with brass inlets, brass lugged caps with gaskets and brass chains, and brass lugged swivel connections. Include inlets with threads according to NFPA 1963 and matching local fire department sizes and threads, outlet with pipe threads, extension pipe nipples, check devices or clappers for inlets, and marking similar to "AUTO SPKR and Standpipe"

1. Type: two-way, exposed, freestanding.
2. Finish: Polished brass.

B. Fire Department Hose Valves: 2-1/2-inch hose valves for fire department use shall be installed in all building stairwells. Valves shall be recessed in approved fire department valve cabinets, where applicable.

2.9 ALARM DEVICES

A. Alarm-device types shall match piping and equipment connections.

B. Electrically Operated Alarm: UL 464, with an approved diameter for the City of Oakland, vibrating-type, metal alarm bell with red-enamel factory finish and suitable for outdoor use.

C. Water-Flow Indicator: UL 346, electrical-supervision, paddle-operated-type, water-flow detector with 250-psig pressure rating and designed for horizontal or vertical installation. Include two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-set, field-adjustable retard element to prevent false signals and tamperproof cover that sends signal if removed.

D. Valve Supervisory Switch: UL 753, electrical, single-pole, double-throw switch with normally closed contacts. Include design that signals controlled valve is in other than fully open position.

2.10 PRESSURE GAUGES

- A. Description: UL 393, 3-1/2- to 4-1/2-inch- diameter, dial pressure gauge with range of 0 to 250 psig minimum.

- 1. Water System Piping: Include caption "WATER" on dial face.

2.11 SIGNS

- A. Steel with vitreous enamel finish, lettering on contrasting background to identify and indicate the function of:

- 1. Control valves.
 - 2. Drain, test, and check valves.
 - 3. Hydraulic Design Nameplate Data: Size approx. 9 x 12 inches, inscribed with the following:
 - a. SPRINKLER SYSTEM HYDRAULICALLY DESIGNED (in block letters).
 - b. Location and area of hydraulically designed section.
 - c. Discharge density over designed area in gallons per minute.
 - d. Residual pressure at base of riser supplying water to designed section.

2.12 HANGERS

- A. Pipe hangers and anchoring means shall be designed in accordance with NFPA 13.
- B. Pipe shall be supported with clevis-type or swivel ring hangers of steel constructional hangers shall be UL listed for their intended use.
- C. Hangers shall be supported directly by building structure by listed expansion anchors, beam clamps, center load clamps, wall brackets, concrete inserts, wood screws/fasteners or equal hanging systems certified by a professional engineer to support the sprinkler piping as required by NFPA 13 and all other supported loads.
- D. Hangers shall account for all seismic loading on system piping.
- E. Only sprinkler or standpipe piping may be supported by sprinkler/standpipe system hangers; no other utilities, equipment or devices shall be supported by sprinkler hangers or piping.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Hydraulic supply analysis shall be performed. Data shall not be more than six months old.
- B. Report test results promptly and in writing.

3.2 PIPING APPLICATIONS, GENERAL

- A. Welded piping must be shop welded. Other pipe and fitting materials and other joining methods must also be specified to permit field assembly of shop-welded piping.

1. Shop weld pipe joints where welded piping is indicated.
2. Do not use welded joints for galvanized-steel pipe.
3. Flanges, flanged fittings, unions, nipples, and transition and special fittings with finish and pressure ratings same as or higher than system's pressure rating may be used in aboveground applications, unless otherwise indicated.
4. Piping between Fire Department Connections and Check Valves: Galvanized, standard-weight steel pipe with threaded ends; cast- or malleable-iron threaded fittings; and threaded or grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.
5. Underground Service-Entrance Piping: Ductile-iron, mechanical-joint pipe and fittings and restrained joints. Include corrosion-protective encasement.

3.3 SPRINKLER SYSTEM PIPING APPLICATIONS

- A. If more than one type of material and joining method is used for a particular pipe size, identify materials on Drawings and show points of transition from one material to another.
 1. Standard-Pressure, Wet-Pipe Sprinkler System, 175-psig Maximum Working Pressure:
 - a. Sprinkler-Piping Fitting Option: Specialty sprinkler fittings, NPS 2-1/2 and smaller, including mechanical-T and -cross fittings, may be used downstream from sprinkler zone valves.
 - b. NPS 2: Threaded-end, standard-weight steel pipe; cast- or malleable-iron threaded fittings; and threaded joints.
 - c. NPS 2-1/2 to NPS 6: Grooved-end, standard-weight steel pipe; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.

3.4 VALVE APPLICATIONS

- A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
 1. Listed Fire-Protection Valves: UL listed and FMG approved for applications where required by NFPA 13.
 - a. Shutoff Duty: Use ball, butterfly, or gate valves.
 2. Unlisted General-Duty Valves: For applications where UL-listed and FMG-approved valves are not required by NFPA 13.
 - a. Shutoff Duty: Use ball, butterfly, or gate valves.
 - b. Throttling Duty: Use ball or globe valves.

3.5 JOINT CONSTRUCTION

- A. Threaded Joints: Comply with NFPA 13 for pipe thickness and threads.
- B. Grooved Joints: Assemble joints with listed coupling and gasket, lubricant, and bolts.

1. Steel Pipe: Square-cut. Use grooved-end fittings and rigid, grooved-end-pipe couplings, unless otherwise indicated.
- C. Dissimilar-Metal Piping Joints: Construct joints using dielectric fittings compatible with both piping materials.
1. NPS 2 and Smaller: Use dielectric unions, couplings, or nipples.
 2. NPS 2-1/2 to NPS 4: Use dielectric flanges.
 3. NPS 5 and Larger: Use dielectric flange insulation kits.

3.6 SERVICE-ENTRANCE PIPING

- A. Connect fire-suppression piping to water-service piping of size and in location indicated for service entrance to building. Refer to Division 22 Section "Facility Water Distribution Piping" for exterior piping.
- B. Install shutoff valve, backflow preventer, pressure gauge, drain, and other accessories indicated at connection to water-service piping. Refer to Division 22 Section "Facility Water Distribution Piping" for backflow preventers.
- C. Install shutoff valve, check valve, pressure gauge, and drain at connection to water service.

3.7 PIPING INSTALLATION

- A. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.
1. Deviations from approved working plans for piping require written approval from authorities having jurisdiction and the Owner. File written approval with Architect before deviating from approved working plans
 2. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including light fixtures, HVAC equipment, and partition assemblies.
- B. Piping Standard: Comply with NFPA 13 requirements for installation of sprinkler piping.
- C. Install seismic restraints on piping. Comply with NFPA 13 requirements for seismic-restraint device materials and installation.
- D. Use approved fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.
- E. Install unions adjacent to each valve in pipes NPS 2 and smaller. Unions are not required on flanged devices or in piping installations using grooved joints.
- F. Install flanges or flange adapters on valves, apparatus, and equipment having NPS 2-1/2 and larger connections.

- G. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, sized and located according to NFPA 13.
- H. Install sprinkler piping with drains for complete system drainage.
- I. All piping shall be installed at a height so as not to obstruct any portion of a window, doorway, stairway or a passageway, and shall not interfere with the operation of any mechanical or electrical equipment.
- J. Install ball drip valves to drain piping between fire department connections and check valves. Drain to floor drain or outside building.
- K. Install alarm devices in piping systems.
- L. Hangers and Supports: Comply with NFPA 13 for hanger materials.
 - 1. Install sprinkler system piping according to NFPA 13.
- M. Install pressure gauges on riser or feed main, at each sprinkler test connection, and at top of each riser. Include pressure gauges with connection not less than NPS 1/4 and with soft metal seated globe valve, arranged for draining pipe between gauge and valve. Install gauges to permit removal and install where they will not be subject to freezing.
- N. Fill wet-pipe sprinkler system piping with water.

3.8 VALVE INSTALLATION

- A. Install listed fire-protection valves, unlisted general-duty valves, specialty valves and trim, controls, and specialties according to NFPA 13 and authorities having jurisdiction.
- B. Install listed fire-protection shutoff valves supervised-open, located to control sources of water supply except from fire department connections. Install permanent identification signs indicating portion of system controlled by each valve.

3.9 SPRINKLER APPLICATIONS

- A. Sprinklers are to be provided and installed as indicated on the drawings.
- B. Where applicable, all public and occupant areas shall be equipped with concealed sprinklers with non-painted metallic cover plates.
- C. All mechanical, closet, storage and plenum spaces shall use brass finish sprinklers.

3.10 SPRINKLER INSTALLATION

- A. Install sprinklers in accordance with NFPA 13 and in the general patterns indicated on the submitted Working Drawings.

- B. The contractor shall be responsible for furnishing additional sprinklers and piping to provide additional coverage that may be required to avoid lights and diffusers not indicated on the drawings.
- C. Contractor responsible for relocating lights, if necessary to accommodate the contractors shop drawings, if the lights constitute an obstruction to sprinkler pattern development in accordance with NFPA 13.
- D. Provide recessed pendent sprinklers with white finish centered in the width of ceiling tiles. Pendant sprinklers located in 4-foot long ceiling tiles may be installed only at the mid or quarter points of the tile's long side.
- E. Do not install sprinklers, mains or branchline pipes in locations where likely to be inadvertently damaged, such as in front of access hatches, doors, cabinets, etc.

3.11 FIRE DEPARTMENT CONNECTIONS

- A. Install two-way, freestanding, fire department connections.
- B. Install ball drip valve at each check valve for fire department connection.

3.12 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment to allow service and maintenance.
- C. Connect water-supply piping to fire-suppression piping. Include backflow preventer between potable-water piping and fire-suppression piping.
- D. Install ball drip valves at each check valve for fire department connection. Drain to floor drain or outside building.
- E. Connect piping to specialty valves, specialties, fire department connections, and accessories.
- F. Connect alarm devices to fire alarm.
- G. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.13 LABELING AND IDENTIFICATION

- A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13.

3.14 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Energize circuits to electrical equipment and devices.
4. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
5. Coordinate with fire alarm tests. Operate as required.
6. Verify that equipment hose threads are same as local fire department equipment.

B. Report test results promptly and in writing to Owner and authorities having jurisdiction.

3.15 CLEANING AND PROTECTION

- A. Clean dirt and debris from sprinklers.
- B. Remove and replace sprinklers with paint other than factory finish.
- C. Protect sprinklers from damage until Substantial Completion.

3.16 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain specialty valves.

END OF SECTION 211313

SECTION 213113

ELECTRIC-DRIVE, CENTRIFUGAL FIRE PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. This Section includes electric-drive, split-case centrifugal fire pumps and the following:
 - 1. Full service fire pump controllers.
 - 2. Fire-pump accessories and specialties.
 - 3. Pressure-maintenance pumps, controllers, accessories, and specialties.
 - 4. Fire pump power is provided under a separate contract. Fire pump monitoring and alarms are furnished by the Electrical Contractor.
- B. Drawings supplied with this specification shall be used as a reference for the requirement and general location of system components. Work includes visiting the site to observe the existing conditions, and confirmation of the required quantities of devices and specific options for locations of the same.
- C. At the time of bid, all exceptions taken to these Specifications, variances from these Specifications and all substitutions of equipment specified shall be listed in writing and forwarded to Peralta Community College District (Owner). Any such exceptions, variances, or substitutions, which were not listed at the time of bid shall not be approved or considered.
- D. The Work includes all labor, materials, tools, transportation, temporary demolition, and temporary construction necessary to design, fabricate, install, and test a fully operational and code compliant electric fire pump and controller as indicated on the drawings.
- E. The Work includes all fees and activities required to secure approvals for necessary State and Local permits.
- F. The Work includes preparing and submitting detailed Working Plans, Hydraulic Calculations and Product Data to the Owner for review prior to submitting same to local officials for approval and permit.
- G. The Work includes performing field quality control activities.
- H. The Work includes documenting and submitting the results of integrity and functional testing.
- I. The Work includes performing overall system, half-day "Owner Demonstration" test(s) for the Owner's approval.
- J. The Work includes performing overall system, half-day "Final Authority Acceptance" test(s) for Authority approval.

- K. The Work includes preparing and submitting Closeout Documentation including As-built Plans to the Owner.
- L. The Work includes training Owner's facilities personnel on the operation of the system, required maintenance tasks and frequencies, and the locations of all spare tools and equipment necessary to maintain and operate the system.

1.3 PERFORMANCE REQUIREMENTS

- A. Compliance: Comply with NFPA 20, the California Fire Code, and DSA Guidelines.
- B. Seismic Performance: Fire pumps shall withstand the effects of earthquake motions determined according to NFPA and the California Fire Code.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified (and the unit will be fully operational after the seismic event)."
 - 2. Component Importance Factor: 1.5
- C. Pump, Equipment, Accessory, Specialty, and Piping Pressure Rating: 175-psig minimum working-pressure rating, unless otherwise indicated.

1.4 ORDER OF PRECEDENCE

- A. Should conflicts arise out of discrepancies between documents referenced in this specification, the most stringent requirement shall apply; however, should a level of stringency be indeterminable, the discrepancies shall be resolved as follows:
 - 1. State and local codes shall take precedence over this specification.
 - 2. The National Fire Protection Association Standards shall take precedence over this specification.
 - 3. Drawing specific requirements as documented on the RFP drawing package.

1.5 SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, certified pump performance curves with each selection point indicated, operating characteristics, and furnished accessories and specialties for each fire pump and pressure-maintenance pump. Products may include but are not limited to:
 - 1. Pumps
 - 2. Pump controllers
 - 3. Motor
 - 4. Air-release valves
 - 5. Circulation relief valves
 - 6. Pressure gauges
 - 7. Eccentric reducers
 - 8. Concentric reducers
 - 9. Pressure-maintenance pumps
 - 10. Enclosures

11. Control valves
 12. Sensing lines
 13. Flow meters
- B. Shop Drawings: For fire pumps and drivers, fire-pump controllers, fire-pump accessories and specialties, pressure-maintenance pumps, pressure-maintenance-pump controllers, and pressure-maintenance-pump accessories and specialties. Include plans, elevations, sections, details, and attachments to other work.
1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 2. Wiring Diagrams: Power, signal, and control wiring.
- C. Product Certificates: For each type of fire pump and fire-pump controller, signed by product manufacturer.
- D. Source quality-control test reports.
- E. Field quality-control test reports.
- F. Operation and Maintenance Data: For fire pumps and drivers, pressure-maintenance pumps, controllers, accessories and specialties, alarm panels, and flowmeter systems to include in emergency, operation, and maintenance manuals.

1.6 AS-BUILT (RECORD) DRAWINGS

- A. On a daily basis the contractor's superintendent shall record as built conditions on a set of Shop Drawings maintained at the job site. Three sets of Shop Drawings reflecting as built conditions shall be available prior to and for use in the final acceptance test. Two weeks after the acceptance test and before final acceptance of the work, furnish three complete sets of as built drawings. The drawings shall be prepared on uniform sized sheets not less than 36 by 48 inches in size. In addition, provide a USB flash drive containing AutoCAD (Version to be coordinated with Owner) DWG and PDF format of all as built drawings and schematics. The drawings shall include:
1. As built location of all devices and equipment.
 2. As built schematics of electrical service connections
 3. All deviations from the project drawings and approved shop drawings.

1.7 QUALITY ASSURANCE

- A. Source Limitations: Obtain fire pumps, pressure-maintenance pumps, and controllers through one source from a single manufacturer for each type of equipment.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of fire pumps, pressure-maintenance pumps, and controllers and are based on specific systems indicated.
- C. Equipment and devices shall be labeled and listed for the intended use in the Underwriters Laboratories, Inc. (UL), UL FPED *Fire Protection Equipment Directory*.

- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- E. All materials and equipment shall be new and unused.
- F. All equipment shall be first quality and capable of complying with all requirements of this specification and shall have been in continuous production and in service in commercial applications for at least one year. Obsolete equipment shall not be used.
- G. Installer Qualifications:
 - 1. Installer's responsibilities include designing, fabricating, and installing fire-suppression systems and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire hydrant flow test or hydraulic supply analysis.
 - a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified professional engineer.
 - b. Foreman: Provide proof of competence of both their company and the individual foreman that will be assigned to this project, in the area of installing automatic fire sprinkler systems for at least five (5) years and acceptable to Owner. Once assigned, the foreman shall not be changed without the approval of the Owner.
 - c. Service Organization: Capable of providing a service technician on-site within 4 hours of a request for on-site service.
- H. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
- I. Comply with NFPA 20, "Stationary Pumps for Fire Protection," for fire pumps, drivers, controllers, accessories, and their installation.

1.8 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Pad and grouting of the pump base is by others.

1.9 WARRANTY

- A. Guarantee equipment installed to be free from defects in workmanship and inherent mechanical defects for a period of one (1) year from the date of substantial completion of the project.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified in Section 2.2 C1.

2.2 CENTRIFUGAL FIRE PUMPS

- A. Description, General: UL 448, factory-assembled and -tested, electric-drive, centrifugal fire pumps capable of furnishing not less than 150 percent of rated capacity at not less than 65 percent of total rated head and with shutoff head limited to 5 percent of total rated head.
 1. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
 2. Nameplate: Complete with capacities, characteristics, and other pertinent data.
- B. Fabricate base and attachment to fire pumps, pressure-maintenance pumps, and controllers with reinforcement to resist movement of pumps and controllers during a seismic event when their bases are anchored to building structure.
- C. Single-Stage, Vertical In-Line Fire Pumps: End suction type with pump and driver mounted on same base and connected with coupling.
 1. Available Manufacturers:
 - a. A-C Pump; ITT Industries.
 - b. Armstrong Darling, Inc.
 - c. Aurora Pump; Pentair Pump Group.
 - d. Fairbanks Morse; Pentair Pump Group.
 - e. Paco Pumps, Inc.
 - f. Patterson Pump Company.
 - g. Reddy-Buffaloes Pump Co.
 - h. Sterling Peerless Pump; Sterling Fluid Systems Group.
 2. Pump: Axially split cast-iron casing with suction and discharge flanges machined to ASME B16.1, Class 125 dimensions, unless otherwise indicated.
 - a. Impeller: Cast bronze of construction to match fire pump, statically and dynamically balanced, and keyed to shaft.
 - b. Wear Rings: Replaceable, bronze.
 - c. Shaft and Sleeve: Steel shaft with bronze sleeve.
 - 1) Shaft Bearings: Grease-lubricated ball bearings in cast-iron housing.
 - 2) Seals: Stuffing box with minimum of four rings of graphite-impregnated braided yarn and bronze packing gland.
 3. Coupling: Flexible and capable of absorbing torsional vibration and shaft misalignment. Include metal coupling guard.
 4. Driver: UL-listed, NEMA MG 1, open-drip proof, squirrel-cage, induction motor complying with NFPA 20 and NFPA 70. Include wiring compatible with controller used.
- D. Fire-Pump Characteristics and Specialty Data:

1. The following Fire Pump Criteria will be determined in the design process:
 - a. Rated Capacity: 750 gallons per minute.
 - b. Total Rated Head: 110 pounds per square inch.
 - c. Inlet Size: 6 inch.
 - d. Outlet Size: 6 inch.
 - e. Outlet Flange Class 125.
2. Speed: Same as driver.
3. Electric-Motor Driver: 75 HP, 3600 RPM, 3 Phase, 60 Hz.
4. Test Header Size: 6 inch.
5. Hose Valves Required: 3.
6. Hose Valve Size: NPS 2 ½ inches.

2.3 FIRE-PUMP CONTROLLERS

- A. Fire-Pump Controllers, General: UL 218 and NFPA 20; listed for electric-drive, fire-pump service and service entrance; combined automatic and manual operation; factory assembled and wired; and factory tested for capacities and electrical characteristics. Provide a variable frequency drive to control the speed of the fire pump for the purpose of limiting system pressure in the sprinkler system.
 1. Available Manufacturers:
 - a. Firetrol, Inc.
 - b. Hubbell Industrial Controls, Inc.
 - c. Joslyn Clark.
 - d. Master Control Systems, Inc.
 - e. Metron, Inc.
 2. Rate controllers for scheduled fire-pump horsepower and short-circuit withstand rating at least equal to short-circuit current available at controller location. Take into account cable size and distance from substation or supply transformers.
 3. Enclosure: UL 50, Type 2, drip proof, indoor, unless special-purpose enclosure is indicated. Include manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
 4. Controls, devices, alarms, functions, and operations listed in NFPA 20 as required for drivers and controller types used, and specific items listed.
 - a. Isolating means and circuit breaker.
 - b. "Power on" pilot lamp.
 - c. Fire-alarm system connections for indicating motor running condition, loss-of-line power, and line-power phase reversal.
 - d. Automatic and manual operation, and minimum run-time relay to prevent short cycling.
 - e. Water-pressure-actuated switch with independent high and low calibrated adjustments responsive to water pressure in fire-suppression piping.
 - f. Automatic and manual shutdown.
 - g. System pressure recorder, electric ac driven with spring backup.

5. Nameplate: Complete with capacity, characteristics, approvals and listings, and other pertinent data.
6. Controller Sensing Pipes: Fabricate pipe and fittings according to NFPA 20 with nonferrous-metal sensing piping, NPS 1/2, with globe valves for testing controller mechanism from system to pump controller as indicated. Include bronze check valve with 3/32-inch orifice in clapper or ground-face union with noncorrosive diaphragm having 3/32-inch orifice.

B. Full-Service Fire-Pump Controllers:

1. Type Starting: Across the line.
2. Mounting: Floor stand type for field electrical connections.

2.4 FIRE-PUMP ACCESSORIES AND SPECIALTIES

A. Match fire-pump suction and discharge ratings as required for fire-pump capacity rating. Include the following:

1. Automatic air-release valve.
2. Circulation relief valve.
3. Suction and discharge pressure gauges.
4. Eccentric-tapered reducer at suction inlet.
5. Concentric-tapered reducer at discharge outlet.
6. Test-Header Manifold: Ductile-iron, cast steel or brass body for hose valves, hemispherical in construction, with sufficient number of 2 1/2" valves, UL listed and capable of the designed flow in gallons per minute.
7. Hose Valves: UL 668, straightway pattern, and bronze. Include NFPA 1963 hose thread that complies with local fire department standards and finish same as for test-header manifold escutcheon plate. Valves will be in place only for pump testing; provide caps for openings when valves are stored.
8. Ball Drip Valve: UL 1726.
9. Finish: Manufacturer's standard factory-applied red paint unless brass or other finish is specified.

2.5 PRESSURE-MAINTENANCE PUMPS

A. Pressure-Maintenance Pumps, General: Factory-assembled and -tested pumps with electric-motor driver, controller, and accessories and specialties. Include cast-iron or stainless-steel casing and bronze or stainless-steel impellers, mechanical seals, and suction and discharge flanges machined to ASME B16.1, Class 125 dimensions unless Class 250 flanges are indicated and except that connections may be threaded in sizes where flanges are not available.

1. Finish: Manufacturer's standard color paint applied to factory-assembled and -tested unit before shipping.
2. Nameplate: Complete with capacity, characteristics, and other pertinent data.

B. Regenerative-Turbine, Pressure-Maintenance Pumps: Close-coupled type complying with HI 1.1-1.2 and HI 1.3 requirements for regenerative-turbine centrifugal pumps. Include base.

1. Available Manufacturers:

- a. Aurora Pump; Pentair Pump Group.
 - b. Crane Pumps & Systems, Inc.
 - c. Fairbanks Morse; Pentair Pump Group.
 - d. Grundfos
 - e. MTH Tool Co., Inc.
 - f. Paco Pumps, Inc.
2. Driver: NEMA MG 1, open-drip proof, squirrel-cage, induction motor complying with NFPA 20 and NFPA 70. Include wiring compatible with controller used.
- C. Controllers: UL 508; factory-assembled, -wired, and -tested, across-the-line type for combined automatic and manual operation. Provide a variable frequency drive to control the speed of the fire pump for the purpose of limiting system pressure in the sprinkler system.
- 1. Available Manufacturers:
 - a. Firetrol, Inc.
 - b. Hubbell Industrial Controls, Inc.
 - c. Tornatech
 - d. Joslyn Clark.
 - e. Master Control Systems, Inc.
 - f. Metron, Inc.
 - 2. Enclosure: UL 508 and NEMA 250, Type 2, wall-mounting type for field electrical wiring.
 - a. Finish: Manufacturer's standard color paint applied to factory-assembled and -tested unit before shipping.
 - 3. Rate controller for scheduled horsepower and include the following:
 - a. Fusible disconnect switch.
 - b. Pressure switch.
 - c. Hand-off-auto selector switch.
 - d. Pilot light.
 - e. Running period timer.
- D. Accessories and Specialties: Match pressure-maintenance-pump suction and discharge ratings as required for pump capacity rating. Include the following:
- 1. Circulation relief valve.
 - 2. Suction and discharge pressure gauges.
- E. The following Fire Pump Criteria will be determined in the design process. Pressure-Maintenance-Pump Characteristics and Specialty Data:
- 1. Rated Capacity: 7.5 gpm.
 - 2. Total Rated Pressure: 121 psi.
 - 3. Electric-Motor Driver Size: Approximately 1.5 HP, 3 Phase, 60 Hz.

2.6 PRESSURE GAUGES

- A. Description: UL 393, 3-1/2- to 4-1/2-inch- (90- to 115-mm-) diameter dial with range of 0-250 psig (0- to 1725-kPa) (0- to 2070-kPa) minimum. Include caption "WATER" on dial face.
 - 1. Available Manufacturers:
 - a. AGF Manufacturing Co.
 - b. AMETEK, Inc.; U.S. Gauge.
 - c. Brecco Corporation.
 - d. Dresser Equipment Group; Instruments Div.
 - e. Marsh Bellofram.
 - f. WIKA Instrument Corporation.

2.7 GROUT

- A. Description: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
 - 1. Properties: Nonstaining, noncorrosive, and nongaseous.
 - 2. Design Mix: 5000-psi, 28-day compressive strength.

2.8 SOURCE QUALITY CONTROL

- A. Test and inspect fire pumps with their controllers according to NFPA 20 for certified shop tests.
- B. Verification of Performance: Rate fire pumps according to requirements indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas, concrete bases, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of fire pumps.
- B. Examine roughing-in for fire-suppression piping to verify actual locations of piping connections before fire-pump installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 CONCRETE BASES

- A. Install concrete bases of dimensions indicated for fire pumps, pressure-maintenance pumps, and controllers.
 - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch(450-mm) centers around full perimeter of base.
 - 2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.

B. Cast-in-place concrete materials and placement requirements are provided by the others.

3.3 INSTALLATION

A. Install and align fire pump, pressure-maintenance pump, and controller according to NFPA 20 and manufacturer's instructions.

B. Install pumps and controllers to provide access for periodic maintenance including removal of motors, impellers, couplings, and accessories.

C. Set base-mounting-type pumps on concrete bases. Disconnect coupling halves before setting. Do not reconnect couplings until alignment operations have been completed.

1. Support pump baseplate on rectangular metal blocks and shims or on metal wedges having small taper, at points near anchor bolts, to provide 3/4- to 1-1/2-inch gap between pump base and concrete base for grouting.

2. Adjust metal supports or wedges until pump and driver shafts are level. Verify that coupling faces and pump suction and discharge flanges are level and plumb.

D. Install suction and discharge piping equal to or greater than diameter of fire-pump nozzles.

E. Install valves that are same size as piping connecting fire pumps, bypasses, test headers, and other piping systems.

F. Install pressure gauges on fire-pump suction and discharge at pressure-gauge tappings.

G. Support pumps and piping separately so weight of piping does not rest on pumps.

H. Install piping accessories, hangers and supports, anchors, valves, meters and gauges, and equipment supports.

I. Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not specified to be factory mounted. Furnish copies of manufacturers' wiring diagram submittals to electrical installer.

3.4 ALIGNMENT

A. Align split-case fire-pump and driver shafts after complete unit has been leveled on concrete base, grout has set, and anchor bolts have been tightened.

B. After alignment is correct, tighten anchor bolts evenly. Fill baseplate completely with grout, with metal blocks and shims or wedges in place. Tighten anchor bolts after grout has hardened. Check alignment and make required corrections.

C. Align piping connections.

- D. Align pump and driver shafts for angular and parallel alignment according to HI 1.4 and to tolerances specified by manufacturer.
- E. Align vertically mounted, split-case pump and driver shafts after complete unit has been made plumb on concrete base, grout has set, and anchor bolts have been tightened.

3.5 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to pumps and equipment to allow service and maintenance.
- C. Connect controllers to pumps.
- D. Connection of the fire-pump controllers to building fire-alarm system is by the Electrical Contractor.
- E. Ground equipment according to the California Fire Code and NFPA 70.
- F. Connect wiring according to the California Fire Code and NFPA 70.
- G. All drain lines are to be piped to the nearest floor drain. Discharge onto the floor will not be accepted.

3.6 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test and adjust field-assembled components and equipment installation, including connections and to assist in field testing. Report results in writing.
- B. Perform field tests for fire pump when installation is complete. Comply with operating instructions and procedures in NFPA 20 to demonstrate compliance with requirements. Where possible, field correct malfunctioning equipment, then retest to demonstrate compliance. Replace equipment that cannot be satisfactorily corrected or that does not perform as indicated, then retest to demonstrate compliance. Verify that each fire pump performs as indicated.
- C. Perform the following field tests and inspections and prepare test reports:
 - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Final Checks before Startup: Perform the following preventive-maintenance operations and checks:
 - a. Lubricate oil-lubrication-type bearings.
 - b. Remove grease-lubrication-type bearing covers, flush bearings with kerosene, and clean thoroughly. Fill with new lubricant according to manufacturer's written instructions.
 - c. Disconnect coupling and check electric motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.

- d. Verify that pump is free to rotate by hand. If pump is bound or if it drags even slightly, do not operate until cause of trouble is determined and corrected.
3. Starting procedure for pumps is as follows:
 - a. Prime pump by opening suction valve and closing drains and prepare pump for operation.
 - b. Open sealing-liquid supply valves if pump is so fitted.
 - c. Start motor.
 - d. Open discharge valve slowly.
 - e. Observe leakage from stuffing boxes and adjust sealing-liquid valve for proper flow to ensure lubrication of packing. Do not tighten gland immediately but let packing run in before reducing leakage through stuffing boxes.
 - f. Check general mechanical operation of pump and motor.
 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - a. Contractor is responsible for proper disposal of water if large quantities are required.
 5. Furnish fire hoses in number, size, and length required to reach storm drain or other acceptable location to dispose of fire-pump test water. Fire hoses are for field-acceptance tests only and are not property of Owner.

3.7 DEMONSTRATION

- A. Final acceptance test:
- B. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fire pumps, drivers, controllers, and pressure-maintenance pumps.

END OF SECTION 213113

SECTION 220000

PLUMBING

PART 1 GENERAL

1.1 WORK INCLUDED

- A. Work included in Division 22 Plumbing: Provide all materials, equipment, fabrication, installation and tests as noted in Contract Documents in conformity with applicable codes and authorities having jurisdiction.
- B. Related Sections
 - 1. All work in every Section must also comply with such general conditions of the specifications as are applicable, including, but not limited to
 - a. Instructions to Bidders
 - b. General Conditions
 - c. Special Conditions
 - d. Supplementary Conditions
 - e. Division 1 General Requirements
 - 2. Section 01120 LEED® Requirements, provisions of LEED® environmental categories and credits and submittal requirements
 - 3. Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable installation. See also Coordination Table in Section 230501 Basic Mechanical Materials & Methods.
- C. Related Work Specified Elsewhere
 - 1. Commissioning: See Section 019100 Commissioning
 - 2. Utilities five feet beyond building line unless noted otherwise: See Division 33 Utilities
 - 3. Underground de-watering piping: See Division 31 Earthwork
 - 4. Irrigation piping: See Division 32 Exterior Improvements
 - 5. Pre-cast concrete planter boxes and site drainage structures: See Division 3 Concrete
 - 6. Structural steel (except as specified herein): See Division 5 Metals
 - 7. Miscellaneous lumber and framing work, such as for framing, soffits and support of mechanical materials and equipment: See Division 6 Wood, Plastics, and Composites
 - 8. Scupper downspout overflow drains: See Division 7 Thermal and Moisture Protection
 - 9. Painting: See Division 9 Finishes
 - 10. Accessories including soap dispenser: See Division 10 Specialties

1.2 REFERENCE STANDARDS

- A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Such codes or standards shall be considered a part of this Specification as though fully repeated herein.
- B. Work shall be performed in accordance with all applicable requirements of the latest edition of all governing codes, rules and regulations including but not limited to the following minimum standards, whether statutory or not.

- C. Requirements of Regulatory Agencies
1. In accordance with the requirement of Division 1 General Requirements
 2. Nothing in contract documents shall be construed to permit work not conforming to current and applicable laws, ordinances, rules and regulations.
 3. When contract documents exceed requirements of applicable laws, ordinances, rules and regulations, comply with documents establishing the more stringent requirement.
 4. It is not the intent of contract documents to repeat requirements of codes except where necessary for completeness or clarity.
 5. Seismic construction and restraints: In accordance with requirements of Title 17 of California Administrative Code.
 6. Comply with the Safety Orders issued by California Occupational Safety and Health Act, COSHA and any other safety, health or environmental regulations of the State of California and any districts having jurisdictional authority. Where an omission or conflict appears between COSHA requirements and the Drawings and Specifications, COSHA requirements shall take precedence.
 7. Applicable codes as listed below, in addition to others specified in individual sections
 - a. CEC – California Electrical Code
 - b. CBC – California Building Code
 - c. CMC – California Mechanical Code
 - d. CPC – California Plumbing Code
 - e. City and County Codes and Amendments
 - f. California Code of Regulations, including Titles 8, 17, 19, 20, 21, 22 and the California Building Standards Code Part 2, Basic Building Regulations.
- D. Published specifications, standards, tests or recommended method of trade, industry or governmental organizations as listed below apply to all work in Division 22 Plumbing, in addition to other standards which may be specified in individual sections.
- E. All base material shall meet ASTM and ANSI standards
- F. All Pressure Vessels, Relief Valves, Safety Relief Valves and Safety Valves: Comply with standards, ASME stamped
- G. All Electrical Devices and Wiring
1. Conform to standards of CEC/NEC
 2. All devices UL or ETL listed and identified
- H. Guidelines and Standards: The latest edition of guidelines and standards published by the following groups will govern the Mechanical Systems and associated support system design. The systems shall be designed to meet or exceed these guidelines and standards.

AGA	American Gas Association
AMCA	Air Movement and Control Association, Inc.
ANSI	American National Standards Institute
ASME	American Society of Mechanical Engineers
ASSE	American Society of Sanitary Engineering
ASTM	American Society for Testing and Materials
AWWA	American Water Works Association
AWS	American Welding Society
COSHA	California Occupational Safety and Health Act
ETL	Intertek Semko (Formerly Electrical Testing Laboratories)
GISO	General Industry Safety Orders
HI	Hydraulic Institute
IEEE	Institute of Electrical and Electronic Engineers

NBS	National Bureau of Standards
NEBB	National Environmental Balancing Bureau
NEMA	National Electrical Manufacturer's Association
NFPA	National Fire Protection Association
OSHPD	Office of Statewide Health Planning and Development
PDI	Plumbing and Drainage Institute
SFA	California State and Local Fire Marshall
UL	Underwriters' Laboratories, Inc.

1.3 QUALITY ASSURANCE

- A. Supply all equipment and accessories in compliance with the applicable standards listed in Paragraph 1.2 and with all applicable national, state and local codes.
- B. All equipment and accessories shall be new and the product of a manufacturer regularly engaged in its manufacture.
- C. All items of a given type shall be the products of same manufacturer.
- D. All work in Division 22 Plumbing shall be commissioned. See Section 019100 Commissioning and Section 220800 Plumbing Commissioning.

1.4 SUBMITTALS

- A. No work may begin on any segment of this Project until the related submittals have been reviewed for conformity with the design intent and the Contractor has responded to all comments to the satisfaction of the Owner's Representative.
- B. Submit drawings, product data, samples and certificates of compliance required as hereinafter specified.
 - 1. See also Division 1 Shop Drawings, Product Data and Samples. Conditions in this Section take precedence over conditions in above referenced Section.
 - 2. Provide submittals promptly in accordance with schedule and in such sequence as to cause no delay in work or in work of any other division.
 - 3. It is not required (nor desired) for all products to be submitted concurrently. Rather, submittals may be staggered based on schedule and required equipment release dates.
 - 4. Allow 15-working days for review, unless the Owner's Representative agrees to accelerated schedule.
 - 5. For substitutions, list any features or characteristics that are not strictly in compliance with specifications. If none are listed with the submittal, Contractor is guaranteeing that substituted product is functionally equivalent to the specified product in accordance with Paragraph 1.6.
 - 6. Submittal reviews by the Owner's Representative are intended to assist the Contractor in complying with the design intent and requirements of the drawings and specifications. Reviews do not relieve the Contractor from compliance with these requirements, and comments or lack thereof do not constitute approval of changes in these requirements.
- C. Submission and Resubmission Procedure
 - 1. Each submittal shall have a unique serial number that includes the associated specification section followed by a number for each sub-part of the submittal for that specification section, such as "SUBMITTAL 220000-01"

2. Each resubmittal shall have the original unique serial number plus unique revision number such as "SUBMITTAL 220000-01 REVISION 1"
3. Submit in format specified below. Submissions made in the wrong format will be returned without action.
 - a. Product Submittals: One copy in word-searchable electronic format per Paragraph 1.5A.4.c.
 - b. Shop Drawings:
 - 1) One copy in electronic format .dwg, .dwf, .pdf or .tif
 - 2) Two and only two copies on paper; any additional copies will not be returned
 - c. Samples: As indicated in each specification section
4. Owner's Representative will return a memo or mark-up of submittal with comments and corrections noted where required.
5. Make corrections
 - a. Revise initial submittal to resolve review comments and corrections.
 - b. Indicate any changes that have been made other than those requested.
 - c. Clearly identify resubmittal by original submittal number and revision number.
6. Resubmit revised submittals until no exceptions are taken.
7. Once submittals are accepted and stamped with no exceptions taken, provide
 - a. Complete submittal of all accepted products in a single electronic file for each specification section.
 - b. Photocopies for coordination with other trades, if and as required by the General Contractor or Owner's Representative.

D. Product Data Submittals

1. Contents
 - a. Manufacturer's name and model number
 - b. All information required to completely describe materials and equipment and to indicate compliance with drawings and specifications, including, but not limited to:
 - 1) Schedule when more than one of each item is covered by submittal
 - 2) Physical data, as applicable
 - a) Dimensions
 - b) Weight
 - c) Finishes and colors
 - d) Dimensional shop drawings
 - 3) Performance data, as applicable
 - a) Rated capacities
 - b) Performance curve
 - c) Operating temperature and pressure
 - 4) Flow and wiring diagrams as applicable
 - 5) Description of system operation
 - c. All other pertinent information requested in individual sections
2. Format
 - a. See Division 1 Shop Drawings, Product Data and Samples
 - b. Identify clearly if submittal is substitution: Refer to Paragraph 1.6
 - c. Reference specification Division, Section, Title, Paragraph and Page number or drawing number as applicable
 - d. Use same nomenclature, legend, symbols and abbreviations on submittal material as used in contract documents

E. Layout Shop Drawings. See Section 230501 Basic Mechanical Materials and Methods.

F. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table. "R" means required.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Drains and cleanouts	R	R		R
Plumbing pipe and fittings	R	R		R
Plumbing fixtures and trim	R	R		R
Insulation	R	R		
Trap primers	R	R		R
Plumbing valves	R	R		R
Water heating equipment	R	R		R
Water sterilization	R	R		R

1.5 COMPLETION REQUIREMENTS

A. Procedure

1. Until the documents required in this section are submitted and approved, the system will not be considered "accepted"
2. Before requesting acceptance of work, submit one set of Completion Documents for review and approval of Owner's Representative
3. After review, furnish quantity of sets indicated below to Owner
4. Format
 - a. See Paragraph 1.5F for required format of Completion Documents
 - b. Paper copies; assemble in chronological order following alpha-numeric system used in specification, in heavy three-ring binder
 - c. Where electronic copies are called for in Paragraph 1.5F, comply with the following:
 - 1) Provide in word-searchable electronic format; acceptable formats are MS Word, Adobe Acrobat (pdf) and HTML; submit other formats for review and approval prior to submission; scanned paper documents not acceptable
 - 2) For submittals, provide separate file for each type of equipment
 - 3) Record drawings shall be in AutoCAD version 2000 or later.

B. Operating and Maintenance (O&M) Manual

1. In accordance with requirements of Division 1 Operating and Maintenance and as follows
2. O&M Manual shall include but is not limited to the following
 - a. Complete Product Data Submittals per Paragraph 1.4 so that the details of the device are known
 - b. Manufacturer's name, model number, service manual, spare-parts list and descriptive literature for all components
 - c. Operating instructions
 - d. Maintenance and repair requirements
 - e. Wiring diagrams
 - f. Requirements for special tools, test kits and calibration instructions
 - g. Replacement parts list
 - h. Name, address and phone number of contractor's equipment suppliers and service agencies

C. Record Drawings

1. Keep up-to-date during progress of job, one set of reproducible and erasable transparencies of Mechanical Drawings indicating the Record installation. In addition to changes made during course of Work, show following by dimension from readily obtained base lines
 - a. Fully illustrate all revisions made by all crafts in course of work

- b. Include all field changes, adjustments, variances, substitutions and deletions, including all Change Orders
 - c. Exact location, type and function of concealed valves, dampers, controllers, piping, air vents and piping drains
 - d. Exact size, invert elevations and location of underground and under floor piping and ducts
2. Progress drawing set shall be available for inspection by Owner's Representative weekly
 3. Update shop drawings and record drawings to reflect revisions and additional data listed above at completion of Project
 - a. Original engineering design drawings will be provided to Contactor in electronic format compatible with AutoCAD version 2000 or higher
 - b. Both shop and record drawings shall be in format compatible with AutoCAD version 2000 or later

D. Commissioning & Training

1. See Section 220800 Plumbing Commissioning

E. Miscellaneous Certificates

1. Pressure Test documentation/certificates
2. Training/Instruction completion certificates
3. Fire Marshal and Fire Department approvals of system, as required
4. Final inspection certificate signed by governing authorities
5. Warranty period, including start and end period
6. Field test report, including as applicable
 - a. Start up documents with date and name of technician
 - b. Piping pressure tests
 - c. Flex coupled pump alignment verification
 - d. Letters from manufacturers certifying their supervision of equipment installation and start-up procedures
 - e. Machinery vibration test reports where specified
 - f. Certificates of sterilization/chlorination of plumbing systems
 - g. Others as specified herein

F. Format of Completion Documents

1. Provide the type and quantity of media listed in table below
2. Optical media shall be readable on Operator Workstation: See Section 250000 Building Automation Systems
3. Where indicated in table, the electronic files shall be stored on the BAS systems' Operator Workstation. See Section 250000 Building Automation Systems

	Document	Paper (binder or bound)	Electronic	
			Read only optical disk	Loaded onto Operator Workstation
1.	O&M Manuals	3	1	1
2.	Record Drawings	2 Full size 2 Half size	1	1
3.	Commissioning Reports	5	1	–
4.	Miscellaneous Certificates	1	–	–
5.	Warranty documents	1	–	–
6.	Training materials	1 per trainee	1	1

1.6 SUBSTITUTIONS AND PRODUCT OPTIONS

A. Contractor's Options

1. For products specified only by functionality and/or reference standard, select product meeting that functionality and/or standard, by any manufacturer.
2. For products specified by manufacturer and model number
 - a. Where "Or Equal" lists specific alternative manufacturers including specific model numbers, any of these specific products may be selected and will not be considered a substitution.
 - b. Where "Or Equal" lists specific alternative manufacturers but no specific model numbers
 - 1) Functionally equivalent products by listed alternative manufacturers may be selected.
 - 2) Functionally equivalent products by manufacturers not listed may be selected but may be rejected by Owner's Representative for any reason if there is any question with respect to functional equivalency including unfamiliarity with manufacturer and local representation.
 - 3) Functional equivalent products to the product specified are those that
 - a) Are equal or better in quality, function, capacity, efficiency, serviceability, local support, etc.
 - b) Fully meet the product specifications unless otherwise approved by the Owner's Representative
 - c) Meet site and application constraints including but not limited to size, weight, appearance, and clearance requirements.

B. Substitution Requirements

1. Where substitutions are proposed for products indicated in design documents, the Contractor shall take full responsibility for coordinating with others the requirements of the proposed substitution including but not limited to:
 - a. Adequate space, including service access space
 - b. Power and other electrical connections
 - c. Pads or other equipment supports
 - d. Control devices and interfaces
2. Include all costs for redesign and other work required by all disciplines affected by a substitution.

1.7 DESCRIPTION OF BID DOCUMENTS

A. Specifications

1. Specifications, in general, describe quality and character of materials and equipment
2. Specifications are of simplified form and include incomplete sentences
3. Words or phrases such as "The Contractor shall," "shall be," "furnish," "provide," "a," "an," "the," and "all" have often been omitted for brevity

B. Drawings

1. Drawings in general are diagrammatic. Intention is to show size, capacity, approximate location, direction and general relationship of one work phase to another, but not exact detail or arrangement.
2. Scaled and figured dimensions are approximate and are for estimating purposes only. Indicated dimensions are limiting dimensions where noted. Duct and piping elevations are indicated for initial coordination; final requirements shall be determined by the Contractor after final coordination with other trades.
3. Before proceeding with work check and verify all dimensions in field.

4. Assume all responsibility for fitting of materials and equipment to other parts of equipment and structure.
 5. Make adjustments that may be necessary or requested in order to resolve space problems, preserve headroom and avoid architectural openings, structural members and work of other trades.
 6. For exact locations of building elements, refer to dimensional Architectural and Structural drawings.
- C. Do not use equipment exceeding dimensions indicated on drawings or equipment or arrangements that reduce required clearances or exceed specified maximum dimensions.
- D. If any part of Specifications or Drawings appears unclear or contradictory, apply to Owner's Representative for an interpretation and decision as early as possible.
1. Do not proceed with work without the decision of the Owner's Representative.

1.8 DEFINITIONS

- A. Definitions of term used in Division 22 Plumbing may differ from those given in general and supplementary conditions and take precedence over them.
- B. "Provide": to furnish, supply, install and connect up complete and ready safe and regular operation of particular work referred to unless specifically noted.
- C. "Supply": to purchase, procure, acquire and deliver complete with related accessories.
- D. "Work": labor, materials, equipment, apparatus, controls, accessories and other items required for proper and complete installation.
- E. "Piping": pipe, tube, fittings, flanges, valves, controls, strainers, hangers, supports, unions, traps, drains, insulation and related items.
- F. "Wiring": raceway, fittings, wire, boxes and related items.
- G. "Concealed": embedded in masonry or other construction, installed in furred spaces, within double partitions, above hung ceilings, in trenches, in crawl spaces, or in enclosures.
- H. "Exposed": not installed underground or "concealed" as defined above.
- I. "Indicated," "shown" or "noted": as indicated, shown or noted on drawings or specifications.
- J. "Reviewed," "approved," or "directed": as reviewed, approved, or directed by or to Owner's Representative.
- K. "Motor Controllers": starters, variable speed drives, and other devices controlling the operation of motors.
- L. "Control or Actuating Devices": automatic sensing and switching devices such as thermostats, pressure, float, electro-pneumatic switches and electrodes controlling operation of equipment.

1.9 PROJECT CONDITIONS

- A. Examine site related work and surfaces before starting work of any Section
1. In case of conflict, the most stringent takes precedence
 2. For purposes of clarity and legibility, Drawings are essentially diagrammatic to extent that many offsets, bends, unions, special fittings, exact locations of items are not indicated, unless specifically dimensioned. Especially note a number of required duct and pipe offsets to coordinate with structure and not shown. Coordinate dimensioned conditions, including invert elevations, with other trades prior to installation by any trade.
 3. Exact routing of piping, ductwork, etc. shall be governed by structural conditions, obstructions. Not all offsets in ductwork or piping are shown on the Mechanical Drawings. Determine which item to offset or relocate. Maintain required slope in piping. Make use of data in Contract Documents. In addition, Owner's Representative reserves right, at no additional cost to the Owner, to make any reasonable change in location of mechanical items, exposed at ceiling or on walls, to group them into orderly relationships or increase their utility. Verify Owner's Representative's requirements in this regard prior to rough-in.
 4. Take dimensions, location of doors, partitions, similar physical features from Architectural Drawings. Verify at Site under this Division. Consult Architectural Drawings for exact location of outlets to center with Architectural features, panels, etc., at the approximate location shown on mechanical Drawings.
 5. Mounting heights of brackets, outlets, etc., as required
 6. Report to Owner's Representative, in writing, conditions which will prevent proper provision of this work
 7. Beginning work of any Section without reporting unsuitable conditions to Owner's Representative constitutes acceptance of conditions by Contractor
 8. Perform any required removal, repair or replacement of this work caused by unsuitable conditions at no additional cost to the Owner
- B. Coordination
1. Work out all "tight" conditions involving Work specified under this Division and Work in other Divisions in advance of installation. If necessary, and before Work proceeds in these areas, prepare supplementary Drawings under this Division for review showing all Work in congested area. Provide supplementary Drawings, additional Work necessary to overcome congested conditions, at no additional cost to the Owner.
 2. Conflicts: Difference or disputes concerning coordination, interference or extent of Work between sections shall be decided as follows
 - a. Install mechanical and electrical systems in the following order of preference (those trades listed below another must reroute to resolve the conflict):
 - 1) Drain piping required by code to be sloped
 - 2) Supply air and exhaust air ductwork connected to fans
 - 3) Electrical conduit 4 inches and larger
 - 4) Hydronic piping connected to pumps
 - 5) Domestic water piping
 - 6) Fire sprinkler piping
 - 7) Electrical conduit smaller than 4 inches
 - 8) Sprinkler piping
 - 9) Transfer ducts and other ductwork not connected to fans
 - 10) Control system piping and wiring
 - b. Continued disputes shall be decided by Contractor and Contractor's decision, if consistent with Contract Document requirements, shall be final.
 3. Supervision: Personally or through an authorized and competent representative, constantly supervise the work from beginning to completion and, within reason, keep the same foreman and workmen on the Project throughout the Project duration.
 4. Provide templates, information and instructions to other Divisions to properly locate holes and openings to be cut or provided.

5. The drawings govern in matters of quantity, and the specifications govern in matters of quality. In the event of conflict within the drawings involving quantities, or within the specifications involving quantities, or within the specifications involving quality, the greater quantity and higher quality shall apply. Such discrepancies shall be noted and clarified in the Bid. No additional allowances will be made because of errors, ambiguities, or omissions that reasonably should have been discovered during the preparation of the Bid.

C. Equipment Rough-In

1. Rough-in locations shown on Drawings for equipment furnished by the Owner and for equipment furnished under other Divisions are approximate only. Obtain exact rough-in locations from following sources
 - a. From Shop Drawings for equipment provided under this contract
 - b. From Owner's Representative for Owner furnished-Contractor installed equipment
 - c. From existing equipment where such equipment is relocated under this Contract
2. Verify mechanical characteristics of equipment before starting rough-in. Where conflict exists between equipment and rough-in shown on Drawings obtain clarification from Owner's Representative and provide as directed by the Owner's Representative at no additional cost to the Owner.
3. Make final connections

1.10 CLEARANCE FROM ELECTRICAL EQUIPMENT

A. Piping

1. Prohibited, except as noted, in
 - a. Electric rooms and closets over equipment, as restricted by CEC
 - b. Telephone rooms and closets
 - c. Elevator machine rooms
 - d. Electric switchboard room
2. Prohibited, except as noted, over or within 5 feet of
 - a. Transformers
 - b. Substations
 - c. Switchboards
 - d. Motor control centers
 - e. Standby power plant
 - f. Bus ducts
 - g. Electrical panels

1.11 PRODUCT DELIVERY, HANDLING AND STORAGE

- A. See Division 1 Product Requirements
- B. Deliver equipment in its original package to prevent damage or entrance of foreign matter. Provide materials on factory provided shipping skids and lifting lugs if required for handling. Provide protective coverings during construction.
- C. Handle and ship in accordance with manufacturer's recommendations
- D. Identify materials and equipment delivered to Site to permit check against approved materials list, reviewed with no exceptions taken Shop Drawings

- E. Protect from loss or damage. Replace lost or damaged materials and equipment with new at no additional cost to the Owner
- F. Where necessary, ship in crated sections of size to permit passing through available space

1.12 PROJECT MANAGEMENT AND COORDINATION SERVICES

- A. See Division 1 Project Coordination
- B. Overview: Provide a project manager/engineer for the duration of the Project to coordinate the Division 22 Plumbing work with all other trades. Coordination services, procedures and documentation responsibility shall include, but shall not be limited to the items listed in this section.
- C. Review of shop drawings prepared by other subcontractors
 1. Obtain copies of all shop drawings for equipment provided by others that require electrical service connections or interface with Division 22 Plumbing work.
 2. Perform a thorough review of the shop drawings to confirm compliance with the service requirements contained in the Division 22 Plumbing contract documents. Document any discrepancy or deviation as follows:
 - a. Prepare memo summarizing the discrepancy
 - b. Provide a copy of the specific shop drawing, indicating via cloud, the discrepancy
 3. Prepare and maintain a shop drawing review log indicating the following information
 - a. Shop drawing number and brief description of the system/material
 - b. Date of your review
 - c. Indication if follow-up coordination is required
- D. Request for information (RFI)
 1. See Division 1 Request For Information

1.13 REVIEW OF CONSTRUCTION

- A. Work may be reviewed at any time by the Owner's Representative
- B. Advise Owner's Representative that work is ready for review at following times:
 1. Prior to backfilling buried work
 2. Prior to concealment of work in walls and above ceilings
 3. When all requirements of Contract have been completed
- C. Neither backfill nor conceal work without Owner's Representative's consent.
- D. Maintain on job set of Specifications and Drawings for use by Owner's Representative's
 1. Include all change orders.
- E. Contractor is responsible for construction methods, sequences and safety precautions

1.14 CUTTING AND PATCHING

- A. See Division 1 Cutting, Patching and Matching

1.15 UTILITY CONNECTIONS

- A. See Paragraph 1.1C.2
- B. Connection to utility company mains
- C. Connection to on-site piping mains
- D. Payment of service charges
- E. Provisions for temporary utilities
- F. Provide concrete pads, stainless steel pipe supports, anchors and stainless steel caged enclosures for connections to exterior pressure regulating valve assemblies and exterior backflow preventer assemblies provided by utility company or provided under this section of work. Installation of pads, supports, anchors and enclosures shall be per the requirements of the authority having jurisdiction or the utility company.

1.16 WARRANTY

- A. In accordance with Division 1 Guarantees, Warranties, Bonds, Service & Maintenance Contracts and as follows
- B. Warranty all materials, equipment, apparatus and workmanship to be free of defective materials and faulty workmanship for period of one year from date of filing of Notice of Completion or upon beneficial use, at the direction of the Owner's Representative.
- C. Provide new materials, equipment, apparatus and labor to replace that determined by Owner's Representative to be defective or faulty
- D. This guarantee also applies to services including instructions, adjusting, testing, noise, balancing, etc.
- E. Furnish Manufacturers' standard Warranties in excess of one year

PART 2 PRODUCTS

2.1 PLUMBING FIXTURES

- A. All fixtures are subject to review and approval by the Architect
- B. Vitreous china fixtures shall be twice fired white vitreous china.
- C. All plumbing fixtures shall be certified by and comply with the State of California Energy Commission (CEC) water conservation regulations and CalGreen.
- D. All fixtures for handicapped personal shall be mounted in accordance with the California Code of Regulations, Title 24, handicapped regulations.
- E. Seal up joints between fixtures and wall or floor with white mastic.

- F. Provide tubing supplies, traps, pipe flanges and wastes to wall of not less than #17 gauge polished chromium-plated brass. Unless noted otherwise, supplies and traps shall be centered, plumb, and perpendicular to wall for lavatories and sinks.
- G. Water Closets (WC-1 and WC-1H): Toto CT708UV(G), or equal, wall mounted, vitreous china water closet, ECOPOWER Ultra High-Efficiency (1.1 gpf) flush valve. Water closet seat shall be Bemis, Church, or equal, white plastic seat with self-sustaining check hinge. Water closets marked WC-1H are for handicapped personnel.
 - 1. Water Closet Carriers: Adjustable combination wall closet fitting and chair carrier, Watts ISCA Series, Zurn, or equal.
- H. Lavatories (LV-1): SloanStone Series Sink model ELGR 8X000 Gradient Style Sink or equal, wall mount per manufacturers recommendations; Toto Model #TEL1A3-D20E series Libella ECOPOWER sensor faucet (0.20 GPC) with ASSE 1070 certified mixing valve, Provide McGuire or equal; grid strainer, polished chrome cast brass tailpiece, trap, and McGuire hot and cold water supply stop valves. LV-1H units shall be mounted in accordance with ADA accessibility guidelines. Provide floor mounted fixture carrier
- I. Lavatories (LV-2): Kohler K-2005 "Kingston", American Standard, or equal. Wall mounted vitreous china; Toto Model #TEL1A3-D20E series Libella ECOPOWER sensor faucet (0.20 GPC) with ASSE 1070 certified mixing, Provide McGuire or equal; grid strainer tailpiece, offset waste, trap, and McGuire hot and cold water supply stop valve. Provide floor mounted fixture carrier. Mount at ADA height.
- J. Lavatory (LV-3): Kohler K-2882-0 "Verticyl Rectangle", American Standard, or equal undermount sink. Toto Model #TEL1A3-D20E series Libella ECOPOWER sensor faucet (0.20 GPC) with ASSE 1070 certified mixing valvem, Provide McGuire or equal; grid strainer tailpiece, offset waste, trap, and McGuire hot and cold water supply stop valve.
- K. Sink (SK-1): Elkay ELUHAD211550 stainless steel 23 1/2"x18 1/4" x 4 7/8" single bowl undermount ADA sink with Chicago Faucet 1100-GN2AE35-317AB hot and cold water sink faucet with wrist blade handles, gooseneck spout, 1.5 gpm aerator, ceramic disc operating cartridges and faucet with polished chrome finish. Provide McGuire crumb cup strainer, tailpiece, insulated offset waste, supply stop valves and trap. Entire assembly shall be, be mounted in accordance with ADA accessibility guidelines.
- L. Sink Staff Lounge and Library Classroom (SK-2): Elkay LRADQ312255 or equal: Self rimming Laney Plumb counter mount with overall dimensions of 31" left to right; 22" front to back, 18 gauge, type 304 stainless steel with full undercoating, off centered drain opening and crumb-cup strainer and tailpiece. Sink shall be complete with Chicago Faucet 1100-GN2AE35-317AB hot and cold water sink faucet with wrist blade handles, gooseneck spout, 1.5 gpm aerator, ceramic disc operating cartridges and faucet with polished chrome finish. Provide McGuire crumb cup strainer, tailpiece, insulated offset waste, supply stop valves and trap. Entire assembly shall be mounted in accordance with ADA accessibility guidelines.
 - 1. Provide piping rough-ins and connections to dishwashers, coffee machines, refrigerator ice makers.
 - 2. Provide a fully accessible wall cleanout inside the base cabinet for sink.
- 1. Provide sinks with InSinkErator Badger 5 Food Waste Disposer, continuous feed, with 1/2 H.P. motor, galvanized steel grinding elements with two stainless steel 360 degree swivel lugs and Self service wrench.
- M. Shower Valve (SH-1H): Symmons 6701-EX-L/HD-L/HS Shower/Hand shower trim, Powers or equal, complete with Symmons 352SH-3-1.5 shower head – 1.5 gpm flow restrictor,

261XBODY-CHKS pressure balancing shower valve with integral check stops, temperature limit stop screw, lever handle, and 1/2" IPS connections, ADACHS hand spray unit (1.5 GPM) with minimum 60" long flexible stainless steel hose, wall hook and wall connection with in-line vacuum breaker. Diverter valve included for toggling between hand shower and shower head.

Provide all interconnecting piping within the wall. Entire assembly shall be located on the wall as shown on the Architectural drawings. Entire assembly shall be installed and shall comply with State of California Accessibility Guidelines.

- 1) Grab bars, benches, soap dishes, and shower receptors will be furnished and installed under another Division.

- N. Service Sinks (SSK): Florestone, Fiat, or equal, 24"x 24"x10" high, pre-cast terrazzo with acid resisting tiling flanges cast-in, brass drain cast in center with chromium plated removable open grid strainer, and stainless steel caps integrally cast in on exposed ledges. Receptor shall be reinforced throughout. Install cast iron hub & spigot p-trap below floor. Faucet shall be Chicago 897 faucet, polished chrome plated, with wall brace, integral stops, hose spout with pail hook and vacuum breaker. Mount faucet on wall 3'-0" above bottom of receptor.
- O. Drinking Fountain (DF): Haws H1119.14, Elkay, or equal, dual height, wall mounted, all 18-gauge type 304 stainless steel with No.4 satin finish, and complete with common single piece back plate, bubblers, automatic stream controls, dual push buttons, traps and screwdriver stops, vandal-proof bottom access plates, wall box, and all necessary mounting accessories and devices. Back plate shall be absolutely true and each shall be secured with concealed fasteners.

2.2 DRAINS AND CLEANOUTS:

- A. Zurn, Wade or as noted, or equal
- B. Floor Drains, (FD-1): Z415 with 6" diameter adjustable nickel-bronze strainer, with cast iron body, clamping device and double drainage flange. Except for shower drains, provide cast iron p-trap with 1/2" primer tap.
- C. Floor Drains, (FD-2): Z556, cast iron body with clamping device, 1/2" trap priming connection, and double drainage flange, with heavy duty tractor strainer, 1/2" trap primer, 7" diameter strainer. All exposed components shall be nickel-bronze.
- D. Floor Sinks, (FSK): cast iron floor sink with acid-resisting porcelain enameled interior, internal dome, nickel bronze frame. Set frame flush with the finished floor. All floor sinks shall be provided with a 1/2" trap primer connection.
 1. FSK: Zurn 1900, rectangular 12" x 12" x 6" deep, with 1/2" grate
- E. Roof Drain, (RD-1): Zurn Z-121-R-C or equal 12" diameter coated cast iron body with combination membrane flashing clamp / gravel guard, cast iron low silhouette dome strainer, underdeck clamp, sump receiver flange.
- F. Roof Overflow Drain, (OD-1): Zurn Z-121-R-C or equal 12" diameter coated cast iron body with combination membrane flashing clamp / gravel guard, 2" high dam, internal dome strainer, underdeck clamp.
- G. Roof Drain, (RD-2): Zurn Z125 8 3/8" diameter or equal, Dura-Coated cast iron body with combination membrane flashing clamp/gravel guard and low silhouette Poly-Dome.

- H. Roof Overflow Drain, (OD-2): Zurn Z125-89 with 2" high external water dam, 8 3/8" diameter or equal, Dura-Coated cast iron body with combination membrane flashing clamp/gravel guard and low silhouette Poly-Dome.
- I. Cleanouts: Z1440A, cast iron body or equal, sealed with raised head bronze threaded plug, shall be complete with cast iron body, raised head bronze threaded plug.
- J. Wall Cleanouts (WCO): Z1445-4 or equal, smooth chromium-plated bronze access cover and frame. Unit shall be complete with a cleanout assembly and smooth chromium-plated bronze access cover and frame. Provide wall cleanout to serve each urinal
- K. Floor Cleanout (FCO): Z1400 or equal, floor level cleanout with round top , cast iron body with clamp ring and flange, neoprene seal, bronze threaded plug and scoriated nickel-bronze cover. Heavy duty cleanouts shall be provided in all parking garage levels, loading dock and garage ramp areas.
- L. Cleanout to Grade (COTG): Z1400 or equal, cast iron floor cleanout with round heavy-duty scoriated cast iron tractor cover.
- M. Furnish suitable wrenches for each style of cleanout plug or cap.
- N. All floor drains and floor sinks shall be trapped, primed and vented.
- O. All floor drains, floor sinks and floor cleanouts in areas with epoxy flooring or a similar float-on finish shall have integral extended flange, same material and drain body to receive the epoxy or similar flooring. Contractor shall confirm locations with the Architect.

2.3 SHOCK ABSORBERS

- A. Wade, MIFAB, or equal
- B. Provide complete with a line size shut-off valve.
- C. Size of units shall be per PDI (Plumbing and Drainage Institute) Standards

2.4 TRAP PRIMERS

- A. MIFAB, or equal
 - 1. 3 psi pressure drop actuated type.
 - 2. Provide complete with a line size shut-off valve and union.
 - 3. Trap priming provisions shall be provided for all floor drains.
- B. Zurn P6000-TPO, or equal
 - 1. Flush valve type, complete with 1-1/2" flush tube with trap primer collar, spud coupling and flange for top spud connection. 3/8" x 12" supply tube and fittings, vacuum breaker, vacuum breaker tube and wall nut and wall escutcheon.

2.5 ICE MAKER BOXES (IM) (FOR REFRIGERATORS WITH ICEMAKERS):

- A. Guy Gray Mfg. Co. Model BIM875, 18-gauge steel box and cover complete with compression outlet.
- B. Refer to Architectural Drawings for locations.
- C. Water supply to each box shall include a fully accessible shut-off valve.

2.6 (HB-1, HB-2) HOSE BIBBS

- A. HB-1, Wall Hydrants: Zurn Z1320XL or equal, Encased Ecolotrol, lead free automatic draining wall hydrant for flush installation. Hydrant features integral backflow preventer with anti-siphoning technology, copper casing, all bronze interior components with ½ turn long-life ceramic disc cartridge, combination ¾" female solder and ¾" male pipe thread inlet connection, and ¾" male hose connection. Hydrant furnished with type 304 stainless steel housing with locking hinged cover stamped "WATER" and includes operating key. Install accessible ball valve in each wall hydrant supply which is not otherwise controlled by other local shut-off valve.
- B. HB-2, Hot and Cold Wall Faucet: Zurn Z1348-BFP or equal, exposed non-freeze anti-siphon dual hot/cold wall faucet complete with automatic draining hose connection backflow preventer, exterior chrome finish, brass casing, all bronze interior parts, operating rod with spring-loaded compression closure valve, replaceable seat washer, combination ½" female solder inlet and ½" male IP inlet connections standard, and ¾" male hose connection.

2.7 THERMOSTATIC MIXING VALVES

- A. Sinks – Watts or equal; Series LFMMV unit
- B. Install inside within base cabinet

2.8 WATER HEATING EQUIPMENT

- A. (EWH) Electric Water Heater
 1. A.O. Smith model DRE-80-40.5, State, or equal
 2. Electric tank type water heater rated at 40.5 kW, 480V, 3 ph. Complete with ASME rated drain valve, T and P valve. Water heater shall be certified and listed by the State of California Energy Commission and ASME rated.
 3. Refer to Equipment Schedule on drawings.
 4. Provide a Holdrite 40-S-24-A or equal 24" x 24" galvanized support stand assembly below water heater units. The Contractor shall arrange and pay for a licensed Structural Engineer in the State of California to provide structural calculations for support of the electric water heater .
 5. Provide Holdrite or equal, heater restraints. Provide wall backing to receive restraints and mounting hardware.
 6. Provide a Smitty or equal drain pan. Provide drain piping from pan outlet and terminate to spill over floor sink
 7. The Contractor shall arrange and pay for a licensed Structural Engineer in the State of California to provide structural calculations for seismic restraints of water heater.
- B. Hot Water Circulating Pump
 1. As specified on Plumbing Equipment Schedule.

2. Domestic Hot Water Circulating Pump: Shall be Grundfos, or acceptable equivalent, lead free, all bronze in-line, with 120V, single phase motor, complete with mechanical seals, resilient mounting, and threaded connections.
3. Pump shall be controlled by BMS.

C. Hot Water Expansion Tank

1. Watts DETA-20 or equal with pre-charged fixed butyl bladder. Tank shall be constructed in accordance with Section VII of the ASME Boiler and Pressure Vessel Code.

2.9 PIPE MATERIALS AND JOINING SYSTEMS:

A. Sanitary Waste and Vent Piping Below Grade

1. Pipe shall be manufactured from virgin rigid PVC (polyvinyl chloride) vinyl compounds with cell class 12454 as identified in ASTM 1784. PVC Schedule 40 pipe shall be Iron Pipe Size (IPS) conforming to ASTM D 1785 and ASTM D 2665. Injection molded PVC DWV fittings shall conform to ASTM D 2665. All pipe and fittings shall be manufactured in the United States. All systems shall utilize a separate waste and vent system. Pipe and fittings shall conform to NSF International Standard 14. Solvent cement joints shall be made in a two-step process with primer conforming to ASTM F 656 and solvent cement conforming to ASDT D 2564. Below grade pipe shall be supported from underside of slab.

B. Sanitary Waste and Vent Piping Above Grade

1. ASTM A74A and CISPI 301 standard weight cast iron soil pipe and fittings. All piping & fittings shall have a standard rust inhibiting coating and shall carry the CISPI mark.
2. Couplings
 - a. Waste Piping: Husky 2000 or 4000 No-Hub Couplings, or equal, type 304 stainless steel couplings with neoprene gasket.
 - b. Vent Piping: Husky Standard No-Hub Couplings, or equal, type 301 stainless steel couplings with neoprene gasket.

C. Rainwater Leader, Storm Drain, and Overflow Drain Piping: Same as for sanitary soil, waste, and vent piping. Insulate overhead horizontal runs of exposed pipe.

D. Trap Priming, Hot and Cold Water Piping:

1. Piping above Slab on Grade: Type "L" copper tubing and wrought copper sweat type fittings per ANSI B16-22, ASTM B 813 and ASTM B 828. Solder shall be lead free.
2. Piping above Slab on Grade: Type "L" copper tubing and wrought copper sweat type fittings per ANSI B16-22, ASTM B 813 and ASTM B 828. Solder shall be lead free.
3. Piping below Grade (Main Cold Water Service): Type "K" copper tubing and wrought copper sweat type fittings and brazed joints. Copper tubing and fittings shall be per ANSI B16-22, ASTM B 813 and ASTM B 828. Copper tubing and fittings below grade shall be wrapped within 8 mil thick polyethylene tubing.
4. Piping below Slab on Grade (Trap Priming): Type "K" copper tubing and wrought copper sweat type fittings and brazed joints. Copper tubing and fittings shall be per ANSI B16-22, ASTM B 813 and ASTM B 828. Copper tubing and fittings below grade shall be wrapped within 8 mil thick polyethylene tubing.

E. Condensate Drain Piping: Type "M" copper tubing and wrought copper sweat type fittings.

- F. Relief Valve and Indirect Drain Piping: Type "M" copper tubing and wrought copper sweat type fittings.
- G. Piping System Accessories
- H. Piping system components shall be selected for maximum design operating pressure based on static head and pressure relief valve setting.
- I. Reduced Pressure Backflow Preventer (Main Domestic Cold Water):
 - 1. Watts Model 375, or equal
 - 2. Main body and access cover shall be epoxy coated ductile iron (ASTM 536), the seat ring and check valve shall NORYL, the stem shall be stainless steel (ASTM 276) and the seat disc elastomers shall be EPDM. The checks and relief valve accessible for maintenance without removing the device from the line.
- J. Reduced Pressure Backflow Preventer (Mechanical Make-up Water):
 - 1. Watts Model 975XL2, or equal
 - 2. Main body and access cover shall be low lead bronze (ASTM B 584), the seat ring and internal polymers shall NORYL and the seat disc elastomers shall be silicon. The first and second checks shall be accessible for maintenance without removing the relief valve from the line.
- K. Strainers:
 - 1. Watts LF777, or equal
 - 2. Unleaded bronze "Wye -pattern" body to match piping material
 - 3. Perforated stainless screen, size of perforations to suit service
 - 4. Provide valve with lead free hose bib adapter with cap for all strainers
 - 5. Provide strainers at the inlet to all hot water circulating pumps and pressure reducing valves
- L. VALVES
 - 1. Ball Valves
 - a. 3 inches and smaller
 - 1) Copper silicon
 - 2) 316 SS trim
 - 3) Two piece body
 - 4) Standard port
 - 5) 600 pounds per square inch water on gage (WOG) at 100 degree F, 150 pounds per square inch saturated steam
 - 6) Equal to Watts
 - 7) Threaded - LFB6000
 - 8) Soldered - LFB6001
 - b. 4 inches and larger: Not used
- M. Check Valves
 - 1. Check Valves, Water Service
 - a. 3 inches and smaller
 - 1) Swing check
 - 2) 200 psig @ 250 degree F water
 - 3) Brass disc
 - 4) Screw-in cap
 - 5) Soldered ends
 - 6) Equal to Milwaukee

- a) Soldered - UP968
- b. 4 inches and larger
 - 1) Swing Check
 - 2) Class 125 (125 psi steam, 200 psi water)
 - 3) Regrinding bronze disc
 - 4) Bolted cap
 - 5) Flanged body
 - 6) Equal to Nibco F-918-8 and suitable for potable water service

- N. Point of Use Thermostatic Mixing Valves at Domestic Water Faucets
 - 1. Zurn,ZW1070XL or equal, ASSE 1070 listed, minimum flow of 0.35 GPM with check stops and strainers. At SK units shall be installed against back inside wall of cabinet. For lavatories install along wall.
- O. Safety Relief Valves
 - 1. Size: ASME Code
 - 2. Similar to Watts No. LF140
 - 3. Lead free
 - 4. Adjustable
- P. WATER METERS
 - 1. Water meter supplied by Division 25 BAS, installed by Division 22. See plans for location.

2.10 MISCELLANEOUS

- A. Pipe Supports:
 - 1. Cooper B-Line, Superstrut, or equal (Provide type 316 Stainless Steel for below grade installation)
 - 2. Where pipe is insulated, protect insulation at hangers by installing a 22 gauge shield and clamp sized to allow pipe insulation to pass continuously through the hanger.
 - 3. For all hot water piping, provide 360 degree high density calcium silicate insert within shield.
- B. Equipment Connections: At a minimum, provide at all equipment connections:
 - 1. Isolation valves and union for each connection
 - 2. Drains with ball valve and hose connection with cap
- C. Escutcheons: Provide chromium steel escutcheons at piping penetrations of walls where exposed public view and required for proper appearance. Provide galvanized steel escutcheons at penetrations of masonry walls elsewhere. Escutcheons not generally required at drywall penetrations where not exposed to public view.
- D. Sleeves:
 - 1. Provide sleeves where pipes pass through floors above grade, roofs, poured-in-place masonry walls, and exterior walls.
 - 2. Sleeves shall be standard weight steel pipe, except sleeves for concealed piping through floors not in structural members may be 25-gauge galvanized sheet metal.
 - 3. Floor sleeves for piping shall extend from the bottom of the slab to 2-inches above the finished floor.
 - 4. Seal between piping and sleeve with fire-rated caulk at all penetrations of fire-rated partitions and floors.

5. Make sleeves through outside walls watertight. Caulk between uninsulated pipe and sleeve.
6. Size sleeves for insulated pipes to allow full thickness insulation.
7. Coordinate with the requirements of the Structural Engineer regarding any sleeves/penetrations through any structural members. Submit proposed penetrations for Structural Engineer review and approval prior to the Shop Drawing Submittal.

E. Water Proof Sleeve Assembly (WSA):

1. Calpico Pipe Linx Model CSL-SSS with 316 grade stainless steel pressure plate.
2. Calpico Wall Sleeve model C-PWS with 2" water stop.

F.

G. Thermometers

1. Weksler, Ashcroft, or equal
2. Stainless steel construction and range of 30 °F to 240 °F

2.11 VIBRATION ISOLATION

A. Manufacturers

1. Vibration Isolation:
 - a. Mason Industries, Inc.
 - b. Kinetics Noise Control, Inc.
 - c. M.L. Saussé & Co. (Vibrex).
 - d. Or equal
2. Seismic Restraints:
 - a. Hangers: Any manufacturer who can verify compliance with SMACNA standards and the California Building Code
 - b. Strut: Channel Framing: Any manufacturer who can verify compliance with the CBC standards
 - c. Anchors: Drill in, wedge type: Any manufacturer within the ICBO standards approved for seismic
 - d. Snubbers: Any manufacturer within the CBC standards

B. Piping Isolation for Noise Control

1. Isolate water piping from structure with Acousto-Plumb System isolators, holders and guides for 1-inch and smaller.
2. Isolate waste pipes and water pipes larger than 1-inch with B-Line B3195 Isolator System components
3. Do not allow the piping, connectors and valves to directly touch the structure, studs, gypsum board, or other pipes

2.12 ANCHORS, INSERTS AND FASTENERS:

A. All anchors and inserts shall be installed according to the CBC standards

B. Do not use any anchor or insert in concrete which does not have a signed structurally engineered design value based on its installed application and one of the following:

1. ICC evaluation report
2. Lab test report verifying compliance

- C. All over-head concrete anchors or inserts shall be selected to comply with the ICC report or CBC table for the anchor or insert
- D. Torque testing of anchors shall be allowed to verify compliance of anchor installation. However, torque testing shall not justify usability of anchor. Only load or pull testing shall be allowed to justify usability of anchors. Failure of torque shall constitute failure of anchor.
- E. Bolts and nuts:
 - 1. Bolts and heavy hexagon nuts: ANSI B18.2.1 and ASTM A307 or A576
 - 2. Bolts, underground: ASTM A325, stainless steel
 - 3. Expansion anchors: Federal Specification A-A-1922

2.13 INSULATION

- A. Manufacturers
 - 1. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
 - 2. Insulation: fiberglass
 - a. Owens-Corning Fiberglass Corporation
 - b. Manville
 - c. Certaineed Corporation
 - d. Knauf
 - e. Or equal
 - 3. Insulation: Elastomeric Closed Cell:
 - a. Armstrong World Industries, Inc.
 - b. Rubatex Corp.
 - c. Or equal
 - 4. Adhesives
 - a. Foster Div. Amchem Products Inc.
 - b. Childers Products Company
 - c. Epolux Mfg. Corporation
 - d. Insul-Coustic/Birma Corporation
 - e. Armstrong 520 Adhesive
 - f. Or equal
 - 5. Mechanical Fasteners
 - a. AGM Industries, Inc.
 - b. Miracle Adhesives Corporation
- B. General
 - 1. Energy Codes: The current versions of California Title 24 and California Building Code shall govern where requirements for thickness exceeds thickness specified
 - 2. All insulation materials, including jackets, facings, adhesives, coatings, and accessories are to be fire hazard rated and listed by Underwriters' Laboratories, Inc., using Standard UL 723 (ASTM E-84), (NFPA-255), (ASA A2.5-1963)
 - 3. Flamespread: maximum 25
 - 4. Fuel contributed and smoke developed: maximum 50
 - 5. Flameproofing treatments subject to deterioration from moisture or humidity are not acceptable
 - 6. Insulation and accessories shall not provide any nutritional or bodily use to fungi, bacteria, insects, rats, mice, or other vermin, shall not react corrosively with equipment, piping or ductwork, and shall be asbestos free: Duct lining shall meet ASTM C1136 and ASTM C665 for biological growth in insulation

C. Materials

1. Pipe Insulation
 - a. Fiberglass:
 - 1) Molded: one piece, maximum 0.26 K factor at 75 degrees Fahrenheit mean temperature
 - 2) Equal to Owens-Corning ASJ/SSL-II Pipe Insulation
 - b. Flexible, closed cell elastomeric thermal insulation
 - 1) Insulation ASTM C534
 - 2) Service rating of 220 degrees Fahrenheit
 - 3) Density 6.0 pounds per cubic foot
 - 4) Closed cell foam: Vapor permeability ASTM E96 0.2 perm
 - 5) Max moisture absorption: 1.0 percent by volume, 10 percent by weight
 - 6) Molded pipe insulation
 - a) Maximum 0.27 K factor at 75 degrees Fahrenheit mean temperature
 - b) Maximum water vapor transmission rating of 0.17 perm-inches
2. Jackets
 - a. Factory Applied Vapor Barrier All Service Jacket (ASJ)
 - 1) ASTM C921, White kraft paper bonded to aluminum foil and reinforced with glass fiber yarn
 - 2) Moisture Vapor Transmission: ASTM E96; 0.02 perm inches
 - 3) Secure with self-sealing longitudinal laps and butt strips
 - 4) Secure vapor barrier mastic
 - 5) Tie Wire: minimum 16 gauge copper clad annealed steel wire with twisted ends on maximum 12 inch centers
 - 6) Vapor Barrier Lap Adhesive: Compatible with insulation
 - b. Aluminum Jacket: ASTM B209:
 - 1) Use for weatherproof jacket
 - 2) Thickness: 0.016 inch sheet
 - 3) Finish: Embossed
 - 4) Joining: Longitudinal slip joints and 2 inch laps
 - 5) Fittings: 0.016 inch thick die shaped fitting covers with factory attached protective liner
 - 6) Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel
 - c. Preformed PVC
 - 1) Polyvinylchloride covers similar to Manville "Zeston."
 - 2) Color: white
3. Preformed Pipe Fitting Covers:
 - a. Aluminum
 - 1) Factory fabricated formed covers
 - 2) Equal to General Aluminum Supply Corp. GASCO
 - 3) Exposed insulation: Insulation exposed to weather shall be protected by a smooth or corrugated aluminum jacket or colored plastic jacket approved for outdoor installation, minimum 0.016 inch thick, secured 3" on center, overlapped at joints and sealed watertight.

2.14 SEISMIC RESTRAINTS

A. General:

1. Capable of safely accepting indicated external forces without failure
2. Maintain equipment and piping in a captive position
3. Seismic design Criteria:

4. See Note CD-5 on sheet S1.01 of the structural package for the current code requirements.
 5. Provide seismic restraints to meet the more stringent requirements of the CBC or the local building code.
 6. Restraints shall not short-circuit vibration isolation systems under normal operation.
 7. Design and provide restraints to prevent permanent displacement in any direction caused by lateral motion, overturning, or uplift of Plumbing equipment, and piping. Restraints shall meet requirements of the CBC.
- B. Published specifications standards, tests or recommended methods of trade, industry or governmental organizations apply to work in this section:
1. CBC – California Building Code
 2. CPC - California Plumbing Code
- C. Seismic load calculations for piping:
1. Calculations required for supports and bracing for situations not covered by referenced "Guidelines" and any revisions to seismic load calculations provided in contract documents at time of bid.
 2. Include horizontal and vertical reaction loads at connections to building structures for all seismic restraints, including those covered by referenced "Guidelines." Coordinate reaction loads and attachment details with structural engineer for building.
 3. Calculations made and signed by registered structural engineer knowledgeable in seismic design:
 - a. Hired under this Section of work
 - b. Cost of calculations borne under this Section
 - c. Refer to 4/S4.21 for pad detail/ calculations. Refer to 10/S5.10 7 7/S5.01 for hanger connection to slab detail/calculations. Refer to PSBD1.01 and PSBD1.02 for attachment details.
 4. Bracing system: One of the following methods as most applicable for each brace:
 - a. Material used, except for pipes, shall be structural steel with ASTM A36. Steel pipes shall conform to ASTM A501
 - b. Complete system of factory fabricated components
 - c. Complete system of job fabricated components
 - d. Miscellaneous metal structural shapes

2.15 BACKFLOW PREVENTERS

- A. Watts LF009, Zurn Model 375, or equal, lead free reduced pressure device
- B. Each unit shall be complete with upstream lead free strainer, check valves, relief valve, ball valves, and test cocks. Furnish and install air gap drain funnel at each reduced pressure device, connect drain piping full size, and terminate over drain provisions as noted on plans.
- C. All units shall be listed on the list of approved devices.
- D. Contractor shall arrange and pay for device certification per the Authority Having Jurisdiction.

PART 3 EXECUTION

3.1 PROTECTION OF WORK DURING CONSTRUCTION

- A. Protect from damage, water, dust, etc., material, equipment and apparatus provided under this Division, both in storage and installed, until Notice of Completion has been filed.
- B. Provide protective covers, skids, plugs or caps to protect equipment and materials from damage and deterioration during construction. Cover motors and other moving machinery to protect from dirt and water during construction.
- C. Material, Equipment or Apparatus:
 - 1. Material, equipment or apparatus damaged because of improper storage or protection will be rejected.
 - 2. Remove damaged material, equipment or apparatus from site and provide new, duplicate, material, equipment or apparatus in replacement of that rejected.
 - 3. Porous materials, such as pipe insulation, shall be protected from weather. If such material becomes wet during construction, it shall be removed and replaced at no cost to Owner; drying is not sufficient due to possible microbial contamination.

3.2 INSTALLATION AND WORKMANSHIP

- A. All equipment and material shall be installed in a neat and workmanlike manner.
- B. Repair all damaged or temporarily removed walls, roofs, roofing, equipment, etc.
- C. Follow manufacturer's installation instructions and recommendations.
- D. All equipment must be anchored to the building. All hung equipment shall incorporate vibration isolation.

3.3 PIPING

- A. Install pipes and pipe fittings in accordance with recognized industry practices which will achieve permanently leak resistant piping systems, capable of performing each indicated service without piping failure. Install each run with minimum joints and couplings but with adequate and accessible unions for disassembly and maintenance/replacement of valves and equipment. Reduce sizes where indicated by use of reducing fittings. Align piping accurately at connections, within 1/16-inch misalignment tolerance.
- B. Wherever possible, piping shall be run in beam bays before offsetting to below a beam.
- C. Verify all invert elevations and pitched lines before starting work.
- D. Coordinate all pipe runs below structural slab at first floor with the Structural Engineer. Offset piping over top of grade beams/footings; vertical penetrations of structural foundation members is not permissible.
- E. Provide insulating couplings or dielectric unions at all connections of ferrous piping to non-ferrous piping.

3.4 VALVES

- A. For valves in multiple parallel runs of piping, provide 4" clearance between valve handle and adjacent pipe, or insulation. Install valve handles in horizontal position between pipes. Do not install valve handles on top of pipe.
- B. Install valves in accordance with manufacturer's written installation instructions
- C. Provide valves as shown on drawings
- D. Provide all valves (except control valves), strainers, and check valves of same size as the pipes in which they are installed unless otherwise indicated
- E. Pressure rating of valves same as piping in which installed
- F. Install valves with stems upright or horizontal, not inverted
- G. Install valves with cast directional arrows in direction of flow
- H. Support line valves at the valve in addition to regularly spaced pipe supports shown and specified
- I. Check valves:
 - 1. Provide silent check valves at discharge of pumps. Install swing checks and gravity closing lift checks in horizontal position.
- J. Provide blow-down ball valves and hose adaptors at strainers, air separators, tanks, pipe traps, equipment drains, etc. of same size as strainer blow-off connection
- K. Provide drain valves at main shut-off valves, low points of piping and apparatus
- L. Locate wheel handles to clear obstructions with hand
- M. Install valves only in accessible locations
- N. Wherever possible, install valves accessible from floor level. Provide guided chain operators on valves over 7 feet above floor in equipment areas. Extend chains to within 6 feet 6 inches of floor.
- O. Locate equipment shut-off valves to be accessible without climbing over equipment
- P. Provide operating handles for all valves and cocks without integral operators, unless otherwise noted. Provide adequate clearance for easy operation
- Q. Provide open-ended line valves with plugs or blind flanges

3.5 PIPE INSULATION SCHEDULE

- A. Insulation Application Types
 - 1. Type P-2:
 - a. Molded Fiberglass
 - b. All-service jacket
 - c. Provide calcium silicate inserts for all pipe sizes
 - 2. Type P-3: Flexible elastomeric insulation

B. Application Schedule

<u>Service</u>	<u>Type</u>	<u>Size</u>	<u>Thickness</u>
Domestic Hot Water (All piping from water heaters to each point of use)	P-2	All	Per Title 24 for circulated systems minimum.
Sanitary waste piping serving air-gap assemblies (including underside of drain bodies) within 10 feet of receiving condensate or indirect waste from ice makers	P-3	All	1/2 inch
Condensate drains	P-3	All	1/2 inch
Exposed Sanitary Drains, Domestic Water, Domestic Hot Water, and Stops for Plumbing Fixtures for People with Disabilities	P-3	All	1/2 inch

C. Non-insulated piping and equipment

1. Vent, overflow, drain and relief, except as noted otherwise

3.6 PIPE INSULATION INSTALLATION

- A. Install materials in accordance with manufacturer's instructions
- B. Coordinate with work of other trades
- C. Deliver material to job site in original non-broken factory packaging, labeled with manufacturer's density and thickness
- D. Install insulation where it cannot become wet. If insulation becomes wet, remove and dispose of properly and replace with new, dry insulation. Wetted insulation is not acceptable. Ensure insulation is dry before and during installation.
- E. Insulate all piping, valves, fittings, flanges and accessories
- F. Provide calcium silicate inserts for all pipe sizes and all types of supports
- G. Insulate fittings, joints and valves with insulation of same material and thickness as adjoining pipe. Use pre-molded fiberglass fitting covers or radial mitered segments of pipe insulation. For strainers, expansion joints, fittings and accessories requiring servicing or inspection insulation shall be removable and replaceable without damage. Enclose within two-piece no. 15 gauge aluminum covers fastened with cadmium-plated bolts and nuts.
- H. Insulate flanges with insulation sleeve of same material as pipe insulation to cover flange and overlap insulation on adjacent piping
- I. Continue insulation through walls, sleeves, pipe hangers and other pipe penetrations

- J. Finish insulation at supports, protrusions and interruptions. No hangers or supports shall be embedded in insulation.
- K. Elastomeric Tubing
 - 1. Provide insulation
 - 2. Butt edges neatly. Seal longitudinal and transverse joints with adhesive to maintain minimum vapor permeance. Adhesive shall be selected and applied in accordance with insulation manufacturer's recommendations.
 - 3. Apply additional jacket as specified
- L. Perform work at ambient and equipment temperatures as recommended by adhesive manufacture
- M. Protection: Protect against dirt, water, chemical, or mechanical damage before, during, and after installation. Repair or replace damaged insulation at no additional cost

3.7 VIBRATION ISOLATION

- A. Installation:
 - 1. Install isolators and seismic restraints in accordance with manufacturer's written instructions
 - 2. Make no rigid connections between equipment and building structure that degrade noise and vibration isolation system herein specified:
 - a. Electrical conduit connections to isolated equipment shall be flexible liquid tight conduit of sufficient length to incorporate a right angle bend, an offset of not less than 8 inches or a loop to allow free motion of isolated equipment
 - b. The Plumbing Sub-contractor shall not install any equipment, piping or conduit which makes rigid contact with the "building" unless permitted in this Specification. Building includes, but is not limited to, slabs, beams, columns, studs and walls
 - c. Coordinate work with other trades to avoid rigid contact with the building. Inform other trades following work, such as plastering or electrical, to avoid any contact which would reduce the vibration isolation.
- B. Piping Isolation:
 - 1. Isolate water piping from structure with Acousto-Plumb System isolators, holders and guides for 1-inch and smaller.
 - 2. Isolate waste, rainwater leader, pipes and water pipes larger than 1-inch with Holdrite Silencer System components or equal.
 - 3. Wall and Floor Penetrations: Do not allow the piping, connectors and valves to directly touch the structure, studs, gypsum board, or other pipes All piping to be isolated shall freely pass through walls and floors without rigid contacts or connections. Penetration points shall be sleeved or otherwise formed to allow passage of piping or ductwork, and maintain 0.75 inches to 1.25 inches clearance around the pipe or duct outside surfaces:

3.8 CLEANING

- A. During construction:
 - 1. Keep openings in piping closed to prevent entrance of foreign matter.
 - 2. Clean pipe, fittings and valves internally.

- B. Clean plumbing fixtures with soap and water. Remove marks and labels. Clean and polish chrome. Remove paint, concrete, plaster and other foreign materials.
- C. Clean all drains, and traps, of dirt and debris.
- D. Remove shipping paper from cleanout covers and drain strainers and polish.
- E. Remove and clean out all dirt and debris from pipe spaces, including all wire, and blocking.
- F. All equipment and materials furnished by this Section shall be completely dust and paint free, clean and rust free and freshly painted or polished when the final inspection is made.
- G. Thoroughly clean and flush interior and exterior of all piping systems (wet systems, and drainage systems) of any nature of all pipe contaminates such as cuttings, fillings, grease, solder, flux and welding residue.

3.9 STERILIZATION

- A. Aquatect. or equal
- B. At the completion of testing and adjusting, and before domestic water systems are put into use, they shall be sterilized. Perform the entire disinfection procedure under the supervision of the Authority Having Jurisdiction. Until sterilization of the domestic water system has been made, all water outlets shall have signs posted at their locations stating the water system has not been sterilized and shall not be used for human consumption. The Plumbing Contractor shall furnish and install all valves, outlets, and devices required by the sterilization sub-contractor to complete the sterilization work.

3.10 EXCAVATING, TRENCHING, AND BACKFILLING

- A. Perform all excavating, trenching, removal of surplus material, and backfilling required for installation of material and equipment under this Section. Provide and maintain dewatering pumps as required. Any rock excavation and disposal shall be included in Base Bid price.
- B. Minimum bury depths, safety and installation requirements shall concur with the Authority Having Jurisdiction.

3.11 EQUIPMENT AND PIPING IDENTIFICATION

- A. Equipment:
 1. All plumbing equipment shall be identified by nameplates securely fastened in a clearly visible location to the equipment housing or frame. Nameplates shall include the equipment design plan mark and brief description of the area or system served, such as: "Water Softener Building A". Nameplates shall be 2-1/2" x 3/4" minimum, either 1/16" thick Bakelite with engraved white core letters and beveled edge, or aluminum with black enameled background and etched or engraved natural aluminum lettering
 2. Manufacturer's nameplate shall be clean and legible and installed in a clearly visible location.
- B. Piping:

1. Identify piping with symbol identification, direction of flow arrows and specific pressure zones, complying with ANSI A 13.1 color standards.
2. Identify piping at approximately 25' centers where unconcealed. Concealed piping above inaccessible ceilings shall be identified at each access panel. Concealed piping above accessible ceilings shall be identified within 10 feet of each wall penetration (both sides of walls).
3. Where capped piping is provided for future connections, provide legible and durable metal tags indicating symbol identification.
4. Printed labels with colored background and attaching strap: Seton, W. Brady, or equal.
5. Apply in accordance with manufacturer's instructions

C. Buried Utility Warning and Identification Tape

1. Seton, Brady, or equal
2. Polyethylene plastic tape manufactured specifically for warning and identification of buried pipe lines. Code and letter coloring shall be permanent, unaffected by moisture and other substances contained in trench backfill material.
3. Install tape 12" above top of pipe during backfilling of trench.

3.12 LEAKAGE TESTING

- A. Before conducting tests, valve-off or disconnect any equipment and apparatus which may be damaged by the test pressures higher than normal working pressures. All testing shall be witnessed by the Authority Having Jurisdiction.
- B. Sanitary Soil, Waste, and Vent Piping: Hydrostatically test and prove tight, to provide a minimum 10 foot head of water, and in accordance with the governing plumbing code.
- C. Domestic Hot and Cold Water Piping: Test and prove tight under 150 PSI hydrostatic pressure.
- D. Trap Primer Piping: Test and prove tight under 50 PSI hydrostatic pressure.

3.13 TESTING AND ADJUSTING

- A. Adjust all faucets and outlets.
- B. Demonstrate correct operation of all water heating equipment
- C. Adjust temperatures of water heating equipment.
- D. Demonstrate correct operation of thermostatic mixing valves
- E. Demonstrate correct operation of trap priming devices.
- F. Assist in the testing and adjusting of equipment furnished and installed under other Divisions, but served and connected under this section

END OF SECTION

SECTION 230501

BASIC MECHANICAL MATERIALS AND METHODS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included: Materials, equipment, fabrication, installation, starting, testing and commissioning in conformance with applicable codes and authorities having jurisdiction for Mechanical Work covered by all sections within this Division including, but not limited to
 - 1. Heating, ventilating and air conditioning systems and equipment

- B. Related Sections
 - 1. All work in every Section must also comply with such general conditions of the specifications as are applicable, including, but not limited to
 - a. Instructions to Bidders
 - b. General Conditions
 - c. Special Conditions
 - d. Supplementary Conditions
 - e. Division 1 General Requirements
 - 2. Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable installation. This section is provided to assist Contractor in coordination of work scope but shall not be construed to limit Contractor's scope of work encompassed by the contract documents.
 - 3. Coordination with other Trades: The following table is intended to assist the Contractors in coordinating the scope of work between Division 23 HVAC (indicated as 23 in table), Division 25 Building Automation Systems (indicated as 25), and other Divisions as indicated. However, the General Contractor is ultimately responsible for coordination among his subcontractors regardless of what is listed in this Section.

INTERFACE / RESPONSIBILITY MATRIX					
System	Division under which the following is specified				Remarks
	Equipment	Installation	Power wiring (remark 1)	Control & interlock wiring (remark 1)	
A. FIRE SPRINKLER SYSTEM					
1. Flow switches	21	21	26	26	
2. Valve monitors	21	21	26	26	
3. Post indicating valves	21	21	26	26	
B. FIRE & LIFE SAFETY SYSTEMS					
1. Fire alarm controls and UUKL atrium smoke controls	28	28	26/ 28	28	
2. Duct mounted & in-duct mounted smoke detectors	28	23	28	28	

INTERFACE / RESPONSIBILITY MATRIX					
System	Division under which the following is specified				Remarks
	Equipment	Installation	Power wiring (remark 1)	Control & interlock wiring (remark 1)	
3. Other smoke detectors	28	28	28	28	
4. Smoke control interlocks to HVAC fans	28	28	28	28	2
5. Smoke dampers with electric actuators	23	23	26	28	
6. Smoke damper end switches	23	23	-	28	
C. MECHANICAL EQUIPMENT					
1. Variable speed drives, field mounted	23	26	26	25 /28	3, 7
2. Motors, 3 phase	23	23	26	-	
3. Motor starters, 3 phase	26	26	26	25 /28	4, 7
4. Motors, 1 phase	23	23	26	26	5, 6, 7
5. Other powered equipment	23	23	26	25	
6. Disconnects/circuit breakers	26/ 23	26/ 23	26	- /28	8, 9
D. BUILDING AUTOMATION SYSTEM (BAS)					
1. Central control workstations & servers	25	25	26	25	
2. Control system network backbone	25	25	25	25	
3. Line voltage control devices to 120V motors	25	26	26	26	6
4. Window switches	25	25	-	25	
5. Control panels	25	25	26	25	10
6. Control devices	25	25	25	25	
E. ELECTRICAL SYSTEMS					
1. Lighting Control BACnet gateway	26	26	26	25	11
2. Lighting relay panels and low voltage switches	26	26	26	26	
3. Lighting occupancy sensors	26	26	26	26	
4. Daylighting sensors and controls	26	26	26	26	
5. Power monitoring sensors and gateway	26	26	26	26/25	12
F. EMERGENCY POWER SUPPORT SYSTEMS					
1. Muffler	26	26	-	-	
2. Exhaust piping	26	26	-	-	
3. Radiator cooling	26	26	-	-	
4. Generator monitoring and alarm points	26	26	-	25	13
5. Generator fuel system	26	26	26	-	
G. IRRIGATION SYSTEM					
1. Controllers	32	32	26	32	
2. Control valves	32	32	32	32	
3. Flow meters	32	32	32	32	
H. PLUMBING SYSTEMS					
1. Condensate drains including traps, primers	22	22	-	-	14
2. Condensate pumps	-	-	-	-	

INTERFACE / RESPONSIBILITY MATRIX					
System	Division under which the following is specified				Remarks
	Equipment	Installation	Power wiring (remark 1)	Control & interlock wiring (remark 1)	
3. Make-up water to hot/chilled/condenser water including backflow prevention	22	22	-	-	15
4. Water flow meters	25	22	25	25	
5. Recirculation pumps	22	22	26	25	
6. Pipe gauges, thermometers, test plugs	22	22	-	-	
7. Self-powered valves, pressure relief valves, liquid level controllers, etc.	22	22	-	-	
8. Sensor wells, meters and other pipe-mounted control devices	25	22	25	25	
I. HVAC HYDRONIC SYSTEMS					
1. Pipe gauges, thermometers, test plugs	23	23	-	-	
2. Self-powered valves, pressure relief valves, liquid level controllers, etc.	23	23	-	-	
3. Automatic isolation and control valves	25	23	25	25	
4. Sensor wells, meters and other pipe-mounted control devices	25	23	25	25	
J. HVAC SHEET METAL					
1. Duct mounted sensors	25	23	25	25	
2. Filter gauges	25	25	-	-	
3. Control dampers	23	23	-	-	16
4. Control damper actuators	25	25	25	25	16
K. HVAC TERMINAL BOXES					
1. Terminal box control transformer panel	25	25	26	25	10, 17
2. Terminal box with damper	23	23	-	-	
3. Digital controller and damper actuator	25	25	25	25	
4. Air-flow measurement pickup	23	23	-	-	
5. Air-flow measurement transducer and piping	25	25	25	25	
6. Wall sensor module	25	25	25	25	
L. MISCELLANEOUS					
1. Plumbing utilities 5 feet beyond building interior wall line	33	33	-	-	
2. CHW and HW utilities outside building interior wall line	33	33	-	-	
3. Roofing, including cant strips and counterflashing at the sides of roof curbs	7	7	-	-	
4. Thermal and acoustical insulation in and on partitions and ceilings	7	7	-	-	
5. Undercutting of doors and door louvers	8	8			
6. Louvers	8	8	-	-	

INTERFACE / RESPONSIBILITY MATRIX					
System	Division under which the following is specified				Remarks
	Equipment	Installation	Power wiring (remark 1)	Control & interlock wiring (remark 1)	
7. Concrete housekeeping pads, piers, pedestals and inertia base fill etc. for equipment.	3	3	-	-	18
8. Equipment, ductwork, and piping steel supports and frames	23	23	-	-	
9. Grates and railings protecting mechanical shaft and other floor openings	5	5	-	-	
10. Curbs at rooftop units, fans, duct/vent penetrations, and piping penetrations	23	23	-	-	19
11. Painting	9/23	9/23	-	-	20
12. Coring or cutting wall and floor openings for ductwork and piping	23	23	-	-	
13. Fire-stopping and acoustic caulking around pipe and duct penetrations in floors and walls	23	23	-	-	
14. Fire rated enclosures where shown around ducts	9	9			
15. Framing of walls and ceilings to accept air outlets, fire dampers, etc.	9	9	-	-	21
16. Ceiling and wall access doors and panels	8	8	-	-	22
NUMBERED REMARKS:					
<ol style="list-style-type: none"> 1. Wiring includes raceway, fittings, wire, boxes and related items, all voltages. 2. Wiring and controls to start and stop fans based on smoke detector status and smoke control logic specified under Division 26 Electrical. 3. Where drive is used for CBC 909 atrium life safety system fan, input to drive to force drive to preset speed specified under Division 23 HVAC; wiring to life safety system specified under Division 26 Electrical. 4. Integral starter control devices such as HOA switches, 120V control transformers specified under Division 26 Electrical. 5. Single phase 120V motors with integral motor overload protection specified under Division 23 HVAC. 6. Line voltage control device such as thermostat or switch specified under Division 25 BAS; wiring and conduit between control device and motor specified under Division 26 Electrical. 7. Fire and life safety control systems, status devices (such as fan status switches and voltage-available relays), start/stop relays and associated wiring and conduit specified under Division 26 Electrical. Identification of mechanical equipment termination contact locations by Division 23 HVAC. 8. Disconnect status where required to be monitored for CBC 909 atrium smoke control systems specified under Division 26 Electrical. 9. Disconnects or circuit breakers are specified under Division 23 HVAC where specifically called for in equipment schedules or specifications to be factory installed with equipment. Otherwise all disconnects are specified under Division 26 Electrical. 10. 120V power to BAS control panels is specified under Division 26 for the panels shown on Drawings. 					

INTERFACE / RESPONSIBILITY MATRIX					
System	Division under which the following is specified				Remarks
	Equipment	Installation	Power wiring (remark 1)	Control & interlock wiring (remark 1)	
<p>Power to all other control panels that may be required is specified under Division 25 BAS, coordinated with Division 26 contractor for available circuits.</p> <p>11. Lighting control vendor to provide all necessary technical assistance to Division 25 BAS Contractor in mapping across lighting control points to the BAS.</p> <p>12. Power measuring sensors, installation and wiring to a single central controller with BACnet/IP interface specified under Division 26 Electrical. BACnet/IP gateway and network connection from gateway to BAS specified under Division 25 BAS. Power monitoring control vendor to provide all necessary technical assistance to Division 25 BAS Contractor in mapping across power monitoring control points to the BAS.</p> <p>13. Generator monitoring sensors and central controller with Modbus gateway specified under Division 26 Electrical. Gateway and network connection from gateway to BAS specified under Division 25 BAS. Generator vendor to provide all necessary technical assistance to Division 25 BAS Contractor in mapping across monitoring control points to the BAS.</p> <p>14. Condensate piping from condensate pans to the sewer system including trap and final connections is specified under Division 22 Plumbing. Piping from auxiliary drain pans where provided at fan-coils is specified under Division 23 HVAC.</p> <p>15. Domestic make-up water, including shut-off valve, backflow prevention, rough-in and final connection to hot water, chilled water, and any other HVAC systems requiring make-up water is specified under Division 22 Plumbing.</p> <p>16. Duct access doors required for access to control devices where required specified under Division 23 HVAC.</p> <p>17. Control transformers for terminal boxes shall be centralized in control panels specified under Division 25 BAS.</p> <p>18. Shop drawings showing dimensions of all curbs, bases, etc. specified under Division 23 HVAC.</p> <p>19. Shims to level curb specified under Division 6. Curb insulation specified under Division 23 HVAC.</p> <p>20. Painting of exposed piping, HVAC equipment, etc. per Paragraph 3.7 specified under Division 23 HVAC. All other painting specified under Division 9.</p> <p>21. Additional T-bar or spline and cut ceiling tile as required to accept air outlets is specified under Division 9.</p> <p>22. Dimensioning of access doors to mechanical equipment and coordination with Architect and Division 8 specified under Division 23.</p>					

1.2 REFERENCE STANDARDS

- A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Such codes or standards shall be considered a part of this Specification as though fully repeated herein.

- B. Work shall be performed in accordance with all applicable requirements of the latest edition of all governing codes, rules and regulations including but not limited to the following minimum standards, whether statutory or not.
- C. Requirements of Regulatory Agencies
1. In accordance with the requirement of Division 1 General Requirements
 2. Nothing in contract documents shall be construed to permit work not conforming to current and applicable laws, ordinances, rules and regulations.
 3. When contract documents exceed requirements of applicable laws, ordinances, rules and regulations, comply with documents establishing the more stringent requirement.
 4. It is not the intent of contract documents to repeat requirements of codes except where necessary for completeness or clarity.
 5. Seismic construction and restraints: In accordance with requirements of Title 17 of California Administrative Code.
 6. Comply with the Safety Orders issued by California Occupational Safety and Health Act, COSHA and any other safety, health or environmental regulations of the State of California and any districts having jurisdictional authority. Where an omission or conflict appears between COSHA requirements and the Drawings and Specifications, COSHA requirements shall take precedence.
 7. Applicable codes as listed below, in addition to others specified in individual sections
 - a. CEC – California Electrical Code
 - b. CBC – California Building Code
 - c. CMC – California Mechanical Code
 - d. CPC – California Plumbing Code
 - e. City and County Codes and Amendments
 - f. California Code of Regulations, including Titles 8, 17, 19, 20, 21, 22 and the California Building Standards Code Part 2, Basic Building Regulations.
- D. Published specifications, standards, tests or recommended method of trade, industry or governmental organizations as listed below apply to all work in Division 23 HVAC, in addition to other standards which may be specified in individual sections.
- E. All base material shall meet ASTM and ANSI standards
- F. All Pressure Vessels, Relief Valves, Safety Relief Valves and Safety Valves: Comply with standards, ASME stamped
- G. All Electrical Devices and Wiring
1. Conform to standards of CEC/NEC
 2. All devices UL or ETL listed and identified
- H. Guidelines and Standards: The latest edition of guidelines and standards published by the following groups will govern the Mechanical Systems and associated support system design. The systems shall be designed to meet or exceed these guidelines and standards.

AABC	Associated Air Balance Council
ADC	Air Diffuser Balance Council
AMCA	Air Movement and Control Association, Inc.
ANSI	American National Standards Institute
AHRI	Air Conditioning, Heating, and Refrigeration Institute
ASC	Adhesive and Sealant Council
ASHRAE	American Society of Heating, Refrigeration and Air Conditioning Engineers
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials

AWWA	American Water Works Association
AWS	American Welding Society
COSHA	California Occupational Safety and Health Act
ETL	Intertek Semko (Formerly Electrical Testing Laboratories)
GISO	General Industry Safety Orders
HI	Hydraulic Institute
IEEE	Institute of Electrical and Electronic Engineers
NBS	National Bureau of Standards
NEBB	National Environmental Balancing Bureau
NEMA	National Electrical Manufacturer's Association
NFPA	National Fire Protection Association
OSHPD	Office of Statewide Health Planning and Development
SFA	California State and Local Fire Marshall
SMACNA	Sheet Metal and Air Conditioning Contractors National Association, Inc.
UL	Underwriters' Laboratories, Inc.

1.3 QUALITY ASSURANCE

- A. Supply all equipment and accessories in compliance with the applicable standards listed in Paragraph 1.2 and with all applicable national, state and local codes.
- B. All equipment and accessories shall be new and the product of a manufacturer regularly engaged in its manufacture.
- C. All items of a given type shall be the products of same manufacturer.
- D. All work in Division 23 HVAC shall be commissioned. See Section 019100 Commissioning and Section 230800 Mechanical Commissioning.

1.4 DOCUMENT FORMAT

- A. This section applies to all documents specified to be provided by Division 23 specifications except where specifically indicated otherwise.
- B. Electronic copies
 - 1. Provide in word-searchable electronic format; acceptable formats are MS Word, Adobe Acrobat (pdf) and HTML. Scanned paper documents not acceptable even if converted to text with OCR.
 - 2. For Submittals and O&M Manuals, provide separate file for each specification section or provide one file with hyperlinked tabs to each system.
 - 3. For Test & Balance report, provide separate files for each air handling system, hydronic system, primary equipment, etc. or provide one file with hyperlinked tabs to each system.
 - 4. Record drawings shall be in original format per Paragraph 1.6C.3.
- C. Paper copies
 - 1. Only provide where specifically required. In general, only electronic copies are required.
 - 2. Assemble in chronological order following alpha-numeric system used in specification, in heavy three-ring binder.

1.5 SUBMITTALS

- A. No work may begin on any segment of this Project until the related submittals have been reviewed for conformity with the design intent and the Contractor has responded to all comments to the satisfaction of the Owner's Representative.
- B. Submit drawings, product data, samples and certificates of compliance required as hereinafter specified.
1. See also Division 1 Shop Drawings, Product Data and Samples. Conditions in this Section take precedence over conditions in above referenced Section.
 2. Provide submittals promptly in accordance with schedule and in such sequence as to cause no delay in work or in work of any other division.
 3. Submittals for each specification section shall be submitted in a single package. However, it is not required (nor desired) for all products to be submitted concurrently. Rather, submittals may be staggered based on schedule and required equipment release dates.
 4. Allow 15-working days for review, unless the Owner's Representative agrees to accelerated schedule.
 5. For substitutions, list any features or characteristics that are not strictly in compliance with specifications. If none are listed with the submittal, Contractor is guaranteeing that substituted product is functionally equivalent to the specified product in accordance with Paragraph 1.7.
 6. Submittal reviews by the Owner's Representative are intended to assist the Contractor in complying with the design intent and requirements of the drawings and specifications. Reviews do not relieve the Contractor from compliance with these requirements, and comments or lack thereof do not constitute approval of changes in these requirements.
- C. Submission and Resubmission Procedure
1. Each submittal shall have a unique serial number that includes the associated specification section followed by a number for each sub-part of the submittal for that specification section, such as "SUBMITTAL 23xxxx-01".
 2. Each resubmittal shall have the original unique serial number plus unique revision number such as "SUBMITTAL 23xxxx-01 REVISION 1". The cover page of resubmittals shall include a summary of prior comments and how they were resolved in the resubmittal.
 3. Submit in format specified below. Submissions made in the wrong format will be returned without action.
 - a. Product Submittals: One copy in word-searchable electronic format per Paragraph 1.4. Submit each specification section in a separate file named with unique name and number described above.
 - b. Shop Drawings:
 - 1) One copy in word-searchable electronic format per Paragraph 1.4.
 - 2) One paper copy only if requested by Owner
 - c. Samples: As indicated in each specification section
 4. Owner's Representative will return a memo or mark-up of submittal with comments and corrections noted where required.
 5. Make corrections
 - a. Revise initial submittal to resolve review comments and corrections.
 - b. Indicate any changes that have been made other than those requested.
 - c. Clearly identify resubmittal by original submittal number and revision number.
 6. Resubmit revised submittals until no exceptions are taken.
 7. Once submittals are accepted with no exceptions taken, provide
 - a. Complete submittal of all accepted products in a single electronic file for each specification section.
 - b. Photocopies or electronic copies for coordination with other trades, if and as required by the General Contractor or Owner's Representative.

D. Product Data Submittals

1. Contents
 - a. Manufacturer's name and model number
 - b. All information required to completely describe materials and equipment and to indicate compliance with drawings and specifications, including, but not limited to:
 - 1) Schedule when more than one of each item is covered by submittal
 - 2) Physical data, as applicable
 - a) Dimensions
 - b) Weight
 - c) Finishes and colors
 - d) Dimensional shop drawings
 - 3) Performance data, as applicable
 - a) Rated capacities
 - b) Performance curve
 - c) Operating temperature and pressure
 - d) Sound power levels
 - 4) Flow and wiring diagrams as applicable
 - 5) Description of system operation
 - c. All other pertinent information requested in individual sections
2. Format
 - a. See Division 1 Shop Drawings, Product Data and Samples
 - b. Identify clearly if submittal is substitution: Refer to Paragraph 1.7
 - c. Reference specification Division, Section, Title, Paragraph and Page number or drawing number as applicable
 - d. Use same nomenclature, legend, symbols and abbreviations on submittal material as used in contract documents

E. Layout Shop Drawings

1. Drawings shall be developed using 3D software such as CAD-Duct and CAD-Pipe that is compatible with Navisworks to minimum Level of Development 350.
2. Shop fabrication, coordination and installation drawings by the Contractor, are for the Contractor's use and shall be the Contractor's responsibility. These Drawings indicate where the Contractor intends to install the material and equipment as required by the Contract Documents. Do not submit shop fabrication documents unless requested. Use of contract documents or electronic files of contract documents for shop drawings is not sufficient.
3. Prepare and submit Shop Drawings for all Work deviating from that indicated on Contract Drawings. Clearly indicate deviations.
4. Review is not intended to verify dimensions or quantities, or to coordinate items shown on these Drawings. Review is for general conformance with design concept of the Project and general compliance with the information given in the Contract Documents. Contractor is responsible for dimensions, which shall be confirmed and correlated at the Jobsite, for fabrication processes and techniques or construction, for coordination of Work with that of all other trades and the satisfactory performance of Work.
5. Prepare and submit layout drawings, sections and details for following areas:
 - a. Fan rooms
 - b. All duct shafts
 - c. All heating and cooling duct mains up to taps to VAV boxes
6. Drawings shall show work of all trades including but not limited to:
 - a. Ductwork
 - b. Piping: All Trades
 - c. Mechanical Equipment
 - d. Electrical Equipment
 - e. Main Electrical conduits and bus ducts

- f. Equipment supports and suspension devices
- g. Structural and architectural constraints
- h. Show location of
 - 1) Valves: manual and automatic
 - 2) Piping specialties
 - 3) Dampers: fire/smoke, automatic and manual volume, etc.
 - 4) Access doors
 - 5) Control and electrical panels
 - 6) Others as required for clear coordination
- 7. Drawings shall indicate coordination with work specified in other Divisions which must be coordinated with work specified under Division 23 HVAC, including, but not limited to:
 - a. Irrigation equipment and piping
 - b. Elevator equipment
 - c. Building vacuum cleaning systems
 - d. Pneumatic tube systems
 - e. Cable trays
 - f. Computer equipment
 - g. Others as required
- 8. Submission of drawings
 - a. See Division 1 Shop Drawings, Product Data and Samples.
 - b. Submit to other trades for review of space allocated to all trades.
 - c. Revise drawings to compensate for requirements of existing conditions and conditions created by other trades.
 - d. Ensure that each trade has coordinated work with other trades
 - e. Submit with stamps of General and all other applicable Contractors, initialed and signed certifying
 - 1) Review of submittal
 - 2) Verification of products, field measurements and field construction criteria
 - 3) Coordination of information in submittal with requirements of work of this Division and other divisions of Contract Documents
 - f. No layout shop drawing will be reviewed without stamped and signed coordination assurance by the Contractor.

F. Samples

- 1. Submit as required in each specification section.

1.6 COMPLETION REQUIREMENTS

A. Procedure

- 1. Until the documents required in this section are submitted and approved, the system will not be considered "accepted."
- 2. Before requesting acceptance of work, submit one set of Completion Documents for review and approval of Owner's Representative.
- 3. After review, furnish quantity of sets indicated below to Owner.
- 4. Format
 - a. See Paragraph 1.6H for required format of Completion Documents

B. Operating and Maintenance (O&M) Manual

- 1. In accordance with requirements of Division 1 Operating and Maintenance and as follows
- 2. O&M Manual shall include but is not limited to the following
 - a. Complete Product Data Submittals per Paragraph 1.5D so that the details of the device are known. This shall include only final approved submittals; rejected early submittals shall be stripped.

- b. Manufacturer's name, model number, service manual, spare-parts list and descriptive literature for all components
 - c. Operating instructions
 - d. Maintenance and repair requirements
 - e. Wiring diagrams
 - f. Requirements for special tools, test kits and calibration instructions
 - g. Replacement parts list
 - h. Valve tag directory
 - i. Name, address and phone number of contractor's equipment suppliers and service agencies
- C. Record Drawings
- 1. Keep up-to-date during progress of job one set of Mechanical Drawings indicating the Record installation. In addition to changes made during course of Work, show following by dimension from readily obtained base lines
 - a. Fully illustrate all revisions made by all crafts in course of work
 - b. Include all field changes, adjustments, variances, substitutions and deletions, including all Change Orders
 - c. Exact location, type and function of concealed valves, dampers, controllers, piping, air vents and piping drains
 - d. Exact size, invert elevations and location of underground and under floor piping and ducts
 - 2. Progress drawing set shall be available for inspection by Owner's Representative weekly
 - 3. Update shop drawings and record drawings to reflect revisions and additional data listed above at completion of Project
 - a. Original engineering design drawings will be provided to Contactor in electronic format compatible with Revit or AutoCAD version 2013 or later. Update to become record set.
 - b. Drawings required to be updated if revisions were made
 - 1) Floor plans
 - 2) Shop drawings
 - 3) Sections
 - 4) Riser diagrams
- D. Test and Balance Reports
- 1. See Section 230593 Testing, Adjusting and Balancing
- E. Commissioning Reports
- 1. See Section 230800 Mechanical Commissioning and 250000 Building Automation Systems
- F. Training Materials
- 1. See Section 230800 Mechanical Commissioning and 250000 Building Automation Systems
- G. Miscellaneous Certificates
- 1. Pressure and Leakage Test documentation/certificates
 - 2. Training/Instruction completion certificates
 - 3. Fire Marshal and Fire Department approvals of system, as required
 - 4. Final inspection certificate signed by governing authorities
 - 5. Warranty period, including start and end period
 - 6. Field test report, including as applicable
 - a. Startup documents with date and name of technician
 - b. Piping pressure tests

- c. Duct leakage and pressure tests
- d. Drain pan drainage tests
- e. Letters from manufacturers certifying their supervision of equipment installation and start-up procedures
- f. Others as specified herein

H. Format of Completion Documents

- 1. Provide the type and quantity of media listed in table below
- 2. Where indicated in table, the electronic files shall be stored on the BAS systems' Operator Workstation. See Division 25 Building Automation Systems.

	Document	Paper (binder or bound)	Electronic	
			Loaded onto Flash Drive	Loaded onto Operator Workstation
1.	O&M Manuals (including submittals)	3	1	1
2.	Record Drawings	2 Full size 2 Half size	1	1
3.	Test and Balance Report	5	1	–
4.	Commissioning Reports	5	1	–
5.	Miscellaneous Certificates	1	–	–
6.	Warranty documents	1	–	–
7.	Training materials	1 per trainee	1	1

1.7 SUBSTITUTIONS AND PRODUCT OPTIONS

A. Contractor's Options

- 1. For products specified only by functionality and/or reference standard, select product meeting that functionality and/or standard, by any manufacturer.
- 2. For products specified by manufacturer and model number
 - a. Where "Or Equal" lists specific alternative manufacturers including specific model numbers, any of these specific products may be selected and will not be considered a substitution.
 - b. Where "Or Equal" lists specific alternative manufacturers but no specific model numbers
 - 1) Functionally equivalent products by listed alternative manufacturers may be selected.
 - 2) Functionally equivalent products by manufacturers not listed may be selected but may be rejected by Owner's Representative for any reason if there is any question with respect to functional equivalency including unfamiliarity with manufacturer and local representation.
 - 3) Functional equivalent products to the product specified are those that
 - a) Are equal or better in quality, function, capacity, efficiency, serviceability, local support, etc.
 - b) Fully meet the product specifications unless otherwise approved by the Owner's Representative
 - c) Meet site and application constraints including but not limited to size, weight, appearance, and clearance requirements.

B. Substitution Requirements

1. Where substitutions are proposed for products indicated in design documents, the Contractor shall take full responsibility for coordinating with others the requirements of the proposed substitution including but not limited to:
 - a. Adequate space, including service access space
 - b. Power and other electrical connections
 - c. Pads or other equipment supports
 - d. Control devices and interfaces
2. Include all costs for redesign and other work required by all disciplines affected by a substitution.

1.8 DESCRIPTION OF BID DOCUMENTS

A. Specifications

1. Specifications, in general, describe quality and character of materials and equipment
2. Specifications are of simplified form and include incomplete sentences
3. Words or phrases such as "The Contractor shall," "shall be," "furnish," "provide," "a," "an," "the," and "all" have often been omitted for brevity

B. Drawings

1. Drawings in general are diagrammatic. Intention is to show size, capacity, approximate location, direction and general relationship of one work phase to another, but not exact detail or arrangement.
2. Scaled and figured dimensions are approximate and are for estimating purposes only. Indicated dimensions are limiting dimensions where noted. Duct and piping elevations are indicated for initial coordination; final requirements shall be determined by the Contractor after final coordination with other trades.
3. Before proceeding with work check and verify all dimensions in field.
4. Assume all responsibility for fitting of materials and equipment to other parts of equipment and structure.
5. Make adjustments that may be necessary or requested in order to resolve space problems, preserve headroom and avoid architectural openings, structural members and work of other trades.
6. For exact locations of building elements, refer to dimensional Architectural and Structural drawings.

C. Do not use equipment exceeding dimensions indicated on drawings or equipment or arrangements that reduce required clearances or exceed specified maximum dimensions.

D. If any part of Specifications or Drawings appears unclear or contradictory, apply to Owner's Representative for an interpretation and decision as early as possible.

1. Do not proceed with work without the decision of the Owner's Representative.

1.9 ALTERNATES

A. Refer to Section 01230 Alternates for possible effect on this Section.

1.10 DEFINITIONS

A. Definitions of term used in Division 23 HVAC may differ from those given in general and supplementary conditions and take precedence over them.

- B. "Provide": to furnish, supply, install and connect up complete and ready safe and regular operation of particular work referred to unless specifically noted.
- C. "Supply": to purchase, procure, acquire and deliver complete with related accessories.
- D. "Work": labor, materials, equipment, apparatus, controls, accessories and other items required for proper and complete installation.
- E. "Piping": pipe, tube, fittings, flanges, valves, controls, strainers, hangers, supports, unions, traps, drains, insulation and related items.
- F. "Wiring": raceway, fittings, wire, boxes and related items.
- G. "Concealed": embedded in masonry or other construction, installed in furred spaces, within double partitions, above hung ceilings, in trenches, in crawl spaces, or in enclosures.
- H. "Exposed": not installed underground or "concealed" as defined above.
- I. "Indicated," "shown" or "noted": as indicated, shown or noted on drawings or specifications.
- J. "Reviewed," "approved," or "directed": as reviewed, approved, or directed by or to Owner's Representative.
- K. "Motor Controllers": starters, variable speed drives, and other devices controlling the operation of motors.
- L. "Control or Actuating Devices": automatic sensing and switching devices such as thermostats, pressure, float, electro-pneumatic switches and electrodes controlling operation of equipment.

1.11 PROJECT CONDITIONS

- A. Examine site related work and surfaces before starting work of any Section
 1. In case of conflict, the most stringent takes precedence
 2. For purposes of clarity and legibility, Drawings are essentially diagrammatic to extent that many offsets, bends, unions, special fittings, exact locations of items are not indicated, unless specifically dimensioned. Especially note a number of required duct and pipe offsets to coordinate with structure and not shown. Coordinate dimensioned conditions, including invert elevations, with other trades prior to installation by any trade.
 3. Exact routing of piping, ductwork, etc. shall be governed by structural conditions, obstructions. Not all offsets in ductwork or piping are shown on the Mechanical Drawings. Determine which item to offset or relocate. Maintain required slope in piping. Make use of data in Contract Documents. In addition, Owner's Representative reserves right, at no additional cost to the Owner, to make any reasonable change in location of mechanical items, exposed at ceiling or on walls, to group them into orderly relationships or increase their utility. Verify Owner's Representative's requirements in this regard prior to rough-in.
 4. Take dimensions, location of doors, partitions, similar physical features from Architectural Drawings. Verify at Site under this Division. Consult Architectural Drawings for exact location of outlets to center with Architectural features, panels, etc., at the approximate location shown on mechanical Drawings.
 5. Mounting heights of brackets, outlets, etc., as required
 6. Report to Owner's Representative, in writing, conditions which will prevent proper provision of this work

7. Beginning work of any Section without reporting unsuitable conditions to Owner's Representative constitutes acceptance of conditions by Contractor
8. Perform any required removal, repair or replacement of this work caused by unsuitable conditions at no additional cost to the Owner

B. Coordination

1. Work out all "tight" conditions involving Work specified under this Division and Work in other Divisions in advance of installation. If necessary, and before Work proceeds in these areas, prepare supplementary Drawings under this Division for review showing all Work in congested area. Provide supplementary Drawings, additional Work necessary to overcome congested conditions, at no additional cost to the Owner.
2. Conflicts: Difference or disputes concerning coordination, interference or extent of Work between sections shall be decided as follows
 - a. Install mechanical and electrical systems in the following order of preference (those trades listed below another must reroute to resolve the conflict):
 - 1) Drain piping required by code to be sloped
 - 2) Supply air and exhaust air ductwork connected to fans
 - 3) Electrical conduit 4 inches and larger
 - 4) Hydronic piping connected to pumps
 - 5) Domestic water piping
 - 6) Fire sprinkler piping
 - 7) Electrical conduit smaller than 4 inches
 - 8) Transfer ducts and other ductwork not connected to fans
 - 9) Control system piping and wiring
 - b. Continued disputes shall be decided by Contractor and Contractor's decision, if consistent with Contract Document requirements, shall be final.
3. Supervision: Personally, or through an authorized and competent representative, constantly supervise the work from beginning to completion and, within reason, keep the same foreman and workmen on the Project throughout the Project duration.
4. Provide templates, information and instructions to other Divisions to properly locate holes and openings to be cut or provided.
5. The drawings govern in matters of quantity, and the specifications govern in matters of quality. In the event of conflict within the drawings involving quantities, or within the specifications involving quantities, or within the specifications involving quality, the greater quantity and higher quality shall apply. Such discrepancies shall be noted and clarified in the Bid. No additional allowances will be made because of errors, ambiguities, or omissions that reasonably should have been discovered during the preparation of the Bid.

C. Equipment Rough-In

1. Rough-in locations shown on Mechanical Drawings for equipment furnished by the Owner and for equipment furnished under other Divisions are approximate only. Obtain exact rough-in locations from following sources
 - a. From Shop Drawings for equipment provided under this contract
 - b. From Owner's Representative for Owner-furnished-Contractor installed equipment
 - c. From existing equipment where such equipment is relocated under this Contract
2. Verify mechanical characteristics of equipment before starting rough-in. Where conflict exists between equipment and rough-in shown on Drawings obtain clarification from Owner's Representative and provide as directed by the Owner's Representative at no additional cost to the Owner.
3. Make final connections

1.12 CLEARANCE FROM ELECTRICAL EQUIPMENT

- A. Piping or ductwork
 - 1. Prohibited, except as noted, in
 - a. Electric rooms and closets over equipment, as restricted by CEC
 - b. Telephone rooms and closets
 - c. Elevator machine rooms
 - d. Electric switchboard room
 - 2. Prohibited, except as noted, over or within 5 feet of
 - a. Transformers
 - b. Substations
 - c. Switchboards
 - d. Motor control centers
 - e. Standby power plant
 - f. Bus ducts
 - g. Electrical panels

- B. Drip pans under piping
 - 1. Where piping is located over any electrical equipment listed above; reroute piping if possible rather than use drip pan
 - 2. 18 gage galvanized steel
 - 3. 18 gage copper
 - 4. Reinforced and supported
 - 5. Watertight
 - 6. With 1-1/4 inch drain outlet piped to floor drain or service sink

1.13 PRODUCT DELIVERY, HANDLING AND STORAGE

- A. See Division 1 Product Requirements

- B. Deliver equipment in its original package to prevent damage or entrance of foreign matter. Provide materials on factory provided shipping skids and lifting lugs if required for handling. Provide protective coverings during construction.

- C. Handle and ship in accordance with manufacturer's recommendations

- D. Identify materials and equipment delivered to Site to permit check against approved materials list, reviewed with no exceptions taken Shop Drawings

- E. Protect from loss or damage. Replace lost or damaged materials and equipment with new at no additional cost to the Owner

- F. Where necessary, ship in crated sections of size to permit passing through available space

1.14 PROJECT MANAGEMENT AND COORDINATION SERVICES

- A. See Division 1 Project Coordination

- B. Overview: Provide a project manager/engineer for the duration of the Project to coordinate the Division 23 HVAC work with all other trades. Coordination services, procedures and documentation responsibility shall include, but shall not be limited to the items listed in this section.

- C. Review of shop drawings prepared by other subcontractors
 - 1. Obtain copies of all shop drawings for equipment provided by others that require electrical service connections or interface with Division 23 HVAC work.
 - 2. Perform a thorough review of the shop drawings to confirm compliance with the service requirements contained in the Division 23 HVAC contract documents. Document any discrepancy or deviation as follows:
 - a. Prepare memo summarizing the discrepancy
 - b. Provide a copy of the specific shop drawing, indicating via cloud, the discrepancy
 - 3. Prepare and maintain a shop drawing review log indicating the following information
 - a. Shop drawing number and brief description of the system/material
 - b. Date of your review
 - c. Indication if follow-up coordination is required
- D. Request for information (RFI)
 - 1. See Division 1 Request For Information

1.15 REVIEW OF CONSTRUCTION

- A. Work may be reviewed at any time by the Owner's Representative
- B. Advise Owner's Representative that work is ready for review at following times:
 - 1. Prior to backfilling buried work
 - 2. Prior to concealment of work in walls and above ceilings
 - 3. When all requirements of Contract have been complete
- C. Neither backfill nor conceal work without Owner's Representative's consent.
- D. Maintain on job set of Specifications and Drawings for use by Owner's Representative's
 - 1. Include all change orders.
- E. Contractor is responsible for construction methods, sequences and safety precautions

1.16 SCHEDULE OF WORK

- A. In accordance with Division 1 Contract Schedules and as follows:
 - 1. Arrange work to conform to schedule of construction established or required to comply with Contract Documents
 - 2. In scheduling, anticipate means of installing equipment through available openings in structure
- B. Confirm in writing to Owner's Representative, within 35-days of signing of contract, anticipated number of days required to perform test, balance, acceptance testing and commissioning of mechanical systems. Schedule test, balance and acceptance testing of mechanical systems as follows:
 - 1. Submit for review at this time, names and qualifications of test and balancing agencies to be used
 - 2. Test & Balance and commissioning must occur after completion of mechanical systems, including all control calibration and adjustment, and requires substantial completion of the building, including closure, ceilings, lighting, partitioning, etc.
 - 3. Allow 21-days after test and balance for system commissioning and life safety testing (where applicable)

4. Complete and test all systems early enough to enable completion of commissioning prior to Owner move-in.
5. Provide post construction purge direction immediately before occupancy. See Paragraph 3.8.

1.17 CUTTING AND PATCHING

- A. See Division 1 Cutting, Patching and Patching

1.18 UTILITY CONNECTIONS

- A. Point of connection to on-site chilled water and hot water piping mains shall be just inside the building envelope. Piping outside the envelope and sealing of envelope openings shall be specified under Division 33.

1.19 WARRANTY

- A. In accordance with Division 1 Guarantees, Warranties, Bonds, Service & Maintenance Contracts and as follows.
- B. Warranty all materials, equipment, apparatus and workmanship to be free of defective materials and faulty workmanship for period of one year from date of filing of Notice of Completion or upon beneficial use, at the direction of the Owner's Representative (see Paragraph 3.4A.1).
- C. Provide new materials, equipment, apparatus and labor to replace that determined by Owner's Representative to be defective or faulty.
- D. This guarantee also applies to services including instructions, adjusting, testing, noise, balancing, etc.
- E. Furnish Manufacturers' standard Warranties in excess of one year.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Alternate manufacturers as identified in each section will be considered under conditions specified in Paragraph 1.7 of this section.
- B. Identify materials, equipment by manufacturer's name, nameplate data. Remove unidentified materials, equipment from Site.
- C. Equipment specified by manufacturer's number shall include all accessories, controls, etc., listed in catalog as standard with equipment. Furnish optional or additional accessories as specified.

- D. Where no specific make of material or equipment is mentioned, any first class product of reputable manufacturer may be used, provided it conforms to requirements of system and meets with acceptance.
- E. Provide an authorized representative to constantly supervise work of this Division, check all materials prior to installation for conformance with Drawings, Specifications, reviewed Submittals and reviewed Shop Drawings.
- F. Conform to conditions shown and specified. Coordinate with other trades for best possible assembly of combined Work. Relocate equipment when necessitated by failures to coordinate Work or to advise Owner's Representative of conflicts in writing.
- G. Material and Equipment-General Requirements
 - 1. New
 - 2. Approved for use by State Fire Marshal and local building inspection department when applicable
 - 3. Testing agency labeled or with other identification wherever standards have been established
 - 4. Owner's Representative reserves right to reject items not in accordance with Specification either before or after installation
 - 5. Comprised to render complete and operable systems; provide additional items needed to complete installation to realized design
 - 6. Compatible with space allocated; modifications necessary to adjust items to space limitations at Contractor's expense
 - 7. Installed fully operating and without objectionable noise or vibration
 - 8. Design of mechanical systems is generally based on product of the first named manufacturers cited. Where systems for product installed necessitate modification of systems shown on drawings, Contractor is responsible for installation of systems appropriate to product installed.
- H. Electrical Requirements
 - 1. Electrical Work performed under Division 23 HVAC shall conform to requirements of Division 26 Electrical
 - 2. Provide weatherproof devices and installation for out-of-doors work

PART 3 EXECUTION

3.1 INSPECTION

- A. Verify that conditions are satisfactory for the installation of materials and equipment. Notify Owner's Representative if conditions are not satisfactory and do not commence work until conditions have been corrected.

3.2 INSTALLATION

- A. Install materials and equipment in compliance with governing codes.
- B. Use printed descriptions, specifications and recommendations of manufacturers as a guide for installation of Work. Follow in all cases where manufacturers' of articles used furnish directions covering points not specified or shown.

- C. Equipment
1. See Division 1 Supporting From Building Structure
 2. Assemble equipment which is required to be field assembled under the direct supervision of the manufacturers' agent
 3. Prior to the final acceptance submit letters from the manufacturers that equipment has been assembled under the direct supervision of the manufacturers' agent
 4. Accurately set and level equipment with supports neatly placed and properly fastened
 5. Properly fasten equipment in place with bolts to prevent movement in earthquake
 6. Coordinate the installation of equipment with openings in structure
 7. Coordinate and fully dimension steel supports for mechanical equipment where shown on drawings with installing contractor
 8. Provide all roof curbs for roof mounted fans, flues, piping and duct penetrations, etc.
 9. Concrete
 - a. Concrete work, include forming, steel bar reinforcing, cast-in-place concrete, finishing and grouting is specified under Division 3 Concrete
 - b. Coordinate and fully dimension concrete housekeeping pads and curbs with installing contractor; dimensions shall be as required for structural and seismic requirements, see Section 230548 Vibration and Seismic Control
 - c. Coordinate inertia base fill with installing contractor
- D. Electrical
1. See Division 26 Electrical
 2. Install electrical devices with code required clearances and access
 3. Assist the electrical contractor in the proper connecting of all electrical wiring and equipment required for mechanical equipment
- E. Sleeves, Chases and Concrete Inserts
1. Provide all required sleeves, chases, concrete inserts, anchor bolts, etc.
 2. Sleeves, chases are prohibited in structural members, except where shown or as directed by Owner's Representative in writing
 3. Embed no piping in concrete or masonry
- F. Waterproof Construction
1. Comply with Division 7 Thermal and Moisture Protection.
 2. Include membrane clamps, sheet metal flashing, counter flashing, caulking and sealant as required for waterproofing of mechanical penetrations and sealing penetrations in or through exterior walls, floors, roofs, and foundation walls.
 3. All penetrations through vapor barriers at slabs on grade shall be taped and made vapor tight.
 4. Provide galvanized sheet metal weather protection canopies, hoods or enclosures over all out-of-doors equipment, the operation or maintenance of which would be impaired by rain water; this requirement applies to damper operators and bearing, damper motors, controls and instruments; see other Sections in this Division for application of this requirement to motors, drive, ducts and fans.
- G. Restoration of Damage
1. Repair or replace, as directed by Owner's Representative, materials and parts of premises which become damaged.
 2. Remove replaced parts from premises at no additional cost to the Owner.
- H. Review architectural drawings and coordinate with Architect and other contractors to be sure that all architectural shafts, plenums, rated duct enclosures etc. required for mechanical systems are properly located and dimensioned.

- I. Access Panels and Doors
 - 1. Product specified under Division 8 Openings and Division 5 Metals:
 - a. Coordinate size requirements and exact location with Contractor who will provide and install access doors
 - b. Minimum Sizes: 18 inches by 18 inches unless otherwise shown on Drawings or approved by Owner Representative
 - 2. Provide where shown, or required by Regulatory Agencies, for access of all concealed equipment such as terminal units, valves, fire/smoke dampers, etc., for Mechanical Work:
 - a. Equipment shall be located wherever practical over accessible ceilings or rooms to avoid access doors
 - b. Access doors shall not be used solely for access to balancing dampers; use instead remote control devices specified under Section 233300 Duct Accessories

- J. Openings
 - 1. Coordinate and fully dimension all openings in walls, floors, roofs and structural elements required for mechanical work.
 - 2. Provide all required fire-stopping around pipe, duct and other penetrations required for mechanical work in rated partitions where required by code.
 - 3. Fire damper openings: Contractor shall provide damper UL installation requirements to contractor installing partitions to ensure construction complies with listing.
 - 4. Air outlet openings
 - a. Contractor shall coordinate exact locations of air outlets in floors, walls and ceilings with contractor installing partition.
 - b. Contractor shall coordinate additional T-bar or spline required to accept air outlets with contractor providing and installing ceiling and associated materials.

3.3 PROTECTION OF MATERIALS

- A. See Division 1 Product Requirements.
- B. Completely cover motors and other moving machinery to protect from dirt and water during construction.
- C. During transport to and storage on the construction site, and during rough-in until final connections are made, all ductwork and other related air distribution component openings shall be covered with plastic to prevent contamination from dust, water, and debris.
- D. Cap all openings in pipe and ductwork daily to protect against entry by foreign matter.
- E. Material, equipment or apparatus damaged because of improper storage or protection will be rejected
 - 1. Remove from site and provide new, duplicate, material, equipment or apparatus in replacement of that rejected.
 - 2. Any porous materials, such as duct liner or flexible ductwork that becomes wet; for example, due to rain shall be replaced; drying is not sufficient (due to possible microbial contamination).
- F. Perform Work in manner precluding unnecessary fire hazard.

3.4 ADJUSTMENT

- A. Preliminary Operation
 - 1. Operate any portion of installation for Owner's convenience if so requested by Owner's Representative. Such operation does not constitute acceptance of Work as complete but does constitute beneficial use, see Paragraph 1.19B. Cost of utilities, such as electrical power, will be borne by the Owner if operation is requested by Owner's Representative.

- B. Startup Service
 - 1. Prior to startup, ensure that systems are ready, including checking the following: Proper equipment rotation, proper wiring, auxiliary connections, lubrications, venting fan balance, controls and installed and properly set relief and safety valves. See pre-function tests in Division 23 HVAC.
 - 2. Start and operate all systems.
 - 3. Provide services of factory trained technicians for startup of major equipment and systems including boilers, fire pumps, etc.
 - 4. Adjusting: See Section 230593 Testing, Adjusting and Balancing.
 - 5. Functional Testing: See Division 25 Building Automation Systems.
 - 6. Life Safety Testing
 - a. Assist Division 26 Electrical contractor in testing fire alarm controls, including control of smoke dampers and of fan systems.
 - b. Correct any problems related to equipment supplied under Division 23 HVAC.
 - c. Complete the control matrix with details such as fan tags, FSD tags, etc. based on control matrix provided with Life Safety Report.
 - d. Assist Life Safety System commissioning agent in testing and commissioning Life Safety System.
 - e. Provide all tests, air balance and start-up personnel required to start and commissioning the system and for assisting the design/construct team in demonstrating system compliance with the local fire district and building department

- C. Noise
 - 1. Cooperate in reducing any objectionable noise or vibration caused by mechanical systems to the extent of adjustments to specified and installed equipment and appurtenances.
 - 2. Completely correct noise problems caused by failure to make installation in accordance with Contract Documents, including labor and materials required as a result of such failure, at no additional cost to the Owner.

3.5 SPECIAL TOOLS

- A. Furnish to Owner at completion of work one set of any special tools required to operate, adjust, dismantle or repair equipment furnished under any section of this Division.

3.6 CLEANING

- A. See Division 1 Closeout Procedures, Final Cleaning and Extra Material
- B. Thoroughly clean equipment, fans, pumps, motors, piping and other materials under this. Division free from all rust, scale and all other dirt before any covering or painting is done, or the systems put in operation; leave in condition satisfactory to Owner's Representative.
- C. At all times keep the premises free from accumulation of waste material and debris caused by his employees. At the completion of the Project, and at other times as Owner's Representative

may direct, remove refuse from within and around the building. All tools, scaffolding and surplus materials shall also be removed, leaving the Site of his Work clean.

- D. Completely cover all motors and other moving machinery to prevent entry of dirt and water during construction.
- E. Effectively cap all openings into ducts and pipes to keep moisture and foreign matter out during construction

3.7 PAINTING

A. Painting

- 1. Piping exposed to outdoors
 - a. One coat primer
 - b. Two coat alkyd oil paint, UV resistant for PVC piping, color as indicated
 - c. Not required for copper, galvanized steel, or insulated piping
- 2. Steel hangers and supports exposed to outdoors
 - a. One coat primer
 - b. Not required for galvanized steel
- 3. Interior of ductwork and duct accessories, including insulation stick pins, at air outlets as far back as visible from occupied spaces
 - a. Flat black
- 4. Marred surfaces of factory painted equipment
 - a. Spot coat to match adjacent coat
- 5. Insulation exposed to sunlight: See Section 230700 Mechanical Insulation

B. Execution

- 1. Protect flooring and equipment with drip cloths.
- 2. Paint and materials stored in location where directed.
- 3. Oily rags and waste removed from building every night.
- 4. Wire brush and clean off all oil, dirt and grease areas to be painted before paint if applied.
- 5. Workmanship
 - a. No painting or finishing shall be done with
 - 1) Dust laden air
 - 2) Unsuitable weather conditions
 - 3) Space temperature below 60 degrees Fahrenheit
 - b. Pipes painted containing no heat and remain cold until paint is dried.
 - c. Paint spread with uniform and proper film thickness showing no runs, sags, crawls or other defects.
 - d. Finished surfaces shall be uniform in sheen, color and texture.
 - e. All coats thoroughly dry before succeeding coats are applied, minimum 24 hours between coats.
 - f. Primer undercoat of slightly different color for inspection purposes
- 6. Piping continuously painted in all exposed areas

C. Paint

- 1. High gloss medium or long alkyd paint
- 2. Best grade for its purpose
- 3. Deliver in original sealed containers.
- 4. Apply in accordance with manufacturer's instructions.

D. Colors

- 1. Colors as directed by Owner's Representative unless specified herein.

2. Condenser water piping: pale green
 3. Interior of ductwork as far back as visible from outside: flat black
 4. Uncoated hangers, supports, rods and insets: dip in zinc chromate primer
- E. Factory finish
1. Ceiling and wall mounted air outlets in acoustical tile ceilings: Baked white enamel
 2. Aluminum air outlets that are not to be painted: anodized
- F. Marred surfaces of prime coated equipment and piping: spot prime coat to match adjacent coat
- G. Properly prepare Work under this Division to be finish painted under Division 9 Painting
- H. Provide moisture resistant paint for exterior painting and heat resisting paint for hot piping, equipment and materials
- I. Factory Finishes
1. Exposed fan coil units: baked enamel
 2. Unit ventilators and unit heaters: baked enamel
 3. Fans, pumps, compressors, tanks and like items
 4. Air handlers, pumps, water heaters and like items where exposed
- J. For the following, provide factory prime coat. Also, provide factory finish painting on each if not specified in Painting Division
1. Other air outlets
- K. Paint all equipment out-of-doors and equipment supports with two coats of weather resistant enamel
- L. Protect all finished surfaces of fixtures with heavy paper pasted thereon, or by other means, throughout the period of construction
- M. Refinish Work supplied with final finish under this Division if damaged under this Division to satisfaction of Owner's Representative

3.8 OPERATION OF SYSTEMS AND POST-CONSTRUCTION PURGE

- A. This section is provided to
1. Minimize the possibility that ducts and air plenums will be contaminated with construction debris.
 2. Ensure that off-gassing volatile organic compounds (VOCs) are not transferred from one area to another.
 3. Purge VOCs that have off-gassed from construction materials and furnishings prior to occupancy.
- B. Construction Period
1. Fan systems shall not be operated during construction (e.g. to assist in drying walls, space conditioning, etc.) unless approved in writing by Owner's representative.
- C. Test and Balance Period
1. Operation of fan systems for test and balance shall only occur after the area served by air systems and all air plenums have been thoroughly cleaned of dust and debris. No

construction work that generates dirt and particles shall be occurring while fan systems are in operation.

2. Procedure
 - a. Install temporary construction filters (prefilters) on all supply air systems. Do not install high efficiency final filters at this time.
 - b. Adjust systems with economizer capability to supply 100% outdoor air, no recirculated air.
 - c. Perform test and balance work per Section 230593 Testing, Adjusting and Balancing) at zone level.
 - d. Immediately prior to the start of the post-construction purge period (see below), remove and discard construction filters and install high efficiency final filters.
 - e. Conduct test and balance work at supply air system. System may be temporarily converted from 100% outdoor air to minimum outdoor air as required for tests only; return to 100% outdoor air configuration after tests.

D. Post-Construction Purge Period

1. Schedule
 - a. Start after
 - 1) All construction work that produces dust or VOCs is complete, except for minor touch-up painting work and installation of furnishings
 - 2) All test and balance work is complete on all air systems with 100% outdoor air capability
 - 3) Temperature control systems are operational
 - 4) Heating systems are fully operational
 - b. End after a time period determined from the following equation, calculated for each fan system individually, where T is time in days, A is the floor area served by the system in ft² and CFM is the outdoor air capacity of the system in cfm:

$$T = \frac{14000 * A}{CFM * 60 * 24}$$

- c. The space may only be occupied
 - 1) After the purge time period calculated above is complete; or
 - 2) After time T' calculated from the equation below provided the space is ventilated with 100% outdoor air until the total purge time period calculated above is complete.

$$T' = \frac{3500 * A}{CFM * 60 * 24}$$

2. Procedure
 - a. Adjust systems with economizer capability to supply 100% outdoor air, no recirculated air.
 - b. Ensure that high efficiency final filters are in place.
 - c. Run fan systems supplying 100% outdoor air during entire purge period.
 - d. Enable boilers and zone controls and set heating setpoints to 70°F.
 - e. Cooling systems may be enabled or disabled.
3. Because final filters will not be challenged with contaminants in the return air, they do not have to be replaced after the flush-out period.

3.9 FIELD QUALITY CONTROL

- A. See Division 1 Quality Control
- B. Tests

1. Perform as specified in individual sections and as required by authorities having jurisdiction
 2. Perform commissioning work
 - a. Perform pre-function tests as specified in Division 23 HVAC
 - b. Perform functional and post-occupancy tests. See Division 25 Building Automation Systems
 3. Duration as noted
- C. Provide required labor, material, equipment and connections
- D. Furnish written report and certification that tests have been satisfactorily completed
- E. Repair or replace defective work, as directed by Owner's Representative in writing, at no additional cost to the Owner
- F. Restore or replace damaged work due to tests as directed by Owner's Representative in writing, at no additional cost to the Owner
- G. Restore or replace damaged work of others, due to tests, as directed by Owner's Representative in writing, at no additional cost to the Owner
- H. Remedial work shall be performed to the satisfaction of the Owner's Representative, at no additional cost to the Owner, including
1. Work related to all Division 23 HVAC pre-functional tests
 2. Division 23 HVAC work related to Section 019100 Commissioning
 3. Division 23 HVAC work related to Section 230593 Testing, Adjusting and Balancing
 4. Division 23 HVAC work related to Section 230800 Mechanical Commissioning
- I. Remedial work shall include performing any commissioning or other tests related to remedial work an additional time at no additional cost to the Owner

END OF SECTION

SECTION 230513

MOTORS AND CONTROLLERS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Motors
 - 2. Variable speed drives
 - 3. Motor controllers where not provided as part of mechanical equipment

1.2 REFERENCE STANDARDS

- A. ABMA 9 Load Ratings and Fatigue Life for Ball Bearings
- B. ABMA 11 Load Ratings and Fatigue Life for Roller Bearings
- C. ANSI/IEEE 112 Test Procedure for Polyphase Induction Motors and Generators
- D. ANSI/NEMA MG 1 Motors and Generators
- E. ANSI/NFPA 70 National Electrical Code
- F. IEEE Standard 519-1992, IEEE Guide for Harmonic Content and Control
- G. NEC 430.120, Adjustable-Speed Drive Systems.
- H. NEMA ICS 7.0, AC Adjustable Speed Drives
- I. Underwriters Laboratories UL 508 Standard for Industrial Control Equipment
- J. Underwriters Laboratories UL 508A Standard for Industrial Control Panels
- K. Underwriters Laboratories UL 508C Standard for Power Conversion Equipment

1.3 DEFINITIONS

- A. VSD: Variable speed drive
- B. ECM: Electrically Commutated Motor

1.4 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.

- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
1. "R" means required.
 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Motors	R	R		R
Belts and Drives		R		
Variable Speed Drives	R	R		R

- C. Submittals shall include certification from the motor manufacturer certifying compliance with NEMA MG-1, part 31 for motors that are driven by variable speed drives.

1.5 WARRANTY

- A. Special Warranty: VSD warranty shall be 24 months from date of start-up certification including all parts, labor, travel time, and expenses.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Motors
1. US Motors
 2. General Electric
 3. Gould Inc.
 4. Baldor
 5. Ebm-papst
 6. Or equal
- B. Variable speed drives
1. ABB
 2. Danfoss
 3. Yaskawa
 4. Or equal

2.2 MOTORS

- A. General
1. In accordance with NEMA, IEEE, and ANSI C50 standards
 2. Capacity
 - a. Minimum horsepower indicated
 - b. To operate driven devices under all conditions without overload
 3. Squirrel-cage induction type, NEMA Type "B": insulation class, continuous duty
 4. Speed
 - a. 1750 RPM, unless otherwise indicated
 - b. See schedules on drawings for other speeds

5. Minimum NEMA KVA/HP Locked Rotor Code:

HP Range	Code Letter
≤2	M
3	K
5	J
7.5-10	H
>10	G

6. Service factor: 1.15

7. Type unless otherwise scheduled on Drawings

- a. Voltage: As scheduled on Drawings
- b. 1/2 horsepower and smaller
 - 1) Single-phase, 60 hertz
 - 2) With built-in auto-reset thermal overload protection
- c. 3/4 horsepower and larger
 - 1) Three-phase, 60 hertz
 - 2) 50 horsepower and over: Reduced voltage start, suitable for star-delta starting
- d. Electrically Commutated Motor (ECM)
 - 1) Where scheduled on Drawings or equipment Specifications

8. Bearings

- a. Ball type, unless otherwise indicated
- b. Sealed, permanently lubricated, unless otherwise noted or not available in motor size
 - 1) One bearing size on both ends of the motor
 - 2) Minimum bearing life of
 - a) 50,000 hours for belt-drive
 - b) 130,000 hours for direct-drive

B. Enclosure

- 1. Open drip-proof (ODP)
 - a. Provide ODP motors unless otherwise indicated
- 2. Totally enclosed (TEFC)
 - a. Motors outside the building or otherwise exposed to the weather
 - b. Non-ventilated: under 1/2 horsepower
 - c. Fan-cooled: 1/2 horsepower and larger
- 3. See schedules on drawings for other enclosures

C. Belt-connected motors

- 1. Foundation slide base
- 2. Shaft as required for aligning pulleys

D. Motors 1 horsepower and larger shall be NEMA Premium™ labeled and have guaranteed efficiencies equal to or exceeding NEMA Table 12-6D.

E. Motors driven by variable speed drives

- 1. Shall be "inverter ready" motors that meet the requirements of NEMA MG-1 part 31
- 2. Where used for pumps or fans (variable torque), shall have minimum 10:1 turndown and be capable of operating at 10 percent speed indefinitely
- 3. Shall incorporate a design to prevent arcing through the motor bearings, such as: insulated bearings, ceramic bearings, grounded motor shafts such as those manufactured by AEGIS Ground Shafting Systems, or approved equal, for the following applications:
 - a. Motors are larger than 75 HP

- b. The VSD runs near constant speed such as data center air handlers and VSDs used only to adjust for filter loading such as clean room air handlers
- c. Where indicated on Drawings

F. Electrically Commutated Motors (ECMs) ≤1 HP

1. Brushless DC type with electronic commutation from 115 volt, 277 volt, or 480 volt single phase power to a DC signal
2. Speed controllable from a minimum of 15% or less to 100% of full speed
3. Minimum 80% efficiency at all speeds
4. Include time delay relays or other electrical devices as necessary to limit motor in-rush current to 10 times the maximum motor running current.
5. Provide one of the following as indicated on Drawings or Specifications
 - a. Constant speed applications
 - 1) Potentiometer dial mounted on the exterior of the motor housing
 - 2) Programmed with fan-curve for “constant airflow”
 - b. Variable speed applications
 - 1) 0-10 volt DC control signal input
 - 2) Signal configured to be proportional to fan speed, or to torque if speed not available.
 - 3) Where specified in other Sections: Motor shall shut off when speed signal is below 2 Vdc minimum.
 - 4) Where specified in other Sections, include 0-10 volt DC speed feedback output.
6. The motor in-rush current, including transient in-rush currents of less than one 60 Hz cycle (0.016 seconds), shall not exceed 10 times the motor RLA. The manufacture shall include transient in-rush suppression circuit as required to achieve these values. The transient in-rush suppression circuit shall be ETL or UL listed by the manufacturer and shall be designed to be fail safe. The manufacturer shall submit actual factory recorded in-rush values recorded with a meter for the first 10 seconds of the motor starting for the complete assembly, including the current waveform of the initial transient current.
7. Equal to Regal Beloit ECM

2.3 VARIABLE SPEED DRIVES

A. General

1. All variable speed drives other than those that are factory packaged with equipment shall be supplied by one manufacturer.
2. VSDs shall be completely assembled and tested by the manufacturer in an ISO 9001 & 14001 facility.
3. All circuit boards shall be coated to protect against corrosion. Control boards shall be conformal coated to at least IEC 60721-3c2.
4. Include factory installed door interlocked pad-lockable disconnect switch that will disconnect all input power from the drive and all internally mounted options and comply with Lock Out/Tag Out (LOTO) requirements of CEC 430.

B. Performance

1. The VSD shall provide full rated output from a line of ±10% of nominal voltage. The VSD shall continue to operate without faulting from a line of +30% to -35% of nominal voltage.
2. Overload rating of VSD shall be 110% of normal duty current rating for 1 minute every 10 minutes, 130% overload for 2 seconds every minute.
3. VSDs shall be capable of continuous full load operation in the following environmental conditions:

- a. Ambient temperature: 5°F to 104°F. Operation to 120°F shall be possible with a 10% reduction from VSD full load current
- b. Altitude: 0 to 3300 feet above sea level. Operation to 6600 feet shall be possible with a 10% reduction from VSD full load current
- c. Relative humidity: 0 to 95%, non-condensing
- 4. Efficiency shall be not less than 97 percent at rated voltage, current, and frequency and fundamental power factor shall not be less than 98 percent at all speeds and loads.

C. Electrical Characteristics

- 1. Provide as a minimum 5% impedance line reactors. The 5% impedance may be from dual (positive and negative DC bus) reactors or 5% AC line reactors. VSDs with only one DC reactor shall include AC line reactors.
- 2. VSD shall automatically mitigate harmonics throughout the effective load range using Swinging chokes or other devices designed to lower harmonics when VSD is at partial loads.
- 3. Include Ferrite Core EMI/RFI/Common mode filters. The onboard filters shall allow the VSD assembly to be CE Marked and the VSD shall meet product standard EN 61800-3 for the First Environment restricted level (Category C2).

D. Equipment Protection and Safeties

- 1. VSD shall:
 - a. Be UL 508 listed for a minimum of 100 kA short circuit current rating (SCCR) without the need for external input fuses or external series rated combination circuit breakers.
 - b. Include built in coordinated AC transient surge protection system consisting of 4 MOVs (phase to phase & phase to ground), capacitor clamp, 1600 PIV Diode Bridge and internal chokes.
 - c. Automatically mitigate harmonics throughout the effective load range using Swinging chokes or other devices designed to lower harmonics when VSD is at partial loads.
 - d. Protect itself against all normal transients and surges in incoming power line, any grounding or disconnecting of its output power, and any interruption or run away of incoming speed signal without time delay considerations. Protection is defined as normal shutdown with no component damage.
 - e. Be capable of sensing a loss of load (broken belt / broken coupling) and signal the loss of load condition. The VSD shall be programmable to signal this condition via a keypad warning, relay output and/or over the serial communications bus. Relay output shall include programmable time delays that will allow for drive acceleration from zero speed without signaling a false under-load condition.
 - f. Protect itself against all phase-to-phase or phase-to-ground faults.
 - g. Be able to start into a rotating load (flying start) at all speeds (forward or reverse) without trip.
 - h. Ride through an input power dip of 3 cycles without trip.
 - i. Operate properly at a -35% +30% voltage fluctuation from rated voltage.
 - j. Operate properly at a 10 percent frequency variation from rated frequency.
 - k. Employ three current limit circuits to provide trip-free operation: slow current regulation, rapid current regulation, and current limit switch-off limit. VSD shall be designed so that overcurrent trip shall be at least 315 percent of the drive's current rating.
 - l. Withstand unlimited switching of the output under full load, without damage to the VSD. Operation of a disconnect switch between the motor and VSD shall not have an adverse effect on the VSD, whether the motor is operating or not. Controls conductors between the disconnect and the VSD shall not be required for the safe and reliable operation of the VSD.

- m. Withstand switching of the input line power up to 20 times per hour without damage to the VSD.
 - 2. Anti-regeneration circuit shall match the deceleration rate of the drive to that of the motor to prevent high bus voltage shutdown common to high inertia loads, such as fans.
- E. Human-Machine Interface
 - 1. Keypad with backlit LCD
 - 2. Removable, capable of remote mounting and allow for uploading and downloading of parameter settings as an aid for start-up of multiple VSDs.
 - 3. Password protection against parameter changes
 - 4. Hand-Off-Auto selections and manual speed control with “bumpless transfer” of speed reference when switching between “Hand” and “Auto” modes
 - 5. “Help” button with built-in assistance for programming and troubleshooting
 - 6. Complete English words for programming and fault diagnostics; alphanumeric codes only are not acceptable
 - 7. Time stamped fault history with details (amps, volts, type of fault etc.) of drive conditions of at least the last 3 faults with a timestamp and total history of at least 7 of the last faults
 - 8. Displays and meters for the following: Output voltage, output frequency, motor rpm, motor current, motor watts, speed signal input, last three faults
- F. Software Features
 - 1. Adjustable PWM switching carrier frequencies from 1 to 8 kHz.
 - a. Include a PWM switching carrier frequency control circuit that reduces the carrier frequency based on actual VSD temperature that allows the highest PWM switching carrier frequency without derating the VSD or operating at high PWM switching carrier frequency only at low speeds.
 - 2. Ability to automatically restart after an over-current, over-voltage, under-voltage, or loss of input signal protective trip. The number of restart attempts, trial time, and time between attempts shall be programmable for each fault type.
 - 3. Ability to set a maximum current available to the motor with automatic speed reduction to prevent high current trip.
 - 4. Motor flux optimization that automatically reduces applied motor voltage to the motor to optimize energy consumption and reduce audible motor noise.
 - 5. Noise smoothing feature that randomly varies switching frequency to distributes acoustic motor noise over a range of frequencies instead of a single tonal frequency resulting in lower noise intensity.
 - 6. Three programmable critical frequency lockout ranges to prevent the VSD from operating the load continuously at an unstable speed. Each lockout range must be fully adjustable from 0 to full speed.
 - 7. Adjustable acceleration and deceleration ramps, 1 – 1800 seconds adjustable.
 - 8. Fireman’s override logic
 - a. May be applied to any programmable input
 - b. Upon contact closure input, the VSD shall
 - 1) Operate in one of two modes:
 - a) Operate at a programmed predetermined fixed speed ranging from -500Hz (reverse) to 500Hz (forward).
 - b) Operate using internal PID loop that automatically adjusts motor speed based on programmable analog input and override set point.
 - 2) Ignore all serial communication and keypad commands
 - 3) Capable of being configured to ignore the run permissive contact (used for high static safeties, smoke detector, etc.) This mode shall be capable of being disabled during system testing to avoid damage.

- 4) Capable of being configured to “run to destruct” ignoring all internal safeties that might prevent the VSD from operating at the preset speed. This mode shall be capable of being disabled during system testing to avoid damage.

G. Input/Outputs

1. Minimum Inputs
 - a. Two programmable analog inputs, 0/4-20ma or 0/2-10 Vdc signals, any of which shall be capable of being programmed to the following:
 - 1) Control point feedback signal for internal PID loop
 - 2) Control point setpoint for internal PID loop
 - b. Six programmable digital inputs, 24Vdc, any of which shall be capable of being programmed to the following:
 - 1) Start/stop
 - 2) Run permissive safety interlock
 - 3) Programmable preset speed
 - 4) Forward/reverse direction
2. Minimum Outputs
 - a. Two programmable analog outputs, 0/4-20ma or 0/2-10 Vdc signals, any of which shall be capable of being programmed output proportional to the following:
 - 1) Motor Speed
 - 2) Motor Power (kW)
 - 3) Active PID Reference
 - 4) Active PID Feedback
 - b. Three programmable, digital Form-C relay outputs, ≥8 amps at 24 VDC, any of which shall be capable of being programmed to the following:
 - 1) Open damper or VAV boxes with programmable time delay start
 - 2) Fan status, based on field adjustable motor current that can indicate broken belt or coupling
 - 3) Any fault/alarm
 - 4) Loss of input power to VSD

H. Controls

1. Self-contained controls
 - a. Built-in PID control loop, allowing connection of a pressure or flow signal to a VSD analog input for closed loop control.
 - b. A second PID loop that can utilize the second analog input and modulate one of the analog outputs to maintain the set point of an independent process.
 - c. PID sleep feature to shut off VSD when speed drops below an adjustable value for an adjustable period of time.
 - d. PID set points adjustable from the VSD keypad, analog inputs, or over the communications bus.
 - e. Built-in time clock with a battery backup with 10 years minimum life span. The clock shall be used to date and time stamp faults and record operating parameters at the time of fault. VSD programming shall be held in non-volatile memory and is not dependent on battery power
2. Serial Communications
 - a. Built in EIA-485 port with standard protocols
 - 1) BACnet-MS/TP
 - a) Certified BTL listing as B-ASC
 - b) Adjustable to 9.6, 19.2, 38.4, or 76.8 Kbps
 - b. At a minimum, the following points shall be provided:
 - 1) Read only: Speed feedback, output speed, current, % torque, kW power, kilowatt hours (resettable), operating hours (resettable), drive temperature, digital input

status, analog input values, all diagnostic warning and fault information, keypad "Hand" or "Auto" selected, bypass selected, deceleration rate, and acceleration rate

- 2) Read/write: On/off, output speed, digital output status, analog output values, remote fault reset, PID setpoint and gains, maximum speed, and minimum speed

I. Bypass. Not required:

J. Enclosure

1. Enclosure requirements apply to VSD and all specified options and accessories.
2. VSD Enclosures shall be UL rated. Self-certified enclosures or enclosures with only NEMA ratings are not acceptable.
3. Provide enclosure scheduled on Drawings
 - a. NEMA 1/UL Type 1 enclosure for indoor installation
 - b. NEMA 3R/ UL Type 3R enclosure for outdoor installation
 - c. NEMA 12/UL Type 12 for wet or dirty mechanical rooms
 - d. NEMA 4X for outdoor installation in extreme climates
4. VSDs shall be UL listed as plenum rated where located in supply, return, or outdoor air stream.
5. NEMA 4X panel shall be stainless steel cabinet with temperature controlled mechanically cooled air isolated from outside air in the VSD cabinet.
6. Thermostatically controlled cooling fans shall be provided where required to meet ambient operating conditions. Fans shall be designed for replacement without requiring removal of the VSD from wall mount or removal of circuit boards. Fan sound power shall be no greater than local noise sources where VSD is installed. Fans shall operate only when required, based on the temperature and run command to the drive.

2.4 MOTOR CONTROLLERS

- A. See Division 26 Electrical.
- B. Refer to individual equipment sections for factory-provided controllers
 1. Installed on equipment by manufacturer
 2. Supplied with equipment by manufacturer for field installation

PART 3 EXECUTION

3.1 INSTALLATION

- A. See Section 230548 Vibration and Seismic Control.
- B. Coordinate with work of other trades.
- C. Install in accordance with manufacturer's written installation instructions.
- D. See 250000 Building Automation Systems for control wiring, including network interface wiring.
- E. Drives for packaged equipment shall be mounted and wired by equipment manufacturer.

- F. Mounting and power wiring of field mounted variable speed drives and other motor controllers is specified under Division 26 Electrical.
 - 1. Where wall space is not available for mounting VSDs or other motor controllers, provide mounting struts securely mounted to the floor, roof, or adjacent structure
 - 2. Strictly follow VSD manufacturer's recommendations, in particular with respect to grounding.
- G. Set overload devices to suit motors provided in accordance with NEC.

3.2 INSPECTION

- A. Verify that adequate clearance between motor, controllers and adjacent walls or equipment is available to permit maintenance and repairs.
- B. Check that motor and controller are properly supported and allows for proper alignment and tension adjustments as necessary for application.

3.3 PRE-OPERATING CHECKS

- A. Before operating motors and controllers
 - 1. See Section 230800 Mechanical Commissioning.
 - 2. Complete the Pre-Functional Test Data Sheet for each motor and controller.
 - 3. Check for proper and sufficient lubrication.
 - 4. Check for correct rotation.
 - 5. Confirm alignment and re-align if required.
 - 6. Check for proper adjustment of vibration isolation.

3.4 STARTUP, TESTING, AND ADJUSTING

- A. Start and test motors and controllers in accordance with manufacturers written installation instructions.
- B. After starting motors
 - 1. Check for high bearing temperatures.
 - 2. Check for motor overload by taking ampere reading at maximum operating conditions, with all valves open and individual motor running.
 - 3. Check for objectionable noise or vibration; correct as needed at no additional cost to the Owner.
- C. Variable speed drives
 - 1. Certified factory start-up shall be provided. A certified start-up form shall be filled out for each VSD with a copy to the Owner's Representative and a copy kept on file by the manufacturer. Start-up technician shall configure the VSD as follows:
 - a. Set variable speed ramp-up rates on variable air volume systems slow enough to prevent high pressure trips and/or damage to duct systems. Coordinate with Division 25 Building Automation Systems contractor.
 - b. Set minimum speed for all applications in accordance with procedure indicated in Division 25 Building Automation Systems.
 - c. Enable current limit control and set maximum current limit setpoint to the motor to the motor's full load amps.

- d. Enable flying start feature.
 - e. Set voltage to speed ratio (V/f) to “squared”
 - f. Enable Flux Optimization capability.
 - g. Set switching frequency:
 - 1) Set to 4 kHz then check for motor noise in nearby occupiable spaces.
 - 2) If motor noise is audible in occupied space, enable noise smoothing feature.
 - 3) If noise is still a problem, raise switching frequency to 8 kHz. Do not raise switching frequency above 8 kHz.
 - h. Configure status point to only indicate status when the drive detects a current above that which occurs when a belt is broken (fan), the rotor is locked, or a discharge damper or valve is fully closed.
 - i. Set VSD to automatically restart with shortest time period allowed by VSD
 - 1) After power is restored after a power interruption
 - 2) After alarms are cleared
 - j. For fans such as relief fans and cooling tower fans: Run fan through entire speed range and program out speeds that cause fan vibration.
 - k. For VSDs powered by emergency generators, disable Under-volt Control (to cause the Pre-Charge Contactor to open as quickly as possible and prior to transfer of power, avoiding current surge and possible VFD damage).
 - l. For supply air fans for which supply air FSDs are interlocked to shut when the fan is off:
 - 1) Configure one DO contact to close when the VFD has been commanded to start. (This is used to convey to the fire alarm system that the FSDs must be opened. All wiring by Division 26.)
 - 2) Configure the VFD so the drive does not actually start until 15 seconds after the above DO contact has been closed. (This provides sufficient time for the fire alarm system to open the FSDs to avoid a nuisance trip.)
2. For VSDs used for life safety fans:
- a. Configure programmable input(s) per Paragraph 2.3F.8 to speed determined under Section 230593 Testing, Adjusting, and Balancing. This input shall be connected to the Fire Alarm System by Division 26.
 - b. During smoke control system testing, disable safety ignore and run-to-destruct features described under Paragraphs 2.3F.8.b.3) and 2.3F.8.b.4). Once testing is fully complete and just prior to witness testing with AHJ, enable both features.
 - c. Configure one DO contact to open when power is not available per Paragraph 2.3G.2.b.4). This contact shall be connected to the Fire Alarm System by Division 26.
3. After VSD is fully configured and programmed, all settings shall be documented and included with commissioning documentation in electronic format per Section 230501 Basic Mechanical Materials and Methods. The intent is to allow replacement drive electronics to be readily configured.
4. See Section 250000 Building Automation Systems for points to be mapped from the drive controller to the BAS; coordinate information addresses and other information required with the Division 25 Building Automation Systems contractor.
- D. See Section 230593 Testing, Adjusting and Balancing.
- E. See Section 230800 Mechanical Commissioning.

3.5 TRAINING

- A. See Section 230800 Mechanical Commissioning.

- B. VSD manufacturer to provide one of the following:
1. 8-hours of customer training
 2. Interactive Computer based training on VSD installation, start-up, programming, and trouble shooting

END OF SECTION

SECTION 230523

VALVES

PART 1 GENERAL

1.1 SUMMARY

- A. Work Included in This Section: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
1. Service valves in hydronic systems
 2. Check valves
 3. Pressure reducing valves
 4. Safety and relief valves
 5. Manual and automatic air vents
 6. Miscellaneous valves

1.2 QUALITY ASSURANCE

- A. Provide valves with manufacturer's name and pressure rating clearly marked on outside of body.

1.3 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
1. "R" means required.
 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Valves, all types	R	R		R
Manual and automatic air vents	R2	R		

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Ball, butterfly, and check valves
1. Nibco Inc.
 2. Crane Company

3. De Zurik Corporation
 4. Victaulic
 5. Or equal
- C. Silent check valves
1. Nibco, Inc.
 2. Grinnell
 3. Mueller Steam Specialty
 4. Victaulic
 5. Or equal
- D. Combination check and shut-off valves and Triple duty valves: Not allowed
- E. Pressure relief valves
1. ITT Bell and Gossett
 2. Watts
 3. Consolidated
 4. Tour & Anderson
 5. Or equal
- F. Vent and cocks
1. Weiss
 2. Weksler
 3. Crane Company
 4. Lunkenheimer
 5. Or equal
- G. Automatic air vents
1. Amtrol Inc.
 2. Bell and Gossett ITT
 3. Hoffman
 4. Or equal

2.2 GENERAL

- A. Where possible, provide valves of same manufacturer for all Mechanical Sections per products in this Section.
- B. For copper tubing provide solder-joint valves, flare fittings, or IPS-to-copper adaptor, sized for use with tubing and respective valve.
- C. For flanged valves, provide streamline companion flanges, ANSI B16.5, 1988 150 class pounds per square inch
 1. 255 pounds per square inch at 150 degree Fahrenheit
 2. 225 pounds per square inch at 250 degree Fahrenheit unless indicated otherwise
- D. Provide valves rated not less than 125 pounds per square inch steam working pressure, unless indicated otherwise.
- E. Provide valve materials suitable for service and temperature of respective systems, especially with respect to discs, plugs, balls, linings, gaskets, and lubricants of plug cocks, ball valves, etc.

- F. Provide chain-operated hand wheels, rustproof chain and chain guide for following valves
 - 1. Valves 8 feet or more above operating floor or platform
 - 2. As noted

- G. Valves in Insulated Piping: With 2 inch stem extensions and the following features:
 - 1. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation and memory stops that are fully adjustable after insulation is applied. Nibco Nib-seal handle extension or equal by Conbraco Industries, Inc. or Apollo Div.
 - 2. Butterfly Valves: With extended neck.

2.3 BUTTERFLY VALVES

- A. Flange Type
 - 1. Cast Iron body
 - 2. 316 or 416 stainless steel stem, continuous with pinned disc
 - 3. Disk shall be either
 - a. 304 or 316 stainless steel
 - b. Aluminum bronze
 - c. Nickel encapsulated ductile iron
 - d. EPDM encapsulated ductile iron
 - e. Nylon encapsulated ductile iron
 - 4. EPDM seat and seal
 - 5. Factory tested bubble-tight at 150 pounds per square inch

- B. Type
 - 1. Lug Type
 - a. Equal to Nibco Series LD-2000
 - b. Lugs drilled and tapped to match ANSI 150 flanges
 - c. Recommended by manufacturer or dead-end service at full pressure without the need for downstream flanges
 - d. Use cap screws both sides
 - 2. Wafer Type
 - a. Equal to Nibco Series WD-2000
 - 3. Grooved-end type
 - a. Equal to Victaulic 300 MasterSeal
 - b. Recommended by manufacturer or dead-end service at full pressure without the need for downstream flanges

- C. Operator
 - 1. Throttling handle with memory stops: smaller than 8 inches
 - 2. Gear operators: 8 inches and larger

2.4 BALL VALVES

- A. Materials
 - 1. Two piece body, bronze ASTM B584 C84400
 - 2. 316 stainless steel stem and ball
 - 3. PTFE Seat
 - 4. Full Port 1/2 to 1 inch; Standard Port 1-1/4 and larger
 - 5. 600 pounds per square inch at 100 degree F, 125 pounds per square inch saturated steam

6. Infinite throttling handle with memory stop
 7. Equal to Nibco 580-70-66
- B. Lock guard/shield
1. Where called for on drawings
 2. Equal to Brady Ball Valve Lockout (padlock by Owner)

2.5 MANUAL BALANCING VALVES

- A. Not used

2.6 AUTOMATIC BALANCING VALVES

- A. Not used

2.7 CHECK VALVES

- A. Silent Check Valves
1. For pump discharges:
 - a. Variable speed pumps. Check valve pressure drop shall vary roughly as the square of flow rate to near zero flow. Valves that use hydrodynamic profiles (e.g. Victaulic 716 and 779 check valve) resulting in high or erratic pressure drop at low flow rates are not acceptable.
 2. 2 inches or smaller
 - a. Bronze body
 - b. Center-guided disk, silent check
 - c. Class 125 (125 psi steam, 200 psi water)
 - d. Bronze trim
 - e. Buna-N disk
 - f. Equal to Nibco 480
 3. 2-1/2 inches or larger
 - a. Cast-Iron body
 - b. Center-guided disk, silent check
 - c. Class 125 (125 psi steam, 200 psi water)
 - d. Bronze trim
 - e. Bronze disk with Buna-N seat
 - f. Flanged body or wafer style
 - g. Equal to Nibco F-910 or W-910

2.8 SAFETY AND RELIEF VALVES

- A. General
1. Constructed, rated and stamped in accordance with Section IV of the ASME Boiler and Pressure Vessel
 2. Direct spring-loaded type
 3. Adjustable discharge pressure setting
 4. Brass or bronze body and all wetted parts shall be non-ferrous
 5. Suitable and rated for system pressure and temperature

- B. Set pressures
 - 1. Set pressure as indicated on Drawings; not to exceed pressure rating of protected equipment
 - 2. Valves to open, under test, at set pressure with following tolerance
 - a. Set pressure up to 70 pounds per square inch gage: plus or minus 2 pounds per square inch
 - b. Set pressure, above 70 pounds per square inch gage: plus or minus 3 percent
- C. Capacities
 - 1. Valves shall have capacity to relieve maximum possible generated energy while maintaining pressure in protected equipment at no more than 10 percent above vessel working pressure.
 - 2. Provide multiple valves if required for capacity even though only one valve may be shown on Drawings

2.9 VENT & GAUGE COCKS

- A. Bronze body, 1/4 inch size
- B. Lever handle
- C. 125 pounds per square inch steam working pressure
- D. Equal to Weiss LC-14

2.10 AIR VENTS

- A. Manual Air Vents
 - 1. Vertical
 - 2. Provide 1/4 inch brass needle or ball valve at top of chamber
 - 3. To 3 inch pipe: Line size air chamber, 12 inch long
 - 4. 4 inch to 8 inch: Line size air chamber, 6 inch long
 - 5. 10 inch and larger: Line size pipe cap
- B. Automatic Air Vents
 - 1. Float type
 - a. With isolating valve
 - b. Brass or cast iron body
 - c. Copper or stainless steel float
 - d. Stainless steel valve and valve seat
 - e. Suitable for system operating temperature and pressure
 - f. Non-opening on negative pressure
 - g. Equal to Amtrol No. 747
 - 2. Threaded vent connection for piping vent to drain
 - 3. Upstream valve cock for isolation

PART 3 EXECUTION

3.1 INSTALLATION

- A. Coordinate with work of other trades.
- B. Install valves in accordance with manufacturer's written installation instructions.
- C. Provide valves as shown on drawings.
 - 1. Ball and butterfly valves are considered interchangeable; where one type is shown on drawings, the other type may be used at contractor's option.
- D. Provide all valves (except control valves), strainers, and check valves of same size as the pipes in which they are installed unless otherwise indicated.
- E. Pressure rating of valves same as piping in which installed.
- F. Install valves with stems upright or horizontal, not inverted.
- G. Install valves with cast directional arrows in direction of flow.
- H. Support line valves at the valve in addition to regularly spaced pipe supports shown and specified.
- I. Check valves
 - 1. Provide silent check valves at discharge of pumps. Triple duty valves shall not be used as a substitution for check and shut-off valve.
 - 2. Install swing checks and gravity closing lift checks in horizontal position.
 - 3. Provide straight pipe upstream of valve after pump discharge or elbows as recommended by the valve manufacturer.
- J. Butterfly valves
 - 1. Lug or Grooved-end type at equipment isolation valves and for capped dead head shut off only. Piping adjacent to lug type shall be flange removable while valve is in use.
 - 2. Lug, wafer or Grooved-end type at all other locations
- K. Control valves
 - 1. See Section 250000 Building Automation System for valve specifications.
 - 2. Install so that actuators, wiring, and tubing connections are accessible for maintenance. Where the actuator top and position indicator are below 5 feet above the floor, install with valve stem axis vertical with actuator side up. Otherwise, valves shall be installed with stem horizontal so that the position indicator is visible from the floor. Do not install valves with stem below horizontal or down.
- L. Provide blow-down ball valves and hose adaptors at strainers, air separators, tanks, pipe traps, equipment drains, etc. of same size as strainer blow-off connection.
- M. Provide drain valves at main shut-off valves, low points of piping and apparatus.
- N. Locate wheel handles to clear obstructions with hand.
- O. Install valves only in accessible locations.
- P. Wherever possible, install valves accessible from floor level. Provide guided chain operators on valves over 8 feet above floor in equipment areas. Extend chains to within 6 feet 6 inches of floor.

- Q. Locate equipment shut-off valves to be accessible without climbing over equipment.
- R. Provide operating handles for all valves and cocks without integral operators, unless otherwise noted. Provide adequate clearance for easy operation.
- S. Provide discharge pipe to atmosphere from all relief and safety valves, sized with area equal to sum of outlet areas of all valves connected thereto, unless indicated larger. Extend to over code compliant drain receptacle with air gap.
- T. Provide open-ended line valves with plugs or blind flanges.

3.2 AIR VENTS

- A. Manual air vents
 - 1. Locate
 - a. As shown on drawings
 - b. At all high points in closed piping systems
 - c. At equipment with vents, such as coils
 - 2. 1/4 inch copper tube discharged into nearest drain or with 180 degree bend to discharge into portable container
 - 3. Extend tubing or piping as required to make valve accessible
- B. Automatic air vents
 - 1. Locate as shown on drawings.
 - 2. Provide manual cock at inlet to automatic air vents. Except for vent on air separators, shut valve after system is free of air (to prevent leaks from failed floats).
 - 3. 1/4 inch copper tube discharged into nearest drain

3.3 FIELD QUALITY CONTROL

- A. Test operate valves from closed-to-open-to-closed position while valve is under test pressure.
- B. Test automatic valves including solenoid valves, expansion valves, water regulating valves, pressure reducing valves, pressure relief valves, safety valves and temperature and pressure relief valves for proper operation at settings indicated.
- C. Insure that valves are field checked for packing and lubricant and that disc is for service intended. Replace leaking packing at no additional cost to the Owner. Service valves which do not operate smoothly and properly with suitable lubricant before placing in operation at no additional cost to the Owner.

3.4 INSPECTION & COMPLETION

- A. Verify that adequate clearance between valves and adjacent walls or equipment is available to permit maintenance and repairs.
- B. Verify valve set for normal operation.
- C. Valves tags: See Section 230553 Mechanical Identification.

- D. See Section 230800 Mechanical Commissioning.
- E. See Section 230593 Testing, Adjusting and Balancing.

END OF SECTION

SECTION 230529

HANGERS AND SUPPORTS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Pipe and duct hangers, supports and associated anchors
 - 2. Thermal hanger shields for insulated piping

1.2 REFERENCE STANDARDS

- A. American Society of Mechanical Engineers: ASME Section VIII – Boiler and Pressure Vessel Code – Pressure Vessels
- B. Pipe Supports: ANSI B31.9, Facility Services Piping
- C. Duct Hangers: SMACNA Duct Manuals

1.3 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. “R” means required.
 - 2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Pipe hangers and supports	R2			R
Structural attachments	R2			R
Pipe protection and thermal hanger shields	R2			
Expansion shields	R2			

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Hangers, Inserts and Supports

1. Midland-Ross Corp.: Superstrut
2. Elcen Metal Products Company
3. Fee and Mason
4. ITT Grinnell Corporation
5. Kin-Line, Inc.
6. Unistrut
7. Superstrut
8. B-Line
9. Tolco
10. Mason Industries
11. Or equal

C. Pipe Protection and Thermal Hanger Shields

1. Pipe Shields, Inc.
2. Elcen Metal Products Company
3. Midland-Ross Corp.: Superstrut
4. Uni-Grip
5. Kin Line
6. Or equal

D. Expansion Shields

1. ITT Phillips Drill Co.: Red Head
2. Hilti Fastening Systems
3. Omark Industries, Inc.
4. Ramset Fastening Systems
5. Or equal

2.2 PIPE HANGERS AND SUPPORTS

- A. Model numbers are Superstrut, unless otherwise indicated. Equal products from all other manufacturers are acceptable.
- B. Provide electro-chromate, galvanized or factory painted finish; no plain "black" hangers allowed
- C. Dielectric Isolators: All uninsulated copper tubing systems; Superstrut isolators or equal, Cush-A-Strip or Cush-A-Clamp on all pipe clamps; for individual hangers, use felt lined hangers
- D. Individual Pipe Hangers
1. Cold pipe all sizes: Clevis hanger, No. C710
 2. Hot pipe sizes up to 4 in: Clevis hanger, No. C710
 3. Hot pipe sizes above 6 in: Adjustable steel yoke and cast iron roll No. C729
- E. Multiple or Trapeze Hangers
1. Factory channel
 - a. 12 gauge thick steel
 - b. Single or double section
 - c. Electro-chromate finish
 - d. Strutnuts: Series A-100 or CM-100
 - e. Straps: Series 702
 - f. Other accessories
 - g. No. A-1200 or A-1202
 2. Hot pipe sizes 6 in and larger: cast iron roll and stand; C728 or CR728

- F. Wall Supports
1. Pipe sizes up to 3 in: Steel bracket No. C738
 2. Pipe sizes 4 in and larger: Welded steel bracket C-735
 3. Hot pipe sizes 6 inches and larger
 - a. Welded steel bracket No. C739
 - b. Adjustable steel yoke and cast iron roller No. C729
- G. Vertical Support
1. General: Riser clamp Series C-720
 2. Chilled water: Either of the following:
 - a. Hydra-Zorb (copper) or Pipe Shield (steel)
 - b. Series C-720 wrapped with insulating tape.
- H. Floor Support:
1. Hot pipe sizes up to 4 in; cold pipe, all sizes
 - a. Adjustable cast iron saddle No. R786
 - b. Locknut nipple
 - c. Floor flange
 2. Hot pipe sizes 6 in and larger: Adjustable cast iron roll and stand No. R-730-C
- I. Thermal Hanger Shields
1. High density insert
 - a. See Section 230700 Mechanical Insulation
 - b. Same thickness as adjoining pipe insulation
 2. Galvanized sheet metal shield
 - a. Shield length and gauges

Pipe Size	Shield Length	Minimum Gauge
1/2-1 1/2	4	26
2 - 6	6	20
8 - 10	9	16
 3. Insert to extend one inch beyond metal shield ends on chilled water piping
 4. Use double layer shield on bearing surface for
 - a. Roller hangers
 - b. Support spacing exceeding 10 feet
 5. Pipe Shields Incorporated or equal
- J. Pipe Isolators
1. Hanger with minimum ¼ inch felt padding
 2. Tolco Fig. 3F felt lined hangers or equal
- K. Insulated Pipe Supports
1. Pipe supported on rod hangers - use Models A1000, A2000, A3000, 4000 and A9000
 2. Pipe supported on flat surfaces - use Models A1000, A2000, A5000, A6000, A7000, A7200 and A7400 Series
 3. Pipe supported on pipe rolls - use Models A3000, A4000, A5000, A6000, A8000, A8200 and A8400 Series
 4. Model designations are Pipe Shields, Inc. or equal; use only models designed for service for which supports are to be used
- L. Anchors and Guides: Provide anchors and guides where indicated on the Drawings and as required. Structural inserts shall be high density calcium silicate compressive strength 600 pounds per square inch. Guide slide pads shall be Teflon. Ensure that slide accommodates pipe

movement over full range of service and out-of-service temperatures. Guides shall be Pipe Shields, Inc. Model #B3000 or equal. Anchors shall be Pipe Shields, Inc. Model #C4000 or equal. See Section 230700 Mechanical Insulation.

- M. Insulated Pipe Strap
 - 1. 1/2 in to 1 in plumbing piping in wood frame construction
 - 2. Felt insulated
 - 3. Nailable pipe straps; In lieu of other hangers and dielectric isolators
 - 4. Koptoy or equal

- N. Escutcheons: See Section 232114 Piping Specialties

- O. Flashing and Sleeves
 - 1. Flashings
 - a. See Division 7 Thermal and Moisture Protection
 - b. Flash and counter flash watertight all pipe and duct penetrations of roofs and exterior walls
 - c. Flash pipes through roofs with ITWBuildex Dektite
 - d. Flash vents through roofs with
 - 1) Minimum 24 gage soldered roof jack for flat surface roofs
 - 2) Minimum 4 pound lead soldered roof jack for roofs other than flat surface roofs
 - 3) Vandal caps
 - 4) Provide counter-flashing sleeves and storm collars
 - 5) Caulk counter-flashing and storm collar weather tight
 - 6) Other flashings shall be minimum 24-gage galvanized sheet metal
 - 2. Sleeves
 - a. Through exterior concrete walls below grade, floor slabs on grade, and through concrete tank walls
 - 1) Schedule 40, galvanized steel pipe sleeves
 - 2) Seal annular space between pipe and sleeve water tight with one of the following
 - a) Thunderline Link-Seals
 - b) Calpico Pipe Linx
 - c) Or equal
 - b. Other concrete walls, floors and roofs
 - 1) Adjustable telescopic metal sleeves
 - 2) Tightly pack annular space between pipe and sleeve with fiberglass. Seal both sides with mastic
 - c. For insulated piping, sleeve diameter shall not be less than diameter of insulation.
 - d. Terminate sleeves flush with walls, and ceiling.
 - e. For flood prevention on vertical pipe, extend sleeves 1 inch above finished floor or use W-rated waterproof fire barrier packing.
 - f. Firestopping at penetrations of fire rated floors and partitions. See Section 232113 HVAC Piping.
 - 3. Separate piping through walls, other than concrete walls, from contact with wall construction materials; use non-hardening caulking.
 - 4. Install insulation on piping in walls which require insulation at time of installation.

2.3 DUCT HANGERS AND SUPPORTS

- A. See Section 233100 Ducts

2.4 STRUCTURAL ATTACHMENTS

- A. Model Numbers are Superstrut, unless otherwise indicated
- B. Anchor Bolts: Size as specified for hanger rods
- C. Concrete Inserts
 - 1. Malleable iron
 - 2. Place reinforcing steel through insert as recommended by manufacturer for recommended loads
 - 3. No. 452 or equal
- D. Beam Clamps
 - 1. All with U-568 safety strap
 - 2. All with locknuts on
 - a. Set Screw
 - b. Hanger rod
 - 3. Bottom flange attachment
 - a. Loading 150 pound and less: U-563
 - b. Loading 150 pound to 300 pound: U-562
 - c. Loading more than 300 pound: U-560
 - 4. Top flange attachment
 - a. Permitted only when bottom flange attachment cannot be used
 - b. Loading 400 pound and less: M-777
 - c. Loading more than 400 pound: M-778
- E. Welded Beam Attachments
 - 1. No. C-780 or equal
- F. Side Beam Brackets
 - 1. No. 542 or equal
- G. Hanger Rods
 - 1. ASTM A575 Hot rolled steel
 - 2. ANSI B1.1 Unified Inch Screw Treads
 - 3. Threaded both ends, threaded one end, or continuous threaded
- H. Hanger Rod Fixtures
 - 1. Turnbuckles: No. F-112 or equal
 - 2. Linked Eye Rod
 - a. Rod swivel
 - b. No. E-131 or equal
 - 3. Clevis: No. F-111 or equal
- I. Powder or Gas Actuated Anchors
 - 1. Hardened steel stud with threaded shank; size of shank to match hanger rod size
 - 2. Use only with non-shock loads
 - 3. Maximum load safety factors:
 - a. Maximum anchor load: 100 pounds
 - b. Static loads - 5
 - c. Vibratory loads - 8-10
 - 4. For concrete and steel; not to be used for light weight concrete, brick or concrete block
 - 5. 10% testing rate required, testing by contractor
 - 6. Omark Drivit or equal
- J. Expansion Shields

1. Carbon-steel anchors, zinc coated
 2. Stainless steel for corrosive atmospheres
 3. For normal concrete use
 - a. Self-drilling anchor
 - b. Sleeve anchor
 - c. Stud anchor
 4. For thin concrete use: wedge anchor
 5. For brick or concrete block use: sleeve anchor
 6. Maximum load safety factors
 - a. Static loads - 4
 - b. Vibratory loads - 8 - 10
 - c. Shock loads - 8 - 10
 7. Size to suit hanger rods
 8. ITT Phillips Red Head or equal
- K. Steel Deck Inserts
1. Factory stud with
 - a. Clip
 - b. Spring
 - c. Coupling
 2. ITT Phillips Red-Head or equal
- L. Miscellaneous Metal
1. Steel plate, shapes and bars: ASTM A36
 2. Steel pipe columns: ASTM A53, Schedule 40, black
 3. Bolts and nuts: regular hexagon-head type, ASTM A307, Grade A
 4. Lag bolts: square head type, Fed. Spec. FF-B-561
 5. Plain washers: round, carbon steel, Fed. Spec. FF-W.92

PART 3 EXECUTION

3.1 PIPE HANGERS, SUPPORTS AND GUIDES

- A. General
1. Assure adequate support for pipe and contents
 2. Provide adjustable hangers for all pipes complete with inserts, adjusters, bolts, nuts, swivels, all-thread rods, etc., except where specified otherwise
 3. Arrange for grouping of parallel runs of horizontal piping to be supported together on trapeze type hangers where possible. Where piping of various sizes is to be supported together by trapeze hangers, space hangers for smallest pipe size or install intermediate supports for smaller diameter pipe. Do not use wire or perforated metal to support piping and do not support piping from other piping.
 4. Except as otherwise indicated for exposed continuous pipe runs, install hangers and supports of same type and style as installed for adjacent similar piping
 5. Install all cast iron piping in accordance with Cast Iron Soil Pipe Industry (CISPI) Standards
 6. Support all piping within 2 feet of each change of direction on both sides of fitting
 7. Thermal hanger shields shall be provided at hangers and supports where piping is insulated
 8. Prevent vibration or swaying
 9. Provide for expansion and contraction

10. Supports of wire, rope, wood, chain, strap perforated bar or any other makeshift device not permitted
11. Comply with applicable requirements at ANSI B31.1 and B31.2 for piping
12. Support piping independently so that equipment is not stressed by piping weight of expansion
13. See Section 230548 Vibration and Seismic Control for mechanical sound, vibration, and seismic control
14. See Section 230548 Vibration and Seismic Control for hangers, guides, anchors and supports requiring vibration isolation units
15. Hangers and supports shall have minimum safety factor of five (5), based on ultimate tensile or compressive strength, as applicable, of material used; base calculations on equipment's heaviest operating weight and pipes full of water
16. Install additional supports or braces if, during normal operation, piping should sway, crawl or vibrate. Piping shall be immobile
17. Install thrust blocks as required to prevent sway

B. Horizontal piping, except as noted

1. Adjustable clevis type and rod; all services at or below 250 degrees F
2. Rollers or slide bases: not required
3. Trapeze hangers; guide individual pipes on trapezes with 1/4 inch U-bolt or Superstrut 702 pipe clamp
 - a. Install thermal hanger shield at each support point
4. Galvanized sheet metal shields between hangers and PVC piping
5. Threaded steel rods
 - a. 2 in vertical adjustment with 2 nuts each end for positioning and locking
 - b. Size to 12 in inside pipe size (IPS)

Pipe, IPS	Rod
to 2 inch	3/8 inch
2-1/2 inch and 3 inch	1/2 inch
4 inch	5/8 inch
6 inch and 8 inch	3/4 inch
10 inch and 12 inch	7/8 inch

- c. Size above 12 inch IPS and multiple pipe standards: safety factor of 5 on ultimate strength on area
- d. For double rod hangers: 1 size smaller than above

C. Vertical piping

1. Base support
 - a. Base elbow or welded equivalent
 - b. Bearing plate on structural support
2. Guides
 - a. At every third floor but not to exceed
 - 1) 25 feet for piping to 2 inch
 - 2) 36 feet for piping 2-1/2 inch to 12 inch
 - 3) 50 feet for piping 14 inch and larger
 - b. Or as otherwise designed by the Vibration Isolation vendor; coordinate with Section 230548 Vibration and Seismic Control
3. Top support
 - a. Special hanger or saddle in horizontal connection
 - b. Provisions for expansion
4. Intermediate supports: steel pipe clamp at floor

- a. Bolted and welded to pipe
 - b. Extension ends bearing on structural steel or bearing plates
- 5. For multiple pipes: coordinate guides, bearing plates and accessory steel
- D. Horizontal insulated piping
 - 1. Install saddles for rollers or slide bases
 - 2. Install thermal hanger shields for all other types of supports
 - 3. See Section 230700 Mechanical Insulation for insulation connection to shields
- E. Vertical insulated piping
 - 1. Install thermal hanger shields at guides
 - 2. Use insulated riser clamps at rigid connections.
 - 3. See Section 230700 Mechanical Insulation for insulation connection to shields
- F. Install Pipe Isolators between hangers and piping for all uninsulated copper tubing.
- G. Spring Supports for Piping
 - 1. See Section 230548 Vibration and Seismic Control
- H. Miscellaneous Steel
 - 1. Provide miscellaneous steel members, beams, brackets, etc., for support of work in this division unless specifically included in other divisions
- I. Fire-stopping
 - 1. At pipe penetrations through rated assemblies
 - 2. Commercial pipe sleeve assemblies that are UL listed and that have been approved by the fire marshal for this purpose.

3.2 PIPE SUPPORT SPACING

A. Maximum spacing for horizontal piping

Type of Pipe	Size	Maximum Spacing
Steel	1-1/2 inch and smaller	7 feet
	2 inch and larger	10 feet
Copper	3/4 inch and smaller	5 feet
	1- 1-1/2 inch	6 feet
	2 - 3 inch	8 feet
	4 inch and larger	10 feet
	Plastic	3/4 inch and smaller

- B. Spacing Notes: Additional supports at
 - 1. Changes in direction
 - 2. Branch piping and runouts over 5 feet
 - 3. Concentrated loads due to valves, strainers and other similar items
 - 4. At valves 4 inch and larger in horizontal piping, support piping on each side of valve
- C. Parallel piping on trapezes
 - 1. Maximum spacing to be that of pipe requiring closest spacing

3.3 ATTACHMENT TO STRUCTURE

- A. Concrete
 - 1. Use inserts for suspending hangers from reinforced concrete slabs, walls and sides of reinforced concrete beams wherever practicable
 - 2. Set inserts in position in advance of concrete work
 - 3. Provide reinforcement rod in concrete for inserts carrying
 - a. Pipe over 4 inch
 - b. Ducts over 60 inches wide
 - 4. Where concrete slabs form finished ceiling, finish inserts flush with slab surface
 - 5. Where inserts are omitted, install hangers with expansion shields
 - 6. Through-deck support
 - a. Drill through concrete slab from below
 - b. Provide rod with recessed square steel plate and nut above slab
 - 7. Powder actuated anchors or expansion shields may be used in lieu of inserts
 - a. In bottom of thick slabs
 - b. In thin slab construction, only in sides of beams
 - 8. Pre-Cast Concrete
 - a. Use pre-set inserts
 - b. Where inserts are not available, field drill through beam or joists at locations as directed by Owner's Representative
 - c. Through bolt side beam bracket to beam or joist
 - 9. Poured-In-Place Concrete
 - a. With metal form or underdeck
 - b. Before concrete is poured
 - 1) Field drill hole through metal deck
 - 2) Provide bearing plate, nut and locknut on rod; or install factory-made steel deck inserts specified hereinbefore
 - c. After concrete is poured
 - 1) Install hangers with expansion shields
- B. Steel Beam Anchors
 - 1. Beam or channel clamps
 - 2. Do not cut or weld to structural steel without permission of structural engineer
- C. Steel Deck Anchors
 - 1. Concrete filled: as specified above
 - 2. Decking without concrete
 - a. Through rod Support
 - 1) Weld to square plate, 1/4 in thick
 - 2) Plate to distribute load over minimum of two full cells
 - 3) Coordinate with floor layouts to clear cells with wiring
- D. Side Wall Supports
 - 1. Concrete walls
 - a. As specified for hangers
 - 2. Stud Walls
 - a. Toggle bolts
 - b. Studs welded to structural studs
- E. Support Spreaders
 - 1. Install spreaders spanning between structural members when hangers fall between them, and hanger load is too great for slab or deck attachment
 - 2. Spreaders may be one of methods listed below, or combination of both as required
 - a. Fabricated from structural channel
 - 1) End fittings bolted or welded

- 2) Secure to structural members
 - a) As required by construction
 - b) As reviewed by Structural Engineer
- b. Formed channels with fittings, Superstrut or equal
 - 1) Submit manufacturer's calculations for installation

3.4 DUCT HANGERS AND SUPPORTS

- A. See Section 233100 Ducts

END OF SECTION

SECTION 230548

VIBRATION AND SEISMIC CONTROL

PART 1 GENERAL

1.1 SUMMARY

- A. Work Included in This Section: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
1. Vibration isolators for equipment
 2. Vibration isolators for piping systems
 3. Equipment bases
 4. Inertia bases
 5. Seismic control for equipment on isolators
 6. Seismic bracing and restraints for piping and ductwork
 7. Seismic bracing and restraints for rigidly mounted equipment
 8. Seismic bracing and restraints for flues

1.2 REFERENCE STANDARDS

- A. ASHRAE – American Society of Heating, Refrigerating and Air Conditioning Engineers
- B. NEMA – National Electrical Manufacturer's Association
- C. Underwriters' Laboratories, Inc.: UL 778 – Motor Operated Water Pumps
- D. American Society of Mechanical Engineers: ASME Section VIII – Boiler and Pressure Vessel Code – Pressure Vessels
- E. Published specifications standards, tests or recommended methods of trade, industry or governmental organizations apply to work in this section where cited below
1. Mason Industries “Seismic Restraint Guidelines for Suspended Piping, Ductwork, and Electrical Systems”
- F. Publication references below are basic industry standards; however, regulatory requirements may reference, modify or supersede:
1. American Institute of Steel Construction (AISC) publications
 - a. Specification for the Design, Fabrication and Erection of Structural Steel Buildings (Eighth Edition)
 2. American National Standards Institute (ANSI) Standard
 - a. B027.2-965 – Plain Washers
 3. American Society for Testing and Materials (ASTM) Specifications
 - a. A 6 – General Requirements for Delivery and Rolled Steel Plates, Shapes, Sheet Piling, and Bars for Structural Use
 - b. A 36 – Structural Steel
 - c. A 53 – Welded and Seamless Steel Pipe
 - d. B633 – Electrodeposited Coatings of Zinc on Steel
 - e. A 307 – Carbon Steel Externally and Internally Threaded Standard Fasteners
 - f. A 500 – Cold-Formed Welded and Seamless Carbon Steel Structural Tubing

- g. A1011 – Hot Rolled Carbon Steel Sheet and Strip
- 4. American Welding Society (AWS) Publication
 - a. D 1.1 – Structural Welding Code

1.3 QUALITY ASSURANCE

- A. Qualifications
 - 1. Manufacturer
 - a. All equipment and accessories to be the product of a manufacturer regularly engaged in its manufacture for not less than five years
- B. Manufacturer or manufacturer's representative of vibration isolation equipment shall have the following responsibilities
 - 1. Determine vibration isolator sizes and locations
 - 2. Provide piping and equipment isolation systems as scheduled or specified
 - 3. Guarantee specified isolation system static deflection under installed actual load.
 - 4. Provide installation instructions, drawings and field supervision to assure proper installation, adjustment and performance
- C. The installation of all vibration isolation units and associated hangers and bases shall be as directed by the vibration isolation manufacturer's representative.
- D. It is the objective of this Specification to provide the necessary design for the control of excessive noise and vibration in the building due to the operation of machinery or equipment, and due to interconnected piping, ductwork or conduit
 - 1. All vibration isolators shall have either known undeflected heights or calibration markings so that, after adjustment, when carrying their load, the deflection under load can be verified, thus determining that the load is within the proper range of the device and that the correct degree of vibration isolation is being provided according to the design.
 - 2. All isolators shall operate in the linear portion of their load versus deflection curve. Load versus deflection curves shall be furnished by the manufacturer and must be linear over a deflection range of not less than 50 percent greater than the design deflection.
 - 3. The theoretical vertical natural frequency for each support point, based upon load per isolator and isolator stiffness, shall not differ from the design objectives for the equipment as a whole by more than ± 10 percent.
 - 4. All neoprene mountings shall have a Shore hardness of 30 to 50 ± 5 , after minimum aging of 20 days or corresponding oven-aging.
- E. Acoustical Testing
 - 1. The contractor shall cooperate with regard to sound tests (ARI 575, ANSI S1.13) which may be conducted by the Owner's Representative to verify that noise criteria are met.
 - 2. The contractor shall notify the Owner's Representative of any changes which will affect the acoustical performance.
- F. Seismic load calculations for piping, ductwork and equipment
 - 1. F_p , the total design lateral seismic force, shall be calculated by a licensed structural engineer, unless it is explicitly stated in the plans or specifications. This engineer shall be hired by the contractor responsible for this Section of work.
 - 2. Shall meet California Building Code requirements
 - 3. Calculations required for supports and bracing for situations not covered by referenced "Guidelines" and any revisions to seismic load calculations provided in contract documents at time of bid:
 - a. Hired by contractor under this Section or work

- b. Cost of calculations borne by contractor under this Section
- 4. Calculations made and signed by registered civil or structural engineer knowledgeable in seismic design
- 5. Include horizontal and vertical reaction loads at connections to building structures for all seismic restraints, including those covered by referenced Standards
 - a. Coordinate reaction loads and attachment details with structural engineer for building

1.4 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. "R" means required.
 - 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Vibration isolation devices: catalog cuts, static deflections, quantity, load per isolator, mounting details, seismic restraints, mounting details, etc.	R	R		
Concrete and steel details for equipment pads.				R
Welds or anchor bolt locations.				R
Reinforcing and template steel locations and details				R
Seismic calculations for each seismic restraint sized and signed by registered structural or civil engineer.	R	R		
Inertia and equipment bases	R	R		R
Anchors, inserts and fasteners and fastening details	R2	R2		R
Seismic restraints	R2	R2		R
Seismic bracing and restraint mounting details	R	R		
Flexible pipe connectors	R	R		R
Flexible duct connectors	R2	R2		R

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Vibration Isolation
 - 1. Mason Industries, Inc.
 - 2. Kinetics Noise Control, Inc.
 - 3. M.L. Saussé & Co. (Vibrex)
 - 4. Amber-Booth
 - 5. Or equal.
- C. Flexible Duct Connections
 - 1. Ventfabrics

2. Duro Dyne
3. Or equal

D. Seismic Restraints

1. Hangers and snubbers: Any manufacturer who can verify compliance with SMACNA standards and the California Building Code
2. Strut - Channel Framing: Any manufacturer who can verify compliance with SMACNA standards and the California Building Code
3. Anchors - Drill in, wedge type: Any manufacturer who can verify compliance with the California Building Code
4. Snubbers: Any manufacturer who can verify compliance with the California Building Code

2.2 VIBRATION ISOLATOR TYPES

A. Spring type

1. Spring isolators shall incorporate following
 - a. All springs to be single coil steel with minimum spring coil outer diameter 0.8 of loaded operating height
 - b. Horizontal spring stiffness within 0.8 to 1.25 times rated vertical spring stiffness
 - c. Corrosion resistance
 - 1) Where exposed to corrosive environment including but not limited to:
 - a) Outdoors
 - b) Exposed to outdoor air within 5 feet of outdoor air intake
 - 2) All metal parts hot dip galvanized unless noted otherwise
 - d. Reserve deflection (from loaded to solid height) of 50 percent of rated deflection
 - e. Designed and installed so that ends of springs remain parallel; neoprene cups not acceptable
 - f. Noise pads of ½ inch or 1 inch thickness below the spring base or within the frame to reduce the chance that the springs shall be resonant with equipment forcing frequencies or support structure natural frequencies. For seismic isolators, the pad shall be within the frame. See Table in Paragraph 3.4A.8 for applicability and thickness.
 - g. Leveling device
 - h. Where operating weight differs from installed weight provide built-in adjustable limit stops to prevent equipment rising when weight is removed. Stops shall not be in contact during normal operation.
2. Type "A": Similar to Mason Type SLF
3. Type "B": same as Type "A" except
 - a. Provide built-in resilient vertical limit stops
 - b. Tapped holes in top plate for bolting to equipment
 - c. Capable of supporting equipment at fixed elevation during equipment erection
 - d. Mason Type SLRSO or equal for 1 inch and 2 inch deflection, Type SLR Series 100 for 3 inch to 5 inch deflection
4. Type "C": spring hanger rod isolators shall incorporate the following
 - a. Spring element seated on steel washer within neoprene cup
 - b. Steel retainer box encasing spring and neoprene cup
 - c. Minimum 1/2 inch clearance between retainer box and spring hanger rod
 - d. Minimum 15 degrees angular clearance between rod and retainer box
 - e. Double deflection LDS element
 - f. Mason RW30N or equal

B. Elastomer mounting types

1. Type "D": Double deflecting type incorporating following

- a. Bolt holes for bolting to equipment base
- b. Bottom steel plates for bolting to sub-base as required
- c. Unit type design molded in black oil-resistant neoprene
- d. Neoprene compounded to meet following:
 - 1) Not greater than 50 durometer
 - 2) Minimum tensile strength 2000 pounds per square inch
 - 3) Minimum elongation 300 percent
 - 4) Maximum compression set of 25 percent of the original deflection
- e. Mason Type ND or equal (where seismic restraint not required by CBC)
- f. Mason Type BR or equal (where seismic restraint required by CBC)
- 2. Type "E": Elastomer hanger rod isolators shall incorporate following
 - a. Molded unit type neoprene element
 - b. Compounding described in Type "D" above
 - c. Steel retainer box encasing neoprene mounting.
 - d. Minimum 1/2 inch box
 - e. Mason Type HD or equal
- 3. Type "F": Pad type elastomer mountings to incorporate following
 - a. 5/16 to 3/8 inch minimum thickness per layer
 - b. 50 psi maximum loading
 - c. Ribbed or waffled design
 - d. 1/16 inch galvanized steel plate between multiple layers of pad thickness
 - e. 1/16 inch deflection per pad thickness
 - f. Suitable bearing plate to distribute load
 - g. Bolts through equipment and pad shall be oversized and provided with resilient washers, bushings and lock nuts
 - h. Mason Type Super W Series or equal
- 4. Type "G": Pad type elastomer mountings to incorporate following
 - a. High quality bridge bearing neoprene
 - b. Maximum loading 800 psi
 - c. Suitable bearing plate to distribute load
 - d. Minimum thickness 2 inch
 - e. Mason Type BBP or equal
- 5. Type "H": Combination spring/elastomer hanger rod isolators to incorporate following
 - a. Spring and neoprene isolator elements in steel box retainer
 - b. Characteristics of spring and neoprene as described in Type "C" and Type "E" hanger isolators
 - c. Factory preloading to 75 percent of rated load
 - d. Mason PC30N or equal
- C. Seismic Snubbers
 - 1. Type SS: All-directional seismic snubber
 - 2. Neoprene bushing to be bridge bearing quality
 - 3. Male portion to be smooth round bar; threaded bolts not acceptable
 - 4. Mason Z-1225 or equal

2.3 EQUIPMENT BASES

- A. Integral structural steel bases, Type "B-1"
 - 1. Reinforced as required to prevent base flexure at start-up and misalignment of drive and driven units
 - 2. Fan bases complete with motor slide rails
 - 3. Drilled for drive and driven unit mounting template
 - 4. Mason Type WFSL/WFND or equal

- B. Concrete inertia base, Type "B-2"
 - 1. Formed in structural steel frame
 - 2. Structural base reinforced as required to prevent flexure, misalignment of drive and driven unit or stress transfer into equipment
 - 3. Minimum thickness of the inertia base shall be 6 inches or greater if required to meet weight ratio specified below
 - 4. Fan bases complete with motor slide rails
 - 5. Pump bases shall be large enough to support suction and discharge elbows and suction diffusers
 - 6. Bases complete with
 - a. Height saving brackets
 - b. Reinforcing
 - c. Equipment bolting provisions
 - d. Isolators provided by vibration control supplier, type as scheduled
 - 7. Base ready for concrete pour
 - 8. Inertia Base Weights
 - a. Centrifugal Fans, except as noted: Minimum 1.0 times weight of fan, motor and drive
 - b. Air handling Units, except as noted: Minimum 1.0 times weight of fan and coil cabinet, coils, fan, motor and drive
 - c. Pumps: Minimum 1.5 times weight of pump, motor and base
 - 1) Base to be sized to support suction diffuser when used
 - 9. Mason Type KSL/BMK or equal
- C. Seismic restraint, Type I
 - 1. All directional type
 - 2. Steel and elastomeric
 - 3. Mason Type Z-1225 or equal
- D. Seismic restraint, Type II
 - 1. Criteria
 - a. Designed for seismic force criteria specified in Part 3
 - b. Submit application details for approval

2.4 ANCHORS, INSERTS AND FASTENERS

- A. All anchors and inserts shall be installed according to the California Building Code.
- B. Do not use any anchor or insert in concrete which does not have a signed structurally engineered design value based on its installed application and one of the following
 - 1. California Building Code evaluation report
 - 2. Lab test report verifying compliance
- C. Do not use powder driven and power driven (Shoot-In) fasteners, expansion nails or friction spring clips.
- D. All over-head concrete anchors or inserts shall be selected to comply with the California Building Code table for the anchor or insert.
- E. Torque testing of anchors shall be allowed to verify compliance of anchor installation. However, torque testing shall not justify usability of anchor. Only load or pull testing shall be allowed to justify usability of anchors. Failure of torque shall constitute failure of anchor.
- F. Bolts and nuts

1. Bolts and heavy hexagon nuts: ANSI B18.2.1 and ASTM A307 or A576
2. Bolts, underground: ASTM A325
3. Expansion anchors: Federal Specification A-A-1922

2.5 SEISMIC RESTRAINTS

- A. General
 1. Capable of safely accepting indicated external forces without failure
 2. Maintain equipment, piping and ducts in a captive position
- B. Criteria: Design for seismic forces specified herein
- C. Bracing system: Provide one of the following methods as most applicable for each brace
 1. Material used, except for pipes, shall be structural steel with ASTM A36. Steel pipes shall conform to ASTM A501
 2. Complete system of factory fabricated components
 3. Complete system of job fabricated components
 4. Miscellaneous metal structural shapes

2.6 FLEXIBLE PIPE CONNECTORS

- A. Flexible Piping Couplings for Vibration Isolation
 1. Flexible mechanical joints
 2. Victaulic Style 077/177 or equal
- B. Twin Sphere Connections for Vibration Isolation
 1. Molded twin-sphere type connectors made of peroxide cured EPDM and Kevlar tire cord reinforcement and reinforcing ring
 2. Connectors up to 2 inch diameter may have threaded ends
 3. Connectors 2-1/2 inch diameter and larger to have floating steel flanges recessed to lock the connector's neoprene flanges
 4. Connectors rated a minimum of 150 pounds per square inch at 220 degrees Fahrenheit without control rods or cables; connectors that require control rods are not acceptable.
 5. Mason SAFEFLEX Type SFDEJ (no equal)

2.7 FLEXIBLE DUCT CONNECTORS

- A. General
 1. Conform to NFPA 701 and NFPA 90A
 2. Flame spread rating: 25
 3. Smoke development rating: 50
 4. Airtight and waterproof to plus or minus 10 inches
- B. Construction
 1. Metal collar at each end
 - a. Galvanized steel G60
 - b. Minimum thickness: No. 24 USSG
 - c. Minimum length: 3"
 - d. Double lock joint
 2. Length of fabric

- a. Minimum: 4 inch
- b. Maximum: 10 inch
- 3. Materials
 - a. Coated glass fabric
 - b. 30 ounces per sq yard
 - c. Sewed and cemented seams
 - d. Indoors
 - 1) Neoprene or woven nylon/polyester blend with vinyl coating
 - 2) Ventfabrics, Inc. Ventglas or equal
 - e. Outdoors
 - 1) Woven fiberglass with Hypalon coating
 - 2) Weather-resistant
 - 3) UV, sunlight, and ozone resistant
 - 4) Ventfabrics, Inc. Ventlon or equal

PART 3 EXECUTION

3.1 INSTALLATION

- A. Install isolators and seismic restraints in accordance with manufacturer's written instructions
- B. Vibration isolators must not cause any change of position of equipment or piping resulting in piping stresses or misalignment
- C. Make no rigid connections between equipment and building structure that degrade noise and vibration isolation system herein specified
 - 1. Electrical conduit connections to isolated equipment shall be flexible liquid tight conduit of sufficient length to incorporate a right angle bend, an offset of not less than 8 inches or a loop to allow free motion of isolated equipment
 - 2. The HVAC Sub-contractor shall not install any equipment, piping or conduit which makes rigid contact with the building unless permitted in this Specification; building includes, but is not limited to, slabs, beams, columns, studs and walls
 - 3. Coordinate work with other trades to avoid rigid contact with the building. Inform other trades following work, such as plastering or electrical, to avoid any contact which would reduce the vibration isolation
- D. Do not use isolator leveling bolts as jacking screws
- E. Verify that all installed isolators and mounting systems permit equipment motion in all directions

3.2 SEISMIC CONTROL

- A. General
 - 1. Install seismic restraints for pipes, ducts and equipment per applicable code
 - 2. Design and provide restraints to prevent permanent displacement in any direction caused by lateral motion, overturning or uplift
 - a. Update designs and submit for DSA approval, if required, and include on shop drawings, including arrangements, sizes and model numbers indicated or referenced in applicable standards. Each shop drawing shall bear a Structural or Civil Engineer's stamp and signature registered in the State of California.

- b. Where designs, etc., are neither indicated nor referenced, contractor shall submit such designs, together with supporting calculations prepared by Structural or Civil Engineer registered in State of California. Calculations shall substantiate seismic restraint capability to safely accept external forces without failure and maintain equipment in position.
- c. Capable of safely accepting external forces per CBC without failure.
- 3. Provide resilient restraining devices as required to prevent equipment motion in excess of 1/4 inch
- 4. Coordinate seismic bracing requirements with other sections to result in
 - a. Vertical pipe and duct restraints to coincide with and take place of required hangers
 - b. Longitudinal pipe bracing to coincide with required pipe anchors
- 5. Shall not short circuit vibration isolation systems or transmit objectionable vibration or noise

B. Attachments to Structure: See Section 230529 Hangers and Supports

3.3 FLOOR MOUNTED EQUIPMENT

- A. Concrete housekeeping pads
 - 1. Isolation and seismic restraint supplier to determine dimensions and thickness required
 - a. Minimum thickness: 5.5 inches
 - 2. Support all vibration isolation devices and bases
 - 3. Key with stirrups as required, integral with structural slab
 - 4. Incorporate seismic restraint anchor plates flush with top of housekeeping pad

3.4 EQUIPMENT ISOLATION

- A. General
 - 1. Provide 1 inch operating clearance between equipment or structural bases and housekeeping pad
 - a. 2 inch minimum clearance for inertia bases over 96 inches in any dimension
 - 2. Position equipment, structural base and concrete bases on blocks or wedges at proper operating height
 - 3. Provide operating load conditions prior to transferring base isolator loads to springs and removing wedges
 - 4. Adjust or provide additional resilient restraints to flexibly limit start-up equipment lateral motion to 1/4 inch
 - 5. Prior to start-up, clean out all foreign matter between bases and equipment
 - 6. Verify that there are no isolation short circuits in the base, isolators or seismic restraints or conduit, pipe and duct connections
 - 7. Position all corner or side seismic restraints with equipment in operation for proper operating clearance. Weld or bolt seismic restraints to seismic anchor plates in housekeeping pad
 - 8. Locate spring hanger boxes directly adjacent to the structural support element above, as opposed to down at the location of the supported equipment.
 - 9. Where isolator base pad is called for in Vibration Isolator Schedule, install pad between the isolator base and structure.
 - 10. For isolator pads penetrated by anchors to the structure, to prevent short-circuiting, provide neoprene grommet between the anchor and isolator. Hand-tighten nut to so that grommet is not compressed then secure with lock nut.

B. Vibration Isolator Schedule

Equipment	Base Type	Isolator Type	Isolator Static Deflection	Acoustical Base Pad Thickness
In-line pumps >1 HP	None	C	1 inch	–
Floor-mounted AHUs (internally isolated)	None	F	0.1 inch	–
Suspended fan-coils	None	C	1 inch	–
Floor-mounted fans <10 HP	B-1 if fan is not self-supporting	A	1 inch	1/2 inch
Floor-mounted fans 10 HP and larger				
<300 RPM	B-1 (B-2 if 50 HP or larger)	A	3.5 inch	1/2 inch
300-450 RPM	ditto	A	3 inch	1/2 inch
451-600 RPM	ditto	A	2.5 inch	1/2 inch
601-750 RPM	ditto	A	2 inch	1/2 inch
751-850 RPM	ditto	A	1.5 inch	1/2 inch
>850 RPM	ditto	A	1 inch	1/2 inch
Suspended fans direct drive				
1/3 HP and larger	None	E	0.2 inch	–
<1/3 HP	None	–	–	–

3.5 PIPING ISOLATION

- A. See Section 232113 HVAC Piping
- B. See Section 230529 Hangers and Supports for general support of piping including felt lined hangers for uninsulated piping.
- C. Piping other than risers
 - 1. No vibration isolation required
- D. Vertical Pipe Risers
 - 1. Riser Support 1
 - a. Applies to copper pipe risers and welded steel less than 50 feet in length, and steel pipe risers with flexible mechanical couplings.
 - b. Risers shall be laterally supported with a riser clamp at each floor set on a Type F isolation pad, 0.1 inch deflection.
 - 2. Riser Support 2
 - a. Applies to all pipe risers other than those qualifying for Riser Support 1
 - b. Riser supports shall be engineered by the vibration isolation vendor as follows.
 - c. All vertical risers shall be supported by spring isolators designed to support the riser filled with water. Assigned loads must be within the building design limits at the support points.
 - d. Neutral central resilient anchors close to the center of the run shall direct movement up and down. The anchors shall be capable of holding an upward force equal to the water weight when the system is drained. If one level cannot accommodate this force, anchors can be located on 2 or 3 adjacent floors. Anchors shall be Mason ADA or equal.
 - e. Resilient guides shall be spaced and sized properly depending on the pipe diameter. Guides shall be Mason VSG Vertical Sliding Guides or equal.

- f. Support spring mountings shall be Type A. The initial spring deflection shall be a minimum of 0.75 inches or four times the thermal movement at the isolator location, whichever is greater.
- g. Submittals must include the initial load, initial deflection, change in deflection, final load and change in load at all spring and anchor support locations, as well as guide spacing. Calculations shall include pipe stress at end conditions and branch off locations and the manufacturer must include installation instructions. Submittal must be stamped and signed by a licensed professional engineer in the employ of the vibration isolator vendor.

E. Equipment

- 1. Provide twin-sphere flexible couplings where shown on drawings, such as at pumps. Install per manufacturer's instructions.
- 2. Provide flexible hose connections where shown on drawings, such as at AC units and hydronic heat pumps. Install per manufacturer's instructions.
- 3. For motorized equipment not shown to have flexible connections on drawings, such as chiller, cooling towers, and boilers, provide minimum three flexible style mechanical couplings between the vibrating equipment and the first rigid support to the structure. This can be couplings that are part of elbows and other normally required fittings; it is not necessary to include couplings dedicated to this purpose.
 - a. Not required at:
 - 1) Air handling equipment with internal fan isolation
 - 2) VAV boxes including fan-powered VAV boxes
 - 3) Equipment piped with copper piping

3.6 DUCTWORK ISOLATION

- A. See Section 233100 Ducts.
- B. Ductwork
 - 1. No vibration isolation required other than flexible connections at fans
- C. Flexible Connections
 - 1. Install at all connections to fans and air handling units and as indicated on Drawings
 - a. Not required at suspended direct drive fans <1/3 HP
 - b. Not required at internally isolated air handling units unless shown on drawings
 - 2. 2 inch slack in fabric; install to allow minimum movement of 1 inch in both tension and compression

3.7 WALL AND FLOOR PENETRATIONS

- A. All piping and ductwork to be vibration isolated, and all piping and ductwork passing through acoustically rated partitions, shall freely pass through walls and floors without rigid contacts or connections. Penetration points shall be sleeved or otherwise formed to allow passage of piping or ductwork, and maintain 0.75 inches to 1.25 inches clearance around the pipe or duct outside surfaces. For installations through air plenum partitions and through acoustically rated partitions, clearance space shall be tightly packed with fiberglass, and caulked airtight after installation of piping or ductwork. Caulk shall be Hilti CP 506 or equal.
- B. For installation in rated walls, see Section 232113 HVAC Piping and Section 233100 Ducts

- C. Provide sleeves and escutcheons as specified in Section 232113 HVAC Piping and Section 233100 Ducts.

3.8 SEISMIC BRACING INSTALLATION

- A. Piping and Ductwork
 1. Bracing system shall meet the seismic load requirements (See Section 1.3F)
 2. Install all bracing and restraints per referenced Guidelines in Paragraph 1.2, where applicable
 3. Where the referenced Guidelines in Paragraph 1.2 are not applicable then submit details of a proposed bracing system. The proposed system shall be stamped by a licensed civil or structural engineer and shall be submitted for approval prior to construction.
 4. Coordinate seismic bracing and restraints so that required expansion provisions will not be restricted
 5. Provide floor support and bracing of pipe connection risers to equipment
 6. Where seismic bracing and restraints are not required refer to Section 230529 Hangers and Supports
- B. Flexibly Supported Piping and Ducts
 1. Provide and locate restraints to allow normal operation of systems without transmitting vibrations to building structure
 2. Location of Restraints: Per referenced Guidelines in Paragraph 1.2
 3. Construction of Restraints: Steel cables, installed slack
- C. Rigidly Mounted Equipment
 1. Secure to floor as required to prevent horizontal motion and overturning
 2. Secure to walls or other equipment to prevent overturning
 - a. Attach to elements capable of taking calculated loads
 - b. Provide steel backing in walls as required to brace equipment and piping from wall

3.9 FIELD QUALITY CONTROL

- A. Inspection by manufacturer's representative of all vibration isolating devices
 1. After installation of all devices
 2. Provide written report by manufacturer regarding
 - a. Installation errors
 - b. Improper selection of devices
 - c. Other fault that could affect performance of system
- B. Submit written report to Owner's Representative
 1. Include manufacturer's report indicating required corrections
 2. Include report on steps to properly complete isolation work
- C. See Section 230800 Mechanical Commissioning

END OF SECTION

SECTION 230553

HVAC SYSTEM IDENTIFICATION

PART 1 GENERAL

1.1 SUMMARY

- A. Identify piping and equipment components of the mechanical systems to indicate their function and system served

1.2 REFERENCE STANDARDS

- A. Pipe marker shall comply with ANSI/ASME A13.1

1.3 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. "R" means required.
 - 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Pipe markers	R2			
Equipment tags	R2			
Concealed equipment markers	R			

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. W.H. Brady
- C. Seton
- D. Marking Services, Inc. (MSI)
- E. Or equal

2.2 DUCTWORK IDENTIFICATION

- A. Not required

2.3 PIPING IDENTIFICATION

- A. Colors

Pipe Service	Background	Lettering
Chilled water supply	Blue	White
Chilled water return	Blue	White
Heating water supply	Yellow	Black
Heating water return	Yellow	Black

- B. Label Content
 - 1. Pipe service
 - 2. Arrow indicating flow direction
- C. Labels
 - 1. Vinyl duct markers, self-adhesive
 - 2. Able to withstand temperatures up to 160°F
 - 3. Minimum letter size: per ANSI/ASME A13.1
 - 4. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- D. Provide custom marker labels for all piping for which no standard manufactured marker is available. Submit sample for approval
- E. Specialty Gases piping shall be identified with Brady B-60 fiber tags, or equal, with chemical symbol on tag

2.4 VALVE IDENTIFICATION

- A. Valve Tags: Not required

2.5 EQUIPMENT IDENTIFICATION

- A. Nameplates
 - 1. Tag all scheduled and uniquely tagged mechanical equipment with engraved nameplates. Nameplates shall be 1/16-inch thick, 3 x 5 or 2 x 6 laminated 2-ply plastic, center ply white, outer ply black. Form letters by exposing center ply.
 - 2. Identify unit with building number, unit mark as shown on equipment schedules on Drawings, and service. For example: SF-1 SUPPLY FAN

2.6 TERMINAL UNITS

- A. Same as Paragraph 2.5
 - 1. Hand-written or stenciled tag on terminal casing in indelible ink also acceptable

PART 3 EXECUTION

3.1 MANUFACTURER'S IDENTIFICATION

- A. Equipment manufacturer's nameplate, name or trademark shall be permanently affixed to all equipment and material furnished under this specification. The nameplates of subcontractor or distributor are not acceptable.
- B. Identify model number, size, capacity, electrical characteristics, serial number, etc.
- C. Leave nameplates clean, legible and with unobstructed view

3.2 PIPING IDENTIFICATION

- A. All piping concealed or exposed shall have identification markers.
- B. Unless the current version of the recommendations of ANSI A13.1, 1981 are more stringent, apply labels or letters after completion of pipe cleaning, insulation, painting, or other similar work, as follows:
 - 1. Every 20 feet along continuous exposed lines
 - 2. Every 10 feet along continuous concealed lines
 - 3. Adjacent to each valve and stubout for future
 - 4. Where pipe passes through a wall, into and out of concealed spaces
 - 5. On each riser
 - 6. On each leg of a "T"
 - 7. Locate where conspicuously visible
- C. Further, apply labels or letters to lower quarters of the pipe on horizontal runs where view is not obstructed or on the upper quarters when pipe is normally viewed from above. Apply arrow labels indicating direction of flow; arrows to be the same color and sizes as identification labels.
- D. Spray a protective coating of clear epoxy over markers and arrows in corrosive atmosphere areas.

3.3 EQUIPMENT IDENTIFICATION

- A. All equipment and apparatus shall have identification nameplates. Cardholders in any form not acceptable.
 - 1. Provide identification nameplate for variable speed drives and starters provided under this Division indicating the equipment that the VFD powers.
- B. Locate where conspicuously visible
- C. Attach either with sheet metal screws, brass chain, or contact cement as applicable
- D. Identify equipment out of view behind access doors, in unfinished rooms on the face of the access door
- E. Place warning signs on machines driven by electric motors which are controlled by fully automatic starters, in accordance with Article 3281, General Industry Safety Orders

- F. Nameplate Directory: Post final copy in Operation and Maintenance Manual

3.4 TERMINAL UNITS

- A. Same as Paragraph 3.3
- B. Identify room sensor/thermostat relating to terminal unit with indelible marker on sensor hidden by cover.

3.5 CONCEALED EQUIPMENT IDENTIFICATION

- A. Where fire/smoke dampers, terminal units, and other equipment requiring routine maintenance are located above accessible ceilings, color-coded markers shall be provided as specified below to make it easier for equipment to be located by maintenance personnel.
 - 1. Marker
 - a. DONN Fineline, narrow tee-bar (tees with flat surface less than 1/2 inch wide), or concealed spine ceilings: 1/8 inch round-head map tack
 - b. Standard tee-bar ceilings: 3/8 inch round sticker made of vinyl, polyester, or PVC (paper not acceptable), equal to EMS Tough-Spots
 - 2. Locate marker on the ceiling tile (tack) or tee (sticker) closest to side of the equipment requiring maintenance (such as damper motor, controls, and valves).
 - 3. Unless otherwise directed, color codes shall be:
 - a. Fire/smoke and smoke dampers: red
 - b. HVAC equipment, such as terminal units, VAV boxes, and heat pumps: blue
 - c. Valves such as at riser taps and riser or branch isolation valves: yellow
- B. Label duct access door to fire and smoke dampers in letters not less than 1/2 inch height reading SMOKE DAMPER, FIRE DAMPER, or FIRE/SMOKE DAMPER. Indelible ink is acceptable.

END OF SECTION

SECTION 230593

TESTING, ADJUSTING AND BALANCING

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Operational testing and adjusting of air handling equipment
 - 2. Balancing of air distribution systems
 - 3. Testing and adjustment of air terminal devices
 - 4. Flow testing, adjusting and balancing of hydronic systems.

1.2 REFERENCE STANDARDS

- A. National Environmental Balancing Bureau Procedural Standards
- B. Associated Air Balance Council National Standards
- C. Testing, Adjusting and Balancing Bureau Standards
- D. ASHRAE Standard 111 Practices for Measurement, Testing, Adjusting, and Balancing of Building Heating, Ventilating, and Air-Conditioning Systems

1.3 QUALITY ASSURANCE

- A. Contractor shall be member of Associated Air Balance Council (AABC), National Environmental Balancing Bureau (NEBB), or Testing, Adjusting and Balancing Bureau (TABB)
- B. Contractor shall have satisfactorily balanced at least three systems of comparable type and size
- C. Prior to start of testing, adjusting and balancing, verify that required Project conditions are met
 - 1. Systems installation is complete and in full operation
 - 2. All pre-functional tests have been performed
 - 3. Equipment has been started and tested in accordance with manufacturers' installation instructions
 - 4. Doors and windows are in place and closed or under normal traffic conditions

1.4 SUBMITTALS

- A. All submittals shall follow Submission and Resubmission Procedures outlined in 230501 Basic Mechanical Materials and Methods.
- B. Submit documentation that demonstrates
 - 1. Contractor is a member of AABC, NEBB, or TABB
 - 2. Contractor has satisfactorily balanced at least three systems of comparable type and size

C. Pre-Test Submittal

1. At least 30 days prior to starting field work, submit the following:
 - a. Set of final report forms
 - 1) Complete with design conditions of all equipment and design flow rates for all equipment and devices to be tested.
 - 2) Forms shall include blank entry space for all data requested in this Section. Carefully review requested data; standard balancing forms may not be acceptable.
 - 3) Forms shall be in acceptable word-searchable electronic format per Section 230501 Basic Mechanical Materials and Methods.
 - b. Complete list of instruments proposed to be used
 - 1) Organize in appropriate categories
 - 2) Include data sheets for each
 - 3) Show
 - a) Manufacturer and model number
 - b) Description and use when needed to further identify instrument
 - c) Size or capacity range
 - d) Latest calibration date
 - c. Provide certification that
 - 1) All instruments have been calibrated prior to tests
 - 2) Instruments comply with requirements of AABC, NEBB, or TABB for tests required
 - 3) Contractor is currently certified by AABC, NEBB, or TABB
2. Do not proceed with field work until the above submittal has been approved by Owner's Representative.

D. Final Test & Balance Report

1. At least 15 days prior to Contractor's request for final inspection, submit electronic copy of final reports on approved reporting forms for review and approval by Owner's Representative. Once approved, provide required quantity of paper and electronic copies per 230501 Basic Mechanical Materials and Methods.
2. Form of Final Reports
 - a. Completed forms shall be typed (not hand written) and be in acceptable word-searchable electronic format per Section 230501 Basic Mechanical Materials and Methods.
 - b. Fully completed report forms for all systems specified to be tested and balanced including at a minimum all data specified herein to be recorded
 - c. Each individual final reporting form must bear
 - 1) Signature of person who recorded data
 - 2) Signature of air balance supervisor of reporting organization
 - d. When more than one certified organization performs total air balance services, firm having managerial responsibility shall make submittals.
 - e. Identify instruments of all types that were used and last date of calibration of each.

1.5 PROJECT REVIEW

A. Pre-Construction Review

1. Review following documents
 - a. Contract documents
 - 1) Drawings
 - 2) Specifications
 - 3) Addenda
 - 4) Change orders

- b. Submittal data
 - c. Shop drawings
 - d. Building Automation System drawings
 - e. Pre-functional test reports
 - 2. Identify potential problems from standpoint of total system balance.
 - 3. Review design and shop drawings and specifications for
 - a. Potential problems for total system balance
 - 1) Location of balancing devices
 - 2) Lack of balancing devices
 - 3) General System layout
 - 4) Architectural features
 - 5) Accessibility
 - b. Most effective system balance procedures
 - c. Scheduling and coordination requirements
 - 4. Review submittal data for
 - a. Completeness of data
 - b. Conformity with contract documents
 - c. Special instructions for use of balancing devices
 - d. Factors for flow meters
 - e. Limitations affecting accuracy of measurements
 - f. Balancing forms shall show design data and submittal data where different
 - g. Equipment performance data and curves
 - 5. Review BAS drawings and specifications for:
 - a. Calibration and setpoint adjustment requirements by this Section
 - b. Determining most effective total system balance procedure for minimum control manipulation
 - c. Coordinate required control manipulation with BAS installer
 - 6. Submit report recommending addition and/or relocation of balancing devices, including, but not limited to
 - a. Volume dampers
 - b. Balancing valves (including ball and butterfly valves with memory-stops, which are used in the design for balancing)
 - c. Pressure and temperature measuring points
- B. Construction Review
- 1. Make on-site visits during progress of construction: Number of visits to be as required to perform the functions specified below.
 - 2. Purpose of review
 - a. Identify potential problem for performing total system balance
 - b. Identify modifications that will affect air total system balance
 - c. Schedule and coordinate total system balance with other work
 - d. Identify conditions that could create hazardous environment for building occupants
 - 3. Typical activities
 - a. Check that necessary balancing and measuring hardware is
 - 1) In place
 - 2) Located properly and accessibly
 - 3) Installed correctly
 - b. Identify and evaluate variations from system design
 - c. Record data from equipment nameplates
 - d. Identify and report possible restrictions in systems; such as
 - 1) Poorly designed duct fittings
 - 2) Questionable piping connections
 - 3) Others as may arise or based on contractor's experience
 - e. Verify that construction progress will not delay total system balance

- f. Identify best location for duct traverses
- g. Identify scaffolding needs

PART 2 PRODUCTS

2.1 TEST EQUIPMENT

- A. All testing equipment shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified herein. If not otherwise noted, the following minimum requirements apply
 - 1. Volt-meter: plus or minus 1 percent scale
 - 2. Ammeter: plus or minus 1 percent scale
 - 3. Ohmmeter: plus or minus 0.1 percent scale for calibrating plus or minus 0.4 degrees Fahrenheit resistance temperature sensors, plus or minus 0.25 percent scale for calibrating plus or minus 1 degrees Fahrenheit temperature sensors, plus or minus 1 percent scale for measuring motor current
 - 4. Ultrasonic time-of-travel strap-on flow sensor: plus or minus 5 percent of reading
 - 5. Other flow sensors: plus or minus 2 percent of reading
 - 6. Water pressure gauge: plus or minus 1/2 percent scale, ASME Grade 2A
 - 7. Watt meter, plus or minus 1/2 percent scale: 3 phase split core current transducers
 - 8. Temperature: plus or minus 0.4 degrees Fahrenheit
- B. All equipment shall be calibrated within 6 months of use, or according to the manufacturer's recommended interval, whichever is shorter, and when dropped or damaged. Calibration tags shall be affixed or certificates readily available and proof of calibration shall be included reports.

PART 3 EXECUTION

3.1 GENERAL

- A. Coordinate with work of other trades.
- B. Coordinate all work with Commissioning Coordinator
 - 1. See Section 019100 Commissioning
 - 2. See Section 230800 Mechanical Commissioning
- C. Report to Owner's Representative any discrepancies or items not installed in accordance with the Contract Drawings pertaining to proper balance and operation of air and water distribution systems.
- D. Perform testing, adjusting and balancing in accordance with AABC, NEBB, or TABB standards.
- E. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to Section 230700 Mechanical Insulation.

- F. Mark equipment settings with paint or other suitable, permanent identification material, including damper control positions, valve indicators, and similar controls and devices, to show final settings.
- G. Assist in performance testing where specified in Section 230800 Mechanical System Commissioning.

3.2 CONTROL SYSTEM COORDINATION

- A. See Division 25 Building Automation Systems
- B. System balance techniques in this Section rely on the operation of the BAS. Test and balance contractor shall coordinate schedule of work with BAS installer to ensure test and balance work can be executed and completed in a timely manner.
- C. Cooperate with BAS installer in determining operating conditions and setpoints, as indicated in this Section.
- D. Cooperate with BAS installer in calibrating all airflow measuring devices.
- E. Obtain and receive training for required software from BAS installer for setting calibration constants in terminal devices.

3.3 WATER SYSTEMS BALANCING

- A. Prepare water systems for balancing in following manner
 1. Verify the following conditions
 - a. Piping systems have been flushed and treated in accordance with Section 232113 HVAC Piping
 - b. Strainers have been cleaned
 - c. Piping systems are completely full of water, all air properly vented
 - d. All coil and heat exchanger shut-off, balance, and control valves are fully open
 2. Check pump
 - a. Rotation
 - b. Pump factory impeller trimming by comparing shut-off heads with pump curves from approved submittals
 - 1) Note that impellers on variable speed pumps should not be trimmed to design flow and head conditions. See Section 232123 Pumps.
 - 2) Report discrepancy in shut-off head to Owner's Representative and if impeller does not appear to be properly trimmed. Wait for direction before proceeding with pump test and balance.
 3. BAS and Central Plant Operability
 - a. Do not proceed with any of the following balancing procedures until the BAS is capable of operating equipment such as fans, pumps, VAV boxes, control valves, etc. in manual and automatic modes and capable of reading sensors such as differential pressure, flow rates, temperatures, etc. of air and hydronic systems to be tested and adjusted.
 - b. Do not proceed with air handler testing until chilled and hot water at design temperatures are available from the central plant.
- B. Pumps

1. Test and report for each pump at test conditions indicated in Paragraphs below.
 - a. Tag
 - b. Manufacturer and model of pump and motor
 - c. Motor horsepower, volts, phase, full load amps
 - d. Pump shut-off head from curves, measured shut-off head, and resulting impeller diameter from pump curve
 - e. At test condition specified
 - 1) Volts and amps
 - 2) Calculated brake horsepower
 - 3) Entering and leaving gage pressure and difference in feet
 - 4) Flow rate deduced from pump curve
 - 5) For pump with variable speed drive
 - a) Speed (Hz)
 - b) Kilowatts
 2. Include pump curve from approved submittals in final report.
- C. Chilled Water and Hot Water Distribution System
1. Coil Test & Balance
 - a. System is self-balancing. Two-way control valves at coils prevent each coil from being over-supplied with water, other than minor excursions during transients such as cool-down or warm-up. Conventional balancing (throttling of balancing valves) will increase pump energy use by not allowing aggressive differential pressure setpoint reset. Hence, do not adjust any valves on any coil or pump, except temporary adjustments where noted. All manual valves at coils and pumps shall be wide open when test and balance work is complete.
 - b. Report with all control valves open to coil and all pumps (except standby pumps, where applicable) operating at full speed
 - 1) See Air Balance below for coil temperature data where required
 - 2) See Pump test data above for pump data
 - 3) Coils with modulating two-way
 - a) Terminal tag
 - b) Control valve model number and serial number
 - c) Pressure drop across coil
 - d) Flow as measured by calibrated balancing valve (where applicable).
Determine flow by either of the following:
 1. Use test plugs to measure pressure drop across the coil and estimate flow using coil manufacturer's submittal data of flow vs. pressure drop. This option shall only be used when design coil pressure exceeds 5 feet.
 2. Use test plugs to measure pressure drop across the control valve and calculate flow using valve manufacturer's submitted Cv.
 2. HW Pump Variable Speed Drive Setpoint Determination
 - a. For systems with variable speed drives, determine maximum differential pressure setpoint (DPmax) in conjunction with the BAS installer as follows.
 - 1) Fully open all control valves serving coils that are located downstream of the differential pressure sensor.
 - 2) Fully close all control valves serving coils that are located upstream of the differential pressure sensor.
 - 3) Start pump(s). Manually adjust speed slowly until design flow (or design pressure drop, for coils without calibrated balance valves) is just achieved through all open coils without modulating any balance valves. One coil should be just at design flow, while others should be at or above design flow.
 - 4) Once flow condition in previous step is achieved, note the BAS system differential pressure reading at the differential pressure sensor. This reading becomes the differential pressure setpoint. Using pressure taps at differential

- pressure sensor and handheld digital pressure sensor, verify accuracy of BAS reading.
 - 5) If there are multiple differential pressure sensors, repeat steps above for each sensor.
 - b. Convey to the BAS installer
 - 1) Differential pressure setpoint
 - 2) Any discrepancy between BAS differential pressure reading and handheld measurement
 - c. Report at condition described above
 - 1) Differential pressure setpoint and concurrent reading of handheld measurement: Initials of BAS installer to indicate that the information was transmitted to them.
 - 2) Tag of coils downstream of differential pressure sensor, along with the following for each
 - a) Design flow rate and pressure drop
 - b) Tested flow rate and pressure drop with differential pressure at setpoint determined above
 - 3) Water flow rate through flow meter (where applicable), through BAS
 - 4) See Pump test data above for pump data
3. Control Valve Shut-off Test
 - a. Close all control valves in the system through the BAS. Run all pumps at full speed.
 - 1) Verify that all control valves remain shut with no measurable flow, as indicated by pump differential pressure and any temperature rise across coils.
 - 2) Do not run pumps deadheaded for more than 5-minutes at any one time.
 - 3) After test, release control valves to automatic operation through the BAS.
 - b. Report at condition described above
 - 1) Tag of coils where flow is detected: Initials of BAS installer to indicate that this information was transmitted to them.
 - 2) Measured pump inlet and outlet pressures, and difference converted to feet
 - 3) Differential pressure reading at all differential pressure sensors, through BAS

3.4 AIR SYSTEM BALANCING

A. General

1. Do not operate fan systems for test or balance until spaces served have been cleaned of dust and debris, to avoid contamination of supply air or return air paths and equipment.
2. Filters
 - a. Check that filters of the type specified are installed, oriented in the proper airflow direction, free of bypass, and clean.
 - b. Make no adjustment for dirty filters; fans were selected for clean filters at design airflow.
 - c. For systems with construction prefilters and high efficiency final filters
 - 1) Perform all zone level balancing with only pre-filter installed, no final filter, and system operating on 100 percent outdoor air.
 - 2) Immediately prior to pre-occupancy 100 percent outdoor air purge (see procedure specified under Section 230501 Basic Mechanical Materials and Methods), remove and discard prefilters and install clean final filters. With final filters in place, perform tests of air handling unit as described for appropriate AHU type below. After system testing and balancing is complete, conduct 100 percent outdoor air purge per Section 230501 Basic Mechanical Materials and Methods.
3. In cooperation with BAS installer, set adjustments of automatically operated dampers and valves to operate as indicated.

4. Balance hydronic systems prior to air balance and have operational during air balance for air temperature measurements where specified.

B. Air Outlets

1. Adjust diffusers' throw pattern prior to balance as indicated below unless otherwise indicated on Drawings. Review manufacturer's instructions for proper diffuser blade or weir gate positions to provide this throw pattern as it is not always intuitive. It is TAB contractor's responsibility to adjust throw patterns for all adjustable throw diffusers. If diffuser has a fixed throw pattern and is incorrectly installed, HVAC contractor shall correct pattern prior to balance.
 - a. Ceiling diffusers: As indicated on the Drawings.
 - 1) Star pattern diffuser deflectors shall be adjusted for corner blow pattern unless otherwise indicated on Drawings.
 - b. Slot diffusers supplying cooling-only, or heating and cooling with ceilings 15 feet and lower: Adjust to throw away from adjacent walls along the ceiling toward the center of the room served.
 - c. Slot diffusers supplying heating-only, or heating and cooling with ceiling above 15 feet: Adjust to throw downward and slightly toward adjacent wall.
 - d. Double-deflection grilles: Adjust rear blades horizontal 22 degree upward and splay front blades in 45 degree pattern at each end gradually rotating to be almost straight at blades in center of grille.
 - e. Thermafusers: Install directional baffles (or verify factory installation) to achieve the blow pattern shown on plans and schedules.
2. Test and adjust each diffuser, grille and register to within plus or minus 10 percent of design requirements
 - a. Start with all dampers wide open.
 - b. Adjust dampers, starting with nearest to terminal unit or fan. Make adjustments using duct mounted volume dampers rather than dampers at diffuser face (if any) unless absolutely required.
 - c. At least one damper shall remain wide open at end of balance.
3. Thermafusers
 - a. See manufacturer's instructions.
 - b. All measurements shall be made with all appearance panels in place.
 - c. Design flow
 - 1) Fully open the damper using the balancing lever
 - 2) Balance Thermafusers to design flow just like any other diffuser per Paragraph 3.4B.2 adjusting the VAV box damper through the BAS as needed so at least one balancing damper is wide open.
 - 3) Once all Thermafusers are at design flow and at least one balancing damper wide open, the VAV box discharge static pressure reading becomes the design setpoint, (DPmax). Coordinate with the BAS system and installer to record this value. No field measurement of static pressure is required, only the BAS sensor reading.
 - d. Minimum flow
 - 1) Set minimum flow adjustment dial to 10% (the factory setting)
4. Plenum return air grilles or slots in lights: No balance required
5. Report
 - a. Tag each grille, diffuser and register and mark tag on copy of floor plan.
 - b. For each grille, diffuser and register, indicate tag, size, type, and effective area (where applicable).
 - c. Required velocity/cubic feet per minute
 - d. Initially tested velocity/cubic feet per minute
 - e. Finally tested cubic feet per minute after adjustments
 - f. Thermafuser VAV box static pressure setpoint; also convey to BAS contractor.

C. Terminal Boxes

1. Balancing contractor shall provide laptop computer or other device for communicating with BAS system, using software provided by BAS installer. Cooperate with BAS installer to learn how to use software to calibrate BAS zone controller.
2. Terminal box calibration procedure listed below may be modified based on specific features or limitations of digital controller and recommendations of the controller manufacturer. Submit revised procedure for approval by Owner's Representative along with pre-test submittal per Paragraph 1.4C.
3. Use BAS terminal "commissioning" software where available and record all calibration and test data through the BAS.
4. Zero transmitter prior to each test.
5. Adjust BAS calibration constants so that the VAV box controller and measured air flow rate at air outlets matches BAS reading within range listed at all of the following conditions at a minimum:
 - a. Maximum airflow setpoint, $\pm 5\%$
 - b. Controllable minimum airflow setpoint, $\pm 10\%$. The controllable minimum value shall be that determined by the BAS contractor per Section 250000.
 - c. Zero flow
6. Terminal fans (fan-powered boxes)
 - a. Adjust speed to achieve design cfm within 10 percent
 - b. For series-flow boxes, adjust BAS setpoint to allow VAV damper to operate at maximum airflow rate: Increase fan speed until there is no backflow through plenum opening.
 - c. For ECMs with speed controlled by BAS, set maximum speed via BAS interface and note speed setpoint in air balance report.
7. Report
 - a. Tag, manufacturer, and model
 - b. VAV maximum cooling flow rate, design and measured
 - c. VAV minimum flow rate, design and measured
 - d. BAS calibration coefficients at all calibration points

D. BAS airflow measuring stations (AFMS)

1. For cooling AHU AFMS
 - a. Test Conditions
 - 1) Command all VAV boxes to full open.
 - 2) Override the economizer to 100% outdoor air, i.e. configure the outdoor air damper to be 100% open and the return air damper to be 0% open.
 - 3) Start supply fan and run it slowly from 10% speed up to 100% speed, in 10% increments with a pause at each step to allow time for the VAV boxes to communicate. At each 10% increment, measure and report:
 - a) Sum of VAV box airflows (should be displayed on BAS AHU graphic)
 - b) Airflow measurement station airflow reading
 - c) Traverse across supply air duct, filter bank, or other location where the most accurate airflow reading is possible
 - b. Plot the speed vs. all three measured airflows. They should be linear and the three readings should be within 10% of each other.
2. For factory calibrated AFMS: If measured airflow and BAS readings differ by more than 10%, consult with Owner's Representative for recalibration instructions. Do not change factory calibration without written direction.
3. For field calibrated AFMS: Coordinate with BAS installer to adjust calibration coefficients. Report coefficients in air balance report.

E. Air Handling Unit and Fan-coil Airflow Rate Readings

1. Total supply air quantities shall be determined at all of the following where applicable

- a. Pitot traverse in the supply duct downstream, positive pressure side of the fan
 - b. Pitot traverse at coil or filter bank
 - c. Totaling the readings of individual air outlets
 - d. Totaling the readings of individual terminals as read through the BAS
 - e. Supply fan airflow sensor reading as read through the BAS
 - 2. Total return air quantities shall be determined at all of the following where applicable
 - a. Pitot traverse in the return air duct or damper entering air handler
 - b. Totaling the readings of individual air outlets, if ducted return system
 - c. Totaling reading of each return air shaft inlet, if multi-story plenum return system
 - d. Return fan airflow sensor reading as read through the BAS
 - 3. Outside air quantities shall be determined by all of the following where applicable
 - a. Subtracting pitot traverses of supply and return ducts
 - b. Pitot traverse of outdoor air intake duct
 - c. Outdoor airflow sensor reading as read through the BAS
 - d. Note: Balance by measurement of return air, outside air, and mixed air temperatures shall not be used due to inherent inaccuracy.
- F. Variable Air Volume Air Handlers
- 1. Adjust fan speed using manual adjustment of variable speed drive for testing only. Do not change or adjust sheaves.
 - 2. Supply fan DP Setpoint.
 - a. Establish maximum static pressure setpoint (DPmax) in conjunction with the BAS installer as follows. All adjustments made via the BAS, not field measurements except as noted.
 - b. Test Conditions
 - 1) Set all boxes to operate at maximum airflow setpoints; allow controls to stabilize.
 - 2) For cooling systems only to account for diversity: Shut off boxes, starting with boxes whose dampers are the most closed, as indicated by the BAS, and upstream of the DP sensor, until the airflow equals scheduled design airflow rate.
 - c. Procedure
 - 1) Manually lower fan speed slowly while observing VAV box airflow rates downstream of the static pressure sensor. Stop lowering speed when one or more VAV box airflow rates drops 10 percent below maximum airflow rate setpoint.
 - 2) Once flow condition in previous step is achieved, note the BAS system static pressure reading at the duct static pressure sensor.
 - a) This reading becomes the maximum static pressure setpoint.
 - b) Using pressure taps at differential pressure sensor and handheld digital pressure sensor, verify accuracy of BAS reading.
 - d. If there are multiple static pressure sensors, repeat steps above for each sensor. Each sensor will have its own setpoint.
 - e. Convey to the BAS installer
 - 1) Static pressure setpoints
 - 2) Any discrepancy between BAS differential pressure reading and handheld measurement
 - f. Report
 - 1) Static pressure setpoint and concurrent reading of handheld measurement: Initials of BAS installer to indicate that the information was transmitted to them.
 - 2) Tag of VAV boxes that dropped below design maximum airflow rate in tests above. These are the critical boxes, those requiring the largest static pressure.
 - 3) Concurrent fan data
 - a) Volts and amps
 - b) Amps and kilowatts from variable speed drive
 - c) Variable speed drive speed in hertz

- d) Entering and leaving fan static pressure
 - e) Flow rate, summed from BAS terminals
 - f) Fan airflow sensor reading from BAS, where applicable
- 3. Minimum outside air flow
 - a. Supply air fan and return air fan (if any) shall first be operating at design airflow. For VAV systems with diversity, close enough boxes close to fan to reduce supply airflow to scheduled design condition.
 - b. For systems with outdoor airflow measuring stations, see Paragraph 3.4D. Adjust dampers to achieve minimum design outdoor air flow rate via the BAS.
- 4. Test with system operating at design fan and minimum outside air flow conditions described above and report the following on a schematic of the system:
 - a. Tags of all equipment
 - b. Manufacturer and model of all fans and motors
 - c. Motor horsepower, rpm, volts, phase, full load amps
 - d. Sheave data at motor and fan; belt data
 - e. Fan airflow rate at all locations measured, as listed above
 - f. Final measured fan speed and amps
 - g. Amps and kilowatts from variable speed drives
 - h. Variable speed drive speed in hertz
 - i. Static pressures measured at
 - 1) Return air plenum
 - 2) Mixed air plenum
 - 3) Downstream of relief fan (where applicable)
 - 4) Downstream of filter
 - 5) Downstream of coil
 - 6) Discharge of supply fans
 - 7) At static pressure sensor
 - j. Concurrent airflow rate readings from BAS airflow sensors, including sum of VAV box airflow rates
 - k. Minimum BAS outdoor air control setpoints and signals as applicable
 - l. Coil Performance
 - 1) Test with
 - a) Associated pumps running in automatic maintaining differential pressure setpoint determined above
 - b) Central plant cooling (heating) equipment operational
 - c) Controls adjusted to provide coil design water temperature entering coil
 - d) Fan is running at design airflow
 - e) Fully open control valve, allow steady-state to be reached, and measure
 - 2) Measure and report on a schematic of the system
 - a) Entering water temperature
 - b) Leaving water temperature
 - c) Coil differential pressure drop
 - d) Coil flow rate, deduced from manufacturer's coil flow vs. pressure drop data, see submittals
 - e) Coil entering drybulb and wetbulb to cooling coils, drybulb only for heating coils
 - f) Leaving supply air drybulb and wetbulb from cooling coils, drybulb only for heating coils
- 5. Relief Fans
 - a. Test Conditions
 - 1) Economizer in 100% outdoor air position
 - 2) Supply fan at design supply air rate
 - 3) All doors and windows closed in area served by air handler
 - 4) All exhaust fans on in area served by air handler

- b. Procedure
 - 1) Measure building pressure using BAS sensor.
 - 2) Manually adjust fan speed at variable speed drive to achieve than 0.05" building pressure.
 - a) Fan speed may exceed 60 Hz if necessary. Do not change or adjust sheaves.
 - b) If required fan speed exceeds 60 Hz, convey maximum speed to BAS contractor.
 - 3) At the above design conditions, measure fan inlet and outlet pressures and measure total relief air quantities with pitot tube traverse of main ducts near the fan inlet or outlet where possible.
 - c. Report
 - 1) Amps and kilowatts from variable speed drive
 - 2) Variable speed drive required speed in hertz
 - 3) Inlet and outlet static pressure
 - 4) Building static pressure
- G. Drain Pan Testing
- 1. This test shall be performed for all drain pans including
 - a. Primary condensate drain pans on all air handling units and fan-coils
 - b. Humidifier and evaporative cooler sump pans that include a drain-down cycle
 - 2. This test does not apply to:
 - a. Auxiliary drain pans under fan-coils
 - b. Other drain pans for emergency use not expected to be wet during normal operation
 - 3. Procedure
 - a. Pan Slope Test
 - 1) Turn AHU off.
 - 2) Plug the drain at the discharge air gap.
 - 3) Fill the drain pan with water until standing water covers all of the pan.
 - 4) Remove the test plug and verify all of the water drains, leaving puddles no larger than 2" in diameter and 1/8" deep anywhere in the pan.
 - b. Trap Sizing Test – Blow-Through Fans
 - 1) Plug the drain at the discharge air gap.
 - 2) Open the air handler/fan-coil coil access panel and fill the drain pan until all areas of the pan are covered with at least 1/2" of water. Close the access panel.
 - 3) Configure and operate the air handler/fan-coil at design operating conditions as defined above herein. The intent is that the coil section will be at the highest expected operating pressure.
 - 4) Remove drain and observe condensate flow at drain pipe discharge air gap. Within a few minutes, there should be little to no flow.
 - 5) Use theatrical smoke or other flow indicator near the drain vent/cleanout and verify that air is not being blown out of the trap. If airflow is detected, the trap is dry and the trap depth, as measured from the centerline of the drain connection to the centerline of the bottom of the trap, is too shallow.
 - c. Trap Sizing Test – Draw-Through Fans
 - 1) Plug the drain at the discharge air gap.
 - 2) Open the air handler/fan-coil coil access panel and fill the drain pan until all areas of the pan are covered with at least 1/2" of water. Close the access panel.
 - 3) Configure and operate the air handler/fan-coil at design operating conditions as defined above herein. The intent is that the coil section will be at the lowest expected operating pressure.
 - 4) Remove drain and observe condensate flow at drain pipe discharge air gap. Within a few minutes, there should be little to no flow.

- 5) Use theatrical smoke or other flow indicator near the drain vent/cleanout and verify that air is not being drawn into the trap. If airflow is detected, the trap is dry and the trap depth, as measured from the centerline of the drain connection to the centerline of the bottom of the trap, is too shallow.
 - 6) Place a bucket or other receptacle at the drain discharge to capture condensate runoff.
 - 7) Turn off air handler/fan-coil fan. Additional runoff will occur from the P-trap, and possibly from the AHU if the drain pan is still partially full. The vertical distance from the centerline of the unit connection to the drain connection is "A". If the amount of water in the receptacle after runoff stops exceeds the condensate pipe volume determined based on the nominal pipe diameter and "A", then moisture was still standing in the pan at the end of the test, indicating future water retention problems are likely. If so, the distance "A" needs to be extended. Otherwise, the pan was dry, and the install is acceptable.
- H. Constant Volume & Variable Volume Exhaust Fans and Recirculating Fan-Coils
1. See Paragraph 3.4B for air outlet balancing
 2. Total air quantities for fan shall be determined by both
 - a. Pitot tube traverse of main ducts near the fan inlet, and
 - b. Totaling the readings of individual air outlets
 3. Total air quantities shall be obtained within 10 percent of design by adjustment of fan speed
 - a. Constant speed fans
 - 1) Adjust sheaves on fans with adjustable sheaves.
 - 2) Change sheaves on fans with fixed sheaves.
 - 3) Adjust speed potentiometer for ECMs
 - b. Variable speed fans
 - 1) Adjust maximum fan speed at ECM or VFD
 4. Report
 - a. Tag
 - b. Manufacturer and model of fan and motor
 - c. Sheave data at motor and fan; belt data
 - d. Motor horsepower, rpm, volts, phase, full load amps
 - e. Fan airflow rate at all locations measured, as listed above
 - f. Final measured amps
 - g. Inlet and outlet static pressure
- I. Life Safety Systems
1. Review Smoke Control Report provided by Owner's representative for required airflow and pressure differential requirements, where applicable.
 2. All work shall be done under direction of Owner's life safety commissioning agent and in coordination with fire alarm/smoke control system installer.
 3. Atrium Exhaust
 - a. Configure smoke dampers and make-up operable openings for atrium smoke control mode. Verify dampers/makeup openings are in the required position indicated in Smoke Control Report via the feedback lights provided at the fire alarm/smoke control panel.
 - b. Release (close) all smoke doors to atrium.
 - c. Measure atrium exhaust rate at air openings from atrium to the relief fan mechanical plenum.
 - d. Adjust exhaust fan speed until desired atrium exhaust rate and differential pressure is achieved relative to adjacent smoke zones.
 4. For variable speed driven fans, adjust preset speed setpoint in variable speed drive so that desired speed is achieved when life safety system contact closes. Only after final

tests are complete, configure variable speed drive so that contact closure results in “run to destruct” operation (no safeties) as required by code.

5. Report
 - a. Tag
 - b. Manufacturer and model of fan and motor
 - c. Sheave data at motor and fan; belt data
 - d. Motor HP, rpm, volts, phase, FLA
 - e. Fan airflow rate at all locations measured, as listed above
 - f. Final measured fan speed and amps
 - g. Inlet and outlet static pressure
 - h. Variable speed drive fan preset speed signal

3.5 ADDITIONAL COSTS

- A. Fans: If drives are not capable of being adjusted to meet required performance, inform Owner’s Representative and indicate added price to supply and install required sheaves. Do not include sheave changes in initial bid.
- B. Pumps: If impeller must be trimmed, inform Owner’s Representative and indicate added price to trim impeller and replace. Do not include impeller trim in initial bid.
- C. Do not proceed until work is approved by Owner’s Representative.

3.6 SPOT CHECKING

- A. Spot checks shall take place after test and balance work is complete and reports have been prepared and approved.
- B. Spot checks shall be witnessed by an Owner’s Representative. Schedule spot checks with Owner’s Representative at least 1 week prior to proposed test date.
- C. Owner’s Representative shall select subsets of any tested and balanced air or hydronic system to be spot-checked on the day of tests without prior notice to the Contractor.
 1. Spot-checking will not require more than one working day.
 2. If additional spot checks are requested by the Owner’s Representative causing the time limit above to be exceeded, inform Owner’s Representative and indicate added price to perform the additional tests. Do not include additional tests in initial bid.
- D. Discrepancies
 1. If any of the spot-check measurements differ more than 15 percent from those documented in test and balance reports, the Contractor shall completely rebalance the associated system. For balance discrepancies at or downstream of a VAV box, rebalance only is required at or downstream of that box.
 2. If discrepancies as described above are found on more than 25 percent of the spot-checks for air systems, all air systems shall be rebalanced.
 3. If discrepancies as described above are found on more than 25 percent of the spot-checks for hydronic systems, all hydronic systems shall be rebalanced.
 4. Rebalance work shall be witnessed by an Owner’s Representative at the option of the Owner’s Representative.
 5. All rebalance work shall be documented and documentation shall be resubmitted as specified above.
 6. All rebalance work shall be provided at no additional cost to the Owner.

3.7 TRAINING OWNER PERSONNEL

- A. See Section 230800 Mechanical Commissioning.
- B. Go over the final Testing, Adjusting and Balancing Report, explaining the layout and the meanings of each data type.
- C. Discuss any outstanding deficient items in control, ducting, piping or design that may affect the delivery of air or water.
- D. Identify and discuss any systems or system components that are not meeting their design capacities.
- E. Discuss any temporary settings and steps to finalize them for any areas that are not finished or fully occupied.
- F. Any other appropriate points that may be helpful for facilities operations, relative to testing, adjusting and balancing or the mechanical systems.

END OF SECTION

SECTION 230700

HVAC INSULATION

PART 1 GENERAL

1.1 SUMMARY

- A. Work Included in This Section: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Piping insulation
 - 2. Pipe insulation jacket
 - 3. Equipment insulation
 - 4. Ducts and plenums, thermal insulation
 - 5. Duct and plenums, acoustic insulation

1.2 REFERENCE STANDARDS

- A. ASTM B209 – Aluminum and Aluminum-Alloy Sheet and Plate
- B. ASTM C177 – Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus
- C. ASTM C335 – Steady-State Heat Transfer Properties of Horizontal Pipe Insulation
- D. ASTM C585 – Inner and Outer Diameters of Rigid Thermal Insulation for Nominal Sizes of Pipe
- E. ASTM C921 – Properties of Jacketing Materials for Thermal Insulation
- F. ASTM E84 – Surface Burning Characteristics of Building Materials
- G. ASTM E96 – Water Vapor Transmission of Materials
- H. ASTM E1222 – Standard Test Method for Laboratory Measurement of the Insertion Loss of Pipe Lagging Systems
- I. ASTM D 5590 - Standard Test Method for Determining the Resistance of Coatings to Fungal Defacement
- J. ASTM F 1249 -- Standard Test Method for Water Vapor Transmission Rate Through Plastic Film Using a Modulated Infrared Sensor
- K. NFPA 255 – Surface Burning Characteristics of Building Materials
- L. SMACNA – HVAC Duct Construction Standards - Metal and Flexible
- M. UL 723 – Surface Burning Characteristics of Building Materials

1.3 DEFINITIONS Duct Dimensions

1. Where acoustical liner is indicated on the Drawings the duct sizes indicated shall be clear inside dimensions unless duct size is specifically indicated as outside dimensions (OD)

1.4 QUALITY ASSURANCE

- A. Source Quality Control
 1. Service: Use insulation specifically manufactured for service specified
 2. Labeling: Insulation labeled or stamped with brand name and number
- B. Applicator: Company specializing in performing the work of this section with minimum three years experience

1.5 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 1. "R" means required.
 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Equipment insulation	R			
Piping insulation	R			
Jackets	R			
Duct insulation, wrap and liner	R			
Adhesives and coatings	R2			
Mechanical fasteners	R2			

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Insulation: Fiberglass
 1. Owens-Corning Fiberglass Corporation
 2. Manville
 3. Certainteed Corporation
 4. Knauf
 5. Or equal
- C. Insulation: Elastomeric Closed Cell
 1. Armacell, Inc.
 2. Rubatex Corporation
 3. Or equal

- D. Weatherproof Aluminum Jacket
 - 1. Childers Products Company
 - 2. Insul-Coustic/Birma Corporation
 - 3. Or equal

- E. Pre-molded pipe fitting covers and Jacketing
 - 1. Manville: Zeston
 - 2. Childers Products Company
 - 3. Proto Corporation
 - 4. Insul-Coustic/Birma Corporation
 - 5. Or equal

- F. Adhesives, Coatings, and Sealants
 - 1. Foster
 - 2. Childers
 - 3. Epolux Mfg. Corporation
 - 4. Insul-Coustic/Birma Corporation
 - 5. Armacell
 - 6. Or equal

- G. Mechanical Fasteners
 - 1. AGM Industries, Inc.
 - 2. Miracle Adhesives Corporation
 - 3. Grip-Nail
 - 4. Or equal

2.2 GENERAL

- A. Energy Codes: The current versions of California Title 24 and California Building Code shall govern where requirements for thickness exceeds thickness specified

- B. All insulation materials, including jackets, facings, adhesives, coatings, and accessories are to be fire hazard rated and listed by Underwriters' Laboratories, Inc., using Standard UL 723 (ASTM E-84), (NFPA-255), (ASA A2.5-1963)
 - 1. Flamespread: maximum 25
 - 2. Fuel contributed and smoke developed: maximum 50
 - 3. Flameproofing treatments subject to deterioration from moisture or humidity are not acceptable

- C. Insulation and accessories shall not provide any nutritional or bodily use to fungi, bacteria, insects, rats, mice, or other vermin, shall not react corrosively with equipment, piping or ductwork, and shall be asbestos free: Duct lining shall meet ASTM C1136 and ASTM C665 for biological growth in insulation

- D. Products shall not contain or be coated with any PBDEs.

2.3 INSULATION MATERIALS

- A. Pipe Insulation
 - 1. Fiberglass

- a. Molded: one piece, maximum 0.26 K factor at 75 degrees Fahrenheit mean temperature: Owens-Corning ASJ/SSL-II Pipe Insulation or equal
- b. Blanket: minimum 1 lb. density, maximum 0.28 K factor at 75 degrees Fahrenheit mean temperature: Owens-Corning Faced Duct Wrap or equal
- c. Board: Density as noted, maximum 0.26 K factor at 75 degrees Fahrenheit mean temperature: Owens-Corning 700 Series with face or equal
- 2. Flexible, closed cell elastomeric thermal insulation
 - a. Insulation ASTM C534
 - b. Service rating of 220 degrees Fahrenheit
 - c. Density 3 to 6 pounds per cubic foot
 - d. Closed cell foam: Vapor permeability ASTM E96 0.2 perm
 - e. Max moisture absorption: 1.0 percent by volume, 10 percent by weight
 - f. Molded pipe insulation
 - 1) Maximum 0.27 K factor at 75 degrees Fahrenheit mean temperature
 - 2) Maximum water vapor transmission rating of 0.17 perm-inches
 - g. Sheet insulation
 - 1) Maximum 0.28 K factor at 75 degrees Fahrenheit mean temperature
 - 2) Maximum water vapor transmission rating of 0.17 perm-inches
 - h. Seal with Rubatex adhesive or equal
 - i. Armacell Armaflex or equal
- 3. Calcium Silicate
 - a. Insulation ASTM C 533, Type I
 - 1) ESLIN Industrial Insulation also acceptable
 - b. Sectional with 14 pounds per cubic foot nominal density
 - c. 0.45 maximum K-factor at 300 degrees Fahrenheit mean temperature and 1200 degrees Fahrenheit maximum service rating
 - d. Waterproofed
 - e. Flexural Strength 100 pounds per square inch
 - f. JM Thermo-12 Gold or equal
- 4. Underground pipe insulation: See Section 232113 HVAC Piping

B. Jackets

- 1. Factory Applied Vapor Barrier All Service Jacket (ASJ)
 - a. ASTM C921, White kraft paper bonded to aluminum foil
 - b. Moisture Vapor Transmission: ASTM E96; 0.02 perm inches
 - c. Secure with self sealing longitudinal laps and butt strips.
 - d. Seal all seams with vapor barrier coating.
 - e. Coat all insulated fittings, elbows, and valves with vapor barrier coating and reinforcing mesh.
 - f. Tie Wire: See Paragraph E.1, with twisted ends on maximum 12 inch centers
 - g. Vapor Barrier Lap Adhesive: Compatible with insulation
- 2. Aluminum Jacket: ASTM B209
 - a. Use for weatherproof jacket
 - b. Thickness: 0.016 inch sheet
 - c. Finish: Embossed
 - d. Joining: Longitudinal slip joints and 2 inch laps
 - e. Fittings: 0.016 inch thick die shaped fitting covers with factory attached protective liner
 - f. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel
- 3. Preformed PVC
 - a. Polyvinylchloride covers similar to Manville Zeston.
 - b. Color: white

4. Equipment insulation facings: Foil-scrim-kraft laminate of aluminum foil facing, glass scrim reinforcing, kraft paper backing
- C. Preformed Pipe Fitting Covers
1. Aluminum
 - a. Factory fabricated formed covers
 - b. General Aluminum Supply Corporation GASCO or equal
 2. PVC
 - a. Factory fabricated formed covers
 - b. Manville Zeston or equal
 - c. Grooved end piping: Proto Corporation Losmoke or equal
- D. Adhesives and coatings
1. Foster and Childers product names and figure numbers or approved equal
 - a. Lagging adhesive: Foster 30-36; Childers CP-50AMV1
 - b. Vapor barrier coating:
 - 1) Foster Vapor Safe 30-80
 - 2) UP Label, comply with MIL-C-19565C, Type II; fire and water resistant
 - 3) Permeance no greater than 0.08 perms at 37 mil dry film thickness as test by ASTM F 1249
 - c. Vapor-seal adhesive (lap adhesive): Foster 85-60
 - d. Fiberglass adhesive (duct liner and duct wrap adhesive): Meets ASTM C916 Type II. Foster 85-60; Childers CP-127
 - e. Cellular glass bedding and sealing compound adhesive: Foster Foamseal 30-45; Childers CP-70
 - f. Outdoor vapor barrier coating: Foster 30-90. Permeance no greater than 0.08 perms at 37 mil dry film thickness as test by ASTM F 1249.
 - g. Elastomeric insulation: 520 contact adhesive
- E. Wire, banding and fastening devices
1. Wire: minimum 16 gauge copper clad annealed steel wire
 2. Bands: 3/4 inches nominal width with wing seals, of minimum thickness as follows:
 - a. Aluminum: 0.007 inches. Except where exposed to weather, 0.020 inches
 - b. Galvanized steel: 0.005 inches
 - c. Stainless steel: 0.010 inches
 3. Staples: outward clinching type of corrosion resistant steel
- F. Mechanical Fasteners
1. Mild steel, copper plated
 2. AGM Industries Power Base insulation pins or equal
 3. Insulation washers
 - a. Galvanized steel
 - b. 1- 1/2 inch diameter
 - c. AGM Industries SLW-1 or equal
- G. Provide a continuous vapor seal for any service piping that carries liquid below 60 degrees Fahrenheit. Coat all ASJ vapor retarder seams with vapor barrier coating to prevent moisture ingress. Coat all ASJ seams with vapor barrier coating.
- H. Pre-insulated pipe support and shields
1. Provide insulated pipe supports for all insulated pipe and tubing.
 2. Hangers and supports shall fit outside of all pipe insulation and insulation inserts. See Section 230529 Hangers and Supports
 3. Insulated pipe supports

- a. Pipe Shields, Inc. or equal
 - b. Waterproof calcium silicate or polyurethane insulation insert
 - c. Galvanized steel or aluminum shield
 - d. Minimum temperature rating equal to maximum design fluid temperature plus 25°F
 - e. Load rated, based upon testing and analysis in conformance with the latest edition of the following codes: ASME B31.9, MSS SP-58, MSS SP-69 and MSS SP-89
4. Pipe supports for use on flat surfaces shall have integral load distribution plates coated with zinc primer minimum 3 mils thick.
 5. Install pre-insulated pipe supports per manufacturer's installation instructions. Shield lengths and gauges shall also be per manufacturer's recommendations.
 6. Tape all butt joints where pipe insulation butts up against hanger shield
 - a. On hot pipe, apply three inch wide vapor barrier tape or band over the butt joint
 - b. On cold pipe, apply a wet coat vapor barrier lap cement on all butt joints and seal the joints with a minimum of three inch wide vapor tape or band and vapor barrier coating.
- I. Fire-stopping
1. At pipe penetrations through rated assemblies
 2. Commercial pipe sleeve assemblies that are UL listed and that have been approved by the fire marshal for this purpose
 3. Insulation shall be continuous through penetration.
- J. Accessories
1. Insulation Protection Saddles: 12-inch long, 16 gauge steel
 2. Paint: Ultraviolet resistant latex paint with special adherence capabilities to the fitting covers, elastomeric, aluminum facing, Kraft paper, tapes and adhesives
- K. Equipment Insulation
1. Glass fiber, semi-rigid
 - a. Insulation: ASTM C612; rigid, noncombustible
 - 1) 'K' ('ksi') value: ASTM C335, 0.24 at 75 degrees Fahrenheit
 - 2) Maximum service temperature: 450 degrees Fahrenheit
 - 3) Maximum moisture absorption: 0.1 percent by volume
 - 4) Density: 3.0 pounds per cubic foot density
 - b. Vapor Barrier Jacket
 - 1) Kraft paper bonded to aluminized film
 - 2) Moisture vapor transmission: ASTM E96; 0.04 perm
 - 3) Secure with self sealing longitudinal laps and butt strips. Minimum lap 2 inches
 - 4) Secure with bands, adhesive or ties
 - c. Facing: 1 inch galvanized or stainless steel hexagonal wire mesh stitched on one face of insulation
 - d. Vapor Barrier Lap Adhesive: Compatible with insulation
 - e. Insulating Cement/Mastic: ASTM C195; hydraulic setting on mineral wool
 2. Jackets
 - a. Aluminum
 - b. Use for weatherproof jacket
 - c. Thickness: 0.016 inch sheet
 - d. Finish: Embossed
 - e. Joining: Longitudinal slip joints and 2 inch laps
 - f. Fittings: 0.016 inch thick die shaped fitting covers with factory attached protective liner
 - g. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel

3. Equipment insulation facings: Foil-scrim-kraft laminate of aluminum foil facing, glass scrim reinforcing, kraft paper backing
4. Wires, bands and fastening devices
 - a. Wires: Minimum 16 gage galvanized steel wire
 - b. Bands: 3/4 inch nominal width wing seals, of minimum thickness as follows
 - 1) Aluminum: 0.007 inches indoors. Where exposed to weather 0.020 inches
 - 2) Stainless Steel: 0.010 inches

L. Duct Insulation

1. Duct Wrap with Vapor Barrier; Type DW-V
 - a. Insulation
 - 1) ASTM C553
 - 2) Flexible, noncombustible blanket
 - 3) K-value: ASTM C518, 0.3 at 75 degrees Fahrenheit
 - 4) Maximum service temperature: 250 degrees Fahrenheit
 - 5) Maximum moisture absorption: 0.20 percent by volume
 - 6) Minimum density: 0.75 pounds per cubic foot
 - b. Vapor Barrier Jacket
 - 1) Factory installed Foil Scrim Kraft (FSK)
 - 2) Kraft paper reinforced bonded to aluminized film
 - 3) Moisture vapor transmission: ASTM E96 Procedure E; 0.02 perm
 - c. Vapor Barrier Tape: Kraft paper reinforced bonded to aluminized film, with pressure sensitive rubber based adhesive
 - d. Owens-Corning All Service Faced Duct-Wrap or equal
2. Duct Board without Vapor Barrier; Type DB
 - a. Insulation
 - 1) ASTM C612
 - 2) Rigid, noncombustible blanket
 - 3) K-value: ASTM C518, 0.25 at 75 degrees Fahrenheit
 - 4) Maximum service temperature: 250 degrees Fahrenheit
 - 5) Maximum moisture absorption: 0.20 percent by volume
 - b. Owens-Corning Type 703 or equal
3. Duct Board with Vapor Barrier; Type DB-V
 - a. Insulation
 - 1) ASTM C612
 - 2) Rigid, noncombustible blanket
 - 3) K-value: ASTM C518, 0.25 at 75 degrees Fahrenheit
 - 4) Maximum service temperature: 250 degrees Fahrenheit
 - 5) Maximum moisture absorption: 0.20 percent by volume
 - b. Vapor Barrier Jacket
 - 1) Factory installed Foil Scrim Kraft (FSK)
 - 2) Moisture vapor transmission: ASTM E96 Procedure E; 0.02 perm
 - c. Vapor Barrier Tape: Kraft paper reinforced bonded to aluminized film, with pressure sensitive rubber based adhesive
4. Tie Wire: Annealed steel, 16 gage

M. Duct and Plenum Lining

1. Rectangular Duct Lining; Type AL
 - a. Material
 - 1) Insulation: ASTM C423
 - 2) K-value: ASTM C518, 0.23 at 75 degrees Fahrenheit
 - 3) Maximum service temperature: 250 degrees Fahrenheit
 - 4) Maximum moisture absorption: 0.20 percent by volume

- 5) 1-1/2 pounds per cubic foot unless shown otherwise to be 3 pounds per cubic foot
- 6) Minimum noise reduction coefficient (NRC) rating of 0.7 at 1 inch, 0.9 at 2 inch
- b. Interior air-side surface
 - 1) Smooth black neoprene or matte facing overlay on air side. Coating shall conform to NFPA 90A, ASTM C665, ASTM G21
 - 2) Suitable for velocity up to 4000 feet per minute
 - 3) Meet erosion test method described in UL publication No. 181
 - 4) Durable and mechanically cleanable
 - 5) EPA registered anti-microbial agent
 - 6) Certainteed Toughgard R Duct Liner or equal
 - 7) Adhesives
 - a) Duct Insulation, Internal: Foster 85-60 or equal
 - b) Weld Pins: Duro-Dyne CP or equal
- 2. Round Duct Lining; Type RAL
 - a. Material same as Paragraph 2.3M.1.a
 - b. Interior air-side surfaces same as Paragraph 2.3M.1.b
 - c. Self-supporting, slide-in installation
 - d. JM Permacote Spiracoustic or equal
 - e. Small diameter ducts which cannot be insulated internally using duct lining materials shall be pre-fabricated. Insulation material shall be fixed between outer duct metal and a perforated metal liner. United McGill k27 series or equal. Fittings shall be insulated to same standard and shall be by same manufacturer.
- 3. Plenum Lining; Type PL
 - a. Material same as Paragraph 2.3M.1.a
 - b. Interior air-side surfaces same as Paragraph 2.3M.1.b

PART 3 EXECUTION

3.1 PIPE & EQUIPMENT INSULATION SCHEDULE

- A. Insulation Application Types
 - 1. Type P-1
 - a. Molded fiberglass
 - b. All-service jacket
 - c. Vapor-sealed
 - 2. Type P-2
 - a. Molded fiberglass
 - b. All-service jacket
 - 3. Type P-3: Flexible elastomeric insulation
 - 4. Type P-4
 - a. Calcium silicate insulation
 - b. Aluminum preformed jacket
 - 5. Type E-1
 - a. Fiberglass board
 - b. Minimum 3 pounds per cubic foot density
 - c. Foil-scrim-kraft facing
 - d. Vapor-sealed
 - 6. Type E-2
 - a. Fiberglass board
 - b. Minimum 3 pounds per cubic foot density
 - c. Segmented or scored for curved surfaces

7. Type E-3: Flexible cellular foam insulation

B. Application Schedule

Service	Location	Type	Pipe Size	Thickness
Chilled water piping	General	P-1	All	Per Title 24, 1 inch minimum
Hot water piping	General	P-2	All	Per Title 24, 1.5 inches minimum
Hot water pumps	General	E-2 or E-3		Per Title 24, 2 inches minimum
Hot water coil frame and tube bends	Outdoors, ceiling return air plenum, and unconditioned spaces	E-2 or E-3 or DW-V duct wrap		1/2 inch E-2/3 1.5 inch DW-V

C. Non-insulated piping and equipment

1. Pneumatic tubing
2. Pot feeders and piping to them other than the first 2 feet from the point of connection at piping mains
3. Vent, overflow, drain and relief, except as noted otherwise

3.2 PIPING INSULATION INSTALLATION

- A. Install materials in accordance with manufacturer's instructions
- B. Coordinate with work of other trades
- C. Deliver material to job site in original non-broken factory packaging, labeled with manufacturer's density and thickness
- D. Install insulation where it cannot become wet. If insulation becomes wet, remove and dispose of properly and replace with new, dry insulation. Wetted insulation is not acceptable. Ensure insulation is dry before and during installation.
- E. Insulate all piping, valves, fittings, flanges and accessories
- F. On piping exposed to public view, locate insulation and cover seams in least visible locations
- G. Insulate fittings, joints and valves with insulation of same material and thickness as adjoining pipe. Use pre-molded fiberglass fitting covers or radial mitered segments of pipe insulation. For strainers, expansion joints, fittings and accessories requiring servicing or inspection insulation shall be removable and replaceable without damage.
- H. Insulate flanges with insulation sleeve of same material as pipe insulation to cover flange and overlap insulation on adjacent piping
- I. Continue insulation through walls, sleeves, pipe hangers and other pipe penetrations
- J. Finish insulation at supports, protrusions and interruptions. No hangers or supports shall be embedded in insulation. Do not insulate expansion bellows.
- K. Fiberglass insulation
 1. Provide insulation with factory applied vapor barrier jackets

2. Butt edges neatly. ASJ with 3 inch minimum butt strips
 3. Longitudinal overlaps: Minimum 2 inch self sealing, double adhesive
 4. Apply additional jacket as specified
 5. For piping conveying fluids below ambient temperature finish with vapor barrier adhesive
- L. For all pipe systems exposed in the mechanical equipment rooms, finish with an all service jacket
- M. For insulation exposed to weather
1. Insulate fittings, joints, and valves with insulation of like material and thickness as adjoining pipe, and finish with glass mesh reinforced vapor barrier cement.
 2. Cover with weatherproof aluminum jacket with seams located on bottom side of horizontal piping. For mechanical joints (such as Victaulic) only, 30 mil UV-resistant PVC fitting covers are acceptable in lieu of aluminum.
- N. Perform work at ambient and equipment temperatures as recommended by adhesive manufacture
- O. Protection: Protect against dirt, water, chemical, or mechanical damage before, during, and after installation. Repair or replace damaged insulation at no additional cost
- P. All vapor barriers shall be continuous. Tears, holes, staples, etc. shall be coated with vapor barrier mastic and patch with facing or tape.
- Q. Joints between insulation and access shall be sealed with vapor barrier mastic

3.3 PIPE INSULATION APPLICATION

- A. General
1. Before applying insulation
 - a. Test piping for tightness and obtain approval
 - b. Clean surfaces to be insulated of dust, grease and foreign matter
 2. Butt edges neatly
 3. Fill voids with insulating cement
 4. Longitudinal overlaps
 - a. 2 inches minimum
 - b. For exposed work: toward ceiling or wall
 - c. For weatherproof aluminum jackets: on side to shed water
 5. Circumferential overlaps on weatherproof aluminum jackets: 2 inches minimum
 6. Continuous insulation passing through sleeves or other openings
 7. Oversize insulation to accommodate heat tracing on piping
- B. Valves, fittings, flanges and accessory insulation
1. Unless otherwise noted, insulate
 - a. Valves including bonnets
 - b. Flanges
 - c. Fittings
 - d. Strainers
 - e. Expansion joints
 - f. Specialties
 2. Insulation for strainers, expansion joints, fittings and accessories requiring servicing or inspection
 - a. Insulation removable and replaceable without damage

- b. Enclosed within two piece, No. 18 gauge aluminum covers fastened with cadmium plated bolts and nuts
 - 3. Insulation of same thickness as adjacent piping insulation
 - 4. For piping systems insulated with fiberglass
 - a. Wire on pre-molded fiberglass fitting covers or mitered segments of pipe insulation
 - b. For pipe sizes under 3 inches, hydraulic setting insulating cement may be used
 - c. Vapor barrier for vapor-sealed insulation only
 - 1) Apply uniform layer of vapor barrier coating to cover entire surface of fitting insulation
 - 2) Embed layer of fiberglass tape into wet coating, extending 2 inches over adjoining pipe covering
 - 3) Apply finish layer of vapor barrier coating over entire surface
 - d. Finish for exposed locations only
 - 1) Apply skim coat of insulating cement to smooth out surface of fitting insulation
 - 2) Embed layer of fiberglass tape into uniform coat of wet mastic, extending 2 inches over adjoining pipe covering
 - 3) Apply finish coat of same mastic over entire surface of fitting insulation
 - 5. For piping systems insulated with calcium silicate
 - a. Wire on pre-molded sections of calcium silicate fitting covers or mitered segments of pipe insulation
 - b. Under 3 inches pipe size, built up coating of insulating and finishing cement to match thickness of adjoining pipe insulation, may be used
 - c. For exposed locations only, apply skim coat of finishing cement to smooth out surface of fitting insulation
 - 6. Flanges
 - a. Insulation sleeve of same material as pipe insulation, to cover flange and overlap insulation on adjacent piping
 - b. For calcium silicate insulation provide calcium silicate rings between sleeve and pipe insulation
- C. At pipe hangers
 - 1. Insulation protection shields specified in Section 230529 Hangers and Supports
 - 2. Butt insulation to shields
 - 3. Cold piping: Wet coat of vapor barrier lap cement on all butt joints
- D. Jackets and facings
 - 1. Vapor-sealed types: continuous; staples not permitted
 - 2. Adhere longitudinal laps: Adhere 3 inches wide joint strip, of same material as facing, at center of each butt joint
 - 3. Adhesives
 - a. Vapor-sealed insulation: vapor-seal adhesive
 - b. Heating service insulation: vapor-seal adhesive
 - c. Weatherproof aluminum jacket: sealing compound
 - d. Underground asphalt felt jacket: asphalt mastic
- E. Wiring, banding and fastening devices: Secure insulation to piping and equipment in accordance with following minimum requirements
 - 1. Piping insulation section 3 foot long
 - a. Concealed vapor-sealed insulation banded at ends and center
 - b. Other concealed insulation banded at ends and center or stapled on 2 inches centers
 - 2. Pipe fitting insulation
 - a. Loops of wire to secure mitered segments of insulation
 - b. Wire spiraled on from end to end on blanket insulation

3. Outdoor piping weatherproof aluminum jackets banded at circumferential joints and center of each section: Lap joint at bottom

3.4 EQUIPMENT INSULATION

- A. Apply insulation close to equipment by grooving, scoring, and beveling insulation. Secure insulation to equipment with bands, welded-on anchors, ties or adhesive. Where access to equipment is required for testing or maintenance the insulation shall be installed so that it is removable and so that the vapor barrier can be remade after access.
- B. Fill joints, cracks, seams, and depressions with bedding compound to form smooth surface. On cold equipment, use vapor barrier cement.
- C. For cold equipment or equipment containing fluids below ambient temperature
 1. Insulate entire system
 2. Provide vapor barrier jackets, factory applied or field applied
 3. Finish with glass cloth and vapor barrier adhesive
 4. Cover with aluminum jacket where specified
- D. For equipment containing fluids above ambient temperature
 1. Insulate entire system
 2. Provide standard jackets, with or without vapor barrier, factory applied or field applied
 3. Finish with glass cloth and adhesive
 4. Cover with aluminum jacket where specified
 5. For hot equipment containing fluids 140 degrees Fahrenheit or less, do not insulate flanges and unions, but bevel and seal ends of insulation
 6. For hot equipment containing fluids over 140 degrees Fahrenheit, insulate flanges and unions with removable sections and jackets
- E. Finish insulation at supports, protrusions, and interruptions
- F. For equipment in mechanical equipment rooms or in finished spaces, finish with aluminum jacket
- G. Do not insulate over nameplate or ASME stamps; bevel and seal insulation around such
- H. General
 1. Apply insulation with edges tightly butted
 - a. Joints staggered and secured in place by steel bands
 - b. Where necessary weld on suitable anchors
 2. Seal with 520 adhesive
- I. Special considerations
 1. Strainers and suction diffusers: removable and replaceable covers to allow strainer removal
 2. Pumps: removable and replaceable covers to allow impeller replacement
 3. Provide sufficient clearance around openings for normal operation of equipment

3.5 DUCT & PLENUM INSULATION

- A. Duct Insulation Type and Thickness Schedule

<u>Location</u>	<u>Cooling or Heat/Cool Supply</u>	<u>Heating-only Supply</u>	<u>Return</u>	<u>Exhaust</u>
Outdoors	2 inches 1.5 pounds per cubic foot AL or RAL	2 inches 1.5 pounds per cubic foot AL or RAL	2 inches 1.5 pounds per cubic foot AL or RAL	-
Concealed in ceiling or return air plenum	1.5 inches DW-V	1.5 inches DW-V	-	-
In unconditioned spaces	1.5 inches DW-V	1.5 inches DW-V	1.5 inches DW-V	-
Exposed within conditioned space	-	-	-	-
In mechanical rooms below 7'0" from floor or otherwise exposed to damage	1.5 inches DB-V	1.5 inches DB	-	-
Lined duct on drawings indicated to have 2 inch liner	2 inches 1.5 pounds per cubic foot AL	2 inches 1.5 pounds per cubic foot AL	2 inches 1.5 pounds per cubic foot AL	2 inches 1.5 pounds per cubic foot AL
Lined duct on drawings (unless otherwise noted)	1 inch 1.5 pounds per cubic foot AL or RAL	1 inch 1.5 pounds per cubic foot AL or RAL	1 inch 1.5 pounds per cubic foot AL or RAL	1 inch 1.5 pounds per cubic foot AL or RAL
Terminal cans	0.5 inches 1.5 pounds per cubic foot AL	0.5 inches 1.5 pounds per cubic foot AL	0.5 inches 1.5 pounds per cubic foot AL	-
Flex duct	By manufacturer	By manufacturer	By manufacturer	-

- B. Non-Insulated Ductwork
1. No insulation required for ducts so indicated in Duct Insulation Type and Thickness Schedule, plus
 - a. Exhaust ducts, unless shown to be lined
 - b. Return air ducts in conditioned spaces, unless shown to be lined
 - c. Outside air ducts
 2. Do not line ducts
 - a. Where prohibited by codes

3.6 DUCT INSULATION INSTALLATION

- A. General
1. Ensure that insulation is continuous through inside walls: See 230548 Vibration and Seismic Control for packing openings through walls
 2. Finish insulation neatly at hangers, supports and other protrusions
 3. Locate insulation joints or cover seams in least visible locations
 4. Where ducts run in groups too close to be individually insulated and finished
 - a. Completely fill all spaces between ducts with rigid or flexible insulating material
 - b. Insulate and finish exterior surfaces of group as specified for particular service
 5. Where ducts cannot be insulated after erection, insulate prior to installation

6. Where specified thickness of insulation and/or lining exceeds available thickness in single layer, provide insulation and/or lining in 2 or more layers with joints staggered
7. Preparation
 - a. Do not install covering before ductwork and equipment has been tested and reviewed
 - b. Ensure surface is clean and dry prior to installation
 - c. Ensure insulation is dry before and during application
8. Mechanical fasteners
 - a. Use spot weld anchors in all shop fabricated internally lined ducts
 - b. Adhered anchors
 - c. Clip off pin penetrations flush with insulation surface or facing
 - d. Seal pins and washers where pins penetrate vapor barriers
 - 1) With 4 inch square pieces of vapor barrier material to match facing
 - 2) Adhere with vaporseal adhesive
 - e. Spacing on rectangular ducts
 - 1) Typical of horizontal and vertical, unless otherwise specified
 - 2) Duct board
 - a) 3 inches in from edges
 - b) Intermediate fasteners: 12 inches on counter maximum spacing all directions
 - c) Not less than four pins per surface
 - 3) Duct wrap

<u>Side Dimension</u>	<u>Maximum Spacing</u>
24 inches and under	None required.
25 to 32 inches	Horizontal - none. Vertical: 1 row centered, 12 inches on center
33 to 48 inches	2 rows, 12 inches on center.
49 to 60 inches	3 rows, 12 inches on center.
61 inches and over	16 inches on center, all directions.

- 4) Duct wrap spacing applicable to flat surfaces of flat oval ducts
9. Provide 24 gauge sheet metal Z section frames over edges of duct and plenum lining
 - a. At access openings and doors
 - b. Along edges exposed to air flow

B. Rectangular Duct Wrap

1. Without vapor barrier
 - a. Comply with published recommendations of manufacturer and with following
 - b. Secure with 4 inch strips of adhesive, 8 inches on center
 - c. For rectangular ducts 24 inches and wider, secure to bottom of duct with mechanical fasteners 18 inches on center
 - d. Wrap with 18 gauge galvanized wire, 16 inches on center
2. With Vapor Barrier
 - a. Vapor barrier and sealing continuous without breaks. Vapor proof seal around supports and bracing
 - b. 2 inches lap strip at one end
 - c. Peel insulation for 2 inch lap strip along longitudinal joints
 - d. Seal lap strips with vaporseal adhesive; Foster's 85-60 or equal

C. Round Duct Wrap

1. General
 - a. Adhere flexible insulation to ductwork with adhesive applied in 6 inch wide strips on 16 inch centers
 - b. Provide 16 gauge annealed tie wire tied, spiral wound or half hitched at 16 inch centers

- c. Overlap insulation 2 inches and seal joints and breaks with 2 inch lap of foil adhered over joint
 - 2. Apply duct wrap with vapor barrier as specified above for rectangular ducts
- D. Duct Board
 - 1. Comply with published recommendations of manufacturer
 - 2. Secure on top, sides and bottom of duct with mechanical fasteners, spacing as scheduled
 - 3. Secure with 4 inch strips of adhesive, 8 inch on center
- E. Rectangular Duct and Plenum Lining
 - 1. Comply with SMACNA Duct Liner Application Standard, published recommendations of manufacturer, and following:
 - 2. Apply adhesive over 100 percent of surfaces to be lined
 - 3. The coated surface shall face air stream
 - 4. Surface adjacent to air flow, including at joints, to be uniformly flat
 - 5. Insulation on floors of plenums and large ducts where access is required shall be protected by wire mesh so that lining is not damaged when walked or crawled on.
 - 6. Blank-Off Panels: Insulation, enclosed with sheet metal on all sides; all joints with vapor barrier mastic and taped
 - 7. Volume Dampers: Where volume dampers do not allow for continuous insulation, terminate insulation clear of handle sweep and finish edges to maintain vapor barrier and to prevent damage to the insulation
 - 8. Seal butt joints and exposed edges of liner to prevent erosion
 - 9. Edges at terminal points shall be provided with metal beading and heavily coated with adhesive
 - 10. Damaged areas replaced or heavily coated with adhesive
 - 11. Mechanical fasteners
 - a. Use weld pins
 - b. Install mechanical fasteners
 - 1) Weld pins flush with liner surface. Weld pins spaced maximum of 12-inch on center in both directions and within 2 inches of all corners and joints, except where SMACNA Standard requires closer spacing
 - 2) Within 2 inches of all edges
 - 3) Minimum 4 pins per side
 - 4) For field alterations of lined ducts, install adhesive and glued pins with washers. Clip-off pins after washers installed. Field installed pins shall be used for unusual conditions only and shall not exceed 1 percent of total pins.

3.7 PENETRATIONS THROUGH RATED WALLS

- A. Refer to drawings for penetrations of rated assemblies.
- B. Install per manufacturer's installation and listing requirements.

3.8 FIELD QUALITY CONTROL

- A. Repair separation of joints or cracking of insulation due to thermal movement or poor workmanship
- B. All vapor barriers shall be continuous; tears, holes, staples, etc. shall be coated with vapor barrier mastic and patch with facing or tape

C. See Section 233100 Ducts for protection of lined duct during construction

END OF SECTION

SECTION 232113

HVAC PIPING

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Hot water heating system piping
 - 2. Chilled water system piping

1.2 REFERENCE STANDARDS

- A. ANSI/ARI 710 – Liquid Line Dryers
- B. ASTM A53 / A53M - 07 Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
- C. ASTM F2014-00 Standard Specification for Non-Reinforced Extruded Tee Connections for Piping Applications
- D. ASTM A234 – Pipe Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and Elevated Temperatures
- E. ASTM D638 – Tensile Properties of Plastics
- F. ASTM D2105 – Longitudinal Tensile Properties of “Fiberglass” (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe and Tube
- G. ASTM D2143 – Cyclic Pressure Strength of Reinforced, Thermosetting Plastic Pipe
- H. ASTM D2412 – Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading
- I. ASTM D2992 – Obtaining Hydrostatic or Pressure Design Basis for “Fiberglass” (Glass-Fiber-Reinforced Thermosetting Resin) Pipe and Fittings
- J. ASTM D3517 – “Fiberglass” (Glass-Fiber-Reinforced Thermosetting-Resin) Pressure Pipe
- K. ASTM D3567 – Determining Dimensions of Reinforced Thermosetting Resin Pipe (RTRP) and Fittings
- L. ASTM D3681 – Chemical Resistance of Reinforced Thermosetting Resin Pipe in a Deflected Condition
- M. ASTM G53 – Weathering of Non-Metallic Materials
- N. ANSI/ASME SEC 9 – Welding and Brazing Qualifications

- O. ANSI/ASME B16.22 – Wrought Copper and Copper Alloy Solder Joint Pressure Fittings
- P. ANSI/ASME B16.26 – Cast Copper Alloy Fittings For Flared Copper Tubes
- Q. ANSI/ASME B31.9 – Building Services Piping
- R. ANSI/ASTM B32 – Solder Metal
- S. ANSI/ASTM B88 – Seamless Copper Water Tube
- T. ASTM B280 – Seamless Copper Tube for Air Conditioning and Refrigeration Field Service
- U. ANSI/AWS A5.8 – Brazing Filler Metal
- V. ANSI/AWS D1.1 – Structural Welding Code
- W. AWWA C950 – Fiberglass Pressure Pipe

1.3 QUALITY ASSURANCE

- A. Welding materials and labor to conform to ASME Code and applicable state Labor Regulations
- B. Use welders fully qualified and licensed by state authorities
- C. Welders Certification: In accordance with ANSI/ASME SEC 9 and ANSI/AWS D1.1
- D. Each length of pipe, fitting, trap, fixture or device used in any piping system shall be stamped or indelibly marked with
 - 1. Weight or quality
 - 2. Maker's name or mark
- E. Examine piping layouts and determine requirements for piping offsets, loops or expansion joints to adequately protect systems.
 - 1. Determine locations and design of anchors and pipe guides to maintain proper piping alignment.
 - 2. Determine anchor reaction forces and coordinate locations of anchors with Owner's Representative.
- F. Coordinate expansion and flexibility requirements of this Section with seismic bracing requirements of Section 230548 Vibration and Seismic Control.
- G. Conform to ANSI/ASME B31.9

1.4 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. "R" means required.

2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Piping materials	R			
Pipe fittings	R			R
Solder	R2			

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Welding Fittings
1. Babcock and Wilcox Tubular Products Division
 2. Bonney Forge Foundry, Inc.
 3. Landish Company
 4. Taylor Company
 5. Tube Turns Division Allegheny International Inc.
 6. Or equal
- C. Mechanical Couplings and Fittings
1. Victaulic Company of America
 2. Grinnell
 3. Viega
 4. Or equal
- D. Flange Gaskets
1. John Crane Company
 2. Garlock Mechanical Packing Division
 3. Goodrich
 4. Manville
 5. Or equal
- E. Solder
1. Westinghouse
 2. J.W. Harris Co., Inc.
 3. Handy & Harman
 4. Engelhard
 5. Lucas Milhaupt
 6. Or equal
- F. Pipe Joint Compound
1. Rectorseal
 2. Permatest
 3. John Crane
 4. Or equal

2.2 PIPING AND FITTINGS

A. General

1. Piping shall
 - a. Be commercially round and straight
 - b. Be of uniform quality and workmanship
 - c. Be free from all defects
 - d. Be identified

B. Pressure Piping

1. Pressure piping shall conform to requirements of ANSI Safety Code for Pressure Piping, B31.9
2. Type PP-1: Black Steel
 - a. Schedule 40 or Standard Weight, ASTM A53 Type E Grade B (electric resistance welded)
 - b. 2-1/2 inches and larger
 - c. Welded joints
 - 1) Steel welding-neck fittings, ANSI B16.9-93
 - 2) Steel welding-neck flanges and flanged fittings, ANSI B16.5-88, 150 pounds per square inch
 - d. Mechanical joints
 - 1) Machined groove or rolled
 - 2) Fittings as hereinafter specified
 - e. 0.375 inch wall for sizes 12 inch and larger
3. Type PP-2: Galvanized Steel
 - a. Not used
4. Type PP-3: Copper Tubing
 - a. ASTM B88; Type M, L or K
 - b. Hard temper unless indicated otherwise
 - c. Wrought-copper, solder joint fittings, ANSI B16.22, in sizes available
 - d. Cast-bronze solder-joint fittings, ANSI B16.18, only in sizes not available in wrought copper
 - e. Cast-bronze, threaded, ground-joint unions, ANSI B16.15, 2 inches and smaller
 - f. Cast bronze, flanged unions, ANSI B16.24, 150 pounds per square inch class, 2-1/2 inches and larger
 - g. Copper tubing flared fittings: bronze castings for flared type joints, ANSI B-16.26
 - h. Mechanical joints
 - 1) Press-fit
 - 2) Fittings as hereinafter specified

C. Fittings and Flanges: Standard products of respective manufacturer of piping as hereinbefore specified.

D. Flange Gaskets

1. Full faced or flat ring type to suit flange facings, selected from one of following materials
2. Gaskets for flanged joints shall comply with ANSI B16.21
3. Full faced for cast iron flanges
4. Raised face for steel flanges
5. SBR or EPDM, 1/16 inch thick
6. Gaskets coated with thread lubricant when being installed

E. Flange Bolts: Open-hearth bolt steel

F. Unions

1. Steel Piping 2 inches and smaller
 - a. 250 pounds per square inch: ground joint
 - b. Equal to Grinnell Fig. 554
2. Steel Piping Larger than 2 inches: Welding flanges
3. Copper Piping: Equal to Nibco No. 633

G. Dielectric Connections

1. Unions
 - a. Only allowed where union is required elsewhere in specifications or on drawings. Use nipple specified below otherwise.
 - b. 2 inches and smaller
 - 1) 250 pounds per square inch
 - 2) Standard gaskets for plumbing
 - 3) High temperature gaskets for heating
 - 4) Equal to EPCO Model FX
 - c. 2-1/2 inches and larger
 - 1) Brass
 - a) Brass half-union, ANSI B16.1, 1989, 175 pounds per square inch
 - b) To welding flange as hereinbefore specified
 - c) Equal to EPCO Model X
 - 2) Copper
 - a) Half union with EPDM insulator gasket
 - b) 150 pounds per square inch
 - c) The Copper component of the flange adapter shall be Third Party Classified by Underwriters Laboratories Inc.
2. Nipples
 - a. For open circuit hydronic systems:
 - 1) Minimum 4 inch long galvanized steel, stainless steel, brass, or copper nipple with non-conducting thermo-plastic internal lining
 - 2) ASTM Standard F-492 for continuous use at temperatures up to 225°F
 - 3) ClearFlow, Victaulic Style 47 Dielectric Waterway, or equal
 - b. For closed-circuit hydronic systems: minimum 6 inch long brass nipple

H. Grooved End Fittings and Couplings

1. Fittings
 - a. Designed for use with grooved- or rolled-end pipe and couplings
 - b. Materials
 - 1) Steel: ASTM A53 or A106, Grade B
 - 2) Malleable Iron: ASTM A47
 - 3) Ductile Iron: ASTM A536
2. Couplings
 - a. Mechanical type designed to
 - 1) Engage and lock grooved pipe or fitting ends
 - 2) Form leak-proof joint
 - 3) Allow angular deflection, expansion, contraction, and vibration isolation (flexible type, Victaulic Style 77, Style 177, or equal)
 - a) Exception: At contractor's option and risk, rigid couplings (Victaulic Style 107 or equal) may be used except at the following locations:
 1. Mechanical equipment connections where the couplings are being used in lieu of flexible coupling for vibration isolation
 2. Risers, for which we use flexible couplings for expansion and contraction
 3. Straight horizontal runs over 20 feet long, for which we use flexible couplings for expansion and contraction
 - b. Housings

- 1) Malleable Iron: ASTM A47
 - 2) Ductile or Nodular Iron
 - c. Gaskets
 - 1) EPDM
 - 2) Materials required for specific service, minimum 230°F operating temperature
 - 3) Product of coupling manufacturer
 - d. Bolts and Nuts
 - 1) Track-head or oval neck type bolts
 - 2) Standard hexagon nuts
 - 3) Heat treated carbon steel conforming to ASTM A183
 - 4) Minimum tensile strength: 110,000 pounds per square inch
 - 3. Pressure Ratings
 - a. 3/4 inch to 6 inches: 1000 pounds per square inch
 - b. 8 to 12 inches: 800 pounds per square inch
 - c. 14 to 24 inches: 300 pounds per square inch
 - 4. Finish
 - a. Painted
 - 5. Equal to Victaulic Company of America
- I. Press-Fit Fittings and Couplings
- 1. For ½" to 4" copper piping
 - 2. Smart Connect feature to provide clear visual indication of which connections have not been pressed prior to putting the system into operation
 - 3. EPDM sealing element suitable for application
 - 4. Listings and certifications
 - a. NSF-61-372
 - b. IAPMO PS 117
 - c. UL 213
 - d. FM Class 1920
 - e. ABS 1.1.2
 - 5. Compliant with:
 - a. California Mechanical Code
 - b. California Plumbing Code
 - c. NFPA 13, 13D and 13R
 - 6. Operating ranges
 - a. 0°F to 250°F
 - b. 200 psi
 - 7. Equal to Viega ProPress

2.3 PIPING SPECIALTIES

- A. See Section 232114 Piping Specialties

2.4 SOLDER

- A. S-1: Silfos or Silvaloy 15 silver solder (brazing) with 15 percent silver, 80 percent copper and 5 percent phosphorous
- B. S-1A: Safety Silv 56 cadmium-free silver solder (brazing) with 55 to 57 percent silver, 21 -23 percent copper, 15 to 19 percent zinc, 4 to 6 percent tin, and 0.15 percent other metals.
- C. S-2: 95 percent tin 5 percent antimony solder, lead free, or

- D. S-2A: 95.6 percent tin, 4 percent copper, 0.4 percent silver, lead free

PART 3 EXECUTION

3.1 PIPE SERVICES

- A. Piping type shall be in accordance with the table below. Where multiple types are listed, any may be used at Contractor's option.

Service	Location	Type of Pipe	Remarks
Hot water Chilled water	Above ground	PP-1; PP-3 Type L	

3.2 INSTALLATION

- A. Coordinate with work of other trades.
- B. Install pipes and pipe fittings in accordance with recognized industry practices which will achieve permanently leak resistant piping systems, capable of performing each indicated service without piping failure. Install each run with minimum joints and couplings but with adequate and accessible unions for disassembly and maintenance/replacement of valves and equipment. Reduce sizes where indicated by use of reducing fittings. Align piping accurately at connections, within 1/16-inch misalignment tolerance.
- C. Arrangement
 1. Except for large scale details piping is diagrammatically indicated. Install generally as shown.
 2. Do not scale drawings for exact location of piping.
 3. Install piping to best suit field conditions, in coordination with other trades.
 4. Piping Arrangement
 - a. Arrange piping neatly along walls
 - b. In neat, horizontal groups
 - c. Each group to be in one plane, insofar as possible
 - d. Maintain required slope
 5. Do not sleeve structural members without consent of Owner's Representative.
 6. Maintain minimum 1 inch clearance from adjacent work, including insulation, except as noted.
 7. Install piping concealed above ceilings or in walls unless otherwise indicated.
 8. Installation of piping shall be made with use of appropriate fittings. Bending of piping will not be allowed.
 9. Unions installed shall be accessible.
 10. Locate piping runs vertically and horizontally; avoid diagonal runs wherever possible. Orient horizontal runs parallel with walls and column lines. In finished and occupied spaces, conceal piping from view by locating in column enclosures, in hollow wall construction, or above suspended ceilings; do not encase horizontal runs in solid partitions, except as indicated.
 11. Electrical equipment spaces: Do not run piping through transformer vaults and other electrical or electronic equipment spaces and enclosures unless the piping serves equipment in the room.
 12. Use tapered reducers where any change in pipe size occurs. Bushings shall not be used.

13. Conceal piping in finished portions of building, above the floor line. Cutting of walls and floors shall be held to the minimum possible to secure the proper installation.
14. Provide concealed high points with air chambers with 1/4-inch copper tube vent line and stop cock carried to accessible point.
15. Install piping subject to expansion or contraction in a manner permitting strains to be evenly distributed and alleviated.
16. Pipe the discharge of each relief valve, air vent, backflow preventer, and similar device to floor sink or drain.
17. Pipe coils with inlet at bottom, outlet from top, unless otherwise directed by coil manufacturer.

D. Penetrations

1. Escutcheons
 - a. Provide stainless steel escutcheons at piping penetrations of walls that are exposed public view and required for proper appearance. Provide galvanized steel escutcheons at penetrations of masonry walls elsewhere.
 - 1) Clearance from duct to opening shall not exceed 1 inch.
 - 2) Escutcheons shall overlap wall, floor, or ceiling surface by ½ inch minimum.
 - b. Escutcheons are not required at drywall penetrations where not exposed to public view.
2. Caulk and seal all piping penetrations through acoustical walls and partitions. See Section 230548 Vibration and Seismic Control.
1. Firestopping at penetrations of fire rated floors and partitions
 - a. The fire-resistance rating of penetrations and fire-resistant joint systems shall be firestopped with a UL listed firestop system that will maintain the fire rating of the assembly. Through-penetrations and membrane penetrations shall be protected by an approved system installed as required by the system listing or as otherwise permitted by CBC Section 714. Listed through-penetration firestop systems and membrane penetrations shall be installed in accordance with the installation details for the listed system to be installed. Fire protection system installation details and listings shall be submitted for approval prior to the start of system installation.
 - b. Manufacturer
 - 1) 3M Penetration Sealing Systems (PSS 7909) and 3M Fire Barrier Caulk and Putty
 - 2) Dow-Corning LTV Silicone foam
 - 3) Or equal
2. At all below-grade penetrations, provide mechanical seal complete with wall sleeve with wall anchor, and water stop plate. Seals shall be modular mechanical type, consisting of interlocking synthetic rubber links shaped to fill the annular space between pipe and sleeve, complete with pressure plates and cadmium plated nuts and bolts.

E. Sloping, Air Venting and Draining

1. Slope piping as indicated, true to line and grade, and free of traps and air pockets.
2. Reducers/increasers
 - a. Eccentric
 - 1) At pump suction where reducer is required
 - 2) Top side flat
 - b. Concentric: All other locations
3. Connect branch piping to bottom of mains in closed systems.
4. Provide drain valves and hose adapters as indicated on drawings and at the bottom of all risers.
5. Vents: See Section 230523 Valves.

F. Piping Specialties: See Section 232114 Piping Specialties.

- G. Pipe Hanging and Supports: See Section 230529 Hangers and Supports.
- H. Flashing and Sleeves: See Section 230529 Hangers and Supports.
- I. Painting: See Section 230501 Basic Mechanical Materials and Methods.
- J. Pipe Identification: See Section 230553 Mechanical Identification
- K. Copper
 - 1. Crimping of copper tubing prohibited.
 - 2. Isolate copper tubing from ferrous materials and hangers with two thicknesses of 1 inch wide 10 mil polyvinyl tape, spiral-wrapped around pipe. Total width shall be a minimum of 3 inches.
- L. Coatings: Reapply coal-tar coating on buried piping, after installation, to surfaces from which coating has been removed or scraped.
- M. Care of Floors
 - 1. Do not set pipe vises or threading machines on unprotected concrete floors.
 - 2. Cover floor when making plumbing connections to avoid staining floors with oil, white or red lead or other substances.
 - 3. Remove any stains at no additional cost to the Owner.

3.3 COPPER AND STEEL WATER PIPING

- A. Fittings
 - 1. Provide standard, manufacturing fittings in all cases.
 - 2. Prohibited fittings
 - a. Field fabricated
 - b. Bushings on pressure piping
 - c. Clamp-on branch connections
 - 3. Provide insulating couplings or dielectric unions at all connections of ferrous piping to non-ferrous piping.
 - 4. Branch connections, steel piping
 - a. Equal to main and to two pipe sizes smaller: Weld tees, same weight as piping
 - b. Three or more pipe sizes smaller than main, but 2-1/2 inches and larger: Bonney Weld-o-lets
 - c. Two inches and smaller: Bonney Weld-o-lets, or steel couplings
 - 5. Branch connections, copper piping
 - a. Seamless tee or
 - b. Press-fit tee or
 - c. Mechanically formed tee connection
 - 1) ASTM Designation F2014-00
 - 2) Per ASME B31.9 Section 930.2
 - 3) Equal to T-Drill T-D35
- B. Provide unions or flanges to render all items in systems easily removable, including
 - 1. Control valves
 - 2. Both sides of pumps and equipment
 - 3. Where indicated on drawings
 - 4. Use mechanical (Victaulic) couplings at all connections on tube-pull side of chiller to allow for temporary removal of piping to provide full access to the water box for tube pull.
 - 5. Exceptions

- a. Copper water piping 1-inch or less, at Contractor's options, since the copper can be easily cut and the union is a less secure joint than a soldered joint
 - b. Unions not allowed:
 - 1) Where not allowed by code

- C. Pipe Ends
 - 1. Perform pipe cutting and end preparation to result in clean ends with full inside diameter
 - 2. Grind and ream as necessary

- D. Nipples
 - 1. Close nipples not permitted.
 - 2. Provide extra heavy pipe for nipples where unthreaded portion is less than 1-1/2 inch long.

- E. Threaded Joints: Not allowed other than unions and accessories (e.g. gauges, test plugs)

- F. Welded Joints
 - 1. Welded joints shall not be substituted for mechanical (Victaulic) joints where mechanical joints are specifically called out in specifications or on Drawings (for example to provide expansion/contraction or chiller tube pull access).
 - 2. Weld pipe joints in accordance with recognized industry practice and as follows
 - a. Welding shall be done by qualified welders in a first-class, workmanlike manner, conforming to the American Standard Code for Pressure Piping USA B-31.1 and B-31.1A.
 - b. Bevel pipe ends at a 37.5 degree angle where possible, smooth rough cuts, and clean to remove slag, metal particles, and dirt.
 - c. Do not weld-out piping system imperfections by tack-welding procedures; re-fabricate to comply with requirements.
 - d. Standards: Conform to Section UI, Chapter 4, "Welding of Pipe Joints", ANSI B31.9 and applicable portion of ASME Boiler and Pressure Vessel Code, Section IX.
 - e. Operator's qualifications: All welders engaged in work under this Section shall be qualified in accordance with State requirements. Each operator's certificate shall be on file at site and made available to State upon request. Welding of pressure piping shall be done by-welders who have been qualified by recognized agency within 6 months prior to date of Contract.
 - f. Preparation for welding: Bevel piping on both ends before welding; both ends shall have 1-1/6 inch land at bottom of bevel. Pipe with a 3/4 inch wall thickness or less shall be beveled to a standard 37.5 degrees.
 - g. Use backing rings on all butt-welding joints 6-inches and larger.
 - h. State employed Inspector will visually inspect welds. Any weld judged defective by visual inspection shall be cut out and tested in presence of Inspector. If percentage of defective coupons is deemed excessive, contractor shall cut additional coupons as directed by the Owner's Representative or the State Inspector. Removal and replacement of test coupons and samplings shall be done at no additional cost to the Owner. At the option of the State Inspector or the Owner's Representative, certain welds may be required to be radiographed.
 - 3. Where required, peen and wheel-grind welds.
 - 4. Ends of pipe may be burned for welding
 - a. Grind bevel and remove scale between welding joint.
 - b. Ragged edges with metal beads, poor alignment other inferior work will be rejected.
 - 5. Perform welding with oxyacetylene or electric arc process.

- G. Grooved and Rolled-End Joints
 - 1. Perform following in accordance with manufacturer's instructions

- a. Cut or roll pipe
- b. Install couplings and fittings
2. Determine that gasket material and lubricant are compatible with service of pipe.

H. Press-Fit Joints

1. Use only on above-ground applications.
2. Strictly comply with manufacturer's instructions and recommendations.
3. Pressure test with water
 - a. First test for any unpressed fittings using a pressure range of 15 psig to 85 psig.
 - b. Once all fittings are confirmed to be pressed, pressure test as required herein and per code.

I. Soldered and Brazed Joints

1. Solder
 - a. Use Solder S-1 for
 - 1) Mechanically formed tee connection (T-drill)
 - b. Use Solder S-1 or S-2A for
 - 1) Piping 3 inch and larger
 - c. Use Solder S-2 or S-2A other than above.
2. Clean surfaces to be jointed, of oil, grease, rust and oxides
 - a. Remove grease from fittings by washing in solution of 1/16 sodium carbonate and three gallons hot water (except as otherwise specified for medical gas piping)
 - b. Clean socket of fitting and end of pipe thoroughly with emery cloth to remove rust and oxides.
 - c. Wipe excess solder from joint before it hardens.
3. When soldering or brazing materials that could be damaged by heat, remove sensitive parts and protect parts from heat. Joints shall be cool before reassembling.
4. Cut tubing square, reamed, and burrs removed.
5. Prevent annealing of fittings and tubing when making connections.

3.4 EXPANSION CONTROL

A. General

1. Install piping to permit free expansion and contraction without damaging piping or construction.
2. Provide offsets, expansion loops, anchors, guides and supports to permit expansion, within stress limits of ANSI 31.1 Pressure Piping for temperature ranges specified.
3. Where pipe loops or changes in direction of piping cannot be employed to absorb expansion and contraction, provide expansion joints.
4. Install pipe guides so that movement takes place along axis of pipe only. Pipe moves laterally at expansion elbows.
5. Make riser offsets in manner to avoid pocket forming due to expansion.

B. Expansion Calculations

1. Thermal Expansion
 - a. Determine thermal linear expansion of each segment of piping systems.
 - b. Base expansion calculations on following temperatures, plus 30 percent safety factor
 - 1) Hot Water Heating
 - a) Idle temperature: 50 degrees Fahrenheit
 - b) Maximum temperature: 210 degrees Fahrenheit
 - 2) Chilled Water
 - a) Operating temperature: 40 degrees Fahrenheit
 - b) Maximum temperature: 100 degrees Fahrenheit

- c. Determine effect of linear expansion upon piping layout in building
 - 1) If resulting stresses exceed maximum allowable limits introduce additional loops and/or offsets.
 - 2) Where space limitations preclude installation of loops and/or offsets provide expansion joints.
 - 2. Structural Considerations
 - a. Install pipe anchors to provide required restraints on expanding piping systems.
 - b. Install pipe guides to provide required restraints against lateral action of expanding piping systems
 - 1) Spacing for expansion joints: per manufacturer's recommendations.
 - 2) Spacing for pipe loops and/or offsets: as required to maintain alignment within allowable stress limits.
 - c. Locate anchors and guides only at building structural members capable of taking imposed reaction loads.
 - d. Determine horizontal and vertical reaction loads of anchors and guides to building structure
 - 1) Coordinate details and reaction loads with structural engineer for building.
 - 2) If necessary, revise location and number of anchors and guides as recommended by structural engineer to result in allowable reaction loads to building.
- C. Provision for Expansion
 - 1. Loops, bends, offsets
 - a. As indicated or because of job required relocation of piping and equipment.
 - b. Design as follows
 - 1) Use spring type loop U-bend or offset U-bend.
 - 2) Corner radii five to six times pipe diameters.
 - 3) Join bends only by welding
 - a) Welding-steel piping
 - b) Brazing-copper or bronze piping
 - 2. Mechanical Joint System
 - a. Grooved- or rolled-joint piping systems with provisions for expansion control methods incorporating inherent flexibility of couplings and fittings may be provided, under conditions specified below
 - 1) Submit design considerations published by manufacturer of couplings and fittings.
 - 2) Conditions specified below must comply with published design considerations.
 - 3) Rolled-joint piping expansion accommodation is generally less than for grooved-joint systems. Verify sufficient joints are provided.
 - b. Perform calculations as specified elsewhere in this section, along with determining any other data required to assure that longitudinal motion, angular deflection and resultant forces do not exceed recommendations in manufacturer's design considerations.
 - c. Provide required anchors and guides spaced per manufacturer's design considerations.
 - d. Install with gap settings of all couplings and fittings to permit full range of expansion, contraction and/or angular deflection as recommended by manufacturer to take place without excessive displacement and forces.
 - 3. See Section 230548 Vibration and Seismic Control

3.5 TESTING

A. Test of Water Piping

1. Test water piping at completion of roughing in, in accordance with the following schedule and show no loss in pressure or visible leaks after a minimum duration of four hours, or time as indicated, at the test pressures indicated.
2. Make connections to existing CUP systems with flanged connection. During testing of the new work, provide a slip-in plate to restrict test pressure to new systems only. Remove plate and complete connection to existing system at completion of testing.
3. Inspect pressure piping in accordance with procedures of ANSI B31.
4. Hydrostatic test pressure
 - a. Less than 100 psi operating pressure: 150 psi
 - b. Over 100 psi operating pressure: 1-1/2 times operating pressure
 - c. Never exceed test pressure ANSI B16.1 basis
5. Duration: 2 hours
6. With system valves capped and pressure apparatus disconnected
 - a. Pressure change: none
 - b. Compensate for temperature change
7. Leaks and defects
 - a. Repair or replace as directed by the Owner's Representative
 - b. At no additional cost to the Owner
8. Notify Owner's Representative in writing one week before test.
9. Furnish written report and certification that tests have been satisfactorily completed to the Owner's Representative.

3.6 WATER PIPING SYSTEM CLEANING

- A. During Construction
 1. Keep openings in piping closed to prevent entrance of foreign matter
 2. Clean pipe, fittings and valves internally
 3. Hammer welds to remove slag and weld beads
- B. Cleaning Procedure
 1. Cleaning shall be supervised by water treatment supplier. See Section 232500 Water Treatment. When approved, procedure below may be modified based on recommendations of supplier.
 2. Clean system immediately after pressure test.
 3. Protect against damage from freeze up or discharge of water.
 4. Closed Circuit Piping Systems
 - a. Open all valves (including control valves) in all legs so circulation goes through all sections.
 - 1) For 3-way valves, either set to 50% open position or begin procedure with valves full open to coil and change to full open to bypass halfway through cleaning period.
 - b. Install temporary filter bags or fine-mesh start-up strainer screen in all line strainers during cleaning.
 - c. Fill with clean water.
 - d. Keep return isolation valve separating the building from the campus loop closed to prevent startup debris from migrating back to the central plant; crack open supply isolation valve to provide a thermal expansion/contraction path for the mass of water in the building loop (applies after each loop filling). Bypass startup valve shall be open throughout cleaning procedure and closed immediately thereafter.
 - e. Start pumps and operate at design flow rate or greater. On chilled water system without pumps, provide a temporary pump at taps provided; flow rate per water treatment specialist's recommendations.
 - f. Simultaneously drain at low points and fill the loop until effluent is clear.

- g. Shut off makeup water.
 - h. Circulate for a minimum of two 48-hour periods. For each period:
 - 1) Add alkaline detergent via pot feeder. See Section 232500 Water Treatment.
 - 2) At end of period
 - a) Shut the supply isolation valve.
 - b) Remove and clean strainers.
 - c) Drain at low points.
 - i. After last circulation period
 - 1) Shut off pumps.
 - 2) Shut the supply isolation valve.
 - 3) Completely drain out entire system of cleaning solution.
 - 4) Remove filters at strainers, or replace start-up screen with final strainer screen.
 - 5) Fill system with clean water.
 - 6) Start pumps, and simultaneously drain at low points for 8 hours.
 - 7) Test
 - a) Alkalinity not more than 200 parts per million in excess of alkalinity of rinsing water
 - b) Effluent visually clear; no visible particles or color
 - 8) Repeat flushing of water until tests are met.
 - j. Should any pipe be plugged, disconnect piping, clean again, and reconnect at no additional cost to the Owner.
 - k. Connect the building to the campus distribution network.
 - 1) Open both the supply and return isolation valves to place the building into service.
 - 2) Start building pumps at 60 Hz and circulate water for a duration coordinated with the campus' water treatment provider to ensure that treated water from the central plant is distributed throughout the building. Thereafter, release the control valves and building pumps to automatic control.
 - 3) Coordinate start of service with campus engineering so that central plant chemical dosing can be adjusted, if needed, to account for the fluid volume added by the building.
 - 4) Do NOT leave the system filled with untreated water for more than 4 hours.
5. All open circuit systems shall be flushed until water runs clean.

3.7 COMPLETION REQUIREMENTS

- A. Complete Pre-Functional Test Data Sheet for each hydronic system. See Section 230800 Mechanical Commissioning.

END OF SECTION

SECTION 232114
PIPING SPECIALTIES

PART 1 GENERAL

1.1 SUMMARY

- A. Section Includes: Materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Escutcheons
 - 2. Bypass chemical feeders
 - 3. Strainers
 - 4. Thermometers
 - 5. Pressure gauges
 - 6. Test plugs

1.2 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. "R" means required.
 - 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Escutcheons	R2			
Bypass chemical feeders	R			R
Strainers	R			
Thermometers	R	R		
Pressure gages	R	R		
Test plugs	R			

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Bypass chemical feeders
 - 1. J. L. Wingert Co.
 - 2. Industrial Chemical Corporation
 - 3. Or equal

- C. Strainers
 - 1. C.M. Bailey
 - 2. Mueller
 - 3. Keckley
 - 4. Victaulic
 - 5. Or equal

- D. Thermometers
 - 1. Weksler
 - 2. Weiss Instruments, Inc.
 - 3. Ashcroft
 - 4. Trevice
 - 5. Marsh
 - 6. Or equal

- E. Pressure gauges
 - 1. Weksler
 - 2. Weiss Instruments, Inc.
 - 3. Dresser Industries, Ashcroft
 - 4. H. O. Trevice Company
 - 5. Or equal

- F. Pressure-temperature test plugs
 - 1. Peterson Engineering Company
 - 2. Taco, Inc.
 - 3. Or equal

2.2 ESCUTCHEONS

- A. Provide escutcheons with inside diameter closely fitting pipe outside diameter or outside of pipe insulation where pipe is insulated. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, walls, ceilings, or pipe sleeve extension, if any. Furnish pipe escutcheons with nickel or chrome finish and screw or spring clamping device with concealed hinge.
 - 1. Pipe escutcheons for moist areas: For water resistant floors, and areas where water and condensation can be expected to accumulate, provide cast brass or sheet brass escutcheons, solid or split hinged. Split hinged type shall not be used in areas with security requirements.
 - 2. Pipe escutcheons for dry areas: Provide sheet steel escutcheons, solid or split hinged. Split hinged type shall not be used in areas with security requirements.

2.3 BYPASS CHEMICAL FEEDER

- A. Batch feeder for closed circulating water systems
- B. Capacity: 5 gallons
- C. Steel shell and heads
- D. Cap: Cast iron with Buna N "O" ring: Quarter-turn to open

- E. 3/4 inch tapings for water in and out and drain
- F. Operating pressure and temperature
 - 1. Minimum rated operating pressure up to 125 pounds per square inch
 - 2. Minimum rated operating temperature up to 250°F
 - 3. Design and installation as indicated
- G. Wingert Model HD or equal

2.4 STRAINERS

- A. Pressure rating: minimum 150 psi at 200°F
- B. Screen
 - 1. 304 or 316 stainless steel or Monel, reinforced
 - 2. Free area not less than 3 times inlet area
 - 3. Perforations
 - a. To 2 inch: 20 mesh
 - b. To 4 inch: 1/16 inch
 - c. 5 inch and larger: 1/8 inch
- C. Y-Type
 - 1. 2 inches and less
 - a. Cast Bronze
 - b. Solder joint
 - c. Bronze cap and plug, straight thread with composition gasket
 - d. Keckley E-150 or equal
 - 2. Larger than 2 inches
 - a. Cast iron
 - b. Flanged connection
 - c. Bolted cast iron cover with composition gasket and threaded hose connection
 - d. Keckley Style A or equal
- D. Basket type
 - 1. Cast iron
 - 2. Flanged connection
 - 3. Bolted cover, bottom or side drain connection
 - 4. Keckley Style GFV or equal
- E. Provide Hubbell, Refrigerant Specialties, or equal on refrigeration systems.

2.5 THERMOMETERS

- A. Digital, self-powered
 - 1. Display: Minimum 3/8" LCD digits, swivel mount for 360° viewing adjustment
 - 2. Range: 0 to 300°F
 - 3. Sensor: Glass passivated thermistor
 - 4. Accuracy: 1% of reading or 1°F, whichever is greater
 - 5. Resolution: 0.1 °F between 0 and 200°F
 - 6. Recalibration: Internal potentiometer
 - 7. Lux Rating: 10 Lux (one foot-candle)

8. Waterproof cover for outdoor installations
9. Ambient Operating Range:
 - a. Temperature: -30/140°F
 - b. Humidity: 0% RH to non-condensing
10. Power: Self-powered via integral photovoltaic cells
11. Weiss DVU, Weksler AD, or equal

- B. Stem Length for Nominal Pipe Sizes
 1. Below 4 inch: 3-1/2 inch stem, elbow mounted
 2. 4-8 inch: 3-1/2 inch stem
 3. 10-14 inch: 6 inch stem

2.6 PRESSURE GAUGES

- A. Pipe or equipment mounted type
 1. Diameter: 4 1/2 inch, except as noted
 2. Case: black finished cast aluminum with flangeless back
 3. Threaded black cast aluminum ring with gasketed glass face
 4. Type 316 stainless steel spring tube
 5. Stainless steel precision movement: Micrometer adjustment on needle
 6. Accuracy: 0.5 percent full scale range
 7. With calibration adjustment
 8. Quarter turn stop cock: Materials compatible with service
 9. Pressure snubbers
 - a. Filter type
 - b. For liquid, air and gas
 10. Weksler Type AA44 or equal
- B. Pressure gauge ranges in pounds per square inch gauge
 1. Heating water pump: 0-100
 2. Pressure gauges indicated on drawings or in specifications not indicated above to be submitted with appropriate range for review

2.7 PRESSURE/TEMPERATURE TEST PLUG

- A. Solid brass with valve core
- B. Valve core: Nordel or EPDM
- C. Fitted with a color coded and marked cap with gasket
- D. Suitable for 500 pounds per square inch gage and 275°F for water systems
- E. Pete's Plug: No. 110 with yellow cap or equal

2.8 FLANGES

- A. Convolute
- B. Carbon steel, cold-formed

- C. Weld-neck and blind flanges in conformance with the design criteria of Section VIII, Division I of the ASME Pressure Valve Code
- D. Flanges drilled and tapped to match ANSI 150
- E. All material to comply with requirements of ASTM A516
- F. Gaskets: Teflon or as recommended by the flange manufacturer and suitable for the service involved
- G. Slip-on flanges will not be permitted
- H. 150-pound and 300-pound weld-neck and screwed steel flanges on steel lines to conform to ANSI Standard B16.5 for dimensions and ASTM A 181 Material Standard

PART 3 EXECUTION

3.1 INSTALLATION

- A. Install items in accordance with manufacturer's instructions.

3.2 ESCUTCHEONS

- A. Install at piping penetrations of walls, floors and ceilings
 - 1. Where exposed to public view
 - 2. At penetrations of exterior walls
- B. Where piping is insulated, escutcheons shall fit insulation outside diameter.

3.3 BYPASS CHEMICAL FEEDERS

- A. Install feeder in convenient location where it may be easily refilled, maximum 4 feet above floor.
- B. Install as indicated on drawings
 - 1. Support from floor
 - 2. Valves on inlet, outlet and drain

3.4 STRAINERS

- A. Wye-type: Where shown on drawings and ahead of all automatic balancing valves and pressure regulating valves
- B. Basket-type strainers: Where shown on drawings
- C. Install strainers in horizontal or vertical-down position

3.5 INSTRUMENTATION

- A. Install sensors and sensor wells to piping using thread-o-lets welded or soldered to pipe, or other approved means. For piping smaller than 1.5 times well depth, wells shall be installed in the end of an elbow, or tee used in place of an elbow, to minimize obstruction.
- B. Thermometers
 - 1. Install thermometers for easy readability (height, distance, view angle) from floor wherever possible.
 - 2. Install in brass or stainless steel thermowell.
 - 3. Locate where shown on drawings.
- C. Pressure Gauges
 - 1. Provide gauges where shown on drawings.
 - 2. Install gauges on non-vibrating backing.
 - 3. Provide instrument cocks for isolation and removal of gauge at each pressure connection point.
 - 4. Install gauges for easy readability (height, distance, view angle) from floor, except gauges at ceiling coils
 - 5. At pumps, install a single pressure gauge only piped to pump taps at the inlet and outlet of pump. Using two gauges or connecting to piping rather than pump taps is not acceptable.
- D. Pressure-Temperature Test Plugs
 - 1. Provide pressure/temperature test plugs where shown on drawings.
 - 2. Also locate at all temperature and pressure sensors for calibration, see Section 250000 Building Automation Systems.
 - 3. Mount using threadolet welded or braised to pipe.

3.6 INSPECTION

- A. Verify that adequate clearance between piping specialties and adjacent walls or equipment is available to permit maintenance and repairs.

3.7 TESTING AND ADJUSTING

- A. Test thermometers, pressure gauges and water meters for accurate indication with known calibrated master; calibrate or replace if not within 5 percent of reading.
- B. Test air vent points to insure all air has been vented.
- C. Test other piping specialties for proper operation.
- D. See Section 230800 Mechanical Commissioning.

END OF SECTION

SECTION 232123

PUMPS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for all water pumps except
 1. Where integral with manufactured piece of equipment
 2. Where specialty pumps applicable to specific systems are specified under the relevant Section

1.2 REFERENCE STANDARDS

- A. Underwriters' Laboratories, Inc.: UL 778 – Motor Operated Water Pumps
- B. American Society of Mechanical Engineers: ASME Section VIII – Boiler and Pressure Vessel Code – Pressure Vessels
- C. ANSI/HI Pump Standards

1.3 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 1. "R" means required.
 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Pump data	R	R		R
Mounting details				R

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Bell and Gossett

- C. PACO
- D. Patterson
- E. Or equal

2.2 GENERAL

- A. Centrifugal, single stage, unless otherwise noted
- B. Bronze fitted (impeller and wear rings)
- C. Statically and dynamically balance rotating parts
- D. Construction to permit complete servicing without breaking piping connections
- E. Pumps to operate at 1750 rpm unless specified otherwise
- F. Bearings: Grease lubricated roller or ball bearings
- G. Shaft seals
 1. Mechanical, internally flushed
 2. Single, inside mounted, end face rubber bellows type
 3. Springs: stainless steel
 4. Seal head: brass or stainless steel
 5. Carbon face rotating against a stationary ceramic face
 6. Elastomer: Buna or EPDM
- H. Substitutions
 1. Brake horsepower rating at design conditions shall be no more than 10 percent above that scheduled.
 2. Motor horsepower shall be no larger than that scheduled, or compensate Division 26 contractor for any associated cost to increasing motor size.
- I. Motors: See pump schedule and Section 230513 Motors and Controllers
- J. Pump characteristics
 1. Pump curve shall rise continuously from maximum capacity to shutoff
 2. Shutoff head approximately 10 percent greater than design head
 3. Operation between 65% and 115% of GPM at best efficiency point (BEP) for the indicated impeller size, ideally between 85% and 105% of GPM at BEP
 4. For pumps serving variable flow (2-way valve) systems; or where multiple pumps operate in parallel other than lead/standby applications
 - a. Pump shall be capable of operating at 40 percent beyond design flow rate without exceeding break off point
 - b. Motors shall be selected for non-overloading operation at a flow rate 40 percent beyond design flow rate
 5. Impeller diameter
 - a. Minimum tip to cutwater clearance: 4%
 - b. Constant speed pumps: Trim to duty
 - c. Variable speed pumps: Trim to the maximum impeller size that does not cause an increase in motor size (so that maximum efficiency is achieved).

- K. Pumps and flanges tested and rated to withstand 1-1/2 times specified working pressures based on both inlet pressures scheduled and pump shut-off head or 175 pounds per square inch working pressure at 250 degrees Fahrenheit, whichever is greater.
- L. Pumps to be suitable for handling fluids at scheduled temperatures
- M. Pressure taps on both inlet and outlet for gauge connection mounted in the pump casing (not in external piping)
- N. Factory tested
- O. Painted with at least one coat of high-grade machinery enamel

2.3 IN-LINE

- A. Type as scheduled
 - 1. Close coupled
 - 2. Suitable for vertical or horizontal operation
 - 3. Back pullout design
- B. Shaft: Stainless or Carbon Steel
- C. Wearing rings: renewable bronze
- D. Shaft sleeves: bronze
- E. Casing with suction and discharge gauge ports, vent and plugged drain ports
- F. Capable of being serviced without disturbing piping connections
- G. Pump volute base ring tapped for 1-1/2 inch 125 pound ANSI flange to support pump
- H. Pump flanges to have 125 pound ANSI flange drilling

PART 3 EXECUTION

3.1 INSTALLATION

- A. Coordinate with work of other trades
- B. Install pump in accordance with manufacturer's written installation instructions
- C. Provide access space around pumps for service. Provide no less than minimum as recommended by manufacturer
- D. Decrease to pump suction from line size with flat-top eccentric reducers on horizontal inlet piping (or suction diffuser where indicated on drawings), concentric reducers elsewhere
- E. Support piping adjacent to pump such that no weight is carried on pump casings

- F. Allow at least 5 pipe diameters between pump suction entry and closest elbow or strainer, unless a pump suction diffuser is installed
- G. Inlet and discharge valves and other piping specialties shall be pipe size, not pump inlet or discharge connection size
- H. See Section 232114 Piping Specialties
- I. See Section 250000 Building Automation Systems
- J. See Section 230800 Mechanical Commissioning

3.2 MOUNTING AND ALIGNMENT

- A. See Section 230548 Vibration and Seismic Control
- B. Recheck alignment after operation when the pump and the driver are at operating temperature.

3.3 INSPECTION

- A. Verify that adequate clearance between pump and adjacent walls or equipment is available to permit maintenance and repairs.
- B. Check that pump is suspended from building structure and not supported by piping.

3.4 PRE-OPERATING CHECKS

- A. Before operating pumps
 1. See Section 019100 Commissioning
 2. Complete the Pre-Functional Test Data Sheet for each pump; see Commissioning specs.
 3. Assure that piping is clear of debris which might clog pump
 4. Vent air from pump system to assure water in pump and piping system
 5. Check for proper and sufficient lubrication
 6. Check for correct operation of check valve
 7. Check for correct rotation
 8. Confirm alignment again after grouting has properly set and re-align if required
 9. Check packing nut adjustment for proper leakage rate and packing lubrication
 10. Assure that strainer is clean before commencing testing
 11. Check for proper adjustment of vibration isolation

3.5 TESTING AND ADJUSTING

- A. Before starting pump: See Section 019100 Commissioning
- B. After starting pumps
 1. Check for high bearing temperatures
 2. Check temperature of packing gland or mechanical seal for proper cooling operation
 3. Check for motor overload by taking ampere reading at maximum operating conditions, i.e. all valves open and individual pump running

- 4. Check shut-off head to ensure impellers properly trimmed
- C. See Section 230593 Testing, Adjusting, and Balancing
- D. See Section 230800 Mechanical Commissioning

3.6 TRAINING

- A. See Section 230800 Mechanical Commissioning
- B. Engage a factory-authorized service representative to train Owner's maintenance personnel on:
 - 1. Procedures for starting and stopping and troubleshooting pumps
 - 2. Procedures and schedules for maintaining and servicing pumps
 - 3. Organization and content of Operations & Maintenance Manuals

END OF SECTION

SECTION 233100

DUCTS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Ductwork
 - 2. Single wall plenum walls and casings
 - 3. Fasteners and Sealants
 - 4. Exceptions: Where integral with manufactured piece of equipment

1.2 REFERENCE STANDARDS

- A. SMACNA HVAC Duct Construction Standards, latest edition

1.3 DEFINITIONS

- A. Seam: locks or weld applied longitudinally to close section of duct, for example longitudinal seam, spiral seam.
- B. Joint: abutting connection between duct sections for continuity of air passage, for example cross joint, transverse joint, coupling.
- C. Reinforcement: hardware applied to strengthen duct, for example girth angles, tie rods, fasteners (not connectors), and the like.
- D. Stiffening: folding, bending, beading, cross-breaking or corrugating of sheets to achieve strength through shape, for example pocket lock secures joint and is transverse stiffener, with girth angle and fasteners applied (not connectors), joint or stiffener is reinforced.
- E. Duct Classification
 - 1. Terms used in this specification are defined as follows:
 - a. Low Pressure: less than 2 inches pressure class and less than 2000 feet per minute air velocity
 - b. Medium Pressure: 2 inches to 6 inches pressure class or higher than 2000 feet per minute air velocity
 - c. High Pressure: above 6 inches pressure class

1.4 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.

1. "R" means required.
2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Ductwork materials and fittings	R			R
Flexible ducts	R			R
Duct sealants	R			
Duct pressure testing reports		R		

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Spiral oval and round ducts
 1. United Sheet Metal Division, United McGill
 2. Semco Manufacturing, Inc.
 3. Metco
 4. Contractor fabricated
 5. Or equal
- C. Duct Connection Systems
 1. Ductmate Industries, Inc.
 2. Fabriduct Transverse Duct Connection system
 3. Ward Industries, Inc.
 4. Or equal
- D. Flexible Ducts
 1. Thermaflex
 2. Flexmaster
 3. Or equal
- E. Duct Sealants
 1. Minnesota Mining and Manufacturing Company
 2. Foster
 3. Childers
 4. Miracle Adhesive Corporation
 5. United Sheet Metal Division United McGill Corporation
 6. Hardcast Products Group
 7. Mon Eco Industries
 8. Nashua
 9. 3M
 10. Or equal
- F. Flexible Duct Clamps
 1. Panduit

2. Aeroquip Corporation
3. Ideal Division Parker Hannifin Corporation
4. Tridon Corporation
5. Young Regulator Company
6. Or equal

- G. Duct Support Systems
1. CEAS Wedgy Support Systems
 2. Gripple
 3. Or equal

2.2 MATERIALS

- A. Galvanized Steel Sheet Metal
1. Cold rolled soft steel sheets
 2. ASTM A653 and A924
 3. Galvanizing:
 - a. General: minimum G-60
 - b. Exposed to weather or outdoor air, or as indicated herein or on Drawings: minimum G-90
 - c. Plenum walls and blank-offs where in contact with cooling coil: minimum G-90
 4. Lock-forming quality
- B. Miscellaneous Products
1. Screws and rivets
 - a. Same material as sheet, except as indicated on the Drawings
 - b. On aluminum sheets, provide cadmium plated or stainless steel
 - c. Zinc or cadmium plated, permitted on galvanized sheets
 - d. Minimum screw size: No. 10
 - e. Minimum rivet size: 4 pound
 2. Duct Sealants
 - a. Duct Sealing Compound. UL-181 listed, water-based
 - 1) Foster Safetee Duct Sealant 32-19
 - 2) Childers CP-146
 - 3) Design Polymerics DP-1010
 - 4) Hardcast Products Group Flex-Grip 550 or 601
 - 5) Or equal
 - b. Rolled Elastomeric Duct Sealant: Hardcast Products Group Foil-Grip 1403-181BFX, Aluma-Grip AFT-701 or equal, UL-181 listed
 - c. Gaskets
 - 1) Continuous, reinforced, inert self-conforming type
 - 2) 1/8 inch thick
 - 3) Width: to match angle connection.
 - 4) 3M Weatherban Ribbon Sealant PF5422 or equal
 - d. Two-Part Hard-Setting Joint Tape
 - 1) Two part process includes tape and hard setting sealant
 - 2) Mineral impregnated woven fiber tape
 - 3) Impregnated with activator/adhesive of polyvinyl acetate type
 - 4) UL Listed
 - 5) Flame spread: 10
 - 6) Smoke contributed: 0
 - 7) Equal to Hardcast 550 or 601 sealant and Aluma-Grip AFT-701 tape
 3. Spring Fasteners

- a. Oval head stud and receptacle
 - b. Screwdriver slot
 - c. Self-ejecting
 - d. Dzus or equal
 - 4. Angles, tie rod and shapes for reinforcing ducts: In accordance with SMACNA HVAC Duct Construction Standards
 - 5. Duct connection system
 - a. Transverse bolted duct joints
 - b. Flanges with permanent, non-hardening sealant
 - c. Ductmate Industries Ductmate 25 and 35, Fabriduct TDC, or equal
- C. Turning vanes
- 1. Galvanized steel ductwork: galvanized steel or painted black steel, except as indicated on the Drawings
 - 2. Other ductwork: same material as ductwork
 - 3. Construction per SMACNA HVAC Duct Construction Standards for
 - a. Single wall vanes with 3/4 inch trailing edge
 - b. Double wall vanes: Not acceptable
 - c. Vane length: Provide separate equal size sections for vane length greater than those indicated in referenced Standards.
 - d. Vane runners: Type 1 or 2 acceptable
 - 4. Vane radius
 - a. 2 inch radius: duct width up to 36 inches
 - b. 4 inch radius: duct width 36 inches or larger
 - 5. Vanes shall be at the correct angle for airflow (leading edge in line with the entering duct section; leaving edge in line with exiting duct section). If only 45° angles are available, turning vanes shall only be used in 90° elbows where the entering width equals the exiting width; all other elbows shall be full radius type unless otherwise indicated on the drawings.
- D. Low pressure round duct take-off fittings in rectangular duct
- 1. Factory-fabricated spin-in fitting
 - 2. Die-formed galvanized steel
 - 3. Balancing damper
 - a. Spring loaded
 - b. Locking regulator
 - c. Sealed at both ends to prevent leakage
 - 4. No scoop allowed for any application
 - 5. Noll Manufacturing, Young Manufacturing or equal

2.3 ROUND AND OVAL DUCTWORK

- A. General
- 1. Construction
 - a. Factory- or shop-fabricated spiral lock seam duct; no snap lock
 - b. Factory-fabricated longitudinal seam
 - 1) Acceptable for ducts larger than standard factory sizes
 - 2) Welded duct
 - 2. Fittings
 - a. Same material and construction as duct in which installed
 - b. For ductwork exposed to occupant view, do not use fabricated fitting at taps to VAV boxes and outlets. Instead use saddle tap cut into continuous spiral duct. Intent is for

spiral duct to be continuous for aesthetic reasons. Saddle tap flange width shall be 0.5 inches or less.

- c. Tees and taps
 - 1) 45 degree conical or shoe tap
 - 2) 90 degree conical tap
 - a) Inlet diameter shall be minimum 2 inches wider than the round duct diameter
 - b) Maximum 14° taper angle
 - 3) 90 degree straight tap
- d. Elbows
 - 1) Seams
 - a) Spot welded with bonded seams or spiral seam except as indicated below
 - b) Continuous welded seams for the following applications
 - 1. 4 inch and higher pressure class
 - 2. Product conveying ducts such as those for grease exhaust and laboratory fume hood exhaust
 - 3. Dishwasher exhaust for horizontal ducts
 - 4. Where exposed to occupant view
 - c) Adjustable elbows with sealed gores are acceptable on low pressure ducts where concealed from occupant view
 - 2) Minimum gores as follows:
 - a) 2 gores - less than or equal to 30 degrees
 - b) 3 gores - 31 degrees through 45 degrees
 - c) 4 gores - 46 degrees through 60 degrees
 - d) 5 gores (or solid full radius) - over 61 degrees
 - 3) Throat radius to diameter ratio shall not be less than 1.0 except:
 - a) Where shown otherwise on Drawings
 - b) Short radius adjustable elbows with sealed gores are acceptable on low pressure ducts where concealed from occupant view

2.4 FLEXIBLE DUCTS

- A. Flexible ducts
 - 1. UL 181, Class I Air Duct
 - a. Products categorized as only Flexible Air Connectors under UL 181 are prohibited.
 - 2. Labeled for compliance with CMC
 - 3. Minimum working pressure
 - a. 2 to 4 inch positive static pressure class: 4 inches
 - b. 0 to 1 inch negative static pressure class: 1 inch
 - 4. Insulated Flexible Duct
 - a. Chlorinated polyethylene (CPE) inner liner duct permanently bonded to a vinyl or zinc coated spring steel wire helix
 - b. Fiberglass insulating blanket; minimum R-value
 - 1) Ducts outside the conditioned space and in conditioned envelope: 4.2
 - 2) Ducts outside conditioned space and conditioned envelope: 8.0
 - c. Low permeability outer vapor barrier of fiberglass bi-directional reinforced metallized film laminate
 - d. Inner and outer liners shall provide a double air seal
 - e. Minimum Insertion Loss, 10 feet straight duct, 2500 fpm

Duct ID (in.)	Frequency (Hz)						
	125	250	500	1000	2000	4000	8000
6	11	33	37	39	37	19	14
8	13	35	34	39	29	17	14

≥12	10	26	26	35	24	11	9
-----	----	----	----	----	----	----	---

- f. Warranty: free of defects in material and factory workmanship for a period of 10 years from the date of manufacture
- g. Thermaflex M-KE or equal
- 5. Uninsulated Flexible Duct
 - a. Woven fiberglass fabric with flame retardant coating permanently bonded to a vinyl or zinc coated spring steel wire helix
 - b. Thermaflex S-LP-10 or equal
- B. Flexible ductwork clamps
 - 1. Straps listed for use with flexible ductwork
 - 2. 2 inches and greater SP Class: Galvanized steel strap
 - a. Adjustable toggle type
 - b. Young Quick-Clamps or equal
 - 3. Less than 2 inches SP class: Adjustable nylon strap
 - a. With factory furnished installed tool
 - b. Panduit PAN-TY Cable Ties, Heat Stabilized Nylon 6/6

PART 3 EXECUTION

3.1 INSTALLATION

- A. Coordinate with work of other trades
- B. See Division 25 Building Automation Systems
- C. See Section 230800 Mechanical Commissioning

3.2 MOUNTING AND ALIGNMENT

- A. See Section 230548 Vibration and Seismic Control

3.3 DUCT CLASSIFICATION

- A. Minimum operating pressure for each duct system, general
 - 1. Scheduled static pressure for each fan or unit, positive or negative, unless otherwise indicated on the Drawings
 - 2. Adjust upward to nearest pressure class tabulated in SMACNA HVAC Duct Construction Standards
- B. Static pressure class, unless otherwise indicated on the Drawings

Application	SMACNA Pressure Class
VAV supply air duct and risers from AHU thru shaft fire/smoke damper	3 inches
Other VAV supply air duct upstream of VAV boxes	2 inches
Downstream of VAV boxes, fan-coils, heat pumps, SZ VAV etc.	1 inch

Application	SMACNA Pressure Class
Outdoor air	-2 inches
Toilet exhaust	-2 inches
Other fans systems	Per fan static
Return air transfers	1/2 inch

3.4 DUCTWORK INSTALLATION

A. General

1. Install ducts in accordance with manufacturer's written installation instructions
2. Construct with gages, joints, bracing, reinforcing, and other details per current CMC and SMACNA, unless specified otherwise
 - a. Comply with most stringent
 - b. Provide ducts with CMC gages or thicker when traversing rated corridors
 - c. Combustion air ducts: Minimum 24 gage
3. Construct of galvanized sheet metal, except where otherwise indicated herein or on Drawings
4. Provide for duct rigidity by either of these methods
 - a. Beading at 12 inches on center, maximum
 - b. Crossbreak outward in ducts having positive internal pressure
 - c. Crossbreak inward in ducts having negative internal pressure
 - 1) Exception: All ducts exposed to rain shall outward crossbreak on top of the duct.
5. Duct dimensions indicated are outside duct dimensions (OD) unless indicated on the Drawings as inside dimension (ID or net, clear dimension).
6. Alter duct sizes on basis of equal friction where required to facilitate installation. Reflect changes in shop drawings for review by Owner's Representative.
7. At duct penetrations of walls, floors and ceilings where exposed to occupant view, provide sheet metal angle type escutcheons with no sharp corners or edges.
 - a. Clearance from duct to opening shall not exceed 2 inches.
 - b. Escutcheons shall overlap wall, floor, or ceiling surface by ½ inch minimum.
8. Frame, trim, caulk and seal all duct penetrations through acoustical walls and partitions. See Section 230548 Vibration and Seismic Control.
9. Firestopping at penetrations of fire rated floors and partitions
 - a. The fire-resistance rating of penetrations and fire-resistant joint systems shall be firestopped with a UL listed firestop system that will maintain the fire rating of the assembly. Through-penetrations and membrane penetrations shall be protected by an approved system installed as required by the system listing or as otherwise permitted by CBC Section 714. Listed through-penetration firestop systems and membrane penetrations shall be installed in accordance with the installation details for the listed system to be installed. Fire protection system installation details and listings shall be submitted for approval prior to the start of system installation.
 - b. Manufacturer
 - 1) 3M Penetration Sealing Systems (PSS 7909) and 3M Fire Barrier Caulk and Putty
 - 2) Dow-Corning LTV Silicone foam
 - 3) Or equal
10. Tapers
 - a. Pitch sides of duct in diverging or converging airflow maximum of 1 to 4 taper
 - b. Abrupt, bushing type fitting not allowed
11. Duct openings

- a. Provide openings where required to accommodate thermometers, smoke detectors, controllers, and the like. Insert through airtight rubber grommets.
- b. Where openings are provided in insulated ductwork for insertion of instruments, install insulation material inside metal ring for use as plug.
- c. At fire dampers allow adequate length of duct to install access door.
- 12. Avoid penetration of ducts; provide airtight seal at unavoidable penetrations of hanger rods and tie rods.
- 13. No exposed sharp metal allowed
 - a. All exposed pins, screws and sharp objects shall be covered with hardening silicon
 - b. All exposed sheet metal edges shall be hemmed with exposed corners rounded smooth
 - c. Remove all sheet metal fish hooks
 - d. Dryer ducts shall have no screws or other elements protruding into ducts that might catch lint.
- 14. Install lining in ducts and plenums as specified in Section 230700 Mechanical Insulation.
- 15. Volume dampers: Install dampers as specified in Section 233300 Duct Accessories
- 16. Ducts exposed to occupant view
 - a. Use only spiral round or oval ducts; no rectangular duct or flex duct unless specifically shown on Drawings.
 - b. Use Grippler hangers.
 - c. Duct sealant shall be clear and concealed in the joint, invisible to occupants.
 - d. Run ducts parallel to the structure unless specifically shown on Drawings.
 - e. Ducts shall not intersect wall corners or run parallel to and within a full height wall.
 - f. Where painting is shown on architectural drawings, materials shall be de-greased or otherwise ready to paint (paint by others).
 - g. Ducts shall have no external markings or tags.
 - h. Saddle taps and other taps to grilles, tees, wyes, etc.:
 - 1) Have flanges at duct connection inside the duct concealed from view
 - 2) Do not break the duct, i.e. use taps cut into a continuous spiral duct, not factory constructed tees.

B. Rectangular Elbows

- 1. Use radius elbows in rectangular ducts unless otherwise indicated on the Drawings based on ratio of inner throat radius (R) to duct width in plane of radius (W):
 - a. Low pressure: R/W shall not be less than 0.5
 - b. Medium pressure: R/W shall not be less than 1.0
 - c. Where space does not permit radius specified above, install short radius splitter vanes per SMACNA HVAC Duct Construction Standard with number of splitter vanes determined by R/W ratio
 - 1) One vane: R/W above 0.3
 - 2) Two vanes: R/W between 0.1 to 0.3
 - 3) Three vanes: R/W 0.1 and smaller
- 2. Square turns with turning vanes in rectangular ductwork may only be used as follows:
 - a. Where shown on drawings. Note: turning vanes are not required on return air transfer boots unless shown on Drawings.
 - b. Where radius elbow specified above cannot fit.
 - c. Where close to inlets at fans (to minimize system effect).

C. Rectangular ductwork

- 1. Transverse Joints
 - a. Standard: Fabriduct TDC or Ductmate or equal. Low pressure ductwork may be slip & drive (S&D) per SMACNA.
 - b. Welded. Where indicated herein or on plans.
- 2. Longitudinal Joints

- a. Standard: Pittsburgh. Snap lock not allowed.
 - b. Welded. Where indicated herein or on plans.
 - 3. Branch take-offs
 - a. Medium pressure riser taps: double 45 degree (upstream and downstream)
 - b. Other medium pressure: 45 degree upstream
 - c. Low pressure: straight 90 degrees

- D. Plenum walls, blank-offs, and casings
 - 1. Constructed per SMACNA HVAC Duct Construction Standard, Casings and Plenums.
 - 2. Static pressure class
 - a. Upstream of fan: -2 inches
 - b. Downstream of fan: fan static pressure or greater
 - 3. Seal all joints, edges, and penetrations as per HVAC ducts as specified herein.

- E. Round and oval ductwork
 - 1. Joints
 - a. Standard: Beaded sleeve joints mechanically fastened with sheet metal screws or pop rivets
 - b. Welded. Where indicated herein or on plans.
 - 2. Longitudinal
 - a. Standard: Spiral lock
 - b. Welded. Where indicated herein or on plans.
 - 3. Branch take-offs
 - a. Medium pressure: 45 degrees or conical 90 degrees
 - b. Low pressure: straight 90 degrees. Branch connections may be made with spin-in fittings
 - c. Center-line take-off, unless otherwise indicated on the Drawings

- F. Flexible ductwork
 - 1. Use only where shown on drawings.
 - 2. Type:
 - a. Insulated acoustical type shall be used for all:
 - 1) Supply air
 - 2) Return air
 - 3) Exhaust air (for acoustical dampening) except rooms with showers or other high moisture sources
 - b. Uninsulated type shall be used for all:
 - 1) Exhaust air from rooms with showers or other high moisture sources
 - 3. Not allowed for:
 - a. Product conveying systems such as kitchen exhaust and laboratory exhaust
 - b. Dishwasher exhaust
 - c. Dryer exhaust (other than final exposed connection at dryer)
 - d. Medium pressure ducts upstream of VAV boxes
 - 4. Continuous, single pieces
 - 5. Length
 - a. Maximum: 5 feet
 - b. Minimum:
 - 1) Insulated acoustical type: 5 feet
 - 2) Uninsulated type: 3 feet
 - 6. End Connections
 - a. Connect to duct collars, terminal unit connections and round air outlets per manufacturer's instructions.
 - b. Secure with strap clamps and seal as specified herein.
 - 7. Installation

- a. Support adequately to avoid excessive droop
 - b. Minimum inside bending radius not less than one duct diameter
 - c. Install as straight as possible except as shown on drawings for sound attenuation
 - d. Cut ducts to lengths required rather than create bends to take up excess lengths except as shown on drawings for sound attenuation
- G. Grille connections
- 1. Provide at entry to diffuser collar either
 - a. Straight duct for 1 duct diameters or greater
 - b. Full radius elbow
 - c. Side inlet plenum
 - 1) Height: 4 inches minimum taller than top of grille to provide room for uniform airflow to grille
 - 2) Width/length: 2 inches wider than duct or round diffuser collar, whichever is larger
 - 3) For supply air grilles, internal surfaces lined with minimum 1/2 inch thick Type AL duct liner as specified under Section 230700 Mechanical Insulation
 - 4) At contractor's option, where plenum is required at round neck diffuser, square neck diffuser with length and width equal to diffuser diameter may be substituted
 - d. Thermaflex FlexFlow Elbow or equal
 - 2. Connections at grilles shall be insulated to the extent the duct is insulated including the final register box.
 - 3. Seal connections at grilles per seal class of upstream ductwork.
- H. Duct hangers and supports
- 1. General
 - a. Support horizontal ducts with hangers of size and spacing as indicated in pertinent SMACNA HVAC Duct Construction Standards
 - b. Attachment to structure: See Section 230529 Hangers and Supports
 - c. Seismic restraints: See Section 230548 Vibration and Seismic Control
 - 2. Horizontal Duct Supports
 - a. Install hangers at each change in direction of duct
 - b. Strap hangers
 - 1) Extend strap down both sides of ducts
 - 2) Turn under bottom one inch minimum
 - 3) Metal screw hangers to
 - a) Bottom of duct
 - b) Upper and lower sides of ducts
 - c) Not more than 12 inches on center
 - c. Angle hangers
 - 1) Provide angle hangers formed by extended vertical bracing angles
 - 2) Or by rods connecting to bottom angles if size or bracing angles conform to hanger schedule
 - 3. Vertical duct supports
 - a. Support vertical ducts at every floor
 - b. Use angles or channels mechanically fastened to ducts with screws or pop rivets.
 - c. Set angles or channels on floor slab or structural steel members placed in opening, unless otherwise indicated on the Drawings
- I. General ductwork
- 1. Applies to ductwork not specifically listed in Paragraphs below
 - 2. Standard galvanized construction
 - 3. Standard seams and joints

- J. Ducts exposed to weather
1. Galvanized steel G-90, 304 stainless steel, or aluminum
 2. Make ducts subject to rain watertight.
 3. Construct as follows to assure water run-off
 - a. Arrange standing seams to not act as dams
 - b. Longitudinal seams at bottom of duct
 - c. Construct all ducts subject to rain watertight and to insure water runoff by one or more of following techniques
 - 1) Slope entire top of duct down toward side
 - 2) Vertical struts within duct to bow top panels of duct into convex shape
 - 3) Sheet metal cap where shown on Drawings
- K. Sound-rated duct packing
1. Wherever possible avoid duct penetrations through sound-rated walls, floors and ceilings.
 2. Provide packing for unavoidable duct penetrations per Section 230548 Vibration and Seismic Control.
- L. Joint Sealing
1. Seal ducts per the Seal Levels tables below
 - a. Seal factory fabricated ducts and plenums, including terminal boxes, if not factory sealed to Seal Level listed
 - b. Provide more stringent sealing if required to meet requirements of Paragraph 3.5.

Seal Level Requirement				
Duct Location	Duct Type			
	Supply		Exhaust/ outdoor air	Return
	<2 in. water column ^b	≥2 in. water column ^b		
Outdoors	A	A	C	A
Unconditioned Spaces	A	A	C	A
Return Air Plenums	A	A	A	C
Conditioned Spaces	C	A	A	C
^b Duct design static pressure classification.				
Seal Level Definitions				
Seal Level	Sealing Requirements			
A	All transverse joints, longitudinal seams, and duct wall penetrations			
B	All transverse joints and longitudinal seams			
C	Transverse joints only			
Longitudinal seams are joints oriented in the direction of airflow. Transverse joints are connections of two duct sections oriented perpendicular to airflow. Duct wall penetrations are openings made by any screw fastener, pipe, rod or wire. Spiral lock seams in round and flat oval duct need not be sealed. All other connections are considered transverse joints, including but not limited to spin-ins, taps and other branch connections, access door frames and jambs, duct connections to equipment, gores of elbows, etc.				

2. Ducts not exposed to weather
 - a. General: Seal using one of the following:
 - 1) Duct Sealing Compound
 - 2) Gasketed TDC or Duct-Mate
 - 3) Two-Part Hard-Setting Joint Tape
 - 4) Rolled Elastomeric Duct Sealant if and only if
 - a) Joint is not exposed to occupant view
 - b) Pressure class is less than 2 inches

- c) Surface is clean, dry, and grease/oil-free
 - d) Extensive pressure is applied, working the tape into the duct surface using an application tool recommended by the Rolled Elastomeric Duct Sealant manufacturer.
 - b. Flexible duct
 - 1) Secure with straps or clamps as specified herein.
 - 2) Supplement with Rolled Elastomeric Duct Sealant, both inner and outer liner.
 - c. Indoor duct where exposed to occupant view: Sealant shall be within joint only and not visible.
 - d. Fire and fire/smoke dampers: Sealant shall be listed as SFM approved on manufacturer's UL installation sheet.
 - e. Continuous welded ducts: Additional sealing not required.
- 3. Duct exposed to weather
 - a. TDC or Duct-Mate joints: Utilize interior joint gasket material plus a bead of butyl rubber sealant at the joint and continuous metal clip or cleat over the top of all four joints (top bottom and sides).
 - b. Continuous welded ducts: Additional sealing not required.
 - c. Other joints: Apply Two-Part Hard-Setting Joint Tape to
 - 1) Longitudinal joints
 - 2) Transverse joints
 - 3) Duct penetrations
 - 4) Screws through duct
 - 5) Gores of elbows
- 4. After installation and testing reseal joints found to be leaking at no additional cost to the Owner.

3.5 DUCT PRESSURE/LEAKAGE TESTING

- A. Scope of Testing
 - 1. HVAC Ductwork and Plenums
 - a. Supply
 - 1) 3-inch pressure class and greater: Test entire duct section.
 - 2) 2-inch pressure class:
 - a) Required only if duct area required to be tested by other sections herein do not total 10% of the total installed duct area for the project.
 - b) Test 2-inch class duct sections starting with those that are directly connected to 3-inch pressure class ducts until 10% of the total installed duct area for the project. Provide a drawing showing proposed sections to be tested for approval prior to testing.
 - 3) Ductwork outside the building envelope: Test entire duct section.
 - 4) Other: Not required
 - b. Return:
 - 1) Ductwork outside the building envelope: Test entire duct section
 - 2) Other: Not required
 - c. Exhaust:
 - 1) General: Not required
 - d. Outdoor air: Not required
 - 2. Life Safety Ductwork
 - a. Since smoke exhaust will be balanced at the atrium exhaust per Section 230593 Testing, Adjusting and Balancing, leakage in the mechanical room is not relevant. Relief fans have been oversized to account for some mechanical room leakage.

B. General

1. Tests conducted in presence of Owner's Representative
2. Use portable high pressure blower and necessary instruments to indicate amount of leakage
3. See Section 230593 Testing, Adjusting and Balancing for testing procedures and accuracy of test instruments
4. Conduct tests as prescribed in SMACNA HVAC Air Duct Leakage Test Manual, and make test before duct sections are concealed
5. Procedure
 - a. Seal openings in ducts and plenums to be tested.
 - b. Connect test apparatus to test section using flexible duct connection or hose.
 - c. Close damper on blower suction side, to prevent excessive buildup of pressure.
 - d. Start blower and gradually open damper on suction side of blower.
 - e. Build up pressure in test section equal to static pressure class.
 - f. Noise generated from duct leakage not acceptable. Seal as required.
 - g. Determine amount of air leakage by makeup air flow measurements:
 - 1) Maximum permitted leakage for HVAC ductwork shall be:

$$CFM_{max} = (A/100) C_L P^{0.65}$$

where

CFM_{max} = the maximum permitted leakage, cubic feet per minute (cfm).

A = surface area of the tested duct sections, square feet.

CL = duct leakage class, cfm/100 square feet at 1 inch water column.
 = 6 for rectangular sheet metal, rectangular fibrous ducts, and round flexible ducts

= 3 for round/flat oval sheet metal or fibrous glass ducts

P = test pressure which shall be equal to the design duct pressure class rating, inches water column.

2) Maximum permitted leakage for life safety ductwork shall be per CBC 909.

3) If leakage exceeds allowable limit, and only a portion of the ductwork was tested per Paragraph 3.5A.1.a.2), repair leaks and retest duct sections until permitted leakage limits are obtained, then expand testing to include 40% of duct system area at no additional cost to the Owner. If failures continue, expand to 100% of duct system area at no additional cost to the Owner.

6. Visually mark tested sections with certification sticker and initials of field test inspector.

C. Documentation

1. Submit certification of test results of compliance to Commissioning Authority.
2. Include certified test results showing compliance per Section 230501 Basic Mechanical Materials and Methods.

3.6 PROTECTION

- A. Adhere to SMACNA Duct Cleanliness for New Construction Guidelines for Intermediate Level Duct Cleanliness unless more stringent requirements are indicated herein.
- B. Storage: Porous materials, such as lined and flexible duct, shall be stored where they will not be exposed to rain or other moisture sources.
- C. Temporary closure: Provide temporary closure of polyethylene film or other covering which will prevent entrance of dust and debris at the following conditions:
 1. Exposed ends of unlined installed ducts at the end of each day
 2. Exposed ends of lined ducts or plenums whether in storage or installed

- D. Duct cleaning
 - 1. Using the connected fan(s) force air at high velocity through duct to remove accumulated dust
 - 2. Protect equipment and spaces, which may be harmed by excessive dirt with filters, or bypass during cleaning
 - 3. In areas, which must be kept dust free, seal all outlets duct tight. When closures are removed avoid spilling dust in room

3.7 INSPECTION

- A. Verify that adequate clearance between ducts and adjacent walls or equipment is available to permit proper sealing, maintenance and repairs.

3.8 PRE-OPERATING CHECKS

- A. Before operating the duct systems: Set all manual dampers in full open position
- B. Complete the Pre-Functional Test Data Sheet (Section 230800 HVAC Commissioning) for each duct system.

3.9 TESTING AND ADJUSTING

- A. Before starting the duct systems
 - 1. Clean the duct system. See Paragraph 3.6D
 - 2. See Section 019100 Commissioning
- B. After starting the duct systems: Check for noise and leakage. Repair as required at no additional cost to the Owner.
- C. See Section 230593 Testing, Adjusting, and Balancing: Coordination with Balance Agency:
 - 1. Provide services of a sheet metal installer familiar with the system ductwork to provide assistance to the balancing agency during the initial phases of air balancing in locating all sheet metal dampers
 - 2. Install missing dampers
- D. See Section 230800 Mechanical Commissioning

END OF SECTION

SECTION 233300
DUCT ACCESSORIES

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Access Doors
 - 2. Balancing Dampers
 - 3. Automatic Dampers
 - 4. Backdraft Dampers
 - 5. Fire Dampers
 - 6. Smoke Dampers
 - 7. Fire/Smoke Dampers
 - 8. Sound Attenuators
 - 9. All duct accessories except, where integral with manufactured piece of equipment.

1.2 QUALITY ASSURANCE

- A. Fire, smoke, and fire/smoke dampers shall be UL listed and constructed in accordance with UL Standard 555 Fire Dampers and UL Standard 555S.
- B. Demonstrate operation of smoke dampers to authorities having jurisdiction and Owner's representative as part of life safety testing.
- C. Access doors shall be UL labeled.
- D. Damper pressure drop and leakage ratings shall be based on tests and procedures performed in accordance with AMCA 500 - Test Methods for Louvers, Dampers and Shutters.

1.3 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. "R" means required.
 - 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Access doors	R2			R
Balancing dampers	R2			R
Automatic dampers	R	R		R
Backdraft dampers	R2			R
Fire dampers	R	R		R

Item	Product Data	O&M Manual	Samples	Shop Drawing
Smoke dampers	R	R		R
Fire/Smoke dampers	R	R		R
Sound attenuators	R			R

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Access Doors, Ducts
1. Ventfabrics, Inc.
 2. Duo Dyne, Corporation
 3. Ruskin Mfg. Company
 4. PCI Industries – Pottorff
 5. Ductmate
 6. Or equal
- C. Access Doors, Plenum
1. Ventfabrics, Inc.
 2. Duo Dyne, Corporation
 3. Elgen Manufacturing Company
 4. Or equal
- D. Balancing and Automatic Dampers
1. Ruskin Manufacturing Company
 2. Greenheck
 3. Air Balance Inc.
 4. American Warming and Ventilating Inc.
 5. Johnson Controls
 6. PCI Industries - Pottorff
 7. Or equal
- E. Backdraft Dampers
1. Greenheck Fan Corp
 2. Ruskin Manufacturing Company
 3. Air Balance, Inc.
 4. American Warming and Ventilating Inc.
 5. Or equal
- F. Damper Hardware
1. Ventfabrics, Inc.
 2. Duo Dyne, Corporation
 3. Young Regulator Company
 4. Or equal
- G. Fire Dampers, Smoke Dampers, and Combination Smoke and Fire Dampers

1. Ruskin Manufacturing Company
2. Greenheck
3. Air Balance Inc.
4. PCI Industries - Pottorff
5. Or equal

H. Sound Attenuators

1. Vibro-Acoustics
2. Dynasonics
3. Industrial Acoustics, Inc.
4. Or equal

2.2 DUCT ACCESS DOORS

A. In accordance with SMACNA Duct Construction Manuals, except as indicated in the Drawings

B. In Ductwork

1. Construction

- a. Same material as duct
- b. Rating same as duct pressure class
- c. Where duct is insulated
 - 1) Fiberglass insulation, thickness to match duct insulation installed R-value, see 230700 Mechanical Insulation
 - 2) Double wall
- d. Positive seal polyethylene gasket
- e. Paired progressive cam-locks, quantity as required for tight, low leakage fit
- f. No tools required for opening and closing

2. Size

- a. 20 inches x 14 inches unless otherwise indicated in the Drawings
- b. Ducts less than 16 inches: one dimension 20 inches; other dimension 2 inch less than duct width
- c. Larger sizes where required for access

C. In Grease and Lab Exhaust Ductwork

1. Factory fabricated access doors listed for application
2. Size as shown on drawings and per code

2.3 DAMPERS

- A. Volume Dampers
1. Conform to requirements of SMACNA HVAC Duct Construction Standards.
 2. General
 - a. Blades of same material as duct where damper is located
 - b. Damper Hardware
 - 1) Ventlok 400 and 4000 series or equal; for low pressure systems 2 inch SMACNA pressure class and less
 - 2) Ventlok HiVel hardware or equal; for greater than 2 inch SMACNA pressure class
 - c. Actuating quadrants typical for single and multi-blade dampers; provide closed bearing on opposite end from quadrant to prevent air leakage: Ventlok No. 609 or equal
 - d. Bearing at one end of damper rod: Ventlok No. 609 or equal
 - e. Sealed bushings installed at both ends to avoid duct leakage
 - f. Accessible quadrant at other end of damper rod
 - 1) With lever and lock screw: Ventlok No. 635 or equal
 - 2) Insulated ducts
 - a) Quadrants mounted on collar to clear insulation
 - b) Ventlok Nos. 637, 638, or 639 or equal
 - c) Selection based on insulation thickness
 - g. For volume dampers above non-removable (inaccessible) ceilings
 - 1) Use ceiling access panels if provided for another purpose and located within reach of the damper; do not provide access panels whose sole purpose is for damper access.
 - 2) Otherwise provide either:
 - a) Ventlok No. 677, MAT Roto-Twist 200, or equal mechanical concealed damper regulator with
 1. Required interconnecting hardware and cable
 - b) Greenheck RBDR-50, MAT Electro-Balance 200 or equal electrically actuated balancing damper assembly (position feedback not required) with
 1. Required interconnecting hardware and cable
 2. Battery powered controller
 - c) With either device, controller connection shall be located in a concealed location as follows:
 1. In the diffuser/grille backpan or plenum where accessible through the diffuser/grille
 2. Above the ceiling at the terminal box that serves the damper. This may be a ganged connector for multiple dampers served by the terminal box.
 3. Above the ceiling at the nearest accessible location, such as next to a fire/smoke damper ceiling access panel
 3. Single blade dampers
 - a. Galvanized steel ductwork: galvanized steel, except as indicated in the Drawings
 - b. Blade: Two gages heavier than duct gage, or 18 gage, whichever is lighter
 4. Multi-blade Dampers
 - a. Low Pressure/Low Velocity Systems (2 inch water column or less static pressure class and 1500 fpm or less face velocity)
 - 1) Opposed blade damper
 - 2) Ruskin Model CD35 or equal
 - b. High Pressure/High Velocity Systems (greater than 2 inch water column static pressure class or greater than 1500 fpm face velocity):
 - 1) Rectangular
 - a) Opposed blade damper
 - b) Ruskin Model CD60 or equal
 - 2) Round and Oval
 - a) Oval: Ruskin Model CDR25 and DO25 or equal

- b) Round: Up to 20 inch diameter: Ruskin Model MDRS25 or equal
- c) Round: Larger than 20 inch diameter: Ruskin Model CDRS25 or equal

B. Automatic Dampers

1. Refer to Section 237300 Air Handling Units for dampers provided with factory packaged air handling equipment.
2. Field installed dampers
 - a. Blade Action
 - 1) Throttling duty: opposed
 - 2) Mixing duty: parallel
 - 3) Two-position: parallel or opposed
 - b. Bearings: Molded synthetic or stainless steel sleeve, turning in extruded hole in frame.
 - c. Seals:
 - 1) Blade: Inflatable PVC coated fiberglass material, silicone, or neoprene mechanically attached to blade edge.
 - 2) Jamb: Flexible metal compression type.
 - d. Linkage: concealed in frame. External linkage, jump-over brackets, jackshafts and any other elements in the airstream will not be accepted.
 - e. Axles: Minimum 1/2 inch diameter plated steel, hex-shaped, mechanically attached to blade. Side access for direct-coupled actuator.
 - f. Finish: Mill galvanized
 - g. Where stainless steel dampers are indicated on drawings, dampers shall have stainless steel blades, stainless steel bearings, stainless steel jamb seals.
 - h. Where aluminum dampers are indicated on drawings, dampers shall have aluminum blades, aluminum frame, synthetic or stainless steel bearings, stainless steel jamb seals.
3. Actuators: Direct coupled type specified under Division 25 Building Automation Systems
4. Damper area: See Drawings.
5. Damper type: See Drawings.

C. Backdraft Dampers

1. Required locations
 - a. Where indicated on the Drawings
 - b. In suction or discharge of all exhaust fans as listed in equipment schedule
 - 1) Integral, heavy-duty factory-installed type acceptable unless otherwise scheduled
2. General Applications
 - a. Construction
 - 1) Extruded aluminum construction, minimum 4 inch 12 gage frame
 - 2) Extruded vinyl locked into blade edge.
 - 3) Blade ends overlapping frame
 - b. Performance
 - 1) Start to open: .02 inches w.g. or less
 - 2) Fully open: .05 inches w.g. or less
 - 3) Leakage for 24 inch wide damper: 25 cfm per ft² or less
 - c. Ruskin Series CBD4 or equal
3. High Velocity Applications
 - a. Applies to discharge of air handlers and where velocity exceeds 1500 fpm. Damper shall be specifically designed for location at turbulent fan discharge.
 - b. Frame
 - 1) Minimum 12 gage galvanized steel channel
 - 2) Bolt Holes: Both flanges
 - c. Blades

- 1) Airfoil-shaped with integral structural reinforcing tube running full length of each blade
- 2) Material: 7 inches x minimum 0.080 inch Alloy 6063-T5 extruded aluminum
- 3) For multiple section dampers, provide galvanized steel or aluminum bracket to link dampers so they operate together.
- d. Axles: Minimum 3/4 inch (19 mm) diameter plated steel
- e. Bearings: Bolt-on bearings with re-lube ball bearings
- f. Linkage
 - 1) 3/16 inch thick x 3/4 inch plated steel tie bar with minimum 16 gage plated steel linkage arms; stainless steel pivot pins
 - 2) Located out of airstream (side or external linkage)
- g. Counterbalance: Located out of airstream
- h. Seals
 - 1) Blade
 - a) Mechanically attach blade seals to blade
 - b) Silicone rubber, rated for 300 degrees Fahrenheit
 - 2) Jamb: Vinyl
- i. Ruskin CBS92 or equal
- j. For Fume Hood Exhaust Fans only
 - 1) As above except stainless steel blades, stainless steel bearings, stainless steel linkage and axles, silicone blade edge seals, and no jamb seals.
 - 2) Greenheck HB-230 or equal

2.4 FIRE DAMPERS

- A. Ratings (test conditions and label) per UL Standard 555
 1. 250 degrees Fahrenheit minimum
 2. 1-1/2 hour fire rating, unless otherwise indicated in the Drawings
 3. Dynamic (closes against air flow) where required by code or where scheduled
- B. Factory sleeve
- C. Damper
 1. Multi-bladed, equipped with fusible link, spring loaded type
- D. Fusible link
 1. UL listed
 2. Fusible links on fire dampers shall be constructed to UL Standard 33 – Fusible Links for Fire Protection Service
 3. Temperature rating: Per code
- E. Type: as indicated on the Drawings

2.5 SMOKE DAMPERS

- A. Factory sleeve
- B. Damper
 1. Leakage class as scheduled, minimum Class 2, rated per UL 555S
- C. Actuator

1. UL 555S listed
 - a. 120 volt two position unless otherwise indicated on drawings
 - b. Spring return normally closed unless otherwise indicated on drawings
 - c. Electronic cut-out at full-open so that actuator creates no noise holding open
 - d. Permanently lubricated gears
 - e. Direct coupled with cold-weld steel clamp; aluminum clamp and external linkage and jackshafts are not acceptable for single section dampers.
 - f. For multiple damper sections using one actuator, jackshafts between sections shall be welded, not bolted or screwed.

D. Controls

1. Status end switches
 - a. Only where scheduled on Drawings
 - b. Built into the direct-coupled actuator; blade mounted end switch packages are not acceptable.
 - c. For dampers with multiple actuators, status switches are required for each independent damper section; sections that have multiple actuators and that also have jackshafts connecting the dampers in each section together shall have actuator end switches on only one actuator.
 - d. UL 555S listed
 - e. California State Fire Marshal approved

E. Type: as indicated on the Drawings

2.6 COMBINATION FIRE AND SMOKE DAMPERS

A. Fire ratings (test conditions and label) per UL Standard 555S

1. 250 degrees Fahrenheit minimum
2. 1-1/2 hour fire rating, unless otherwise indicated in the Drawings

B. Factory sleeve

C. Damper

1. Either parallel blade or opposed blade
2. Leakage class as scheduled, minimum Class 2, rated per UL 555S
3. Locate damper in sleeve starting at approximately 3" from end of the sleeve opposite the damper actuator end. (Damper shall be installed with this end protruding 3 inches out from inside surface of wall.)
4. Horizontal dampers shown on Drawings to be supported by a drywall rated enclosure (rather than a framed concrete opening) shall be listed for this application.

D. Actuator

1. UL 555S listed
 - a. 120 volt two position unless otherwise indicated on drawings
2. Spring return normally closed unless otherwise indicated on drawings
3. Electronic cut-out at full-open so that actuator creates no noise holding open
4. Permanently lubricated gears
5. Direct coupled with cold-weld steel clamp; aluminum clamp and external linkage not acceptable
6. For multiple damper sections using one actuator, jackshafts between sections shall be welded, not bolted or screwed.

E. Controls

1. Heat-actuated electric release
 - a. Controlled closure to prevent duct and HVAC component damage
 - b. Damper to automatically reopen after a test, smoke detection or power failure condition. In the event of heat activated closure, the damper must be manually reset at the damper.
 - c. Release temperature: as scheduled on drawings.
 - d. Ruskin EFL or equal
 2. Status end switches
 - a. Only where scheduled on Drawings
 - a. Built into the direct-coupled actuator; blade mounted end switch packages are not acceptable.
 - b. For dampers with multiple actuators, status switches are required for each independent damper section; sections that have multiple actuators and that also have jackshafts connecting the dampers in each section together shall have actuator end switches on only one actuator.
 - c. UL 555S listed
 - d. California State Fire Marshal approved
- F. Type: as indicated on the Drawings

2.7 SOUND ATTENUATORS

- A. Factory prefabricated
- B. Shell
 1. Galvanized steel: minimum 22 gage
 2. Leakproof at pressure differential of 8 inches water gage
- C. Media:
 1. Flamespread: maximum 25
 2. Fuel contributed and smoke developed: maximum 50
 3. Minimum 4.5 pounds per cubic foot density glass or mineral fiber packed under 5 percent compression
 4. Media shall meet erosion test method described in UP Publication No. 181
 5. Filler to be inert, vermin and moisture proof
- D. Internal construction: Galvanized perforated steel baffles: minimum 24 gauge
- E. Attenuator Performance
 1. See schedule on the Drawings for
 - a. Net insertion ratings
 - b. Maximum allowable air pressure drop
 - c. Model number
- F. Certified tests
 1. Submit a laboratory certified test data for pressure drop and insertion loss ratings
 - a. For square or rectangular attenuators: 24 inch x 24 inch cross-section attenuator
 - b. For round attenuators: 24 inch diameter conical attenuator
 - c. Certification data for pressure drop and net insertion loss: based on tests of same attenuator
 - d. Attenuators and tests: subject to inspection upon request
- G. Industrial Acoustics, Inc. Quiet-Duct or equal

PART 3 EXECUTION

3.1 INSTALLATION

- A. Coordinate with work of other trades
- B. Install duct accessories in accordance with manufacturer's written installation instructions
- C. See Section 233100 Ducts
- D. Provide access doors in following locations:
 - 1. Coils in ducts (including at VAV boxes)
 - a. Entering and leaving side for cooling coils
 - b. Entering side for heating coils
 - 2. Automatic dampers: linkage side
 - 3. Smoke dampers
 - 4. Fire dampers
 - 5. Smoke detection heads enclosed in ducts
 - 6. At the top of each lined duct riser accessible from the fan room floor (for inspection of duct liner)
 - 7. Fan bearings enclosed in ducts
 - 8. Sprinkler heads in ducts
 - 9. Motors, actuators or other accessories that require access or service inside ducts
 - 10. Outdoor air plenums as required to clean plenum from dirt and debris.
 - 11. Where otherwise indicated on the Drawings
- E. Volume dampers
 - 1. Provide at locations indicated on the Drawings
 - a. Volume dampers shall be installed as far away from air outlets as functionally reasonable to avoid noise in the occupied space.
 - b. Provide also in wyes and tap-ins to outlets whether indicated on the Drawings or not, except
 - 1) Where dampers are not indicated on the Drawings above inaccessible ceilings
 - 2) To sidewall outlets in exposed ducts (opposed blade dampers in outlets shall be provided where scheduled)
 - 2. Additional locations where dampers appear to be required for balancing, place request for information with Engineer prior to construction.
 - 3. For ductwork exposed to occupant view, volume damper handles shall be on top of duct or otherwise concealed from occupant view.
 - 4. For dampers above non-removable ceilings that are not accessible from ceiling access panels or removable diffusers, provide concealed damper regulator as specified herein or detailed on Drawings.
- F. Fire and smoke dampers
 - 1. Provide in ducts and openings as indicated in the Drawings
 - 2. Provide access door in duct adjacent to each in location where damper may be inspected and internal fusible link or fire-stat may be replaced
 - 3. Install duct smoke detector provided by Division 26 if required; see Division 26 drawings
 - 4. Smoke and fire dampers installed in tunnel corridors shall have weight of damper supported from structure above.
- G. Control dampers

1. Field mounted control dampers installed with concealed linkage shaft accessible on side of damper with space for direct-coupled actuator
2. Actuator installation: See Division 25 Building Automation Systems

H. Install belt guards at all exposed belts

3.2 MOUNTING AND ALIGNMENT

- A. Install all accessories to prevent air leakage.
- B. Install closed bearing end on all damper blades that penetrate duct to prevent air leakage.
- C. Support extra weight of duct accessories. See Section 230548 Vibration and Seismic Control

3.3 INSPECTION

- A. Verify that adequate clearance between duct accessories and adjacent walls or equipment is available to permit maintenance and repairs.

3.4 PRE-OPERATING CHECKS

- A. Before operating duct accessories: Set all components in normal operating condition

3.5 TESTING AND ADJUSTING

- A. Before operating duct accessories see Section 019100 Commissioning
- B. After starting duct accessories
 1. Check for noise and leakage; repair as required at no additional cost to the Owner
 2. Operation test: Test each piece of equipment to show that it will operate in accordance with requirements.
- C. See Section 230593 Testing, Adjusting, and Balancing
- D. See Section 230800 Mechanical Commissioning

END OF SECTION

SECTION 233400

FANS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. All fans except where integral with manufactured piece of equipment
 - 2. Roof type gravity hoods and ventilators

1.2 REFERENCE STANDARDS

- A. ANSI/ABMA Standard 9 – Load Rating and Fatigue Life for Ball Bearings
- B. AMCA 99 – Standards Handbook
- C. AMCA 210 – Laboratory Methods of Testing Fans for Aerodynamic Performance Rating
- D. AMCA 300 – Reverberant Room Method for Sound Testing of Fans
- E. AMCA 301 – Methods for Calculating Fan Sound
- F. ANSI/ABMA 11 – Load Ratings and Fatigue Life for Roller Bearings

1.3 QUALITY ASSURANCE

- A. AMCA certified ratings per applicable AMCA standard based on the testing conducted in an independent laboratory
- B. Performance Ratings: Conform to AMCA 210 and bear the AMCA Certified Rating Seal
- C. Sound Ratings: AMCA 301; tested to AMCA 300 and bear the AMCA Certified Sound Rating Seal
- D. Fabrication: Conform the AMCA 99
- E. Conform to AMCA Bulletins regarding construction and testing
 - 1. Fans shall bear AMCA certified rating seal
- F. Scheduled equipment performance is minimum capacity required.
- G. Scheduled electrical capacity shall be considered as maximum available.
- H. Scheduled static pressure is external to the fan and does not include the pressure drop of accessories specified to be provided with the fan, such as backdraft dampers, inlet screens, belt

tubes, etc. The manufacturer shall include these pressure drops in the fan total pressure such that the scheduled airflow can be achieved at the scheduled external static pressure.

1.4 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. "R" means required.
 - 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Fans	R	R		R
Fan & Hood accessories	R	R		

- C. Include
 - 1. Complete graph of fan curves, not just curve for design conditions
 - 2. Sound power levels
 - a. Fans 1 horsepower and larger: dB by octave bands
 - b. Fans less than 1 horsepower: sones

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Loren Cook
- C. Greenheck
- D. Twin City
- E. Or equal

2.2 GENERAL

- A. Fans shall bear the AMCA certified ratings seal for sound and air performance and be certified in accordance with ARI Standard 210 and 211, and AMCA Standard 2408 for centrifugal fans
- B. Fans used shall not increase motor size, increase noise level, or increase tip speed by more than 10 percent, or increase inlet air velocity by more than 20 percent, from specified criteria.
- C. Performance
 - 1. See fan schedule on the Drawings

2. Capacities: minimum as scheduled on the Drawings
 3. Brake horsepower rating: Maximum 10 percent above that scheduled on the Drawings
 4. Fans and drives shall be capable of accommodating static pressure variations of plus or minus 10 percent
 5. Motor horsepower: No larger than that scheduled on the Drawings, or compensate Division 26 contractor for any associated cost to increasing motor size
 6. Sound power: No greater than that scheduled on the drawings
- D. Wheels
1. Class as indicated on the Drawings or as required for duty
 2. Formed steel or extruded aluminum
 3. Statically and dynamically balanced in accordance with AMCA Standard 204-96 Balance Quality and Vibration Levels for Fans
 4. Exposed fan wheels protected by finger proof screen where scheduled
- E. Shafts
1. AISI C-1045 hot rolled and accurately turned, ground, and polished
 2. Sized for a critical speed of at least 125% of maximum RPM
- F. Motors
1. Comply with Section 230513 Motors and Controllers.
 2. Provide electrically commutated motor (ECM) where scheduled
- G. Housing
1. Bolted and welded construction utilizing corrosion resistant fasteners
 2. Scroll wrapper and scroll side panels shall be a minimum 12 gauge steel
 3. The entire fan housing shall have continuously welded seams
 4. Spun inlet bell and shaped cut-off for centrifugal fans
 5. Weatherproof drive covers at utility sets shall have access doors
- H. Belt Drive
1. Matched, multiple V-belt
 2. Capacity: minimum 1.5 times motor horsepower
 3. Pulleys
 - a. Cast iron
 - b. Variable pitch diameter
 - 1) Except motors with variable speed drives
 - 2) Fans up to 7-1/2 hp motor
 - 3) Fans from 10 hp to 25 hp, under 1000 rpm
 - c. Fixed pitch diameter
 - 1) All motors with variable speed drives
 - 2) Fans 10 hp and over 1000 rpm
 - d. Select at mid-point of range
 4. Automatic belt tensioner to maintain proper belt tension and provide quick belt removal and replacement, where scheduled. Equal to Loren Cook.
 5. Companion sheaves to maintain belts parallel
 6. Drive guards
 - a. Comply with requirements of State COSHA
 - b. Provide holes in belt guards for tachometer readings
 - c. Indoor Belt Drives: 16 gage expanded metal or wire screen enclosure with 70 percent free area and steel frame
 - d. Outdoor Belt Drives: Provide enclosure over entire motor and drive assembly.
- I. Bearings

1. Designed and tested specifically for use in air handling applications
2. Heavy duty regreasable ball or roller type in a cast iron pillow block housing
3. Bearing shaft mounting mechanism shall be concentric mount, not set screw mount.
4. Grease fittings extended to accessible locations outside housing
5. Life rating: minimum 200,000 hours per ABMA Standard 9 or 11 L₅₀ rating, at maximum catalog speed

J. Painting

1. Electrostatically applied, baked polyester powder coating, minimum 2 mil thick
2. Paint must exceed 1,000 hour salt spray under ASTM B117 test method

K. Discharge: As indicated on the Drawings

2.3 SMOKE EXHAUST FANS

- A. Fans indicated on drawings as being exhaust fans provided to comply with CBC 909 requirements shall meet all CBC 909 requirements including:
 - B. Rated for duty up to 165°F (or temperature listed in schedule) for 20 minutes
 - C. 150% belt safety factor with minimum two belts on belt driven fans

2.4 HIGH VOLUME CEILING FANS

A. Warranty schedule:

1. Mechanical components: 10 years
2. Electrical components: 5 years (no factory install); 10 years (factory install)
3. Labor: 1 year

B. General

1. The entire fan assembly shall be Intertek/ETL-certified and built pursuant to the construction guidelines set forth by UL standard 507 and CSA standard 22.2. No. 113.
2. Sound levels from the fan operating at maximum speed measured in a laboratory setting shall not exceed 40 dBA. Actual results of sound measurements in the field may vary due to sound reflective surfaces and environmental conditions.

C. LED Light Kit

1. The fan shall be equipped with a hollow shaft in which electrical wiring can be routed to below the fan. The LED light kit shall operate independently from the fan at an operating voltage of 120–277VAC, 50–60 Hz. The standard color of the LED light kit components shall be white or silver.
2. The LED light kit shall have a standard LED color temperature and lumen option as scheduled.

D. Controls

1. The fan controller shall be incorporated into the fan assembly and housed in an enclosure independent of the motor to prevent overheating or electrical interference. The fan controller shall be factory programmed to minimize starting and braking torques and shall be equipped with a simple diagnostic program and an LED light to identify and relay faults in the system.
2. The controller shall include the following I/O points:

- a. Start stop
 - b. Status output
 - c. Speed input
 - d. Life safety lockout
3. Wall control module is specified under Division 25.
 4. Lighting dimmer/switch is specified under Division 26.
- E. Airfoil System
1. The fan shall be equipped with eight (8) high volume, low speed airfoils of precision extruded, anodized aluminum alloy. Each airfoil shall be of the high-performance Mini-Elipto design. The airfoils shall be connected to the hub and interlocked with eight (8) stainless steel retainers and two (2) sets of stainless steel bolts and lock washers per airfoil.
 2. The fan shall be equipped with eight (8) upswept winglets designed to redirect outward airflow downward, thereby enhancing efficiency. The winglets shall be molded of high strength polymer and shall be attached at the tip of each airfoil with a stainless steel screw. The standard color of the winglets shall be silver or black.
 3. The fan hub shall be constructed of zinc plated steel for high strength and durability. The hub shall be precision machined to achieve a well-balanced and solid rotating assembly.
- F. Motor
1. The motor shall be an IP43 rated permanent magnet brushless motor rated for continuous operation at maximum speed with the capability of modulating the fan speed from 0–100% without the use of a gearbox or other mechanical means of control.
- G. Mounting System
1. All components in the mounting system shall be of formed metal design using low-carbon steel no less than 3/16" (0.5 cm) thick and containing no critical welds. The mounting system shall be powder coated for appearance and resistance to corrosion. All mounting bolts shall be metric stainless steel or equivalent. No mounting hardware substitutions, including cast aluminum, are acceptable.
 2. The fan extension tube shall be a round, extruded aluminum tube. The extension tube shall include a chrome plate with forward and reverse controls and a fan status indicator light that is visible from the floor.
 3. The fan shall be equipped with a safety cable that provides an additional means of securing the fan assembly to the building structure. The safety cable shall be Ø3/16" (0.5 cm) diameter and fabricated out of 7 x 19 stranded galvanized steel, pre-loaded and tested to 3,200 lbf (13,345 N).

PART 3 EXECUTION

3.1 INSTALLATION

- A. Coordinate with work of other trades
- B. Install fans in accordance with manufacturer's written installation instructions.
- C. See Section 233100 Ducts for duct connections
- D. See Division 25 Building Automation Systems

- E. See Section 230800 Mechanical Commissioning
- F. Flexible duct connection at inlet and outlet: See Section 230548 Vibration and Seismic Control.
- G. Backdraft Dampers
 - 1. Comply with Title 24 Energy Standards and CMC
 - 2. Provide backdraft or shutoff dampers for suction or discharge of every exhaust fan as scheduled on the Drawings
 - 3. See schedules on the Drawings and Section 233300 Duct Accessories for where fan manufacturer may provide dampers and when specialty damper manufacturer must provide them.
- H. Roof Mounted Fans and Ventilators
 - 1. Install on factory fabricated curbs
 - a. Exception: Install Utility fans as indicated on the Drawings
 - b. Secured to structure with hold down methods as detailed
 - c. Made fully weatherproof. See Division 7 Thermal and Moisture Protection for waterproofing and roofing.
- I. High Volume Ceiling Fans
 - 1. Minimum Distances
 - a. Airfoils shall be at least 10 ft above the floor.
 - b. Installation area shall be free of obstructions such as lights, cables, sprinklers, or other building structures with the airfoils at least 2 ft (0.61 m) clear of all obstructions.
 - c. The structure the fan is attached to shall be capable of supporting a torque load of up to 40 ft-lb of torque.
 - 2. Wall control module installation and low voltage wiring are specified under Division 25.
 - 3. Lighting dimmer/switch installation and wiring are specified under Division 26.
 - 4. In buildings equipped with sprinklers, including ESFR sprinklers, fan installation shall comply with all of the following:
 - a. The maximum fan diameter shall be 24 ft.
 - b. The fan shall be centered approximately between four adjacent sprinklers.
 - c. The vertical clearance from the fan to the sprinkler deflector shall be a minimum of 3 ft.
 - d. Fans shall be interlocked to shut down immediately upon receiving a waterflow signal from the alarm system in accordance with the requirements of NFPA 72—National Fire Alarm and Signaling Code. See Division 28.

3.2 MOUNTING AND ALIGNMENT

- A. See Section 230548 Vibration and Seismic Control

3.3 INSPECTION

- A. Verify that adequate clearance between fans and adjacent walls or equipment is available to permit maintenance and repairs.

3.4 PRE-OPERATING CHECKS

- A. Before operating fans

1. See Section 230800 Mechanical Commissioning.
- B. Do not operate fans for any purpose, temporary or permanent, until
1. Ductwork is clean
 2. Filters in place
 3. Bearings lubricated

3.5 TESTING AND ADJUSTING

- A. Before starting fans
1. See Paragraph 3.4B
 2. See Section 019100 Commissioning
 3. Install belt and motor guards
- B. Start and test fans in accordance with manufacturers written installation instructions.
- C. Start up and adjust fans to insure proper operation.
- D. The submitted sound power level shall be verified through actual measurements and calculations in accordance with AMCA standards 300 and 301.
1. In the event the sound power level data measured or being submitted exceeds the designed level, provide additional sound traps or other sound attenuating devices to supplement the design in order to comply with sound power level specifications. Perform this work, including the additional noise control and any increase in motors Hp and increase in electrical service at no additional cost to the Owner. Submit calculations or measurement results to the Owner's Representative, which substantiate that sound power level produced by the submitted equipment and any required sound attenuating devices do not exceed the specified sound power levels.
- E. After starting fans: Check for objectionable noise or vibration. Correct as needed at no additional cost to the Owner.
- F. Balancing: See Section 230593 Testing, Adjusting and Balancing
- G. Commissioning: See Section 230800 Mechanical Commissioning

3.6 TRAINING

- A. See Section 230800 Mechanical Commissioning

END OF SECTION

SECTION 233600
AIR TERMINAL UNITS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following: All air terminal units including
 - 1. Variable air volume boxes

1.2 REFERENCE STANDARDS

- A. ARI Standard 885 – Procedure for Estimating Occupied Space Sound Levels in the Application of Air Terminal and Air Outlets
- B. UL Standard 1995 – Standard for Safety Heating and Cooling Equipment
- C. ASHRAE Standard 130 – Methods of Testing for Rating Ducted Air Terminal Units

1.3 QUALITY ASSURANCE

- A. Terminal units rated and certified in accordance with ARI Standard 880-98 Certification Program
- B. All electrical components shall be UL listed and installed in accordance with the UL Standard 1995.

1.4 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. “R” means required.
 - 2. “R2” means required only for products and equipment differing for the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
VAV boxes	R	R		R

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. VAV Boxes
 - 1. Price
 - 2. Titus
 - 3. Envirotech
 - 4. Or equal

2.2 VAV BOXES

- A. General
 - 1. Ship as a complete assembly requiring no field assembly (including accessories)
 - 2. Casings
 - a. Minimum 22-gage, galvanized steel
 - b. Leakage rating: 10 cubic feet per minute maximum leakage at 1 inch water column, when tested per ASHRAE Standard 130
 - c. Acoustic lining
 - 1) Material: Fiberglass with high density facing
 - 2) Minimum thickness:
 - a) Terminals located in conditioned space or return air plenum: 1/2 inch
 - b) Terminals located in unconditioned spaces: 1 inch
 - 3) Minimum 1.5 pound per cubic foot density
 - 4) Maximum thermal conductivity: 0.28 Btu-in per hour per foot squared per degree Fahrenheit (BTU-inch/h-ft²·°F) measured on a horizontal plane in accordance with ASTM C518 at a mean temperature of 75 degrees Fahrenheit
 - 5) Meet erosion test method described in UL publication No. 181
 - 6) Meet smoke developed and flame spread rating requirements of NFPA-90A
 - 7) Meet ASTM C1136 and ASTM C665 for biological growth in insulation
 - d. Discharge duct connection
 - 3. Controls unit mounted by manufacturer
 - a. Multi-point, double axis cross-flow, center averaging sensor
 - 1) The minimum amplification factor for even sizes 6 to 16 inch shall be greater than 2.0. Provide documentation with submittal that substantiates compliance with this requirement.
 - 2) Be rated for inlet or discharge duty, as indicated on the Drawings
 - 3) Provide accurate flow sensing regardless of inlet duct configuration
 - 4) Brass balancing taps and unit mounted airflow versus flow sensor pressure signal charts for field airflow measurements
 - 5) Be removable for cleaning when box is used for return or exhaust applications
 - b. Control panel:
 - 1) For VAV boxes exposed to public view, include control panel with cover to fully enclose VAV box controller
 - 2) Otherwise provide flat mounting bracket for controller
 - c. For Direct Digital Controls, see Division 25 Building Automation Systems
 - 4. Radiated and discharge sound power
 - a. Equal or less in each octave band than terminal selections scheduled on the Drawings at noted capacities assuming 1.0 inch inlet static pressure, with a tolerance of + 2 dB in any band.
 - b. Due to added space and pressure drop, providing additional plenums or attenuators to meet sound power ratings is not acceptable.
 - 5. Total pressure drop

- a. Equal or less than terminal selections scheduled on the Drawings at noted capacities, with a tolerance of 0.02 inches of water
- b. This limitation is in total, not static, pressure. Where total pressure is not listed on certified performance documents, provide a table of manual adjustments of static pressure with velocity pressure calculated from inlet and outlet velocities.
- 6. Dampers
 - a. Heavy gage steel
 - b. Single blade damper; opposed blade dampers are not acceptable
 - c. Shaft rotating in self-lubricating Delrin or equal bearings; nylon bearings are not acceptable. Shaft shall be clearly marked on the end to indicate damper position.
 - d. Damper shall have durable synthetic seal. Foam seals are not acceptable.
 - e. Close-off leakage rating: 5 cubic feet per minute maximum leakage at 1.50 inches water column.
- 7. Hot water heating coils
 - a. Not used

PART 3 EXECUTION

3.1 INSTALLATION

- A. Coordinate work and access with respective trades
- B. Install terminal units in accordance with manufacturer's written installation instructions.
- C. Duct connections
 - 1. See Section 233100 Ducts
 - 2. Provide sheet metal duct connections at VAV box inlet; flexible duct not acceptable
 - 3. No flexible connection required on duct outlet
- D. See Division 25 Building Automation Systems
- E. See Section 230800 Mechanical Commissioning

3.2 MOUNTING AND ALIGNMENT

- A. Support VAV boxes at four corners with minimum, 1" x 18 gage sheet metal straps or 3/8 inch all-thread rod. Secure lower end of strap to the side of unit casing with minimum two #10 sheet metal screws, or bolt through casing with washers to prevent leakage. Bend end of strap and secure to bottom of casing with one #10 sheet metal screws.
- B. See Section 230548 – Vibration and Seismic Control for vibration isolation requirements.

3.3 INSPECTION

- A. Verify that adequate clearance between air terminal units and adjacent walls or equipment is available to permit maintenance and repairs.

3.4 TESTING AND ADJUSTING

- A. Before operating air terminal units, complete the attached Pre-Functional Test Data Sheet for each air terminal unit. See Section 019100 Commissioning
- B. Start and test fans in accordance with manufacturers written installation instructions.
- C. Start up and adjust fans to insure proper operation.
- D. After starting air terminal units: Check for objectionable noise or vibration. Correct as needed at no additional cost to the Owner.
- E. See Section 230593 Testing, Adjusting, and Balancing
- F. See Section 230800 Mechanical Commissioning

3.5 TRAINING

- A. See Section 230800 Mechanical Commissioning

END OF SECTION

SECTION 233700

AIR OUTLETS AND INLETS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following: All air outlets, inlets, grilles, registers and diffusers except where integral with manufactured piece of equipment

1.2 REFERENCE STANDARDS

- A. ARI Standard 650 – Air Outlets and Inlets
- B. ASHRAE Standard 70 – Methods of Testing for Rating the Airflow Performance of Outlets and Inlets
- C. AMCA Standard 500 – Laboratory Methods of Testing dampers for Rating
- D. NFPA Standard 90A – Installation of Air Conditioning and Ventilating Systems
- E. NFPA Standard 90B – Standard for the Installation of Warm Air Heating and Air Conditioning Systems

1.3 QUALITY ASSURANCE

- A. Comply with ARI Standard 650, ASHRAE Standard 70, AMCA Standard 500, NFPA Standard 90A, and NFPA Standard 90B.
- B. Provide outlets and inlets that have, as minimum, throw and noise criteria ratings for each size device as listed in manufacturer's current data, rated as required by the above standards.

1.4 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. "R" means required.
 - 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Grilles, registers, and diffusers	R			R
Accessories	R			

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Price
- C. Titus
- D. Krueger
- E. Nailor
- F. Or equal

2.2 GENERAL

- A. Manufacturer shall examine and approve of application of each outlet.
- B. Noise level at design capacities: no larger than diffuser selection indicated on the drawings.
- C. Diffuser frame and other options shall be as indicated herein unless otherwise indicated on Drawings.
- D. Volume dampers
 - 1. Do not provide dampers built into grille or directly attached to the grille unless specifically called out on Drawings or in this Section.
 - 2. Volume damper key-operated adjustable from face of diffuser on register except as noted
 - 3. Opposed blade
- E. Diffuser frame
 - 1. Frame type shall be coordinated with ceiling type. Refer to architectural reflected ceiling Drawings.
 - a. At plaster or drywall ceilings, use lay-in diffuser with drywall frame (Price SPF or APF to match diffuser material). Drywall frame to match diffuser color.
 - 2. No visible screw allowed on diffusers or frames, unless otherwise indicated on Drawings or in this Section.
 - 3. Linear and bar diffusers shown as one collinear piece on plans shall be constructed as one piece within manufacturing limitations and to appear as one section if manufacturing limitations require multiple pieces.
- F. Outlets may be steel or aluminum unless otherwise indicated on the Drawings.

- G. Color
 - 1. Face and frame: Unless otherwise indicated on the Drawings:
 - a. General: Factory-baked #26 white enamel
 - b. Mounted in exposed unpainted galvanized steel ducts: aluminum
 - 2. Internal parts of grille visible from occupied space, including all visible parts behind the diffuser face such as pattern controllers, back pans of perforated diffusers, and visible parts of plenums: flat black

2.3 STYLES

- A. General
 - 1. See diffuser schedule on the Drawings for outlet style and size
 - 2. Throw pattern per the Drawings
 - 3. Specific frame, border, and other product references refer to Price
- B. Perforated diffusers and grilles - Steel
 - 1. Supply: Star-pattern diffuser, Price PDSP
 - a. Deflectors factory adjusted for corner blow pattern unless otherwise indicated on Drawings.
 - 2. Ducted return/exhaust: Price PDDR
 - 3. Plenum return:
 - a. Price PDDR
 - b. Light shield
- C. Flow Bar
 - 1. Price AS or JS; slot width as scheduled
 - 2. Integral plenum. For supply air, include minimum 1/2 inch thick insulation equal to Type AL duct liner as specified under Section 230700 Mechanical Insulation
 - 3. Border
 - a. Drywall ceilings or walls: Equal to Price Border 22
 - b. Other: Equal to Price Border 61 with mitered corners, concealed fasteners
 - 4. Controls
 - a. Supply: Adjusta Slot weir gate unless Jet Slot is indicated in schedules
 - b. Return or exhaust:
 - 1) As scheduled, either:
 - a) Adjusta Slot with weir gate removed
 - b) Jet Slot with blade set vertical for full free area
 - 2) With light shield
- D. Sidewall
 - 1. Price 500 series as scheduled
 - 2. Supply air
 - a. Double deflection: vertical blades on room side
 - b. For grilles or diffusers less than 7 feet above the floor, the maximum centerline blade spacing shall be 1/2 inch.
 - 3. Return/exhaust
 - a. Parallel fixed blades set at a deflection of 45 degrees or 0 degrees from horizontal as scheduled
 - 4. Drywall frame with recessed screw holes, face mounting allowed
 - 5. Register (WSR, WER, etc.) to have opposed blade damper unless otherwise indicated on the Drawings
- E. Spiral Duct

1. Price SDGE
2. Double deflection, vertical blades on room side
3. Extruded aluminum with clear anodized finish
4. No scoops or dampers
 - a. Exception: Provide opposed blade dampers for exhaust grilles where indicated on plans

F. Thermally powered diffusers

1. Cooling only:
 - a. Acutherm ST-C
 - b. Adjustable cooling setpoint via knob/wheel behind diffuser face
2. Cooling and Heating:
 - a. Acutherm ST-HC
 - b. Independently adjustable cooling and heating setpoints via knob/wheel behind diffuser face
 - c. Automatic heating/cooling changeover based on supply air temperature
3. Adjustable minimum flow position stop via knob/wheel behind diffuser face
4. Plaque face

2.4 SCREENED OPENINGS

A. Mesh

1. 3/4 in. square pattern
2. No. 16 galvanized wire
3. Interwoven
4. Welded or secured to frame

B. Frames: Optional

1. 1 inch by 1 inch by 1/8 inch galvanized steel angles
2. Continuous around perimeter of screen

PART 3 EXECUTION

3.1 INSTALLATION

- A. Coordinate with work of other trades.
- B. Install air outlets and inlets in accordance with manufacturer's written installation instructions and Section 233100 Ducts.
- C. Return and exhaust registers: Install with blades oriented to prevent sight through outlets.
- D. Grille backs or plenums visible through grilles painted flat black
- E. Transfer grilles
 1. See indications on the Drawings
 2. Wall installations, unless otherwise indicated, provide two grilles
 - a. One on each side of wall, except where open to return air plenum
 - b. Connecting sheet metal collar with 18 inch elevation offset for sound and light attenuation

- F. Provide duct screens at termination ducts as indicated on the Drawings

3.2 MOUNTING AND ALIGNMENT

- A. See Section 230548 Vibration and Seismic Control
- B. All air outlets and inlets shall be secured to building
 1. Ceiling grilles shall be secured to prevent falling from ceiling during construction or service with minimum of two 16-gage ceiling wires, two 22-gage by 1 inch galvanized sheet metal strap or two #10 sheet metal screws.
 2. Comply with CBC.
- C. Mount directional grilles as indicated on the Drawings.
- D. Adjust grille throw patterns prior to test and balance. See Section 230593 Testing, Adjusting and Balancing.

3.3 INSPECTION

- A. Verify mounting, direction and adjustments are installed as indicated on the Drawings.

3.4 TESTING AND ADJUSTING

- A. See Section 019100 Commissioning
- B. See Section 230593 Testing, Adjusting and Balancing
- C. See Section 230800 Mechanical Commissioning

END OF SECTION

SECTION 234000

AIR CLEANING DEVICES

PART 1 GENERAL

1.1 WORK INCLUDED

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Filter media

1.2 REFERENCE STANDARDS

- A. ASHRAE Standard 52.2 – Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size
- B. ANSI/UL 900 – Test Performance of Air Filter Units

1.3 QUALITY ASSURANCE

- A. Filters shall have MERV and dust loading ratings in accordance with ASHRAE Standard 52.2 with preconditioning as specified in Appendix J of that Standard.

1.4 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. “R” means required.
 - 2. “R2” means required only for products and equipment differing from the specified manufacturer and model and for “or equals” where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Filters	R	R		R
Built up system filter rack and housing	R	R		R
Filter gages	R2	R		

1.5 Spare Filters

- A. Furnish one new complete set of filters (excluding construction filters) for each filter bank on completion and acceptance of the Work.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Named manufacturer model numbers used as example of item and establish minimum level of quality and minimum standard options. Equivalent models of listed manufacturers are acceptable.
- B. Filter Media and Frames
 - 1. Camfil Filtration Group
 - 2. Flanders/Precisionaire
 - 3. American Air Filter
 - 4. Filtration Group
 - 5. Or equal

2.2 FILTERS

- A. General
 - 1. UL 900 listed
 - 2. Disposable type
 - 3. Each filter shall consist of media, media support grid and enclosing frame.
 - 4. Each filter shall have flow direction and MERV rating permanently affixed to frame.
- B. Type 1: Pleated Filter
 - 1. 2 inch or 4 inch pleat as scheduled
 - 2. Media: Cotton & synthetic media (no polyester)
 - 3. Minimum performance:
 - a. MERV 8
 - 4. Maximum initial pressure drop at 500 feet per minute face velocity shall not to exceed 0.3 inches water column. Final pressure drop shall be no less than 1.0 inch water column.
 - 5. Equal to Camfil 30/30
- C. Type 2: Not used
- D. Type 3: Bag Filters
 - 1. Deep pleated replaceable element
 - 2. Minimum depth: 22 inch
 - 3. Enclosing frame
 - a. Galvanized steel frame and galvanized steel pocket retainers
 - b. Header bonded to the media to prevent air bypass
 - 4. Media
 - a. Lofted microfine glass (no polyester)
 - b. Chemically bonded to permeable media support backing
 - 5. Minimum performance
 - a. MERV 15
 - 6. Maximum initial pressure drop at 500 feet per minute face velocity shall not to exceed 0.62 inches water column. Final pressure drop shall be no less than 1.0 inch water column.
 - 7. Equal to Camfil Hi-Flo ES

2.3 FRAMES

- A. For air handlers and fan-coils, see individual specifications Sections.

2.4 FILTER GAUGE

- A. See Division 25 Building Automation Systems (DP sensors with LCD display).

PART 3 EXECUTION

3.1 FILTER MEDIA

- A. Media as selected in equipment schedules on the Drawings
- B. Construction filters
 1. Type 1 for all equipment; roll media not acceptable

3.2 INSTALLATION

- A. Factory installed in air handling equipment
- B. Coordinate with work of other trades
- C. Install Air Cleaning Devices in accordance with manufacturer's written installation instructions.
- D. See Division 25 Building Automation Systems
- E. See Section 230593 Testing, Adjusting and Balancing
- F. See Section 230800 Mechanical Commissioning

3.3 START-UP PROCEDURES

- A. Do not operate air handling unit fan systems for any reason until spaces served have been cleaned of dust and debris, to avoid contamination of supply air or return air paths and equipment.
- B. Supply fans shall not be operated unless filters are installed, including temporary filters for use during test and balance.
- C. If the final pressure drop of the temporary filters is reached during test and balance, replace them with a spare set.
- D. Before final air balancing, and immediately before post-construction outdoor air purge if required by Section 230501 Basic Mechanical Materials and Methods remove temporary construction filters and install clean final filters:
 1. Remove prefilters in front of cartridge and bag filters after construction and do not replace. Prefilters shall not be used during for normal operation.

2. See Section 230593 Testing, Adjusting and Balancing and Section 230501 Basic Mechanical Materials and Methods for media installation during test and balance period.

3.4 INSPECTION

- A. Verify that adequate clearance between Air Cleaning Devices and adjacent walls or equipment is available to permit maintenance and replacement of filters.
- B. Verify that filters are firmly seated in frame to minimize bypass.

3.5 TRAINING

- A. See Section 230800 Mechanical Commissioning

END OF SECTION

SECTION 237300

AIR HANDLING UNITS & COILS

PART 1 GENERAL

1.1 SUMMARY

- A. Work included in this section: materials, equipment, fabrication, installation and tests in conformity with applicable codes and authorities having jurisdiction for the following:
 - 1. Air handling units

1.2 SUBMITTALS

- A. See Section 230501 Basic Mechanical Materials and Methods.
- B. Submit product data, O&M data, and samples and show item on shop drawings (where shop drawings are required) according to the following table.
 - 1. "R" means required.
 - 2. "R2" means required only for products and equipment differing for the specified manufacturer and model and for "or equals" where specified.

Item	Product Data	O&M Manual	Samples	Shop Drawing
Air handling units	R	R		R

- C. Air-Handling Units
 - 1. List of exceptions to the specifications including section number and a detailed description of alternative materials and methods. If there are no exceptions, so state in precise language.
 - 2. List of proposed manufactures for fans, filters, coils, motors, drives, dampers and other components
 - 3. Complete dimensional data including exterior dimensions and dimensions of internal components such as plenum dividers.
 - 4. Weight
 - 5. Fans
 - a. Complete graph of certified fan curves (not just curve for design conditions) indicating efficiency, BHP, and RPM
 - b. Certified fan-sound power ratings
 - c. Fan construction and accessories
 - d. Motor ratings, electrical characteristics, and motor accessories
 - 6. Cabinet material, metal thickness, finishes, insulation, and accessories including construction details for panel sealing, thermal break, door seal and hardware, shipping split and field treatment of panel penetration (sleeve) details.
 - 7. Certified coil-performance ratings with system operating conditions indicated.
 - 8. Dampers, including housings and linkage
 - 9. Filters and filter frame product data with performance characteristics
 - 10. Sound power levels by octave bands; radiated and at inlet and discharge
 - 11. Wiring diagram
 - 12. Control panel location, including elevation indicating height above the ground
 - 13. Internal static pressure drop of all components at design conditions

14. The number of shipping sections requiring field reassembly and weight and dimensions of each

1.3 QUALITY ASSURANCE

- A. Unit shall have the approval of one of the following agencies: Underwriters' Laboratories (UL), Electrical Testing Laboratories (ETL) or Canadian Standards Association (CSA). If the manufacturer cannot provide an ETL/UL sticker on the air handler from the factory, it will be the sole responsibility of the manufacturer to arrange for local ETL or UL approval and labeling.
- B. Electrical Components, Devices, and Accessories: Built, listed and labeled in strict accordance to the CEC and NFPA 70, and shall bear an appropriate label certifying compliance with UL Standard 508A by a qualified testing agency, and marked for intended location and application.
- C. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.
- D. ARI Certification: Air-handling units and their components shall be factory tested according to ARI 430, "Central-Station Air-Handling Units," and shall be listed and labeled by ARI.
- E. Fan Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Fans shall bear AMCA-certified sound ratings seal.
- F. Fan Performance Rating: Factory test fan performance for airflow, pressure, power, air density, rotation speed, and efficiency. Rate performance according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating."
- G. Water Coils: Factory tested to 350 psig according to ARI 410 and ASHRAE 33.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Nortek Companies
- B. Energy Labs
- C. Gouvernaire
- D. Equal

2.2 ACOUSTICAL PERFORMANCE

- A. All sound power level measurements and calculations shall be in complete accordance with the latest version of AMCA Standard 300 Reverberant Room Method for Sound Testing of Fans and AMCA Standard 301 Method for Calculating Fan Sound Ratings from Laboratory Test Data. Test and calculation procedures based on sound intensity measurements may be substituted for the above procedures, if directed in advance by the Owner's Representative.

B. Maximum sound power levels

1. The air handling unit components (e.g. fans, coils, panels) shall be selected and constructed to provide no more than the follow sound power levels under all operating conditions:

		Maximum Sound Power Level, dB						
Frequency		63	125	250	500	1000	2000	4000
AH-C	Supply air opening	94	90	98	93	92	87	82
	Return air opening	81	81	94	86	83	76	70
	Radiated	82	78	80	69	67	63	58
AH-H	Supply air opening	90	85	94	89	88	83	78
	Return air opening	83	82	97	85	82	75	70
	Radiated	78	74	79	65	63	59	55

2.3 CONSTRUCTION

A. Cabinet

1. Walls and roof shall be double wall panels
 - a. Indoor location: 2 inch thick
2. Outer panel shall be: 16-gauge solid G90 galvanized
3. Inner panel shall be:
 - a. Minimum 20-gauge solid 304 stainless steel in the coil and humidifier sections, minimum 1 foot upstream and 3 feet downstream of coil/media.
 - b. Minimum 22-gauge G90 perforated bright galvanized steel liner in all other sections
4. Construction shall comply with one of the following options:
 - a. Option 1: All exterior panel seams shall be stitch welded and continuously sealed with a urethane sealant.
 - b. Option 2: Exterior panels shall be mechanically connected with thermal break and sealed with an industrial EPDM gasket to form a water and airtight seal. Gasket seal shall not be exposed to UV light or the weather. Fasteners used to attach the panels shall be stainless steel, bolt-type construction that can be removed and refastened and shall not penetrate the air tunnel. Sheet metal screws are not acceptable.
 - c. Option 3: Panels shall be of standing seam construction with seams turned inward to provide a smooth flush exterior. Panels shall be screwed together on maximum 8" centers with minimum 5/16" zinc plated screws sealed with a continuous bead of silicone caulking applied between the matching panel seams prior to assembly, and with a final bead following assembly on both the exterior and interior panel seams to produce an air tight unit. Wall to base skin and wall to roof panel seams shall be sealed with 1/2" x 1/8" Poron-Rubber strips and all exterior seams shall be continuously caulked to assure leak-proof integrity of the unit housing.
5. Insulation:
 - a. Wall and roof panels shall be insulated with 3 pound density pre-molded rigid board fire-resistant with scrim-Kraft - PSK faced insulation or polyisocyanurate foam.
 - b. All panels shall feature a Class A thermal break.
 - c. Thickness to match panel wall thickness specified herein with the following minimum R-values including the impact of thermal short-circuits:
 - 1) 2 inch panel: R-8
 - d. Insulation to meet NFPA 90A, NFPA 90B and ASTM E 84 requirements for Flame Spread of 25 or less and Smoke Development of 50 or less.

- e. Insulation shall have a thermal conductivity K factor of .23 Btu/hr/Sq. ft/degree F @ 75 F
 - 6. Roof panels
 - a. Indoor units: shall be flat with smooth exteriors the same as the side panels.
 - 7. Stiffeners of angle steel shall be supplied as required to maintain a casing deflection criteria of 1/100 at 1.5 times the working pressure.
 - 8. Access Doors
 - a. Access doors shall be double wall construction using materials, thickness, and insulation matching those of the associated section. All doors installed downstream of the cooling coil shall include a Class A thermal break. Door-jam & frame shall be constructed of extruded aluminum with continuously welded corners for rigidity. Door panels shall be insulated with expandable foam insulation completely encapsulated and sealed between the door panels and frame. Provide doors located and sized to allow for routine maintenance including motor replacement and filter replacement, electrical components and any other sections or components requiring access or maintenance.
 - b. Doors shall be provided with a minimum (2) dual acting heavy duty key locking composite latches through 48" high, (3) latches through 72" high. Latches shall be operable from both the interior and exterior of the unit. Door latches on doors into fan sections shall be provided with a hasp or other mechanism to facilitate locking of the doors. Door hinge shall be heavy duty Stainless Steel.
 - c. Doors shall be provided with double high performance closed cell replaceable neoprene bulb type gasket seals around the entire perimeter of the door / frame.
 - d. Doors shall open against static pressure unless obstructed by internal components. If obstructed by internal components on the positive sections requiring access, the doors shall open with pressure and shall be provided with a safety restraining mechanism. Doors used to access rotating equipment shall be provided with an OSHA approved safety latching mechanism requiring a tool to open and shall also have a highly visible, permanently fixed, caution sign on the exterior of the door. Doors with access to moving parts must also have locking hardware and meet current UL mechanical protection guidelines. Standard door size shall be 24" wide by 60" high unless restricted by height or section width.
 - e. Viewing Window
 - 1) Located in access doors to these sections plus those shown in other sections on drawings:
 - a) Supply Fan
 - b) Return/relief Fan
 - 2) Thermal pane wire glass
 - 3) Minimum window size shall be 8 inches by 12 inches.
- B. Internal walls and plenum dividers
- 1. Walls separating return air/access vestibule from coil sections, supply discharge plenum, and mixed air plenum shall be 2 inch double wall panel constructed and insulated as specified for 2 inch exterior panels except with both panels as specified for inside panel. Return air/access side of all plenum walls shall be perforated.
 - 2. Other plenum walls and blank-off plates shall be single wall, fabricated of formed 16 gage solid galvanized steel panels except cooling coil blank-off plates which shall be constructed of 16 gage solid stainless steel.
 - 3. Provide access panels in wall sections where components cannot be easily accessed or removed through the exterior access doors.
- C. Bases
- 1. Unit bases shall be constructed from structural steel channel iron around the entire perimeter of the unit and provided with intermediate structural tubing, channel and angle

iron as required to support all internal components. All tubing, channel and angle joints shall be solid welded. Bolted or formed channel bases are not acceptable.

2. Floor Construction
 - a. The entire section base (component sections and service vestibule) shall have a floor of minimum 16 gauge G90 galvanized steel or aluminum tread plate.
 - b. Include a minimum 2 inch upturned lip around the section perimeter and all floor openings. No lips or flanges allowed in walking areas to prevent a trip hazard.
 - c. Floor shall be capable of supporting a 300 lb. live load with maximum L/200 deflection at any floor seam.
 - d. Base shall be insulated with water impervious foam under the base skin and covered with a minimum 20 gauge galvanized steel liner. Insulation R-value (including effect of thermal short circuits) shall meet same criteria as cabinet casing requirements specified herein.
 - e. All floor openings greater than 8 inches in either dimension, including dampers openings, shall be covered with a removable galvanized steel or aluminum grating bolted in place suitable for walking on which will prevent any personnel and large objects from falling through into the space below. Grating shall be capable of supporting minimum 100 pounds/ft².
3. Drain pans
 - a. Under cooling coil and humidifier sections and extending under blank plenum section downstream and extending under all headers and return bends. To aid in coil cleaning, drain pans shall be installed under all coils, including all heating coils.
 - b. Type 304 Stainless steel, minimum 16-gage
 - c. Corners soldered, welded or brazed
 - d. Pitched to drain flange to fully drain. Double broken, double sloped to ensure no standing water.
 - e. Fully accessible for cleaning
 - f. Drain connection
 - 1) Minimum size per code
 - 2) Extended to the exterior of the air handler
 - 3) Stainless steel or brass
 - 4) Welded or soldered into bottom of pan
 - 5) Intermediate pans shall drain to the bottom main pan
 - g. Insulation on bottom drain pan: minimum 1 in. thick, coated fiber glass board or injected foam insulation, NFPA-90 or UL listed. (Intermediate drain pans need not be insulated.)

2.4 FAN ARRAY

- A. The fan array shall include multiple, direct driven, arrangement 4 plenum fans constructed per AMCA requirements for the duty specified, minimum Class II or class III as required. Fans shall be rated in accordance with and certified by AMCA for performance.
- B. Each fan/motor cell shall include a 12-gauge, G90 Galvanized steel intake wall, 14 gauge spun steel fan inlet funnel, and a 10-gauge G90 Galvanized steel motor support plate rail and structure. Inlet plate, inlet cone and motor base support shall be powder coated. Fan cell structure shall be heavy gauge, anodized aluminum, interior perforated panels and exterior panels shall be aluminum.
- C. The fan array shall consist of multiple fan and motor cells, spaced in the airway tunnel cross section to provide a uniform air flow and velocity profile across the entire air way tunnel cross section and components contained therein. In order to assure uniform velocity profile in the

AHU cross section, the fan cell dimensions must be variable, such that each fan rests in an identically sized cell, and in a spacing that must be such that the submitted array dimensions fill a minimum of 90% of the cross sectional area of the AHU air way tunnel. There shall be no blank off plates or "spacers" between adjacent fan columns or rows to position the fans across the air way tunnel. The array shall produce a uniform air flow profile and velocity profile within the airway tunnel of the air handling unit to equal the specified cooling coil and/or filter bank face velocity by $\pm 10\%$ when measured at a point 36 inches from the intake side of the fan array intake plenum wall, and at a distance of 72 inches from the discharge side of the fan array intake plenum wall. Submittals for units providing less than the scheduled quantity of fans and/or spacing of the fans for multiple fan arrays shall submit CFD modeling of the air flow profile for pre-bid approval that indicates uniform velocity and flow across all internal components without increasing the length of the AHU unit or changing the aspect ratio of the unit casing as designed.

- D. Fan housing shall include sound absorbing acoustic baffles as required to meet specified sound power levels.
- E. Back flow prevention. Each individual cell in the multiple fan arrays shall be provided with an integral backflow prevention device that prohibits recirculation of air in the event a fan or multiple fans become disabled. The system effects for the backflow prevention device(s) shall be included in the criteria for TSP determination for fan selection purposes, and shall be indicated as a separate line item SP loss in the submittals. Back-flow device blades and frame shall be constructed of aluminum.
- F. Vibration Control
 - 1. Option 1. Each individual fan assembly shall be free-floating at all four corners on minimum 2" deflection spring type isolators with seismic restraints. The spring isolators shall be mounted to structural steel members and shall be rated for a minimum of 1G. The fan discharge shall be isolated from the cabinet by means of a neoprene-coated flexible connection.
 - 2. Option 2. Each fan/motor assembly shall be dynamically balanced to meet AMCA standard 204-96, exceeding category BV-5, to meet or exceed an equivalent Grade G.55, producing a maximum rotational imbalance of 0.022" per second peak, filter in (0.55mm per second peak, filter in). All fan and motor assemblies with 27" dia. and less shall be balanced to meet or exceed the G.55 residual unbalance. Fan and motor assemblies submitted for approval incorporating larger than 10 HP motors shall be balanced in three orthogonal planes to demonstrate compliance with the G.55 requirement with a maximum rotational imbalance of 0.022" per second peak filter in (0.55 mm per second peak, filter in).
- G. Each fan & motor assembly shall be removable through the access door located on the discharge side of the fan wall array.
- H. Filter Rating
 - 1. Where the unit has both prefilters and final filters, select fan using clean filter pressure drops for both the pre-filters and final filters.
 - 2. Where the unit has only final filters, select fan for mean air pressure drop (midway from clean to maximum).

2.5 HOT AND CHILLED WATER COILS

- A. Extended surface type coils

1. Copper Tubes
 - a. Brazed or welded joints
 - b. Minimum thickness: 0.020 inches
 - c. Outside diameter: 1/2 inch or 5/8 inch
 - d. The use of internal restrictive devices such as turbolater springs or ribbons to obtain turbulent construction is not acceptable.
 2. Plate fins
 - a. Aluminum
 - b. Minimum thickness 0.0075 inches
- B. Rows and fin spacing
1. To meet performance scheduled at similar pressure drop; no fewer rows than that scheduled
 2. Selected with tube fouling factor of 0.0001
 3. Maximum fin spacing: Meet Standard 62.1 maximum pressure drop requirement (≤ 0.75 in.w.c. at 500 fpm, dry coil)
 4. Select to avoid moisture carryover
- C. Circuiting: full row, single circuit, fully overall counterflow
- D. Headers
1. Steel or Copper with red brass piping connections
- E. Certified by AHRI per current Standard 410
- F. For field installed coils, coil frame designed for bolting to other sections or ductwork:
- G. Coil Casing
1. Minimum 16-gage
 2. Fan-coils: galvanized steel casing and tube sheet
 3. Air handling units: Type 304 stainless steel casing and tube sheet
 4. Intermediate supports of same material as casing
- H. Design for 200 pounds per square inch, 250 degrees Fahrenheit unless otherwise indicated on the Drawings
- I. Factory tested to
1. 300 pounds per square inch for water coils
 2. 450 pounds per square inch for refrigeration condenser coils
 3. 300 pounds per square inch for refrigeration evaporator coils
- J. Factory cleaned, degreased, and flushed. Piping connections shall be capped with removable caps.
- K. All coils shall be removable from either side of the unit by easily removable end panels. Individual end panels shall be supplied for each coil on the supply and return side of the cabinet to allow single coil piping breakdown for coil removal.
- L. Coil supply and return piping connections extending through the cabinet wall shall be sealed by rubber grommets with caulking on the exterior of the casing. The escutcheon plate shall have a rolled collar around the pipe opening to protect the pipe and be equipped with an "O" ring rubber gasket between the collar and the pipe to prevent chaffing and provide an air tight seal around the opening.

2.6 FILTERS

- A. Filters shall be arranged for Face, Rear or side loading as indicated on the detail drawings. Face loading is preferred where space allows. Face or rear loading shall be in gasketed universal holding frames. The filter rack assemblies shall be blanked off to the sides, roof and floor and properly sealed to minimize filter bypass
- B. Filter Gauge – see Section 250000 BAS.
- C. Filter banks shall be sized so maximum filter face velocity does not exceed 500 fpm unless otherwise shown on drawings.
- D. Filter rack: 304 or 316 SS
- E. Filter type
 - 1. As scheduled
 - 2. In accordance with Section 234000 Air Cleaning Devices.

2.7 ELECTRICAL

- A. Provide separate panels, each with an externally operated non-fused main disconnect switch, for separate field power connections for the following:
 - 1. Supply fan motors
 - 2. Lighting
- B. Each air handling unit shall contain electrical control panels consisting of a surface mounted or fully recessed NEMA rated enclosure.
- C. All motors in the fan array shall be provided with individual disconnects and thermal overload protection. All motor circuit protectors shall be located in main enclosure. Include the following for AHUs used for life safety smoke control: Disconnects shall have auxiliary contacts for monitoring position status by the Fire Alarm System.
- D. Motors
 - 1. Comply with Section 230513 Motors and Controllers.
 - 2. Motors shall be standard foot mounted type, TEFC or TEAO, premium efficiency.
 - 3. Motors, and shall be “off-the-shelf”, available from local motor suppliers, either 1800 or 3600 nominal RPM.
 - 4. Motors shall include permanently sealed bearings
 - 5. The weight of any individual motor shall not exceed 200-lbs.
 - 6. Motors shall meet the requirements of NEMA MG-1 Part 30 and 31, section 4.4.2. (invertor-duty).
 - 7. Where recommended by VFD manufacturer, include shaft grounding system equal to AEGIS SGR unless motor has ceramic bearings
 - 8. Each motor shall be provided with individual disconnects and thermal overload protection, located in main electrical enclosure.
- E. Variable speed drives
 - 1. VSDs are field installed and provided by others.
- F. Lights

1. Provide vapor proof marine type mini-fluorescent light fixtures in each accessible section complete with a protective metal cage and sealed glass enclosure. Cabinets greater than 14 feet in width shall have two fixtures per section.
2. Lights shall be wired to a common switch mounted in a weatherproof box adjacent to the fan access door complete with a GFCI convenience outlet and indicator light.
3. All wiring to lights shall be in conduit and internal to the unit. No external conduit runs for the lights are allowed.
4. If the unit requires splitting, junction boxes shall be furnished at each section to allow the electrical contractor to make final connections in the field. Wiring shall be clearly labeled at junction points to facilitate reconnection.

G. Controls

1. All controls provided under Division 25 Building Automation Systems.

2.8 DAMPERS

A. Dampers shall comply with 233300 Duct Accessories. Construction and performance shall match that of Ruskin models specified below.

B. Type and Size

1. Return air
 - a. UL listed smoke damper with direct coupled actuator with end switches (due to atrium makeup duty)
 - b. Equal to Ruskin SD-60
 - c. Parallel blade
 - d. 1000 fpm sized for supply fan design airflow less design minimum outdoor airflow
2. Economizer Outdoor air
 - a. Equal to Ruskin CD-50
 - b. Parallel blade
 - c. 400 to 1000 fpm sized for supply fan design airflow
3. Minimum outdoor air "dump" damper (AH-C)
 - a. Equal to Ruskin CD-60
 - b. Opposed blade
 - c. Size per plans

C. Actuators are specified under Section 250000 BAS, except for smoke dampers.

D. Damper configuration

1. Each section shall be designed to be operated by a separate direct coupled actuator. Jackshafts and external linkage shall not be used. Provide space between damper sections (or between damper and roof/floor for vertical blade dampers) to allow for side-mounted direct-coupled actuator.
2. Do not interlink economizer outdoor air and return air dampers. Each shall operate independently.
3. Economizer outdoor air and return airflow shall be directed into each other. Provide vertical blades if required.

1.1 AIR OPENINGS

A. Size

1. Supply Air: ≤ 1500 fpm face area

2. Return Air: \leq 1000 fpm face area
- B. Protection
1. For floor openings, provide minimum 80% free area walking grate where opening is in an accessible section.
 2. For all other openings, cover opening with a heavy-duty screen.

2.9 UNIT TESTING AND QUALITY CONTROL

- A. Equipment Qualification
1. Prior to unit shipment, the following qualifications shall be performed and documented:
 - a. All fans shall be balanced and factory run tested to ensure design integrity.
 - b. All bearings shall be provided with a full complement of grease.
 - c. All factory piping shall be leak tested to ensure integrity.
 - d. All electrical circuits shall be tested to ensure correct operation.
 - e. Drain pans shall be tested to ensure positive slope to drain. (See also post-installation tests performed under Section 230593 Testing, Adjusting and Balancing.)

PART 3 EXECUTION

3.1 INSTALLATION

- A. Units shall ship with all openings securely covered and watertight. Protection shall be retained until completion of construction or until opening is field connected to ductwork.
- B. Coordinate with work of other trades.
- C. Vibration isolation and mounting: See Section 230548 Vibration and Seismic Control.
- D. Install in accordance with manufacturer's written installation instructions.
- E. Mount units sufficiently high to allow for proper condensate trapping and drainage.
- F. Piping
1. See Section 232113 HVAC Piping
 2. See piping diagrams
 3. Do not block access doors with piping. Access doors shall be capable of opening 90 degrees.
 4. Pipe condensate to nearest appropriate drain. See Division 220000 Plumbing.
- G. See Division 25 Building Automation Systems

3.2 INSPECTION

- A. Verify that adequate clearance between air handling units and adjacent walls or equipment is available to permit maintenance and repairs.

3.3 PRE-OPERATING CHECKS

- A. Before operating air handling units:
 - 1. See Section 230800 HVAC Commissioning.
 - 2. Complete Pre-Functional Test Data Sheet for each unit.

3.4 CLEANING

- A. After completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean all components including fan wheels, cabinets, dampers, coils, and filter housings.
- B. Install new, clean filters in accordance with Section 234000 Air Cleaning Devices.

3.5 TESTING AND ADJUSTING

- A. Do not operate fans for any purpose, temporary or permanent until
 - 1. Ductwork is clean
 - 2. Filters are in place
 - 3. Bearings are lubricated
 - 4. Fan has been run under observation
- B. Start and test fans in accordance with manufacturer's written installation instructions.
- C. Test cooling coil drain pans. See Section 233300 Duct Accessories
- D. Start-up and adjust completed air handling units to ensure proper operation
- E. See Section 230593 Testing, Adjusting, and Balancing
- F. After starting fans: Check for objectionable noise or vibration. Correct as needed at no additional cost to the Owner.
- G. Commissioning: See Section 230800 Mechanical Commissioning.
- H. Training: See Section 230800 Mechanical Commissioning.

END OF SECTION

SECTION 250000

BUILDING AUTOMATION SYSTEMS

PART 1 GENERAL

1.1 SUMMARY

- A. Furnish and install a digital Building Automation System (BAS) as specified herein.
- B. Coordination with other Divisions: See coordination matrix in Section 230501 Basic Mechanical Materials and Methods.

1.2 INTEGRATION WITH EXISTING SYSTEM

- A. Include all services required to integrate this building into existing BAS for a fully operational system.
- B. Procedure
 1. Obtain a copy of the campus database with access privileges.
 2. Perform a database review with the Owner's Representative to ensure uniformity of point naming, graphic layout and style, BACnet device instance numbering scheme, IP addresses, BACnet Distribution Tables and BACnet Broadcast Management Devices.
 3. BACnet devices
 - a. Create new building database following the BACnet device instance numbering scheme specified under Paragraph 3.12B.4.
 - b. Double check existing database to ensure there are no duplicate BACnet device instance numbers. This includes 3rd party equipment such as VFDs.
 4. Graphics
 - a. For standard applications, such as VAV boxes and VAV box summary pages, use the campus standard graphics file template, including using the same file template name.
 - b. For new or modified graphics custom to the new building, ensure file template name do not duplicate any existing file names.
 5. Programming
 - a. For standard sequences covered by ASHRAE Guideline 36, use the programming provided by the BAS manufacturer, first ensuring they have been updated by the manufacturer to reflect the latest issue and all addenda published when programming work is initiated.
 - b. For other typical applications, first review those used for similar applications in other campus buildings to use as a starting point, then edit to reflect sequences specified herein. The intent is to have standard programming throughout the campus to the extent possible.
 - c. Double check existing database to ensure program file names do not duplicate any existing file names.
 6. If a BACnet/IP Broadcast Management Device (BBMD) router is required, check the existing Broadcast Distribution Tables (BDT) to ensure that a BBMD router is not already assigned to the relevant network before adding a new one.
 7. Install building database and control programming on a temporary portable operator's terminal provided by the Contractor. The POT shall be used for start-up, testing, and commissioning. The POT shall remain the property of the Contractor after final completion of the project.

8. Once the building BAS has been fully commissioned and accepted by the Owner:
 - a. Create a new backup of the existing campus database.
 - b. Merge the new building database with the existing campus database.
 - c. Confirm that no communication issues (in the building and across the campus) have resulted from the merge.
 - d. Confirm that all new controllers have successfully bound to the server and that alarms and trends are being sent to the server.
 - e. Configure alarm page-out notifications (e.g. e-mail, SMS, etc.) per Paragraph 3.12F.
 - f. Make another backup of the merged database.
 - g. Load the merged database onto the campus Control System Server.
 - h. Integrate graphic screens into the Central Plant graphics including adding appropriate hyperlinks so that the system operates as one integrated system.
 - i. Confirm that the merge was successful by sample testing points and sequences
 - j. Perform a post-merge review 4 to 8 weeks following the merge. Review general system operation, problematic areas, alarms and trend histories. Identify and remediate any issues.
 - k. Receive Owner approve of the final installation in writing.
9. Provide high level password for Owner operator access to the system only at this point; Owner will not have access to the system prior to system acceptance and integration.

1.3 CONTRACTOR PROPOSALS

- A. The system requirements described in this specification are generally performance based. Where requirements are prescriptive, the intent is to provide minimum quality, not to give unfair advantage to any given manufacturer or product. If a contractor finds that a certain requirement is unduly difficult or expensive to meet, contact the Engineer prior to bid due date and an addendum modifying the requirement will be considered.
- B. Where requirements are unclear, the contractor shall clarify the requirements with the Engineer before the bid due date. Where requirements continue to be unclear, the contractor's proposal must accurately describe what is included and excluded.
- C. By submitting a proposal, contractor guarantees that their proposal is in full compliance with these specifications except as specifically excluded in their proposal.

1.4 REFERENCE STANDARDS

- A. Nothing in Contract Documents shall be construed to permit Work not conforming to applicable laws, ordinances, rules, and regulations. When Contract Documents differ from requirements of applicable laws, ordinances, rules and regulations, comply with documents establishing the more stringent requirement.
- B. The latest published or effective editions, including approved addenda or amendments, of the following codes and standard shall apply to the BAS design and installation as applicable.
- C. State, Local, and City Codes
 1. CBC – California Building Code
 2. CMC – California Mechanical Code
 3. CEC – California Electrical Code
 4. Local City and County Codes
- D. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

1. ANSI/ASHRAE 135 – BACnet - A Data Communication Protocol for Building Automation and Control Networks.
2. ANSI/ASHRAE Standard 15 – Safety Standard for Refrigeration Systems.

E. Electronics Industries Alliance

1. EIA-232 – Interface Between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange.
2. EIA-458 – Standard Optical Fiber Material Classes and Preferred Sizes.
3. EIA-485 – Standard for Electrical Characteristics of Generator and Receivers for use in Balanced Digital Multipoint Systems.
4. EIA-472 – General and Sectional Specifications for Fiber Optic Cable.
5. EIA-475 – Generic and Sectional Specifications for Fiber Optic Connectors and all Sectional Specifications.
6. EIA-573 – Generic and Sectional Specifications for Field Portable Polishing Device for Preparation Optical Fiber and all Sectional Specifications.
7. EIA-590 – Standard for Physical Location and Protection of Below-Ground Fiber Optic Cable Plant and all Sectional Specifications.

F. Underwriters Laboratories

1. UL 916 – Energy Management Systems.

G. National Electrical Manufacturers Association

1. NEMA 250 – Enclosure for Electrical Equipment.

H. Institute of Electrical and Electronics Engineers (IEEE)

1. IEEE 142 – Recommended Practice for Grounding of Industrial and Commercial Power Systems.
2. IEEE 802.3 – CSMA/CD (Ethernet – Based) LAN.
3. IEEE 802.4 – Token Bus Working Group (ARCNET – Based) LAN.

1.5 DEFINITIONS

A. Acronyms

AAC	Advanced Application Controller
AH	Air Handler
AHU	Air Handling Unit
AI	Analog Input
ANSI	American National Standards Institute
AO	Analog Output

DBMS	Database Management System
DDC	Direct Digital Control
DHW	Domestic Hot Water
DI	Digital Input
DO	Digital Output
D-to-A	Digital-to-Analog
BAS	Building Automation System
EMT	Electrical Metallic Tubing
EP	Electro-Pneumatic
ETL	Edison Testing Laboratories
GUI	Graphical User Interface
HHD	Hand Held Device
HOA	Hand-Off-Automatic
HVAC	Heating, Ventilating and Air-Conditioning
HTTP	Hyper-Text Transfer Protocol
I/O	Input/output
IEEE	Institute of Electrical and Electronics Engineers
ISO	International Organization for Standardization
LAN	Local Area Network
LANID	LAN Interface Device
MAC	Medium Access Control
MHz	Megahertz
MS/TP	Master-Slave/Token-Passing
NEMA	National Electrical Manufacturers Association
NFPA	National Fire Protection Association
NIST	National Institute of Standards and Technology
ODBC	Open Database Connectivity
OI	Operator Interface
OWS	Operator Workstation
P	Proportional
PC	Personal Computer
PI	Proportional-Integral
PICS	Protocol Implementation Conformance Statement
PID	Proportional-Integral-Derivative
POT	Portable Operators Terminal
PTP	Point-to-Point
RAM	Random Access Memory

SOO	Sequence of Operation
SQL	Standardized Query Language
SSL	Secure Socket Layers
TAB	Test, Adjust, and Balance
TDR	Time Delay Relay
UFT	Underfloor Fan Terminal Box
UL	Underwriters' Laboratories, Inc.
XML	Extensible Markup Language

B. Terms

Term	Definition
Accessible	Locations that can be reached with no more than a ladder to assist access and without having to remove permanent partitions or materials. Examples include inside mechanical rooms, mechanical equipment enclosures, instrument panels, and above suspended ceilings with removable tiles.
BACnet Interoperability Building Blocks	A BIBB defines a small portion of BACnet functionality that is needed to perform a particular task. BIBBs are combined to build the BACnet functional requirements for a device in a specification.
BACnet/BACnet Standard	BACnet communication requirements as defined by the latest version of ASHRAE/ANSI 135 and approved addenda.
Change of Value	An event that occurs when a digital point changes value or an analog value changes by a predefined amount.
Client	A device that is the requestor of services from a server. A client device makes requests of and receives responses from a server device.
Concealed	Embedded in masonry or other construction, installed in furred spaces, within double partitions, above hung ceilings, in trenches, in crawl spaces, or in enclosures.
Continuous Monitoring	A sampling and recording of a variable based on time or change of state (such as trending an analog value, monitoring a binary change of state).
Contract Documents	Specifications, drawings, and other materials provided with request for bids.
Control Systems Server	A computer(s) that maintain(s) the systems configuration and programming database.
Controller	Intelligent stand-alone control device. Controller is a generic reference to BCs, AACs, and ASCs.
Direct Digital Control	Microprocessor-based control including Analog/Digital conversion and program logic.
Building Automation System	The entire integrated management and control system.
Equal	Approximately equal in material types, weight, size, design, quality, and efficiency of specified product.
Exposed	Not installed underground or concealed.

Term	Definition
Furnish	To purchase, procure, acquire and deliver complete with related accessories.
Gateway	Bi-directional protocol translator connecting control systems that use different communication protocols.
Hand Held Device	Manufacturer's microprocessor based portable device for direct connection to a field Controller.
Inaccessible	Locations that do not meet the definition of accessible. Examples include inside furred walls, pipe chases and shafts, or above ceilings without removable tiles.
Indicated, shown or noted	As indicated, shown or noted on drawings or specifications.
Install	To erect, mount and connect complete with related accessories.
Instrumentation	Gauges, thermometers and other devices mounted in ductwork or piping that are not a part of the BAS.
IT LAN	Reference to the facility's Information Technology network, used for normal business-related e-mail and Internet communication.
LAN Interface Device	Device or function used to facilitate communication and sharing of data throughout the BAS.
Local Area Network	Computer or control system communications network limited to local building or campus.
Master-Slave/Token Passing	Data link protocol as defined by the BACnet standard.
Motor Controllers	Starters, variable speed drives, and other devices controlling the operation of motors.
Native BACnet Device	A device that uses BACnet for communication. A device may also provide gateway functionality and still be described as a Native BACnet device.
Native BACnet System	A network composed only of Native BACnet Devices without gateways.
Open Database Connectivity	An open standard application-programming interface for accessing a database developed. ODBC compliant systems make it possible to access any data from any application, regardless of which database management system is handling the data.
Open Connectivity	OPC is an interoperability standard developed for industrial applications. OPC compliant systems make it possible to access or exchange data from any application, regardless of which database management system is handling the data.
Operator Interface	A device used by the operator to manage the BAS including OWSs, POTs, and HDDs.

Term	Definition
Operator Workstation	The user's interface with the BAS system. As the BAS network devices are stand-alone, the OWS is not required for communications to occur.
Owner	The Owner or their designated representatives.
Piping	Pipe, tube, fittings, flanges, valves, controls, strainers, hangers, supports, unions, traps, drains, insulation and related items.
Points	All physical I/O points, virtual points, and all application program parameters.
Point-to-Point	Serial communication as defined in the BACnet standard.
Portable Operators Terminal	Laptop PC used both for direct connection to a controller and for remote dial up connection.
Primary Controlling LAN	High speed, peer-to-peer controller LAN connecting BCs and optionally AACs and ASCs.
Protocol Implementation Conformance Statement	A written document that identifies the particular options specified by BACnet that are implemented in a device.
Provide	Furnish, supply, install and connect up complete and ready safe and regular operation of particular work referred to unless specifically noted.
Reviewed, approved, or directed	Reviewed, approved, or directed by or to Owner's Representative.
Router	A device that connects two or more networks at the network layer.
Secondary Controlling LAN	LAN connecting AACs and ASCs.
Server	A device that is a provider of services to a client. A client device makes requests of and receives responses from a server device.
Standardized Query Language	SQL - A standardized means for requesting information from a database.
Supervisory LAN	Ethernet-based LAN connecting Primary Controller LANs with each other and OWSs, CSS, and THS. See System Architecture below.
Supply	Purchase, procure, acquire and deliver complete with related accessories.
Wiring	Raceway, fittings, wire, boxes and related items.
Work	Labor, materials, equipment, apparatus, controls, accessories and other items required for proper and complete installation.

1.6 QUALITY ASSURANCE

A. Materials and Equipment

1. Manufacturer's Qualifications: See 2.1 for approved manufacturers.

B. Installer

1. BAS Contractor's Project Manager Qualifications: Individual shall specialize in and be experienced with direct digital control system installation for not less than 3 years. Project Manager shall have experience with the installation of the proposed direct digital control equipment product line for not less than 2 projects of similar size and complexity. Project Manager must have proof of having successfully completed the most advanced training offered by the manufacturer of the proposed product line.
2. BAS Contractor's Programmer Qualifications: Individual(s) shall specialize in and be experienced with direct digital control system programming for not less than 3 years and with the proposed direct digital control equipment product line for not less than 1.5 years. Programmers must show proof of having successfully completed the most advanced programming training offered by the vendor of the programming application on the proposed product line.
3. BAS Contractor's Lead Installation Technician Qualifications: Individual(s) shall specialize in and be experienced with direct digital control system installation for not less than 3 years and with the proposed direct digital control equipment product line for not less than 1.5 years. Installers must show proof of having successfully completed the installation certification training offered by the vendor of the proposed product line.
4. BAS Contractor's Service Qualifications: The installer must be experienced in control system operation, maintenance and service. BAS Contractor must document a minimum 5-year history of servicing installations of similar size and complexity. Installer must also document at least a 1-year history of servicing the proposed product line.
5. Installer's Response Time and Proximity
 - a. Installer must maintain a fully capable service facility within 50 miles of the subject Project. Service facility shall manage the emergency service dispatches and maintain the inventory of spare parts.
 - b. Installer must demonstrate the ability to meet the emergency response times listed in Paragraph 1.12B.1.
6. Electrical installation shall be by manufacturer-trained electricians
 - a. Exception: Roughing in wiring and conduit and mounting panels may be subcontracted to any licensed electrician.

1.7 SUBMITTALS

- A. No work may begin on any segment of this Project until the related submittals have been reviewed for conformity with the design intent and the Contractor has responded to all comments to the satisfaction of the Owner's Representative.
- B. Submit drawings and product data as hereinafter specified. Conditions in this Section take precedence over conditions in Division 1 or Section 230501 Basic Mechanical Materials and Methods.
- C. Submittal Schedule: Submittal schedule shall be as follows unless otherwise directed by the Owner's Representative:
 1. Allow 10 working days for approval, unless Owner's Representative agrees to accelerated schedule.
 2. Submittal Package 0 (Qualifications) shall be submitted with bid.
 3. Submittal Package 1 (Hardware and Shop Drawings) shall be submitted in accordance with schedule established by the Owner in bid documents.
 4. Submittal Package 2 (Programming and Graphics) and shall be submitted no less than 30 days before software is to be installed in field devices.
 5. Submittal Package 3 (Pre-Functional Test Forms) shall be submitted no less than 30 days prior to conducting tests.

6. Submittal Package 4 (Pre-Functional Test Report) shall be submitted no less than 14 after conducting tests.
7. Submittal Package 5 (Post-Construction Trend Points List) shall be submitted 14 days prior to the start of the trend collection period.
8. Submittal Package 6 (Functional Test Report) shall be submitted no more than 7 days after conducting tests.
9. Submittal Package 7 (Training Materials) shall be submitted no less than 14 days prior to conducting first training class.
10. Submittal Package 8 (Post-Construction Trend Logs) shall be submitted after demonstration tests are accepted and systems are in full automatic operation.
11. Submittal Package 9 (End-of-Warranty Trend Logs) shall be submitted 30 days prior to the end of the warranty period.

D. Submission and Resubmission Procedure

1. Optional Pre-Submittals. At Contractor's option, electronic submittals indicated below may be submitted unofficially via email directly to the Engineer for review and comment prior to formal submission. Comments provided by the Engineer are not official and may be changed or additional comments may be provided on the formal submittal. The intent of pre-submittals is to reduce paperwork and review time.
2. Each submittal shall have a unique serial number that includes the associated specification section followed by a number for each sub-part of the submittal for that specification section, such as SUBMITTAL 250000-01.
3. Each resubmittal shall have the original unique serial number plus unique revision number such as SUBMITTAL 250000-01 REVISION 1. The cover page of resubmittals shall include a summary of prior comments and how they were resolved in the resubmittal.
4. Submit one copy of submittal in electronic format specified under each submittal package below. Submissions made in the wrong format will be returned without action.
5. Submittals shall have bookmarks for each subsection (e.g. Materials, Drawings) and each for each drawing including drawing number and name.
6. Owner's Representative will return a memo or mark-up of submittal with comments and corrections noted where required.
7. Make corrections
 - a. Revise initial submittal to resolve review comments and corrections.
 - b. Indicate any changes that have been made other than those requested.
 - c. Clearly identify resubmittal by original submittal number and revision number.
8. Resubmit revised submittals until no exceptions are taken.
9. Once submittals are accepted with no exceptions taken, provide
 - a. Complete submittal of all accepted drawings and products in a single electronic file.
 - b. Photocopies or electronic copies for coordination with other trades, if and as required by the General Contractor or Owner's Representative.

E. Submittals Packages

1. Submittal Package 0 (Qualifications)
 - a. Provide Installer and Key personnel qualifications as specified in Paragraph 1.6B.
 - b. Format: Word-searchable format per Paragraph 1.8C.3.
2. Submittal Package 1 (Hardware and Shop Drawings)
 - a. Hardware
 - 1) Organize by specification section and device tags as tagged in these specifications.
 - 2) Do not submit products that are not used even if included in specifications.
 - 3) Include a summary table of contents listing for every submitted device:
 - a) Tab of submittal file/binder where submittal is located
 - b) Device tag as tagged in these specifications (such as TS-1A, FM-1)

- c) Specification section number (down to the lowest applicable heading number)
 - d) Whether device is per specifications and a listed product or a substitution
 - e) Manufacturer
 - f) Model number
 - g) Device accuracy (where applicable)
 - h) Accuracy as installed including wiring and A/D conversion effects (where applicable)
- 4) Submittal shall include manufacturer's description and technical data, such as performance data and accuracy, product specification sheets, and installation instructions for all control devices and software.
- 5) When manufacturer's cut-sheets apply to a product series rather than a specific product, the data specifically applicable to the Project shall be highlighted or clearly indicated by other means. Each submitted piece of literature and drawings shall clearly reference the specification or drawing that the submittal is to cover. General catalogs shall not be accepted as cut sheets to fulfill submittal requirements.
- 6) Format: Word-searchable format per Paragraph 1.8C.3.
- b. Shop Drawings
- 1) System architecture one-line diagram indicating schematic location of all control units, workstations, LAN interface devices, gateways, etc. Indicate address and type for each control unit. Indicate media, protocol, baud rate, and type of each LAN.
 - 2) Schematic flow diagram of each air and water system showing fans, coils, dampers, valves, pumps, heat exchange equipment and control devices. The schematics provided on Drawings shall be the basis of the schematics with respect to layout and location of control points.
 - 3) All physical points on the schematic flow diagram shall be indicated with names, descriptors, and point addresses identified as listed in the point summary table.
 - 4) Label each input and output with the appropriate range.
 - 5) Device table (Bill of Materials). With each schematic, provide a table of all materials and equipment including:
 - a) Device tag as indicated in the schematic and actual field labeling (use tag as indicated in these specifications where applicable and practical)
 - b) Device tag as indicated in these specifications where applicable and if it differs from schematic device tag
 - c) Description
 - d) Proposed manufacturer and model number
 - e) Range
 - f) Quantity
 - 6) With each schematic or on separate valve sheet, provide valve and actuator information including pipe size, valve size, C_v , design flow, target pressure drop, actual design pressure drop, manufacturer, model number, close off rating, etc. Indicate normal positions of fail-safe valves and dampers.
 - 7) Indicate all required electrical wiring. Electrical wiring diagrams shall include both ladder logic type diagram for motor starter, control, and safety circuits and detailed digital interface panel point termination diagrams with all wire numbers and terminal block numbers identified. Provide panel termination drawings on separate drawings. Ladder diagrams shall appear on system schematic. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.
 - 8) Details of control panels, including controllers, instruments, and labeling shown in plan or elevation indicating the installed locations.
 - 9) Floor plans: None required.

- 10) Format
 - a) Sheets shall be consecutively numbered.
 - b) Each sheet shall have a title indicating the type of information included and the mechanical/electrical system controlled.
 - c) Table of Contents listing sheet titles and sheet numbers.
 - d) Legend and list of abbreviations.
 - e) Schematics
 1. Word searchable pdf format.
 2. 21 inch x 15 inch or 17 inch x 11 inch.
 - f) Floor plans: None required
- c. Do not include sequence of controls on shop drawings or equipment submittals; they are included in Submittal Package 2.
3. Submittal Package 2 (Programming and Graphics)
 - a. A detailed description of point naming convention conforming to Paragraph 3.12B to be used for all software and hardware points, integrated with existing database convention.
 - b. A list of all hardware and software points identifying their full text names, device addresses and descriptions.
 - c. Control Logic Documentation
 - 1) Submit control logic program listings (graphical programming) consistent with specified English-language Sequences of Operation for all control units.
 - 2) Control logic shall be annotated to describe how it accomplishes the sequence of operation. Annotations shall be sufficient to allow an operator to relate each program component (block or line) to corresponding portions of the specified Sequence of Operation.
 - 3) Include specified English-language Sequences of Operation of each control sequence updated to reflect any suggested changes made by the Contractor to clarify or improve the sequences. Changes shall be clearly marked. SOO shall be fully consistent with the graphical programming. (An electronic version of the sequences of controls in Paragraph 3.12 will be provided to the Contractor upon request.)
 - 4) Include control settings, setpoints, throttling ranges, reset schedules, adjustable parameters and limits.
 - 5) Submit one complete set of programming and operating manuals for all digital controllers concurrently with control logic documentation.
 - d. Graphic screens of all required graphics, provided in final colors.
 - e. Format
 - 1) Points list: Word-searchable format per Paragraph 1.8C.3.
 - 2) Programming: Native Delta GCL+.
 - 3) Programming and operating manual: Word-searchable format per Paragraph 1.8C.3.
 - 4) Graphics: Graphical electronic format (pdf, png, etc.).
4. Submittal Package 3 (Pre-Functional Test Forms)
 - a. Provide pre-functional test forms as required by Paragraph 3.14D.23.14D.2.a.
 - b. Format: Word-searchable format per Paragraph 1.8C.3.
5. Submittal Package 4 (Pre-Functional Test Report)
 - a. Provide Pre-Functional Test Report as required by Paragraph 3.14D.2.
 - b. Format: Word-searchable format per Paragraph 1.8C.3.
6. Submittal Package 5 (Post-Construction Trend Points List)
 - a. Provide a list of points being trended along with trend interval or change-of-value per Paragraph 3.14H.2.d.
 - b. Format: See Paragraph 2.11C.3.
7. Submittal Package 6 (Functional Test Report)
 - a. Provide completed functional test forms as required by Paragraph 3.14F.4.

- b. Format: Word-searchable format per Paragraph 1.8C.3.
- 8. Submittal Package 7 (Training Materials)
 - a. Provide training materials as required by Paragraph 3.15.
 - b. Format: Word-searchable format per Paragraph 1.8C.3.
- 9. Submittal Package 8 (Post-Construction Trend Logs)
 - a. Provide trend logs as required by Paragraph 3.14H.
 - b. Format: See Paragraph 2.11C.3.
- 10. Submittal Package 9 (End-of-Warranty Trend Logs)
 - a. Provide trend logs as required by Paragraph 3.14H.
 - b. Format: See Paragraph 2.11C.3.

1.8 COMPLETION REQUIREMENTS

A. Procedure

1. Until the documents required in this Section are submitted and approved, the system will not be considered accepted and final payment to Contractor will not be made.
2. Before requesting acceptance of Work, submit one set of completion documents for review and approval of Owner.
3. After review, furnish quantity of sets indicated below to Owner.

B. Completion Documents

1. Operation and Maintenance (O & M) Manuals. Provide in both paper and electronic format per Paragraph 1.8C.
 - a. Include all submittals (product data, shop drawings, control logic documentation, hardware manuals, software manuals, installation guides or manuals, maintenance instructions and spare parts lists) in maintenance manual.
 - b. As-built versions of the submittal product data. Submittal data shall be located in tabs along with associated maintenance information.
 - c. Engineering, Installation, and Maintenance Manual(s) that explain how to design and install new points, panels, and other hardware; preventive maintenance and calibration procedures; how to debug hardware problems; and how to repair or replace hardware.
 - d. Complete original issue documentation, installation, and maintenance information for all third-party hardware and software provided, including computer equipment and sensors.
 - e. A list of recommended spare parts with part numbers and suppliers.
 - f. Operators Manual with procedures for operating the control systems, including logging on/off, alarm handling, producing point reports, trending data, overriding computer control, and changing set points and other variables.
 - g. Programming Manuals with a description of the programming language, control block descriptions (including algorithms and calculations used), point database creation and modification, program creation and modification, and use of the programming editor.
 - h. Recommended preventive maintenance procedures for all system components, including a schedule of tasks (inspection, cleaning, calibration, etc.), time between tasks, and task descriptions.
 - i. A listing and documentation of all custom software for the Project created using the programming language, including the set points, tuning parameters, and point and object database.
 - j. English language control sequences updated to reflect final programming installed in the BAS at the time of system acceptance.
 - k. A BACnet Protocol Implementation Conformance Statement (PICS) for each type of controller and operator interface.

2. Complete original issue electronic copy for all software provided, including operating systems, programming language, operator workstation software, and graphics software.
3. Complete electronic copy of BAS database, user screens, setpoints and all configuration settings necessary to allow re-installation of system after crash or replacement of server, and resume operations with the BAS in the same configuration as during owner sign-off.
4. Project Record Drawings
 - a. As-built versions of the submittal drawings in reproducible paper and electronic format per Paragraph 1.8C.
 - b. As-built network architecture drawings showing all BACnet nodes including a description field with specific controller and device identification, description and location information.
5. Commissioning Reports. Completed versions of all Pre-functional, Functional, and Demonstration Commissioning Test reports, calibration logs, etc., per Paragraph 3.14A.9.
6. Copy of inspection certificates provided by the local code authorities.
7. Written guarantee and warranty documents for all equipment and systems, including the start and end date for each.
8. Training materials as required by Paragraph **3.15D**.
9. Contact information. Names, addresses, and 24-hour telephone numbers of contractors installing equipment, and the control systems and service representatives of each.

C. Format of Completion Documents

1. Provide the type and quantity of media listed in table below.
2. Project database, programming source files, and all other files required to modify, maintain, or enhance the installed system shall be provided in their source format and compiled format (where applicable).
3. Where electronic copies are specified, comply with the following:
 - a. Provide in word-searchable electronic format; acceptable formats are MS Word, Adobe Acrobat (pdf), and HTML; submit other formats for review and approval prior to submission; scanned paper documents not acceptable.
 - b. For submittals, provide separate file for each type of equipment.
 - c. Control sequences shall be in MS Word.

	Document	Paper (binder or bound)	Electronic	
			Loaded onto Flash Drive	Loaded onto CSS
1.	O&M Manual	2	1	1
2.	Original issue software	–	1 per workstation	1
3.	Project database including all source files	–	1 per workstation	1
4.	Project Record Drawings	2	1	1
5.	Control sequences	1	1	1
6.	Commissioning Reports	2	1	1
7.	Inspection Certificates	1	–	–
8.	Warranty documents	1	–	–
9.	Training materials	1 per trainee	1	1
10.	Contact information	1	–	1

D. Permanent On-site Documentation

1. In panels, provide the following in a sufficiently permanent manner such that documentation cannot be easily removed (and lost):
 - a. Point list of all points in panel.
 - b. Shop drawings for devices in panel.

1.9 BAS DESIGN

A. System Architecture

1. General
 - a. The system provided shall incorporate hardware resources sufficient to meet the functional requirements specified in this Section. Include all items not specifically itemized in this Section that are necessary to implement, maintain, and operate the system in compliance with the functional intent of this Section.
 - b. The system shall be configured as a distributed processing network(s) capable of expansion as specified herein.
 - c. The existing Campus BAS consists of a control system server interconnected by a high speed Supervisory LAN to each campus building and facility. This project includes integrating building level BCs and other control devices into the campus system.
 - 1) Within the building, the BAS shall be standalone and not rely on any 3rd party networks, such as the Campus IT LAN.
 - 2) To communicate with the central CSS (and internet via VPN), the building Supervisory LAN shall connect via a managed firewall/router or managed switch, provided under Division 27, to the College IT LAN, provided by the College's IT group. Locate in building BDF.
 - d. All control products provided for this Project shall comprise an interoperable Native BACnet System. All control products provided for this Project shall conform to ANSI/ASHRAE Standard 135.
 - e. Power-line carrier systems are not acceptable for BAS communication
2. BAS Network Architecture
 - a. Owner IT LAN. Ethernet-based, 100 or 1000 Mbps network with VPN dedicated to BAS specified under Division 27 Communications.
 - b. Supervisory LAN: Ethernet-based, 100 or 1000 Mbps BACnet/IP network interconnecting BCs and certain gateways and possibly the CSS and OWS(s) as specified herein. LAN shall be IEEE 802.3 Ethernet with switches and routers that support 100 Mbps minimum throughput. This network shall be BACnet/IP as defined in the BACnet standard, and shall share a common network number for the Ethernet backbone, as defined in BACnet.
 - c. Primary LAN: High-speed, peer-to-peer communicating LAN used to connect BCs, AACs, and certain gateways where specified herein. The Primary LAN communicates exclusively control information. Acceptable technologies include and are limited to Ethernet (IEEE802.3)
 - d. Secondary LAN: Network used only to connect certain gateways and sensors where specified herein. It shall not be used to interconnect BCs, AACs, and ASCs. Network speed versus the number of devices on the LAN shall be dictated by the response time and trending requirements. Acceptable technologies include but are not limited to:
 - 1) BACnet over Master Slave/Token Passing (MS/TP)
 - 2) Modbus RTU over RS-485
 - e. Subnets: Networks used to connect sensors and thermostats to AACs and ASCs. This network may as above for Secondary LANs or may be proprietary the manufacturer.

3. Operator Interfaces and Servers. The Control Systems Server (CSS) and Operator interface devices are existing. No additional CSS, OWS, or POT shall be provided as a part of this project. See Paragraph **Error! Reference source not found.** for temporary CSS requirements.
4. The figure below shows an example of the desired network architecture. Note:
 - a. Not all devices shown will exist for this project.
 - b. Ethernet network installer shall be responsible for assigning IP addresses to all devices on the network.

5. Controllers. The BCs, AACs, and ASCs shall monitor, control, and provide the field interface for all points specified.
6. Gateways

- a. See Paragraph 2.4C for a list of gateways and routers.
- b. Where gateways are used, critical points shall be hardwired from the BAS to the controlled device, rather than using the gateway, to avoid problems with gateway failures, currently a common problem. Critical points are those that are essential for proper operation and are listed in points list as separate points. Where listed, these points shall be hardwired even when available through gateway.

B. System Performance

1. The communication speed between the controllers, LAN interface devices, and operator interface devices shall be sufficient to ensure fast system response time under any loading condition. This includes when system is collecting trend data for commissioning and for long term monitoring. (See Paragraph 3.14H.) In no case shall delay times between an event, request, or command initiation and its completion be greater than those listed herein, assuming no other simultaneous operator activity. Reconfigure LAN as necessary to accomplish these performance requirements. This does not apply to gateways and their interaction with non-BAS-vendor equipment.
 - a. Object Command: The maximum time between an operator command via the operator interface to change an analog or binary point and the subsequent change in the controller shall be less than 5 seconds.
 - b. Object Scan: All changes of state and change of analog values will be transmitted over the network such that any data used or displayed at a controller or workstation will have been current within the previous 10 seconds.
 - c. Graphics Scan: The maximum time between an operator's selection of a graphic and it completely painting the screen and updating at least 10 points shall be less than 10 seconds.
 - d. Alarm Response Time: The maximum time from when an object goes into alarm to when it is annunciated at the workstation or broadcast (where so programmed) shall not exceed 10 seconds for a Level 1 alarm, 20 seconds for alarm levels 2 and 3, and 30 seconds for alarm levels 4 and 5. All workstations on the onsite network must receive alarms within 5 seconds of each other.
 - e. Program Execution Frequency: Custom and standard applications shall be capable of running as often as once every 5 seconds. Contractor shall be responsible for selecting execution times consistent with the mechanical process under control.
 - f. Control Loop Performance: Programmable controllers shall be able to execute DDC PID control loops at a selectable frequency of at least once per second. The controller shall scan and update the process value and output generated by this calculation at this same frequency.
2. Sensor selection, wiring method, use of transmitters, A-to-D conversion bits, etc. shall be selected and adjusted to provide end-to-end (fluid to display) accuracy at or better than those listed in the following table.

Measured Variable	Reported Accuracy
Space drybulb temperature	±1°F
Ducted Air drybulb temperature	±0.5°F
Mixed Air drybulb temperature	±1°F
Outside Air drybulb temperature	±0.5°F
Chilled and Condenser Water Temperature	±0.2°F
Hot Water Temperature	±0.5°F
Relative Humidity – general	±5% RH
Relative Humidity – outdoor air	±3% RH
Water and Gas Flow	±1% of reading
Airflow (terminal)	±10% of reading
Airflow (measuring stations)	±5% of reading

Measured Variable	Reported Accuracy
Air Pressure (ducts)	±0.05 inches
Air Pressure (space)	±0.01 inches
Water Pressure	±2% of reading
Electrical power	1% of reading
Carbon Dioxide (CO ₂)	±75 ppm

1.10 OWNERSHIP OF PROPRIETARY MATERIAL

- A. All project-developed software and documentation shall become the property of the Owner. These include, but are not limited to:
1. Project graphic images
 2. Record drawings
 3. Project database
 4. Project-specific application programming code
 5. All documentation

1.11 WARRANTY

- A. At the successful completion of the final testing, commissioning, and demonstration phase in accordance with the terms of this specification, if equipment and systems are operating satisfactorily to the Owner and if all completion requirements per Paragraph 1.8B have been fulfilled, the Owner shall certify in writing that the control system has been accepted. The date of acceptance shall be the start of the warranty period.
- B. Guarantee all materials, equipment, apparatus and workmanship (including programming) to be free of defective materials and faulty workmanship for the following periods from date of acceptance:
1. BCs, AACs, and ASCs: two years
 2. Valve and damper actuators: five years
 3. All else: one year
- C. Provide new materials, equipment, apparatus and labor to replace that determined by Owner to be defective or faulty.
- D. Control system failures during the warranty period shall be adjusted, repaired, or replaced at no additional cost or reduction in service to the Owner. Contractor shall respond to the Owner's request for warranty service within 24 hours during normal business hours.
- E. Operator workstation software, project-specific software, graphic software, database software, and firmware updates that resolve known software deficiencies shall be provided at no cost to the Owner during the warranty period.
- F. Sequence of operation programming bugs (both due to programming misinterpretations and sequence errors) shall be corrected and any reasonable control sequence changes required to provide proper system operation shall be provided at no additional cost to the Owner during this period.

1.12 WARRANTY MAINTENANCE

- A. The Owner reserves the right to make changes to the BAS during the warranty period. Such changes do not constitute a waiver of warranty. The Contractor shall warrant parts and installation work regardless of any such changes made by the Owner, unless the Contractor provides clear and convincing evidence that a specific problem is the result of such changes to the BAS.
- B. At no cost to the Owner, provide maintenance services for software and hardware components during the warranty period as specified below:
 - 1. Emergency Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming that would result in property damage or loss of comfort control shall be corrected and repaired following notification by the Owner to the Contractor.
 - a. Response by telephone or via internet connection to the BAS to any request for service shall be provided within two hours of the Owner's initial request for service.
 - b. In the event that the malfunction, failure, or defect is not corrected, at least one technician, trained in the system to be serviced, shall be dispatched to the Owner's site within eight hours of the Owner's initial request for such services.
 - 2. Normal Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming that would not result in property damage or loss of comfort control shall be corrected and repaired following notification by the Owner to the Contractor.
 - a. Response by telephone to any request for service shall be provided within eight working hours (contractor specified 40 hr. per week normal working period) of the Owner's initial request for service.
 - b. In the event that the malfunction, failure, or defect is not, at least one technician, trained in the system to be serviced, shall be dispatched to the Owner's site within three working days of the Owner's initial request for such services, as specified.
 - 3. Owner's Telephonic Request for Service: Contractor shall specify a maximum of three telephone numbers for Owner to call in the event of a need for service. At least one of the lines shall be attended continuously (24/7). Alternatively, pagers/SMS can be used for technicians trained in system to be serviced. One of the three paged/texted technicians shall respond to every call within 15 minutes.
 - 4. Technical Support: Contractor shall provide technical support by telephone throughout the warranty period.
 - 5. Documentation: Record drawings and software documentation shall be updated as required to reflect any and all changes made to the system or programming during the warranty period.

PART 2 PRODUCTS

2.1 PRIMARY BAS MANUFACTURER

- A. Delta Controls (to match campus standard)

2.2 GENERAL

- A. Materials shall be new, the best of their respective kinds without imperfections or blemishes and shall not be damaged in any way.
- B. To the extent practical, all equipment of the same type serving the same function shall be identical and from the same manufacturer.

- C. All controllers, associated hardware (repeaters, routers, etc.), sensors, and control devices shall be fully operational and maintain specified accuracy at the anticipated ambient conditions of the installed location as follows:
 1. Outdoors or in harsh ambient conditions: -20°C to 55°C (-4°F to 130°F), 10% RH to 90% RH noncondensing.
 2. Conditioned spaces or mechanical rooms: 0°C to 40°C (32°F to 104°F), 10% RH to 80% RH noncondensing.

2.3 CONTROLLERS

- A. Building Controller (BC)
 1. Delta eBMGR
- B. Advanced Application Specific Controller (AAC)
 1. Delta Red5
- C. Application Specific Controller (ASC)
 1. Delta Red5

2.4 COMMUNICATION DEVICES

- A. Supervisory LAN Routers
 1. Delta eBMGR
- B. BACnet Gateways & Routers
 1. Gateways shall be provided to link non-BACnet control products to the BACnet inter-network. All of the functionality described in this Paragraph is to be provided by using the BACnet capabilities. Each Gateway shall have the ability to expand the number of BACnet objects of each type supported by 20% to accommodate future system changes.
 2. Each Gateway shall provide values for all points on the non-BACnet side of the Gateway to BACnet devices as if the values were originating from BACnet objects. The Gateway shall also provide a way for BACnet devices to modify (write) all points specified by the Points List using standard BACnet services.
- C. Gateway and Routers

Equipment/System	Interface			
	Type	Specified Under Division:	Location	Connect to this Network:
Variable Speed Drives	BACnet/MSTP	23	Each VFD	Secondary
Lighting Controls	BACnet/IP	26	BDF Room	Supervisory
Power Monitoring	BACnet/IP	26	BDF Room	Supervisory
BTU meters	BACnet/MSTP	25	Each BTU meter	Secondary
Emergency Generator	Modbus RS-485	26	Generator yard	Secondary

2.5 BAS INTERFACE HARDWARE

- A. Control System Server (CSS) and all other interface hardware is provided under Laney Central Utility Plant scope. No work in this section other than integration of database per Paragraph **Error! Reference source not found.**

2.6 AIR TUBING

- A. Seamless copper tubing, Type L-ACR, ASTM B 88; with cast-bronze solder joint fittings, ANSI B1.18; or wrought-copper solder-joint fittings, ANSI B16.22; except brass compression-type fittings at connections to equipment. Solder shall be 95/5 tin antimony, or other suitable lead free composition solder.
- B. Virgin polyethylene non-metallic tubing type FR, ASTM D 2737, and with flame-retardant harness for multiple tubing. Use compression or push-on brass fittings.

2.7 ELECTRIC WIRING AND DEVICES

- A. All electrical work shall comply with Division 26.
- B. Communication Wiring
 1. Provide all communication wiring between Building Controllers, Routers, Gateways, AACs, ASCs and local and remote peripherals (such as operator workstations and printers).
 2. Ethernet LAN: Use Fiber or Category 5e or 6 of standard TIA/EIA 68 (10baseT). Network shall be run with no splices and separate from any wiring over 30 volts.
 3. ARCnet and MS/TP LAN: Communication wiring shall be individually 100% shielded pairs per manufacturers recommendations for distances installed, with overall PVC cover, Class 2, plenum-rated run with no splices and separate from any wiring over 30 volts. Shield shall be terminated and wiring shall be grounded as recommended by BC manufacturer.
- C. Analog Signal Wiring
 1. Input and output signal wiring to all field devices, including, but not limited to, all sensors, transducers, transmitters, switches, current or voltage analog outputs, etc. shall be twisted pair, 100% shielded if recommended or required by controller manufacturer, with PVC cover. Gauge shall be as recommended by controller manufacturer.

2.8 CONTROL CABINETS

- A. All control cabinets shall be fully enclosed with hinged door.
 1. For panels in mechanical rooms and other spaces that are secure and accessible only to BAS/MEP operators, provide quarter-turn slotted latch.
 2. For panels located in electrical rooms, IDF rooms, and other spaces that may be accessible by persons other than BAS/MEP operators, provide key-lock latch. A single key shall be common to all panels within each building. Provide 3 keys.
- B. Construction
 1. Indoor: NEMA 1
 2. Outdoor: NEMA 3R

- C. Interconnections between internal and face-mounted devices shall be pre-wired with color-coded stranded conductors neatly installed in plastic troughs or tie-wrapped. Terminals for field connections shall be UL Listed for service, individually identified per control-interlock drawings, with adequate clearance for field wiring. All control tubing and wiring shall be run neatly and orderly in open slot wiring duct with cover. Control terminations for field connection shall be individually identified per control Shop Drawings.
- D. Provide ON/OFF power switch with over-current protection for control power sources to each local panel.
- E. Provide with
 - 1. Framed, plastic-encased point list for all points in cabinet.
 - 2. Nameplates for all devices on face.

2.9 SENSORS AND MISCELLANEOUS FIELD DEVICES

- A. The listing of several sensors or devices in this section does not imply that any may be used. Refer to points list in Paragraph 2.12 Points List for device specification. Only where two or more devices are specifically listed in points list (such as "FM-1 or FM-4") may the Contractor choose among listed products.
- B. Control Valves
 - 1. Manufacturers
 - a. Belimo
 - b. Siemens
 - c. Invensys
 - d. Delta
 - e. Bray
 - f. Or equal
 - 2. Butterfly Valves
 - a. Body: Extended neck epoxy coated cast or ductile iron with full lug pattern, ANSI Class bolt pattern to match specified flanges.
 - b. Seat: EPDM replaceable, non-collapsible, phenolic backed.
 - c. Disc: Polished aluminum bronze or stainless steel, pinned or mechanically locked to shaft. Sanded castings are not acceptable.
 - d. Bearings: Bronze or stainless steel.
 - e. Shaft: 416 stainless steel supported at three locations with PTFE bushings for positive shaft alignment.
 - f. Close off rating: Bubble-tight shutoff greater or equal to 125% of pump shut-off head.
 - g. Manufacturers (In Addition to Paragraph 2.9B.1.)
 - 1) Jamesbury
 - 2) Keystone
 - 3) Dezurik
 - 4) Or equal
 - 3. Two Position Ball Valves
 - a. Valves shall be specifically designed for two-position duty in control application with guaranteed average leak-free life span over 200,000 full stroke cycles.
 - b. Industrial quality with nickel plated forged brass body and female NPT threads.
 - c. Blowout proof stem design, glass-reinforced Teflon thrust seal washer and stuffing box ring with minimum 600 psi rating (1 inch and smaller) or 400 psi rating (larger than 1 inch). The stem packing shall consist of 2 lubricated O-rings designed for on-off service and requiring no maintenance.

- d. Valves suitable for water or low-pressure steam shall incorporate an anti-condensation cap thermal break in stem design.
- e. No characterization disks
- f. Close off rating: Bubble-tight shutoff greater or equal to 125% of pump shut-off head.
- g. Ball: Chrome plated brass
- h. Stem: Chrome plated brass
- 4. Modulating Characterized Ball Valves
 - a. Valves shall be specifically designed for modulating duty in control application with guaranteed average leak-free life span over 200,000 full stroke cycles.
 - b. Industrial quality with nickel plated forged brass body and female NPT threads.
 - c. Blowout proof stem design, glass-reinforced Teflon thrust seal washer and stuffing box ring with minimum 600 psi rating (2-way valves) or 400 psi rating (3-way valves). The stem packing shall consist of 2 lubricated O-rings designed for modulating service and requiring no maintenance.
 - d. Valves suitable for water or low-pressure steam shall incorporate an anti-condensation cap thermal break in stem design.
 - e. Close off rating: Bubble-tight shutoff greater or equal to 125% of pump shut-off head.
 - f. Ball: stainless steel
 - g. Stem: stainless steel
 - h. Characterizing disk held securely by a keyed ring providing equal percentage characteristic
- 5. Minimum valve assembly pressure ratings
 - a. Chilled water: 125 psi at 60°F
 - b. Hot water: 125 psi at 200°F
 - c. Condenser water: 125 psi at 100°F
- 6. Valve Selection
 - a. Valve type
 - 1) Modulating 2-way or 3-way valves: characterized ball type
 - 2) Two-position isolation: butterfly or non-characterized ball type
 - b. Valve Characteristic
 - 1) 2-way valves: equal percentage or modified equal percentage.
 - 2) 3-way valves controlling cooling coils and condenser water heat exchangers: linear.
 - 3) 3-way valves controlling heating coils: equal percentage or modified equal percentage.
 - 4) Two-position valves: not applicable. For ball valves used for two-position duty, do not include characterizing disk.
 - c. Valve Sizing
 - 1) Modulating Water: Size valve to achieve the following full-open pressure drop
 - a) Minimum pressure drop: equal to half the pressure drop of coil or exchanger.
 - b) Maximum pressure drop
 - 1. Hot water at coils: 2 psi
 - 2. Chilled water at coils: 5 psi
 - c) 3-way valves shall be selected for near minimum pressure drop. 2-way and 6-way valves shall be selected near maximum pressure drop.
 - d) Flow coefficient (C_v) shall not be less than 1.0 (to avoid clogging) unless protected by strainer. Verify from piping schematics that a strainer is being provided.
 - e) Valve size shall match as close as possible the pipe size where C_v is available in that size.
 - 2) Two-position valves: Line size unless otherwise indicated on Drawings.

C. Control Dampers

- 1. See Section 233300 Duct Accessories and Section 237300 Air Handling Units & Coils.

D. Actuators

1. Manufacturers
 - a. Belimo
 - b. No equal
2. Warranty: Valve and damper actuators shall carry a manufacturer's 5-year warranty.
3. Electric Actuators
 - a. Entire actuator shall be UL or CSA approved by a National Recognized Testing Laboratory.
 - b. Enclosure shall meet NEMA 4X weatherproof requirements for outdoor applications.
 - c. Dampers. The actuator shall be direct coupled over the shaft, enabling it to be mounted directly to the damper shaft without the need for connecting linkage. The clamp shall be steel of a V-bolt design with associated V-shaped, toothed cradle attaching to the shaft for maximum strength and eliminating slippage via cold weld attachment. Single bolt or set screw type fasteners are not acceptable. Aluminum clamps are unacceptable.
 - d. Valves. Actuators shall be specifically designed for integral mounting to valves without external couplings.
 - e. Actuator shall have microprocessor based motor controller providing electronic cut off at full open so that no noise can be generated while holding open. Holding noise level shall be inaudible.
 - f. Noise from actuator while it is moving shall be inaudible through a tee-bar ceiling.
 - g. Actuators shall provide protection against actuator burnout using an internal current limiting circuit or digital motor rotation sensing circuit. Circuit shall insure that actuators cannot burn out due to stalled damper or mechanical and electrical paralleling. End switches to deactivate the actuator at the end of rotation or use of magnetic clutches are not acceptable.
 - h. Modulating Actuators. Actuators shall accept a 0 to 10 VDC or 0 to 20 mA control signal and provide a 2 to 10 VDC or 4 to 20 mA operating range. Actuators shall have positive positioning circuit so that controlled device is at same position for a given signal regardless of operating differential pressure. Actuators that internally use a floating actuator with an analog signal converter are not acceptable.
 - i. Where indicated on Drawings or Points List, actuators shall include
 - 1) 2 to 10 VDC position feedback signal
 - 2) Limit (end) position switches
 - j. All 24 VAC/DC actuators shall operate on Class 2 wiring and shall not require more than 10 VA for AC. Actuators operating on 120 VAC power shall not require more than 10 VA. Actuators operating on 230 VAC power shall not require more than 11 VA.
 - k. All modulating actuators shall have an external, built-in switch to allow the reversing of direction of rotation.
 - l. Actuators shall be provided with a conduit fitting an a minimum three-foot electrical cable and shall be pre-wired to eliminate the necessity of opening the actuator housing to make electrical connections.
 - m. Where fail-open or fail-closed (fail-safe) position is required by Paragraph 2.9D.5, an internal mechanical, spring return mechanism shall be built into the actuator housing. Electrical capacitor type fail-safe are also acceptable. All fail-safe actuators shall be capable of both clockwise or counterclockwise spring return operation by simply changing the mounting orientation.
 - n. Actuators shall be capable of being mechanically and electrically paralleled to increase torque where required.
 - o. All non-spring return actuators shall have an external manual gear release to allow manual positioning of the damper when the actuator is not powered. Spring return actuators with more than 60 inch-pound torque capacity shall have a manual crank for this purpose.

- p. Actuators shall be designed for a minimum of 60,000 full cycles at full torque and be UL 873 listed.
- q. Actuators shall provide clear visual indication of damper/valve position.
- 4. Electric Actuators for Large Butterfly Valves
 - a. Entire actuator shall be UL or CSA approved by a National Recognized Testing Laboratory.
 - b. The valve actuator shall consist of a capacitor-type reversible electric motor, gear train, limit switches and terminal block, all contained in a die cast aluminum enclosure.
 - c. Enclosure shall meet NEMA 4X weatherproof requirements for outdoor applications.
 - d. Output shaft shall be electroless nickel plated to prevent corrosion.
 - e. Actuator shall have a motor rated for minimum 75% duty cycle. Duty cycle shall be defined as running time divided by installed time at maximum torque.
 - f. Actuator shall be suitable for operation in ambient temperature ranging from -22°F to +150°F.
 - g. A pre-wired cable shall bring wiring outside enclosure to avoid necessity of opening cover.
 - h. Gears shall be hardened alloy steel, permanently lubricated. A self-locking gear assembly or a brake shall be supplied.
 - i. Actuator shall be equipped with a hand wheel for manual override to permit operation of the valve in the event of electrical power failure or system malfunction. Hand wheel must be permanently attached to the actuator. When in manual operation electrical power to the actuator will be permanently interrupted.
 - j. The hand wheel will not rotate while the actuator is electrically driven.
 - k. Actuator shall have heater and thermostat to minimize condensation within the actuator housing.
 - l. Provide limit (end) position switches where indicated on schematics.
 - m. Actuators shall provide clear visual indication of valve position.
- 5. Normal and Fail-Safe Position
 - a. Except as specified otherwise herein, the normal position (that with zero control signal) and the fail-safe position (that with no power to the actuator) of control devices and actuators shall be as indicated in table below. "Last" means last position. Actuators with a fail-safe position other than "Last" must have spring or electronic fail-safe capability.

Device	Normal Position	Fail-Safe Position
Outside air damper	CLOSED	OPEN (for life safety)
Return air damper (Note 1)	OPEN	CLOSED (for life safety)
Minimum outside air "dump" damper (Note 1)	CLOSED	CLOSED (for life safety)
Exhaust/relief air damper (Note 2)	CLOSED	OPEN (for life safety)
AHU heating coil valves	OPEN	LAST
AHU cooling coil valves	CLOSED	LAST
HW/CHW valves for changeover coils	Same as fail-safe	See Schematics
VAV box dampers	OPEN	LAST

Device	Normal Position	Fail-Safe Position
Notes: 1. Actuators shall be provided with damper as a UL listed smoke damper assembly under Section 237300 Air Handling Units & Coils. 2. Actuators shall be rated for 200°F ambient temperature minimum, e.g. Belimo FSAF series for smoke exhaust operation		

- 6. Valve Actuator Selection
 - a. Modulating actuators for valves shall have minimum rangeability of 50 to 1.
 - b. Water
 - 1) 2-way, 6-way, and two-position valves
 - a) Tight closing against 125% of system pump shut-off head.
 - b) Modulating duty against 90% of system pump shut-off head.
 - 2) 3-way shall be tight closing against twice the full open differential pressure for which they are sized.
- 7. Damper Actuator Selection
 - a. Actuators shall be direct coupled. For multiple sections, provide one actuator for each section; linking or jack-shafting damper sections shall not be allowed.
 - b. Provide sufficient torque as velocity, static, or side seals require per damper manufacturer's recommendations and the following:
 - 1) Torque shall be a minimum 5 inch-pound per square foot for opposed blade dampers and 7 inch-pound per square foot for parallel blade dampers.
 - 2) The total damper area operated by an actuator shall not exceed 80% of the manufacturer's maximum area rating.

E. General Field Devices

- 1. Provide field devices for input and output of digital (binary) and analog signals into controllers (BCs, AACs, ASCs). Provide signal conditioning for all field devices as recommended by field device manufacturers and as required for proper operation in the system.
- 2. It shall be the Contractor's responsibility to assure that all field devices are compatible with controller hardware and software.
- 3. Field devices specified herein are generally two-wire type transmitters, with power for the device to be supplied from the respective controller. If the controller provided is not equipped to provide this power, or is not designed to work with two-wire type transmitters, or if field device is to serve as input to more than one controller, or where the length of wire to the controller will unacceptably affect the accuracy, provide a transmitter and necessary regulated DC power supply, as required.
- 4. For field devices specified hereinafter that require signal conditioners, signal boosters, signal repeaters, or other devices for proper interface to controllers, furnish and install proper device, including 120V power as required. Such devices shall have accuracy equal to, or better than, the accuracy listed for respective field devices.
- 5. Accuracy: As used in this Section, accuracy shall include combined effects of nonlinearity, non-repeatability and hysteresis. Sensor accuracy shall be at or better than both that specifically listed for a device and as required by Paragraph 1.9B.2.

F. Temperature Sensors (TS)

- 1. General
 - a. Unless otherwise noted, sensors may be platinum RTD, thermistor, or other device that is commonly used for temperature sensing and that meets accuracy, stability, and resolution requirements.
 - b. When matched with A/D converter of BC, AAC, or ASC, sensor range shall provide a resolution of no worse than 0.3°F (0.16 °C) (unless noted otherwise herein).

- c. Sensors shall drift no more than 0.3°F and shall not require calibration over a five-year period.
- d. Manufacturers
 - 1) Mamac
 - 2) Kele Associates
 - 3) Building Automation Products Inc.
 - 4) Delta Controls
 - 5) Or equal
- 2. Duct temperature sensors: Shall consist of sensing element, junction box for wiring connections and gasket to prevent air leakage or vibration noise.
 - a. TS-1A: Single point (use where not specifically called out to be averaging in points list). Sensor probe shall be 304 stainless steel.
 - b. TS-1B: Averaging. Sensor length shall be at least 1 linear foot for each 2 square feet of face area up to 25 feet maximum. Sensor probe shall be bendable aluminum.
- 3. Water Temperature Sensors
 - a. TS-2A: Well mounted immersion sensor, ¼" stainless steel probe, double encapsulated sensor, with enclosure suitable for location.
 - b. TS-2B: Same as TS-2A except provide extra precision (XP) temperature sensors to meet accuracy specified Paragraph 1.9B.2.
 - c. TS-2C. See BTU-1.
 - d. All piping immersion sensors shall be in one-piece machined brass or stainless steel wells that allow removal from operating system, with lagging extension equal to insulation thickness where installed in insulated piping. Wells shall be rated for maximum system operating pressure, temperature and fluid velocity. The well shall penetrate the pipe by the lesser of approximately half the pipe diameter or eight inches. The use of direct immersion or strap-on type sensors is not acceptable.
- 4. Room Sensors
 - a. Thermostat tags refer to the following:

Type:	Tag	
Delta model	eZTS	eZNS
Display	Blank	LCD
Temperature only	TS-3A	TS-3C
With humidity	TS-3AH	TS-3CH
With CO ₂	TS-3AC	TS-3CC
With CO ₂ and humidity	TS-3AHC	TS-3CHC

- 1) Display
 - a) Blank: Blank cover (or LCD display with display configured to be shut off and touchpad or keypad disabled)
 - b) LCD: LCD display of all sensors, temperature setpoint adjustment buttons, and schedule override button
- 2) Humidity Sensor
 - a) 10% to 90%/±2% accuracy
 - b) Where humidity sensor is not specified but included as standard, it shall be configured to not be displayed on the LCD or any graphics and not included in points list, as if it did not exist. (The purpose is to avoid the expense of having to keep the sensor in calibration.)
- 3) CO₂ Sensor
 - a) 400 to 1250 PPM/ ±30PPM or 3% of reading, whichever is greater.
 - b) The sensor shall include automatic background calibration (ABC) logic to compensate for the aging of the infrared source and shall not require recalibration for a minimum of 5 years, guaranteed. If sensor is found to be out of calibration, supplier shall recalibrate at no additional cost to the Owner within 5 years of purchase date.

- c) Meet Title 24 requirements including calibration interval
 - 4) For room sensors connected to terminal box controllers (such as at VAV boxes) that require calibration: Include a USB port or some other means for connection of POT for terminal box calibration. Alternative means of terminal calibration are acceptable provided they result in no cost to Work performed under Section 230593 Testing, Adjusting, and Balancing.
 - b. See equipment schedules for thermostat type.
 - 5. TS-4: Outdoor Air Sensor
 - a. Outdoor air sensors shall have a sun shield, utility box, and watertight gasket to prevent water seepage.
 - 6. Temperature Transmitters: Where required by the Controller or to meet specified end-to-end accuracy requirements, sensors as specified above shall be matched with transmitters outputting 4-20 mA linearly across the specified temperature range. Transmitters shall have zero and span adjustments, an accuracy of 0.1°F when applied to the sensor range.
- G. BTU Meter (BTU-1)
- 1. Matched RTD or solid state temperature sensors with a differential temperature accuracy of +/-0.15°F.
 - 2. Flow meter: FM-1
 - 3. Unit accuracy shall be +/- 1% factory calibrated, traceable to NIST with certification.
 - 4. NEMA 1 enclosure.
 - 5. UL listed.
 - 6. Provide BACnet/MSTP network connection that will allow all point data to be transmitted to BAS network.
 - a. BACnet Points:
 - 1) Supply Temperature
 - 2) Return Temperature
 - 3) Flow
 - 4) Energy Rate (Btu/hr.)
 - 7. Manufacturers
 - a. Onicon System 20
 - b. Siemens Sitrans
 - c. Or Equal
- H. Differential Pressure Transmitters (DPT)
- 1. DPT-1: Water, General Purpose
 - a. Fast-response capacitance sensor
 - b. Two-wire transmitter, 4-20 mA output with zero and span adjustments
 - c. Accuracy
 - 1) Overall Accuracy (at constant temp) $\pm 0.25\%$ full scale (FS).
 - 2) Non-Linearity, BFSL $\pm 0.22\%$ FS.
 - 3) Hysteresis 0.10% FS.
 - 4) Non-Repeatability 0.05% FS.
 - d. Long Term Stability 0.5% FS per year
 - e. Only 316 stainless steel in contact with fluid
 - f. Pressure Limits
 - 1) 0 to 100 psid range: 250 psig maximum static pressure rating, 250 psig maximum overpressure rating.
 - 2) 100 to 300 psid range: 450 psig maximum static pressure rating, 450 psig maximum overpressure rating.
 - g. Include brass 5-valve assembly for single sensor devices. See Paragraph 3.11E.7.
 - h. Manufacturers
 - 1) Setra 209 or 230

- 2) Modus W30
- 3) Or equal
- 2. DPT-2: Not used
- 3. DPT-3: Air, Duct Pressure:
 - a. General: Loop powered two-wire differential capacitance cell-type transmitter.
 - b. Output: two wire 4-20 mA output with zero adjustment.
 - c. Overall Accuracy: $\pm 1\%$ of range (not of maximum range/scale)
 - d. Switch selectable range:
 - 1) ≥ 0.5 inches water column
 - 2) ≤ 10 inches water column
 - 3) Select range as specified in points list or, if not listed for specified setpoint to be between 25% and 75% full-scale.
 - e. Housing: Polymer housing suitable for surface mounting.
 - f. Static Sensing Element: Pitot-type static pressure sensing tips similar to Dwyer model A-301, Davis Instruments, or equal, with connecting tubing.
 - g. DPT-3A: Include LCD display of reading.
 - h. Manufacturers.
 - 1) Setra
 - 2) Modus
 - 3) Invensys
 - 4) Dwyer
 - 5) Or equal
- 4. DPT-4: Air, Low Differential Pressure
 - a. General: Loop powered, two-wire differential capacitance cell type transmitter.
 - b. Output: Two-wire 4-20 mA output with zero adjustment.
 - c. Overall Accuracy
 - 1) General: $\pm 1\%$ FS
 - d. Range
 - 1) Fixed (non-switch selectable)
 - 2) Minimum Range: 0, -0.1, -0.25, -0.5, or -1.0 inches water column
 - 3) Maximum Range: +0.1, 0.25, 0.5, or 1.0 inches water column
 - 4) Range shall be as specified in points list or, if not listed, selected such that specified setpoint is between 25% and 75% full-scale.
 - e. Housing: Polymer housing suitable for surface mounting
 - f. Static Sensing Element
 - 1) Ambient sensor: Dwyer A-306 or 420, BAPI ZPS-ACC-10, or equal
 - 2) Space sensor: Kele RPS-W, BAPI ZPS-ACC-01, Dwyer A-417 or 465, Veris AA05 or equal wall plate sensor
 - 3) Filter or duct pressure sensor: Dwyer A-301 or equal
 - 4) Plenum pressure sensor: Dwyer A-421 or equal
 - g. DPT-4A: Include LCD display of reading
 - h. Manufacturers
 - 1) Setra 267
 - 2) Modus
 - 3) Air Monitor
 - 4) Paragon
 - 5) Or equal
- 5. DPT-5: VAV Velocity Pressure
 - a. General: Loop powered two-wire differential capacitance cell type transmitter.
 - b. Output: Two-wire, 4-20 mA output with zero adjustment.
 - c. Flow transducer (including impact of A-to-D conversion) shall be capable of stably controlling to a setpoint of 0.004 inches differential pressure or lower, shall be capable of sensing 0.002 inches differential pressure or lower, and shall have a ± 0.001 inches or lower resolution across the entire scale.

- d. Calibration software shall use a minimum of two field measured points, minimum and maximum airflow, with curve fitting airflow interpolation in between.
- e. Range: 0 to 1.5 in.w.c.
- f. Housing: Polymer housing suitable for surface mounting.
- g. Manufacturer
 - 1) Automated Logic or Distech
 - 2) No equal

I. Differential Pressure Switches (DPS)

- 1. DPS-1: Water: Diaphragm with adjustable setpoint, 2 psig or adjustable differential, and snap-acting Form C contacts rated for the application. 60 psid minimum pressure differential range. 0°F to 160°F operating temperature range.
- 2. DPS-2: Air: Diaphragm with adjustable setpoint and differential and snap acting form C contacts rated for the application. Automatic reset. Provide manufacturer's recommended static pressure sensing tips and connecting tubing.

J. Current Switches (CS-1)

- 1. Clamp-on or solid-core
- 2. Range: as required by application
- 3. Trip Point: Automatic or adjustable
 - a. Exception: Fixed setpoint (Veris H-300 or equal) may be used on direct drive constant speed fans that do not have backdraft or motorized shutoff dampers.
- 4. Switch: Solid state, normally open, 1 to 135 Vac or Vdc, 0.3 Amps. Zero off state leakage
- 5. Lower Frequency Limit: 6 Hz
- 6. Trip Indication: LED
- 7. Approvals: UL, CSA
- 8. May be combined with relay for start/stop
- 9. Where used for single-phase devices, provide the CS/CR in a self-contained unit in a housing with override switch. Kele RIBX, Veris H500, or equal
- 10. Manufacturers
 - a. Veris Industries H-608/708/808/908, and H6ECM05 for ECMs
 - b. Senva C-2320L
 - c. RE Technologies SCS1150A-LED
 - d. Or equal

K. Current Transformers (CT-1)

- 1. Clamp-On Design Current Transformer (for Motor Current Sensing)
- 2. Range: 1-10 amps minimum, 20-200 amps maximum
- 3. Trip Point: Adjustable
- 4. Output: 0-5 Vdc or 0-10 Vdc,
- 5. Accuracy: $\pm 0.2\%$ from 20 to 100 Hz.
- 6. Amperage range sizing and switch settings in accordance with the following and per manufacturer's instructions:

Motor HP	120V	277V	480V
$\leq 1/2$	0-10A	0-10A	-
3/4 – 1.5	-	0-10A	0-10A
2 – 5	-	-	0-10A
7.5 – 10	-	-	0-20A
15 – 20	-	-	0-30A
25 – 30	-	-	0-40A

- 7. Manufacturers
 - a. Veris Hx22 series

- b. Kele SC100
 - c. Or equal
- L. Flow Meter (FM)
1. FM-1: Magnetic Flow Tube Flow Meters
 - a. General Requirements
 - 1) Sensor shall be a magnetic flow meter, which utilizes Faraday's Law to measure volumetric fluid flow through a pipe. The flow meter shall consist of 2 elements, the sensor and the electronics. The sensor shall generate a measuring signal proportional to the flow velocity in the pipe. The electronics shall convert this EMF into a standard current output.
 - 2) Electronic replacement shall not affect meter accuracy (electronic units are not matched with specific sensors).
 - 3) Provide a four-wire, externally powered, magnetic type flow transmitter with adjustable span and zero, integrally mounted to flow tube. Output signal shall be a digital pulse proportional to the flow rate (to provide maximum accuracy and to handle abrupt changes in flow). Standard 4-20 mA or 0-10 Vdc outputs may be used on HVAC applications provided accuracy is as specified.
 - 4) Flow Tube
 - a) ANSI class 150 psig steel
 - b) ANSI flanges
 - c) Lined with
 1. Heating hot water, glycol: PTFE, PFA, or ETFE liner rated for $\leq -4^{\circ}\text{F}$ to $\geq 212^{\circ}\text{F}$ fluid temperature
 2. Chilled, condenser, domestic hot and cold water: Polypropylene, Ebonite, PTFE, PFA, or ETFE liner rated for $\leq 32^{\circ}\text{F}$ to $\geq 140^{\circ}\text{F}$ fluid temperature
 - 5) Electrode and grounding material
 - a) 316L Stainless steel or Hastelloy C
 - b) Electrodes shall be fused to ceramic liner and not require O-rings.
 - 6) Electrical Enclosure: NEMA 4
 - 7) Approvals
 - a) UL or CSA
 - b) NSF Drinking Water approval for domestic water applications
 - 8) Performance
 - a) Accuracy shall be $\pm 0.5\%$ of actual reading from 3 to 30 feet per second flow velocities, and ± 0.015 fps from 0.04 fps to 3 fps.
 - b) Stability: 0.1% of rate over six months.
 - c) Meter repeatability shall be $\pm 0.1\%$ of rate at velocities > 3 feet per second.
 - d) Calibration: The sensor must be factory calibrated on an internationally accredited (such as NAMAS) water flow rig with accuracy better than 0.1%. Calibration shall be NIST traceable.
 - b. Manufacturers
 - 1) Onicon F-3100 series
 - 2) Siemens/Danfoss Magflo 3100
 - 3) Krohne Optiflux 4000
 - 4) Sparling TigermagEP FM656
 - 5) Or equal
 2. FM-2: Not used
 3. FM-3: Not used
 4. FM-4: Not used
 5. FM-5: Not used
 6. FM-6: Domestic and makeup water meters
 - a. 2 inches and smaller: Multi-jet water meter

- 1) Multi-jet velocity type meter
 - 2) Magnetic drive – no gearing exposed to water
 - 3) 125 psi cast bronze body with integral strainer
 - 4) Meet all requirements of AWWA C-708 Multi-Jet Meter
 - 5) Accuracy: $\pm 1.5\%$ of reading
 - 6) Low voltage pulse output, with configurable volume per pulse.
 - 7) pulse output
 - 8) Odometer-type gallons totalizer display with weather cover
 - 9) Designed for vertical or horizontal piping
 - 10) For potable water: NSF-61 certified and in compliance with California Proposition 65
 - 11) Manufacturers:
 - a) SeaMetrics MJE, MJR, or WTS
 - b) Elster Amco M700
 - c) Master Meter
 - d) Equal
- b. 2.5 inches and larger: Compound-type water meter
- 1) Shall consist of a combination of a turbine-type, mainline meter for measuring high rates of flow and a bypass meter of an appropriate size for measuring low rates of flow. The compound meter shall have an automatic valve mechanism for diverting low rates of flow through the bypass meter.
 - 2) Comply with ANSI and AWWA C702 standards.
 - 3) Comply with NSF/ANSI Standard 61, ANNEX G.
 - 4) Maximum operating pressure of 150 psi and maximum operating temperature of 120°F continuous (220°F peak).
 - 5) Low voltage pulse output, with configurable volume per pulse.
 - 6) Manufacturers:
 - a) Badger Recordall Series Meter
 - b) Neptune
 - c) Or equal

M. Airflow Measuring Stations (AFMS)

1. General. AFMS provided under this Section shall be licensed to bear the AMCA Certified Rating Seal for Airflow Measuring Stations. Ratings shall be based on tests and procedures performed in accordance with AMCA Publication 611 and comply with requirements of the AMCA Certified Ratings Program.
2. AFMS-1
 - a. Differential pressure type with uniframe DP sensor
 - 1) Provide quantity of DP sensors per manufacturer's recommendations
 - b. Station mounted with expanded metal screen
 - c. Analog outputs for airflow and temperature
 - d. Manufacturers
 - 1) Air Monitor OAM-II-AFS
 - 2) No equal

N. Electric Control Components

1. Line-Voltage Wall Thermostat: Wall-mounted thermostat shall consist of SPDT contacts rated for 120V and current as required for application, temperature setpoint range of 50 to 90°F.
2. Control Relays: All control relays shall be UL listed, with contacts rated for the application, and mounted in minimum NEMA-1 enclosure for indoor locations, NEMA-4 for outdoor locations.
 - a. Control relays for use on electrical systems of 120 volts or less shall have, as a minimum, the following:

- 1) AC coil pull-in voltage range of +10%, -15% or nominal voltage.
- 2) Coil sealed volt-amperes (VA) not greater than 4 VA.
- 3) Silver cadmium Form C (SPDT) contacts in a dustproof enclosure, with 8 or 11 pin type plug.
- 4) Pilot light indication of power-to-coil and coil retainer clips.
- b. Relays used for across-the-line control (start/stop) of 120V motors, 1/4 HP, and 1/3 HP, shall be rated to break minimum 10 Amps inductive load.
- c. Relays used for stop/start control shall have low voltage coils (30 VAC or less), and shall be provided with transient and surge suppression devices at the controller interface.
3. General Purpose Power Contactors: NEMA ICS 2, AC general-purpose magnetic contactor. ANSI/NEMA ICS 6, NEMA type 1 enclosure. Manufacturer shall be Square D, Cutler-Hammer, or equal.
4. Control Transformers and Power Supplies
 - a. Control transformers shall be UL Listed. Furnish Class 2 current-limiting type, or furnish over-current protection in both primary and secondary circuits for Class 2 service per NEC requirements. Mount in minimum NEMA-1 enclosure.
 - b. Transformer shall be proper size for application. Limit connected loads to 80% of rated capacity.
 - c. DC power supply output shall match output current and voltage requirements. Unit shall be full-wave rectifier type with output ripple of 5.0 mV maximum peak-to-peak. Regulation shall be 1.0% line and load combined, with 100 microsecond response time for 50% load changes. Unit shall have built-in over-voltage and over-current protection, and shall be able to withstand a 150% current overload for at least 3 seconds without trip-out or failure.
 - d. Separate power transformer shall be used for controllers and for actuators and other end devices that use half wave rectification.
 - e. Unit shall operate between 0°C and 50°C [32°F and 120°F]. EM/RF shall meet FCC Class B and VDE 0871 for Class B, and MIL-STD 810C for shock and vibration.
 - f. Line voltage units shall be UL Recognized and CSA Approved.
5. Electric Push Button Switch: Switch shall be momentary contact, oil tight, push button, with number of N.O. or N.C. contacts as required. Contacts shall be snap-action type, and rated for minimum 120 Vac operation. Switch shall be 800T type, as manufactured by Allen Bradley, Kele, or equal.
6. Pilot Light: Panel-mounted pilot light shall be NEMA ICS 2 oil tight, transformer type, with screw terminals, push-to-test unit, LED type, rated for 120 VAC. Unit shall be 800T type, as manufactured by Allen-Bradley, Kele, or equal.
7. Ceiling Fan Override
 - a. Mechanical Timer Switch: Switch shall be mechanically spring wound with a N.O. contact or N.C. contacts as required. Timer shall be 0-120 minutes and shall not include a "hold" feature, which allows switch contacts to remain closed. Intermatic FF2H or equal.
 - b. Potentiometer. Wall box mounted single turn with knob numbered 0 to 100. Wall plate cover to match electrical. Kele SPA or equal.
 - c. Mount in one-gang box if possible.
 - d. Label: see Drawings

2.10 CALIBRATION & TESTING INSTRUMENTATION

- A. Provide instrumentation required to verify readings, calibrate sensors, and test the system and equipment performance.

- B. All equipment used for testing and calibration shall be NIST/NBS traceable and calibrated within the preceding 6-month period. Certificates of calibration shall be submitted.
- C. Test equipment used for testing and calibration of field devices shall be at least twice as accurate as respective field device (for example if field device is $\pm 0.5\%$ accurate, test equipment shall be $\pm 0.25\%$ accurate over same range).

2.11 SOFTWARE

A. General

- 1. System software shall be the latest version of Delta enteliWEB.

B. Licensing

- 1. Include licensing and hardware keys for all software packages at all workstations (OWSs and POTs) and servers.
- 2. Within the limitations of the server, provide licenses for any number of users to have web access to the CSS at any given time.
- 3. All operator interface, programming environment, networking, database management and any other software used by the Contractor to install the system or needed to operate the system to its full capabilities shall be licensed and provided to the Owner.
- 4. All operator software, including that for programming and configuration, shall be available on all workstations. Hardware and software keys to provide all rights shall be installed on all workstations.

C. Graphical User Interface Software

1. Graphics

- a. The GUI shall make extensive use of color in the graphic pane to communicate information related to setpoints and comfort. Animated graphics and active setpoint graphic controls shall be used to enhance usability.
- b. Graphics tools used to create Web Browser graphics shall be non-proprietary and provided and installed on each OWS.
- c. Graphical display shall be 1280 x 1024 pixels or denser, 256 color minimum.
- d. Links
 - 1) Graphics shall include hyperlinks which when selected (clicked on with mouse button) launch applications, initiate other graphics, etc.
 - 2) Screen Penetration: Links shall be provided to allow user to navigate graphics logically without having to navigate back to the home graphic. See additional discussion in Paragraph 3.12E.
 - 3) Information Links
 - a) On each MEP system and subsystem graphic, provide links to display in a new window the information listed below.
 - 1. English-language as-built control sequence associated with the system. See Paragraph 1.8B.
 - 2. O&M and submittal information for the devices on the graphic. See Paragraph 1.8B. This includes links to electronic O&M and submittal information for mechanical equipment supplied under Section 230501 Basic Mechanical Materials and Methods.
 - b) The display shall identify the target of the link by file name/address.
 - c) Information shall be displayed in electronic format that is text searchable.
 - d) Window shall include software tools so that text, model numbers, or point names may be found. Source documents shall be read-only (not be editable) with this software.

e. Point Override Feature

- 1) Every real output or virtual point displayed on a graphic shall be capable of being overridden by the user (subject to security level access) by mouse point-and-click from the graphic without having to open another program or view.
- 2) When the point is selected to be commanded
 - a) Dialog box opens to allow user to override the point (Operator Mode) or release the point (Automatic Mode). Operator Mode will override automatic control of the point from normal control programs.
 - b) Dialog box shall have buttons (for digital points) or a text box or slide bar (for analog points) to allow user to set the point's value when in operator mode. These are grayed out when in automatic mode.
 - c) When dialog box is closed, mode and value are sent to controller.
 - d) Graphic is updated upon next upload scan of the actual point value.
- 3) A list of points that are currently in an operator mode shall be available through menu selection.
- f. Point override status (if a digital point is overridden by the supervised manual override per Paragraph 2.3A or if a point is in operator mode per Paragraph 2.11C.1.e) shall be clearly displayed on graphics for each point, such as by changing color or flag.
- g. The color of symbols representing equipment shall be able to change color or become animated based on status of binary point to graphically represent on/off status.
2. Alarms
 - a. Standard Delta enteliWEB alarm package configured as indicated below.
3. Trends
 - a. Delta enteliWEB trend package configured as indicated below.
 - b. Trend Data Storage
 - 1) The database shall allow applications to access the data while the database is running. The database shall not require shutting down in order to provide read-write access to the data. Data shall be able to be read from the database without interrupting the continuous storage of trend data being carried by the BAS using SQL queries.
 - 2) Data shall be stored in an SQL compliant database format and shall be available through the Owner's intranet or internet (with appropriate security clearance) without having to disable BAS access to the database.
 - 3) The database shall not be inherently limited in size, e.g. due to software limitations or lack of a correct license. Database size shall be limited only by the size of the provided storage media (hard drive size).
4. Security Access
 - a. Standard Delta enteliWEB security package
5. Report Software
 - a. Delta enteliVault
 - b. Standard reports. Prepare the following standard reports, accessible automatically without requiring definition by user.
 - 1) Tenant or department after-hour usage. System must be capable of monitoring tenant override requests and generating a monthly report showing the daily total time in hours that each tenant has requested after-hours HVAC services.
 - 2) Monthly and annual energy usage and cost. See Utility cost calculation in Paragraph 3.12.
 - 3) Alarm events and status.
 - 4) Points in Hand (Operator Override) via Workstation command (including name of operator who made the command) or via supervised HOA switch at output, including date and time.

D. Control Programming Software

1. Delta GCL+

E. Miscellaneous Software

1. Provide a context-sensitive, on-line help system to assist the operator in operating and editing the system. On-line help shall be available for all applications and shall provide relevant data for the application or object that help is being called from.
2. Provide software for viewing (but not editing) electronic versions of as-built shop drawings of
 - a. Mechanical, electrical, and plumbing systems in Adobe pdf format
 - b. BAS drawings in Adobe pdf format

2.12 CONTROL POINTS

A. Table Column Definitions

1. Point description
2. Type (number in point schedule after each type refers to tag on schematics)
 - a. AO: analog output
 - b. AI: analog input
 - c. DO: digital or binary output
 - d. DI: digital or binary input
3. Device description
 - a. See Paragraph 2.9 for device definition.
4. Trend Logging
 - a. Commissioning: Where listed, point is to be trended at the basis listed for commissioning and performance verification purposes.
 - b. Continuous: Where listed, point is to be trended at the basis listed continuously, initiated after system acceptance, for the purpose of future diagnostics.
 - c. Trend Basis
 - 1) Where range of engineering units is listed, trend on a change of value (COV) basis (in other words record time stamp and value when point value changes by engineering unit listed).
 - 2) Where time interval is listed, trend on a time basis (in other words record time stamp and value at interval listed). All points relating to a specific piece of equipment shall be trended at the same initiation time of day so data can be compared in text format.
5. Calibration
 - a. F = factory calibration only is required (no field calibration)
 - b. HH = field calibrate with handheld device. See Paragraph 3.14D.6.a.2)

B. Note that points lists below are for each system of like kind. Refer to drawings for quantity of each.

C. Points mapped through gateways and network interfaces

1. Variable speed drives

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Fault reset	DO	Through network	COV	COV	–
On/off status	DI	Through network	COV	COV	–
Fault (Critical Alarm)	DI	Through network	COV	COV	–
Minor Alarm	DI	Through network	COV	COV	–

D. Hardwired Points

1. VAV Box - Cooling only

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
VAV Box Damper Position	AO	Modulating actuator	1 min	15 min	–
Local Override	DI	TS-3x – where applicable (see Paragraph 2.9F).	COV	COV	–
Supply Airflow	AI	DPT-5 connected to box manufacturer supplied flow cross	1 min	15 min	HH (see §230593)
Zone Temperature Setpoint Adjustment	AI	TS-3x – where applicable (see Paragraph 2.9F).	15 min	60 min	F
Zone Temperature	AI	TS-3x (see Paragraph 2.9F)	1 min	15 min	F

2. VAV dual duct zones

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Cooling damper	AO	Modulating actuator	COV	COV	–
Heating damper	AO	Modulating actuator	COV	COV	–
Local Override	DI	TS-3x – where applicable (see Paragraph 2.9F).	COV	COV	–
Zone Temperature Setpoint Adjustment	AI	TS-3x – where applicable (see Paragraph 2.9F).	15 min	60 min	F
Zone Temperature	AI	TS-3x (see Paragraph 2.9F)	1 min	15 min	F
Cooling air volume	AI	DPT-5 connected to box manufacturer supplied flow cross at cooling inlet	1 min.	10 min.	HH (see §230593)
Heating air volume	AI	DPT-5 connected to box manufacturer supplied flow cross at heating inlet	1 min.	10 min.	HH (see §230593)
CO ₂ concentration	AI	TS-3x (see Paragraph 2.9F)	1 min.	10 min.	F

3. VAV Box - Cooling only with Thermafusers

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
VAV Box Damper Position	AO	Modulating actuator	1 min	15 min	–
Duct Static Pressure	AI	DPT-3A, 0 to 0.5 inches	1 min	15 min	F
Supply Airflow	AI	DPT-5 connected to box manufacturer supplied flow cross	1 min	15 min	HH
Zone Temperature	AI	TS-3A	1 min	15 min	F

4. Ceiling Fans

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Ceiling Fan Start/Stop	DO	Connect to fan controller	COV	COV	–
Ceiling Fan Status	DI	Connect to fan status	COV	COV	–
Ceiling Fan Speed Setpoint	AO	Connect to fan controller	1 min	15 min	–
Wall Mounted Fan Override	DI	0-2 hour windup timer	COV	COV	–
Wall mounted speed override	AI	Speed potentiometer	1 min	±20%	–

5. Cooling VAV Air Handler

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Relief damper 1 open/close	DO	Two position actuator	COV	COV	–
Relief damper 2 open/close	DO	Two position actuator	COV	COV	–
Relief Fan 1 Start/Stop	DO	Connect to VFD Run	COV	COV	–
Relief Fan 2 Start/Stop	DO	Connect to VFD Run	COV	COV	–
Supply fan high static alarm reset	DO	Dry contact to 120V or 24V control circuit –see control schematics for details	COV	COV	–
Supply Fan 1 Start/Stop	DO	Connect to VFD Run	COV	COV	–
Supply Fan 2 Start/Stop	DO	Connect to VFD Run	COV	COV	–
Changeover valves	DO	Two position 2-way valves, CW and HW, spring return per drawings	COV	COV	–
Outdoor Air Damper	AO	Modulating actuator	1 min	15 min	–
Return Air Damper	AO	Modulating actuator by others (part of UL listed smoke damper)	1 min	15 min	–
Minimum Outdoor Air “Dump” Damper	AO	Modulating actuator by others (part of UL listed smoke damper)	1 min	15 min	–
Relief Fan Speed	AO	Connect to VFD Speed, RF-1 and 2	1 min	15 min	–
Supply Fan Speed	AO	Connect to VFD Speed, SF-1 and 2	1 min	15 min	–
Chilled/hot Water Control Valves	AO	Modulating 2-way valves, CHW and HW, spring return closed	1 min	15 min	–
Mixed Air Temperature	AI	TS-1B across filter bank	1 min	15 min	F
Filter Pressure Drop	AI	DPT-3A, 0 to 1 inch	–	60 min	F
Return Air Temperature	AI	TS-1A	1 min	15 min	F
Outdoor Airflow	AI	AFMS-1, flow output	1 min	15 min	F
Outdoor Temperature	AI	AFMS-1, temperature output	1 min	15 min	F
Supply Air Temperature	AI	TS-1A	1 min	15 min	HH
Duct Static Pressure	AI	DPT-3A, 0 to 2 inches	1 min	15 min	F

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Building Pressure, Building, 2 nd floor	AI	DPT-4, ±0.25	1 min	15 min	F
Building Pressure, Building, 3 rd floor	AI	DPT-4, ±0.25	1 min	15 min	F

6. Heating VAV Air Handler

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Supply fan high static alarm reset	DO	Dry contact to 120V or 24V control circuit –see control schematics for details	COV	COV	–
Supply Fan 1 Start/Stop	DO	Connect to VFD Run	COV	COV	–
Supply Fan 2 Start/Stop	DO	Connect to VFD Run	COV	COV	–
Supply Fan Speed	AO	Connect to VFD Speed, SF-1 and 2	1 min	15 min	–
Hot Water Control Valve	AO	Modulating 2-way valves	1 min	15 min	–
Filter Pressure Drop	AI	DPT-3A, 0 to 1 inch	–	60 min	F
Supply Air Temperature	AI	TS-1A	1 min	15 min	HH
Duct Static Pressure	AI	DPT-3A, 0 to 2 inches	1 min	15 min	F

7. Hot Water Pumps

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Start HWP-1	DO	Connect to VFD Run	COV	COV	–
Start HWP-2	DO	Connect to VFD Run	COV	COV	–
Pump speed	AO	Connect to VFD Speed, HWP-1 and 2	1 min	5 min	–
Hot Water Control Valve	AO	Modulating 2-way valves	1 min	15 min	–
HW differential pressure from plant	AI	DPT-1, 0 to 50 psi	5 min	15 min	F
HW differential pressure in building	AI	DPT-1, 0 to 40 psi	5 min	15 min	F

8. Chilled Water Connection

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
CHW differential pressure from plant	AI	DPT-1, 0 to 50 psi	5 min	15 min	F

9. Domestic Water Heaters

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Recirculation Pumps Start/Stop	DO	Line voltage contact to pump power circuit	COV	COV	–
DHW Supply Temperature	AI	TS-2A	5 min	15 min	F
Recirculation Pump Status	DI	CS-1 OR CT-1	COV	COV	See 3.11F
DHW heater Alarm	DI	Install relay wired downstream of DHW heater safeties with NC relay contact wired as alarm input.	COV	COV	–

10. Toilet Exhaust Fan

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Fan Start/Stop	DO	Dry contact to 120V starter control circuit	COV	COV	–
Fan Status	DI	CS-1 OR CT-1	COV	COV	See 3.11F

11. Miscellaneous Points

Description	Type	Device	Trend Logging		Calibration
			Commissioning	Continuous	
Domestic water consumption	AI	FM-6	1 min	15 min	HH
Domestic hot water consumption	AI	FM-6	1 min	15 min	HH
Outdoor Air Temperature	AI	TS-4, located on north wall	1 min	15 min	HH

PART 3 EXECUTION

3.1 INSTALLATION - GENERAL

- A. Install systems and materials in accordance with manufacturer's instructions, roughing-in drawings and details indicated on Drawings.
- B. Coordinate Work and Work schedule with other trades prior to construction.
- C. Examine areas and conditions under which control systems are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.2 DELIVERY, STORAGE, AND HANDLING

- A. Provide factory-shipping cartons for each piece of equipment and control device. Maintain cartons during shipping, storage and handling as required to prevent equipment damage, and to eliminate dirt and moisture from equipment.
- B. Store equipment and materials inside and protect from weather.

3.3 IDENTIFICATION

- A. General
 - 1. Manufacturers' nameplates and UL or CSA labels to be visible and legible after equipment is installed.
 - 2. Identifiers shall match record documents.
 - 3. All plug-in components shall be labeled such that removal of the component does not remove the label.
- B. Wiring and Tubing
 - 1. All wiring and cabling, including that within factory-fabricated panels, shall be labeled at each end within 2 inches of termination with the BAS address or termination number.
 - 2. Permanently label or code each point of field terminal strips to show the instrument or item served.
 - 3. All pneumatic tubing shall be labeled at each end within 2 inches of termination with a descriptive identifier.
- C. Equipment and Devices
 - 1. Valve and damper actuators: None required.
 - 2. Sensors: Provide 1 inch x 3 inches x 1/8 inches black micarta or lamacoid labels with engraved white lettering, 1/4 inches high. Indicate sensor identifier and function (for example "CHWS Temp").
 - 3. Panels
 - a. Provide 2 inches x 5 inches 1/8 inches black micarta or lamacoid labels with engraved white lettering, 1/2 inches high. Indicate panel identifier and service.
 - b. Provide permanent tag indicating the electrical panel and circuit number from which panel is powered.
 - 4. Identify room sensors relating to terminal box or valves with indelible marker on sensor hidden by cover.

3.4 CUTTING, CORING, PATCHING AND PAINTING

- A. Provide canning for openings in concrete walls and floors and other structural elements prior to their construction.
- B. Penetrations through rated walls or floors shall be filled with a listed material to provide a code compliant fire-stop.
- C. All damage to and openings in ductwork, piping insulation, and other materials and equipment resulting from Work in this Section shall be properly sealed, repaired, or re-insulated by experienced mechanics of the trade involved. Repair insulation to maintain integrity of insulation and vapor barrier jacket. Use hydraulic insulating cement to fill voids and finish with material matching or compatible with adjacent jacket material.

- D. At the completion of Work, all equipment furnished under this Section shall be checked for paint damage, and any factory-finished paint that has been damaged shall be repaired and repainted to original finish.

3.5 CLEANING

- A. Clean up all debris resulting from its activities daily. Remove all cartons, containers, crates, and other debris generated by Work in this Section as soon as their contents have been removed. Waste shall be collected and legally disposed of.
- B. Materials stored on-site shall be protected from weather and stored in an orderly manner, neatly stacked, or piled in the designated area assigned by the Owner's Representative.
- C. At the completion of work in any area, clean all work and equipment of dust, dirt, and debris.
- D. Use only cleaning materials recommended by the manufacturer of the surfaces to be cleaned and on surfaces recommended by the cleaning material manufacturer.

3.6 CONTROLLERS

- A. General
 - 1. Install systems and materials in accordance with manufacturer's instructions, specifications roughing-in drawings and details indicated on Drawings.
 - 2. Regardless of application category listed below, each Control Unit shall be capable of performing the specified sequence of operation for the associated equipment. Except as listed below, all physical point data and calculated values required to accomplish the sequence of operation shall reside within the associated CU. Listed below are point data and calculated values that shall be allowed to be obtained from other CUs via LAN.
 - a. Global points such as outdoor air temperature
 - b. Requests, such as heat/cool requests, used to request operation or for setpoint reset from zones to systems and systems to plants
 - c. Modes, such as system modes, used to change operating logic from plants to systems and systems to zones
 - 3. Where associated control functions involve functions from different categories identified below, the requirements for the most restrictive category shall be met.

- B. Controller Application Categories
 - 1. Controllers shall comply with the application table below (X under controller type indicates acceptable controller type).

Application Category	Examples	Acceptable Controller		
		ASC	AAC	BC
0	Monitoring of variables that are not used in a control loop, sequence logic, or safety, such as status of sump pumps or associated float switches, temperatures in monitored electrical rooms.	X	X	X
1	Miscellaneous heaters Constant speed exhaust fans and pumps	X	X	X

Application Category	Examples	Acceptable Controller		
		ASC	AAC	BC
2	VAV Boxes	X		
3	HW/CHW Plant connections	X (note 1)	X	X
4	Heating Air Handling System		X (note 1)	X
5	Cooling Air Handling System			X
Notes: Controller may be used only if all control functions and physical I/O associated with a given unit resides in one AAC/ASC				

2. ASC Installation
 - a. ASCs that control equipment located above accessible ceilings shall be mounted on the equipment in an accessible enclosure and shall be rated for plenum use if ceiling attic is used as a return air plenum.
 - b. ASCs that control equipment mounted in a mechanical room may either be mounted in or on the equipment, or on the wall of the mechanical room at an adjacent, accessible location.
 - c. ASCs that control equipment mounted outside or in occupied spaces shall either be located in the unit or in a proximate mechanical/utility space.
3. AAC and BC Installation
 - a. AACs/BCs shall be located in a temperature control cabinets constructed per Paragraph 2.8.

3.7 COMMUNICATION DEVICES

- A. General
 1. Install systems and materials in accordance with manufacturer's instructions, roughing-in drawings and details indicated on Drawings.
 2. Provide all interface devices and software to provide an integrated system.
- B. LANID and LAN Routers
 1. Provide as required
 2. Connect networks to both sides of device
 3. Thoroughly test to ensure proper operation
 4. Interruptions or fault at any point on any Primary Controller LAN shall not interrupt communications between other nodes on the network. If a LAN is severed, two separate networks shall be formed and communications within each network shall continue uninterrupted. The system shall automatically monitor the operation of all network devices and annunciate any device that goes off-line because it is failing to communicate.
- C. Gateways and Routers to Equipment Controllers
 1. See Paragraph 2.4C for network connection of gateways and routers.
 2. Wire to networks on both sides of device.
 3. Map across all monitoring and control points listed in Paragraph 2.12C.
 4. Thoroughly test each point to ensure that mapping is accurate.
 5. Initiate trends of points as indication in Paragraph 2.12C.
- D. External Communications
 1. Provide an Ethernet second port on the CSS to which the Owner can connect their Owner IT LAN (intranet), by others. Contractor shall coordinate with the Owner's

Representative to establish an IP address and communications parameters to assure proper operation. This connection shall also provide access to Internet through Owner's firewall to Internet Services Provider procured by Owner.

3.8 CONTROL AIR TUBING

- A. Sensor air tubing shall be sized by the Contractor.
- B. All control air piping shall be concealed except in equipment rooms or unfinished areas.
- C. Installation methods and materials
 - 1. Concealed and Inaccessible: Use copper tubing or FR plastic in metal raceway. Exception: Room thermostat drops in stud walls in areas with lay-in ceiling may be FR plastic tubing.
 - 2. Concealed and Accessible tubing (including ceiling return air plenums) shall be copper tubing or FR plastic tubing, subject to the following limitations
 - a. FR tubing shall be enclosed in metal raceway when required by local code.
 - b. Quantity of FR tubing per cubic foot of plenum space shall not exceed manufacturer's published data for Class 1 installation.
 - 3. Exposed to view or damage: Use hard-drawn copper or FR plastic in metal raceway.
 - a. Where copper tubing is used, a section 12 inches or less of FR plastic tubing is acceptable at final connection to control device.
- D. Mechanically attach tubing to supporting surfaces. Sleeve through concrete surfaces in minimum 1 inch sleeves, extended 6 inches above floors and 1 inch below bottom surface of slabs.
- E. Pneumatic tubing shall not be run in raceway containing electrical wiring.
- F. Where FR tubing exits the end of raceway or junction box, provide a snap-in nylon bushing. Where pneumatic tubing exits control panels, provide bulkhead fittings. Where copper tubing exits junction boxes or panels, provide bulkhead fittings.
- G. All tubing shall be number coded on each end and at each junction for easy identification.
- H. All control air piping shall be installed in a neat and workmanlike manner parallel to building lines with adequate support.
- I. Piping above suspended ceilings shall be supported from or anchored to structural members or other piping or duct supports. Tubing shall not be supported by or anchored to electrical raceways or ceiling support systems.
- J. Brass-barbed fittings shall be used at copper-to-FR tubing junctions. Plastic slipped-over copper tubing is not acceptable.
- K. Number-code or color-code tubing, except local individual room control tubing, for future identification and servicing of control system. Code shall be as indicated on approved installation drawings.

3.9 CONTROL POWER

- A. Power wiring and wiring connections required for Work in this Section shall be provided under this Section unless specifically indicated on Division 26 Drawings or Specifications. See Paragraph 1.1B.
- B. Extend power to all BAS devices, including 120V power to panels, from an acceptable power panel.
 - 1. See Division 26 Electrical Drawings for power locations pre-allocated for BAS system.
 - 2. Where no power source is indicated on drawings, for bid purposes only, assume a dedicated circuit is available within an average of 20 feet of panel location. If this is not the case, request additional cost prior to submission of shop drawings or no additional costs will be reimbursed.
 - 3. Coordinate with Division 26 during shop drawing development for final connection location.
- C. General requirements for obtaining power include the following:
 - 1. Electrical service to controls panels and control devices shall be provided by isolated circuits, with no other loads attached to the circuit, clearly marked at its source. The location of the breaker shall be clearly identified in each panel served by it.
 - 2. Obtain power from a source that feeds the equipment being controlled such that both the control component and the equipment are powered from the same panel. Where equipment is powered from a 460V source, obtain power from the electrically most proximate 120V source fed from a common origin.
 - 3. Where control equipment is located inside a new equipment enclosure, coordinate with the equipment manufacturer and feed the control with the same source as the equipment. If the equipment's control transformer is large enough and of the correct voltage to supply the controls, it may be used. If the equipment's control transformer is not large enough or not of the correct voltage to supply the controls, provide separate transformer(s).
 - 4. Where a controller controls multiple systems on varying levels of power reliability (normal, emergency, or interruptible), the controller shall be powered by the highest level of reliability served.
- D. Unless transformers are provided with equipment as specified in related Division 23 and 26 equipment Sections, Contractor shall provide transformers for all low voltage control devices including non-powered terminal units such as cooling-only VAV boxes and VAV boxes with hot water reheat. Transformer(s) shall be located in control panels in readily accessible locations such as Electrical Rooms.
- E. Power line filtering. Provide transient voltage and surge suppression for all workstations and BCs either internally or as an external component.

3.10 CONTROL AND COMMUNICATION WIRING

- A. Control and Signal Wiring
 - 1. Comply with Division 26.
 - 2. Line Voltage Wiring
 - a. All line-voltage wiring shall meet NEC Class 1 requirements.
 - b. All Class 1 wiring shall be installed in UL Listed approved raceway per NEC requirements and shall be installed by a licensed electrician.
 - c. Class 1 wiring shall not be installed in raceway containing pneumatic tubing.
 - 3. Low Voltage Wiring
 - a. All low-voltage wiring shall meet NEC Class 2 requirements. (Low-voltage power circuits shall be sub-fused when required to meet Class 2 current-limit.)
 - b. Class 2 wiring shall be installed in UL Listed approved raceway as follows:

- 1) Where located in unconcealed or inaccessible locations, such as:
 - a) Equipment rooms
 - b) Exposed to weather
 - c) Exposed to occupant view
 - d) Inaccessible locations such as concealed shafts and above inaccessible ceilings
- 2) Class 2 wiring shall not be installed in raceway containing Class 1 wiring.
- c. Class 2 wiring need not be installed in raceway as follows:
 - 1) Where located in concealed and easily accessible locations, such as:
 - a) Inside mechanical equipment enclosures and control panels
 - b) Above suspended accessible ceilings (e.g. lay-in and spline)
 - c) Above suspended drywall ceilings within reach of access panels throughout
 - d) In shafts within reach of access panels throughout
 - e) Nonrated wall cavities
 - 2) Wiring shall be UL Listed for the intended application. For example, cables used in floor or ceiling plenums used for air transport shall be UL Listed specifically for that purpose.
 - 3) Wiring shall be supported from or anchored to structural members neatly tied at 10 foot intervals and at least 1 foot above ceiling tiles and light fixtures. Support or anchoring from straps or rods that support ductwork or piping is also acceptable. Cables shall not be supported by or anchored to ductwork, electrical raceways, piping, or ceilings.
 - 4) Install wiring in sleeves where it passes through walls and floors. Maintain fire rating at all penetrations.
- d. Boxes and panels containing high-voltage wiring and equipment shall not be used for low-voltage wiring except for the purpose of interfacing the two (for example relays and transformers).
4. All wire-to-device connections shall be made at a terminal block or terminal strip. All wire-to-wire connections shall be at a terminal block.
5. All field wiring shall be properly labeled at each end, with self-laminating typed labels indicating device address, for easy reference to the identification schematic. All power wiring shall be neatly labeled to indicate service, voltage, and breaker source.
6. Use coded conductors throughout with different colored conductors.
7. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals.
8. Maximum allowable voltage for control wiring shall be 120 V. If only higher voltages are available, the Contractor shall provide step-down transformers.
9. All wiring shall be installed as continuous lengths, with no splices permitted between termination points.
10. Size of raceway and size and type of wire shall be the responsibility of the Contractor, in keeping with the manufacturer's recommendation and NEC requirements.
11. Include one pull string in each raceway 1 inch or larger.
12. Control and status relays are to be located in designated enclosures only. These enclosures include packaged equipment control panel enclosures unless they also contain Class 1 starters.
13. Conceal all raceways, except within mechanical, electrical, or service rooms. Install raceway to maintain a minimum clearance of 6 inches from high-temperature equipment (for example steam pipes or flues).
14. Secure raceways with raceway clamps fastened to the structure and spaced according to code requirements. Raceways and pull boxes may not be hung on flexible duct strap or tie rods. Raceways may not be run on or attached to ductwork.
15. Install insulated bushings on all raceway ends and openings to enclosures. Seal top end of all vertical raceways.
16. Terminate all control or interlock wiring.

17. Maintain updated as-built wiring diagrams with terminations identified at the jobsite.
18. Flexible metal raceways and liquid-tight, flexible metal raceways shall not exceed 3 feet in length and shall be supported at each end. Flexible metal raceway less than ½ inches electrical trade size shall not be used. In areas exposed to moisture liquid-tight, flexible metal raceways shall be used.
19. Raceway must be rigidly installed, adequately supported, properly reamed at both ends, and left clean and free of obstructions. Raceway sections shall be joined with couplings per code. Terminations must be made with fittings at boxes and ends not terminating in boxes shall have bushings installed.
20. Wire digital outputs to either the normally-closed or normally-open contacts of binary output depending on desired action in case of system failure. Unless otherwise indicated herein, wire to the NO contact except the following shall be wired to the NC contact
 - a. Hot water pumps
21. Hardwire Interlocks
 - a. The devices referenced in this Section are hardwire interlocked to ensure equipment shutdown occurs even if control systems are down. Do not use software (alone) for these interlocks.
 - b. Hardwire device NC contact to air handler fan starter upstream of HOA switch, or to VFD enable contact.
 - c. Where multiple fans (or BAS DI) are controlled off of one device and the device does not have sufficient contacts, provide a relay at the device to provide the required number of contacts.
 - d. Provide for the following devices where indicated on Drawings or in Sequences of Operation:
 - 1) Duct smoke detector
 - 2) High discharge static pressure
 - 3) Low mixing plenum pressure
22. Shielded cable shield shall be grounded only at one end. Signal wiring shield shall be grounded at controller end only unless otherwise recommended by the controller manufacturer.

B. Communication Wiring

1. Adhere to the requirements of Paragraph 3.10A in addition to this Paragraph.
2. Communication and signal wiring may be run without conduit in concealed, accessible locations as permitted by Paragraph 3.10A only if noise immunity is ensured. Contractor is fully responsible for noise immunity and rewire in conduit if electrical or RF noise affects performance.
3. All cabling shall be installed in a neat and workmanlike manner. Follow all manufacturers' installation recommendations for all communication cabling.
4. Do not install communication wiring in raceway and enclosures containing Class 1 or other Class 2 wiring.
5. Maximum pulling, tension, and bend radius for cable installation as specified by the cable manufacturer shall not be exceeded during installation.
6. Verify the integrity of the entire network following the cable installation. Use appropriate test measures for each particular cable.
7. All runs of communication wiring shall be unspliced length when that length is commercially available.
8. All communication wiring shall be labeled to indicate origination and destination data.
9. Grounding of coaxial cable shall be in accordance with NEC regulations Article on Communications Circuits, Cable and Protector Grounding.
10. Power-line carrier signal communication or transmission is not acceptable.

3.11 SENSORS AND MISCELLANEOUS FIELD DEVICES

- A. Install sensors in accordance with the manufacturer's recommendations.
- B. Mount sensors rigidly and adequately for the environment within which the sensor operates.
- C. Sensors used as controlled points in control loops shall be hardwired to the controller to which the controlled device is wired and in which the control loop shall reside.
- D. Temperature Sensors
 - 1. Room temperature sensors and thermostats shall be installed with back plate firmly secured to the wall framing or drywall anchors.
 - a. For sensors mounted in exterior walls or columns, use a back plate insulated with foam and seal all junction box openings with mastic sealant.
 - b. For sensors on exposed columns, use Wiremold or equal enclosures that are the smallest required to enclose wiring (e.g. Wiremold 400 BAC or equal) and Wiremold or equal junction boxes that are the narrowest required to enclose the temperature sensor and wiring connections (e.g. Wiremold 2348S/51 or equal). Color or raceway and boxes shall be per the architect; submit for approval prior to installation.
 - 2. All wires attached to sensors shall be air sealed in their raceways or in the wall to stop air transmitted from other areas affecting sensor readings.
 - 3. Averaging sensors shall be installed in a serpentine manner vertically across duct. Each bend shall be supported with a capillary clip. Where located in front of filters (such as mixed air sensors), access for filter removal shall be maintained.
 - 4. Temperature sensors downstream of coils shall be located as far from the coil fins as possible, 6 inches minimum. Temperature sensors upstream of coils shall be a minimum of 6 inches away from the coil fins. No part of the sensor or its support elements or conduit shall be in contact with the coil, coil framing or coil support elements. Discharge temperature sensors on VAV boxes shall be mounted as far from the coil as possible but upstream of the first diffuser with the probe located as near as possible to the center of the duct both vertically and horizontally.
 - 5. All pipe-mounted temperature sensors shall be installed in wells. For small piping, well shall be installed in an elbow into pipe length. Install the sensor in the well with a thermal-conducting grease or mastic. Use a closed-cell insulation patch that is integrated into the pipe insulation system to isolate the top of the well from ambient conditions but allow easy access to the sensor. Install a test plug adjacent to all wells for testing and calibration.
 - 6. Unless otherwise noted on Drawings or Points List, temperature sensors/thermostats, humidity sensors/humidistats, CO₂ sensors, and other room wall mounted sensors shall be installed at same centerline elevation as adjacent electrical switches, 4 feet above the finished floor where there are no adjacent electrical switches, and within ADA limitations.
 - 7. Unless otherwise noted on Drawings or Points List, install outdoor air temperature sensors on north wall where they will not be influenced by building exhaust, exfiltration, or solar insolation. Do not install near intake or exhaust air louvers.
- E. Differential Pressure Sensors
 - 1. Supply Duct Static Pressure
 - a. Mount transmitter in temperature control panel near or in BAS panel to which it is wired.
 - b. Low pressure port of the pressure sensor
 - 1) Pipe to either
 - a) Building pressure (high) signal of the building static pressure transmitter.
 - b) Open to a conditioned space inside the building
 - c) Open to the BAS panel in which the DPT is mounted provided the panel is inside the building envelope and not in an air plenum.
 - c. High-pressure port of the pressure sensor

- 1) Pipe to the duct using a static pressure tip located as indicated on Drawings; if no location is indicated, locate at end of duct riser or main as far out in the system as possible but upstream of all smoke and fire dampers.
 - 2) Install pressure tips securely fastened with tip facing upstream in accordance with manufacturer's installation instructions.
2. Building Static Pressure
 - a. Mount transmitter in temperature control panel near or in BAS panel to which it is wired.
 - b. Low pressure port of the pressure sensor
 - 1) Pipe to the ambient static pressure probe located on the outside and at high point of the building through a high-volume accumulator or otherwise protected from wind fluctuations.
 - c. High-pressure port of the pressure sensor
 - 1) Pipe to either
 - a) Behind a BAS temperature sensor cover in an interior zone (provided sensor has openings to allow ambient air to freely flow through it)
 - b) Wall plate sensor
 - 2) Do not locate near elevators, exterior doors, atria, or (for ceiling sensor applications) near diffusers.
 3. Filter Differential Pressure
 - a. Install static-pressure tips upstream and downstream of filters with tips oriented in direction of flow. If there is a Magnehelic gauge installed by the AHU manufacturer, it may be removed and discarded with its pressure tips used for the DPT provided the DPT has an LCD so it can double as a visual gauge.
 - b. Mount transmitter on outside of filter housing or filter plenum in an accessible position with LCD display clearly visible. This sensor is used in lieu of an analog gauge and thus must be readily viewable.
 4. High/Low Static Pressure Safeties
 - a. High static
 - 1) Install DPS-2 on side of supply air duct in accessible location.
 - 2) High port shall be open to supply air duct downstream of fan.
 - 3) Reference low port pressure shall be that at DP location.
 - b. Low static
 - 1) Install DPS-2 inside or outside of mixed air plenum whichever is most accessible.
 - 2) Low port shall be open to mixed air plenum.
 - 3) Reference high port pressure shall be pressure on other side of mixed air plenum with the highest pressure, e.g. ambient pressure for systems with relief fans or non-powered relief, or relief air plenum for systems with return fans.
 5. All pressure transducers, other than those controlling VAV boxes, shall be located where accessible for service without use of ladders or special equipment. If required, locate in field device panels and pipe to the equipment monitored or ductwork.
 6. The piping to the pressure ports on all pressure transducers (both air and water) shall contain a capped test port located adjacent to the transducer.
 7. Piping differential pressure transducers shall have one of the following:
 - a. Five valve manifold, brass, two valves to allow removal of sensor without disrupting the hydronic system, an equalizing valve to allow the sensor to be zeroed and to prevent sensor from experiencing full static (as opposed to differential) where, and two valves used as air vents that also can be used as test plugs for calibration.
 - b. For sensors using two separate sensors, install test plugs on each connection for calibration and also used as vents.

F. Current Switches and Current Transformers for Motor Status Monitoring

1. For CTs, create a software binary point for fan status triggered at a setpoint determined below and ~10% deadband.

2. Adjust the setpoint so that it is below minimum operating current and above motor no load current. For fans with motorized discharge dampers, adjust so that fan indicates off if damper is closed while fan is running. For pumps, adjust so that pump indicates off if valve is closed while pump is running.
- G. Airflow Measuring Stations: Install per manufacturer's recommendations for unobstructed straight length of duct both upstream and downstream of sensor, except those installations specifically designed for installation in fan inlet. For installations in fan inlets, provide on both inlets of double inlet fans and provide inlet cone adapter as recommended by AFMS manufacturer.
- H. Fluid Flow Meters: Install per manufacturer's recommendations for unobstructed straight length of pipe both upstream and downstream of sensor. Commission per the manufacturer's startup and commissioning recommendations. Complete all manufacturer's startup documentation and include this in prefunctional commissioning report.
- I. Actuators
1. Type: All actuators shall be electric.
 2. Mount and link control damper actuators per manufacturer's instructions.
 3. Dampers
 - a. To compress seals when spring-return actuators are used on normally closed dampers, power actuator to approximately 5° open position, manually close the damper, and then tighten the linkage, or follow manufacturer's instructions to achieve same effect.
 - b. Check operation of damper-actuator combination to confirm that actuator modulates damper smoothly throughout stroke to both open and closed positions.
 - c. Provide all mounting hardware and linkages for actuator installation.
 4. Control Valves: Install so that actuators, wiring, and tubing connections are accessible for maintenance. Where possible, mount the valve so that the position indicator is visible from the floor or other readily accessible location. However, do not install valves with stem below horizontal or down. The preferred location for the valve and actuator is on lowest point in the valve train assembly for ease of access and inspection. If this is on the coil supply piping, the control valve may be located there even if schematics (and standard practice) show valves located on the coil return piping. This comment applies to both 2-way valves and 3-way valves (which would become diverting valves rather than mixing valves in this location).

3.12 SOFTWARE INSTALLATION

- A. System Configuration
1. Thoroughly and completely configure BAS system software, supplemental software, network software etc. on OWS, POTs, and servers.
- B. Point Structuring and Naming
1. The intent of this Paragraph is to require a consistent means of naming points across the BAS. The following requirement establishes a standard for naming points and addressing Buildings, Networks, Devices, Instances, etc.
 2. Point Summary Table
 - a. The term "Point" includes all physical I/O points, virtual points, and all application program parameters.
 - b. With each schematic, provide a Point Summary Table listing
 - 1) Building number and abbreviation
 - 2) System type

- 3) Equipment type
 - 4) Point suffix
 - 5) Full point name (see Point Naming Convention Paragraph)
 - 6) Point description
 - 7) Ethernet backbone network number
 - 8) Network number
 - 9) Device ID
 - 10) Device MAC address
 - 11) Object ID (object type, instance number)
 - 12) Engineering units
 - 13) Device make and model number; include range of device if model number does not so identify.
 - 14) Device physical location description; include floor and column line intersection to one decimal place (for example line 6.2 and line A.3).
- c. Point Summary Table shall be provided in both hard copy and in a relational database electronic format (ODBC-compliant).
 - d. Coordinate with the Owner's representative and compile and submit a proposed Point Summary Table for review prior to any object programming or Project startup.
 - e. The Point Summary Table shall be kept current throughout the duration of the Project by the Contractor as the Master List of all points for the Project. Project closeout documents shall include an up-to-date accurate Point Summary Table. The Contractor shall deliver to the Owner the final Point Summary Table prior to final acceptance of the system. The Point Summary Table shall be used as a reference and guide during the commissioning process.
3. Point Naming Convention
 - a. All point names shall adhere to the format as established below, unless otherwise agreed to by the Owner. New categories and descriptors may be created with approval of the Owner.
 - b. Format:
 - 1) Building.Category.System.EquipmentTag.Component.Property.
 - 2) Example: 001.HVAC.Heatplant.B-1.HWS.Temperature

Building	Category	System	Equipment Tag	Component	Property	Typical units
Building number	ELCT	Lighting	(from equipment schedules)	SWITCH	Command	On/off
		Plug		PHOTO	Status	On/off
	Generator	CB		Light	Footcandles	
	Misc			Power	Watts	
HVAC	Airhandling	CWS	Voltage	Volts		
	Exhaust	CWR	Current	Amps		
Coolplant	Heatplant	HWS	ValvePos	%open		
	Misc	HWR	DamperPos	%open		
PLMB	Domwater	CHWS	Temperature	°F		
	Air	CHWR	Humidity	%RH		
Natgas	N2	OA	Pressure	Psig, "H ₂ O		
	O2	SA	Flow	Cfm, gpm		
Irrigation	Waste	RA	Energy	Btu		
	Misc	EA	Speed	%, Hz		
MISC	Weather		GAS	Signal	%	
			FLUID			

4. Device Addressing Convention

- a. BACnet network numbers and Device Object IDs shall be unique throughout the network.
 - b. All assignment of network numbers and Device Object IDs shall be coordinated with the Owner to ensure there are no duplicate BACnet device instance numbers.
 - c. Each Network number shall be unique throughout all facilities and shall be assigned in the following manner: VVVNN, where: VVV = 0-999 for BACnet Vendor ID, NN = 00 - 99 for building network.
 - d. Each Device Object Identifier property shall be unique throughout the system and shall be assigned in the following manner: VVVNNDD , where: VVV = number 0 to 999 for BACnet Vendor ID , NN = 00 - 99 for building network, DD = 01-99 for device address on a network.
 - e. Coordinate with the Owner or a designated representative to ensure that no duplicate Device Object IDs occur.
 - f. Alternative Device ID schemes or cross-project Device ID duplication if allowed shall be approved before Project commencement by the Owner.
5. I/O Point Physical Description
- a. Each point associated with a hardware device shall have its BACnet long-name point description field filled out with:
 - 1) The device manufacturer and model number. Include range of device if model number does not so identify.
 - 2) For space sensors, include room number in which sensor is located.

C. Point Parameters

- 1. Provide the following minimum programming for each analog input
 - a. Name
 - b. Address
 - c. Scanning frequency or COV threshold
 - d. Engineering units
 - e. Offset calibration and scaling factor for engineering units
 - f. High and low value reporting limits (reasonableness values), which shall prevent control logic from using shorted or open circuit values.
 - g. Default value to be used when the actual measured value is not reporting. This is required only for points that are transferred across the primary or secondary controlling networks and used in control programs residing in control units other than the one in which the point resides. Events causing the default value to be used shall include failure of the control unit in which the point resides or failure of any network over which the point value is transferred.
- 2. Provide the following minimum programming for each analog output
 - a. Name
 - b. Address
 - c. Engineering units
 - d. Offset calibration and scaling factor for engineering units
 - e. Output Range
 - f. Default value to be used when the normal controlling value is not reporting.
- 3. Provide the following minimum programming for each digital input
 - a. Name
 - b. Address
 - c. Engineering units (on/off, open/closed, freeze/normal, etc.)
 - d. Debounce time delay
 - e. Message and alarm reporting as specified
 - f. Reporting of each change of state, and memory storage of the time of the last change of state
 - g. Totalization of on-time (for all motorized equipment status points), and accumulated number of off-to-on transitions.

4. Provide the following minimum programming for each digital output
 - a. Name
 - b. Address
 - c. Output updating frequency
 - d. Engineering units (on/off, open/closed, freeze/normal, etc.)
 - e. Direct or Reverse action selection
 - f. Minimum on-time
 - g. Minimum off-time
 - h. Status association with a DI and failure alarming (as applicable)
 - i. Reporting of each change of state, and memory storage of the time of the last change of state.
 - j. Totalization of on-time (for all motorized equipment status points), and accumulated number of off-to-on transitions.
 - k. Default value to be used when the normal controlling value is not reporting.
- D. Site-Specific Application Programming
1. All site specific application programming shall be written in a manner that will ensure programming quality and uniformity. Contractor shall ensure:
 - a. Programs are developed by one programmer, or a small group of programmers with rigid programming standards, to ensure a uniform style.
 - b. Programs for like functions are identical, to reduce debugging time and to ease maintainability.
 - c. Programs are thoroughly debugged before they are installed in the field.
 2. Message and tune application programming for a fully functioning system. It is the Contractor's responsibility to request clarification on sequences of operation that require such clarification.
 3. All site-specific programming shall be fully documented and submitted for review and approval
 - a. Prior to downloading into the panel (see Submittal Package 2, Paragraph 1.7.)
 - b. At the completion of functional performance testing, and
 - c. At the end of the warranty period (see Warranty Maintenance, Paragraph 1.12).
 4. All programming, graphics and data files must be maintained in a logical system of directories with self-explanatory file names. All files developed for the Project will be the property of the Owner and shall remain on the workstations/servers at the completion of the Project.
- E. Graphic Screens
1. All site specific graphics shall be developed in a manner that will ensure graphic display quality and uniformity among the various systems.
 2. Schematics of MEP systems
 - a. Schematics shall be 2-D or 3-D and shall be based substantially on the schematics provided on Drawings.
 - b. All relevant I/O points and setpoints being controlled or monitored for each piece of equipment shall be displayed with the appropriate engineering units. Include appropriate engineering units for each displayed point value. Verbose names (English language descriptors) shall be included for each point on all graphics; this may be accomplished by the use of a pop-up window accessed by selecting the displayed point with the mouse.
 - c. Animation or equipment graphic color changes shall be used to indicate on/off status of mechanical components.
 - d. Indicate all adjustable setpoints and setpoint high and low limits (for automatically reset setpoints), on the applicable system schematic graphic or, if space does not allow, on a supplemental linked-setpoint screen.
 3. Displays shall show all points relevant to the operation of the system, including setpoints.

4. The current value and point name of every I/O point and setpoint shall be shown on at least one graphic and in its appropriate physical location relative to building and mechanical systems.
5. Show weather conditions (local building outside air temperature and humidity) in the upper left hand corner of every graphic.
6. CAD Files: The contract document drawings will be made available to the Contractor in AutoCAD format upon request for use in developing backgrounds for specified graphic screens, such as floor plans and schematics. However the Owner does not guarantee the suitability of these drawings for the Contractor's purpose.
7. Provide graphics for the following as a minimum
 - a. Site homepage: Background shall be a campus map, approximately to scale. Include links to each building, central plant, etc.
 - b. Building homepage: Background shall be a building footprint, approximately to scale, oriented as shown on the campus homepage. Include links to each floor and mechanical room/area, and to summary graphics described below. Include real-time site utility data such as building electrical demand and domestic cold water flow demand shown roughly on the map where the utilities connect to the site.
 - c. Electricity demand limiting
 - 1) Demand limit. Include entries for sliding window interval and a table of Off-Peak, On-Peak or Partial-Peak demand time periods, both Summer and non-Summer, with three adjustable demand level limits for each and adjustable deadband.
 - 2) Electricity demand calculation. For each month, show actual peak kW and kWh for each time-of-day rate period. Show side-by-side as month-this-year and month-last-year, and month-to-date and year-to-date data.
 - d. Each occupied floor plan, to scale
 - 1) HVAC: Floor plan graphics shall show heating and cooling zones throughout the buildings in a range of colors, which provide a visual display of temperature relative to their respective setpoints. The colors shall be updated dynamically as a zone's actual comfort condition changes. In each zone, provide links to associated terminal equipment.
 - 2) If multiple floor plans are necessary to show all areas, provide a graphic building key plan. Use elevation views or plan views as necessary to graphically indicate the location of all of the larger scale floor plans. Link graphic building key plan to larger scale partial floor plans. Provide links from each larger scale graphic floor plan screen to the building key plan and to each of the other graphic floor plan screens.
 - e. Each equipment floor/area plan: To scale, with links to graphics of all BAS controlled/monitored equipment.
 - f. Each air handler and fan-coil: Provide link to associated HW and CHW plants where applicable.
 - g. Each trim & respond reset: Next to the display of the setpoint that is being reset, include a link to page showing all trim & respond points (see Guideline 36) plus the current number of requests, current setpoint, and status indicator point with values "trimming," "responding," or "holding." Include a graph of the setpoint trend for the last 24 hours. Trim & respond points shall be adjustable from the graphic except for the associated device.
 - h. Each zone terminal:
 - 1) Provide link to associated air handling unit where applicable and to floor plan where terminal is located.
 - 2) Include supply air temperature from AHU serving terminal unit.
 - 3) Include a non-editable graphic (picture) showing the design airflow setpoints from the design drawings adjacent to the editable airflows setpoints. The intent is that the original setpoints be retained over time despite "temporary" adjustments that may be made over the years.

- i. Electrical power monitoring system: Show a schematic of the electrical system based on one-line diagrams with meter current kW reading and month-to-date kWh shown in actual locations. Power flow shall change on the diagram (by changing line color or width) to show which power line is active.
- j. Central plant equipment including chilled water system, cooling tower system, hot water system, steam system, generators, etc.: The flow path shall change on the diagram (by changing piping line color or width) to show which piping has active flow into each boiler, chiller, tower, etc. as valve positions change.
- k. Summary graphics: Provide a single text-based page (or as few as possible) for each of the following summary screens showing key variables listed in columns for all listed equipment. Include hyperlinks to each zone imbedded in the zone tag:
 - 1) Air handling units: operating mode; on/off status; supply air temperature; supply air temperature setpoint; fan speed; duct static pressure; duct static pressure setpoint; outdoor air and return air damper position; coil valve positions; etc. (all key operating variables); Cooling CHWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Heating HWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier (if HW coil)
 - 2) VAV Zone terminal units: operating mode; airflow rate; airflow rate setpoint; zone temperature; active heating setpoint; active cooling setpoint; damper position; HW valve position (reheat boxes); supply air temperature (reheat boxes); supply air temperature setpoint (reheat boxes); CO2 concentration and CO2 loop output (where applicable); Fan start/stop command, speed, and status (fan-powered); Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Cooling SAT Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Heating Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier (dual duct); Heating SAT Reset current requests, cumulative %-request-hours, and request Importance Multiplier (dual duct).
 - 3) Electrical meters and switches: Volts, current, kW, switch positions.
- l. For all equipment with runtime alarms specified, show on graphic adjacent to equipment the current runtime, alarm setpoint (adjustable), alarm light, date of last runtime counter reset, and alarm reset/acknowledge button which resets the runtime counter.
- m. For all equipment with lead/lag or lead/standby operation specified, show on graphic adjacent to equipment the current lead/lag order and manual buttons or switches to allow manual lead switching by the operator per Paragraph 3.13B.5.
- n. For all controlled points used in control loops, show the setpoint adjacent to the current value of the controlled point.
- o. All other BAS controlled/monitored equipment.
- p. On all system graphics, include a "note" block that allows users to enter comments relevant to system operation.
- q. All equipment shall be identified on the graphic screen by the unit tag as scheduled on the drawings.

F. Alarm Configuration

- 1. Program alarms and alarm levels per Sequence of Operations.
- 2. Each programmed alarm shall appear on the alarm log screen and shall be resettable or acknowledged from those screens. Equipment failure alarms shall be displayed on the graphic system schematic screen for the system that the alarm is associated with (for example, fan alarm shall be shown on graphic air handling system schematic screen). For all graphic screens, display values that are in a Level 1 or 2 condition in a red color, Level 3 and higher alarm condition in a blue color, and normal (no alarm) condition in a neutral color (black or white).

3. For initial setup, Contractor shall configure alarms as follows:

	Level 1	Level 2	Level 3	Level 4
Criticality	Critical	Not Critical	Not Critical	Not Critical
Acknowledgement	Required	Required	Not Required	Not Required
Acknowledgement of Return to Normal	Not Required	Not Required	Not Required	Not Required
Email to building engineer(s)	Y	Y	Y	N
SMS text to building engineer(s)	Y	Y	N	N
Pop-up dialog box on OWS	Y	Y	N	N
Remove from alarm log	After Acknowledged	After Acknowledged	After 2 weeks	After 2 weeks

3.13 SEQUENCES OF OPERATION

- A. Sequences herein reference ASHRAE Guideline 36-2018 including published addenda, possibly followed by exceptions or additions where indicated. Guideline 36 sequences are not repeated herein for brevity and to make exceptions/revisions very clear. However, the final as-built sequences of operation (see Paragraph 1.8B.1.j and 2.11C.1.d.3)a)1) shall include all installed sequences verbatim from Guideline 36.
- B. General
1. Fully comply with ASHRAE Guideline 36-2018 Section 5.1 General.
 2. Contractor shall review sequences prior to programming and suggest modifications where required to achieve the design intent. Contractor may also suggest modifications to improve performance and stability or to simplify or reorganize logic in a manner that provides equal or better performance. Proposed changes in sequences shall be included as a part of Submittal Package 2.
 3. Include costs for minor program modifications if required to provide proper performance of the system.
 4. Minimum speed setpoints for all VFD-driven equipment shall be determined in accordance with Paragraph 3.14D.8.
 5. Equipment Staging and Rotation
 - a. Parallel devices shall be lead/lag or lead/standby rotated to maintain even wear.
 - b. Two runtime points shall be defined for each device:
 - 1) Lifetime Runtime: The cumulative runtime of the device since device start-up. This point shall not be readily resettable by operators.
 - 2) Staging Runtime: An operator resettable runtime point that stores cumulative runtime since the last operator reset.
 - c. Lead/lag devices: Unless otherwise noted, parallel staged devices (such as CHW pumps and cooling towers) shall be lead/lag alternated when more than one is off or more than one is on so that the device with the most operating hours as determined by Staging Runtime is made the last stage device and the one with the least number of hours is made the lead stage device.
 - d. Exceptions to Lead/lag rotation
 - 1) Operators with appropriate access level shall be able to manually command staging order via software points, but not overriding the In Alarm or Hand Operation logic below.
 - a) Faulted Devices: A faulted device is any device commanded to run that is either not running or unable to perform its required duty. If an operating

device has any fault condition described subsequently, a Level 2 alarm shall be generated and a response shall be triggered as defined below.

1. Fans and Pumps
 - a. Status point not matching its on/off point for 15 seconds after a time delay of 15 seconds when device is commanded on.
 - b) Upon identification of a fault condition:
 1. For fans and pumps:
 - a. The next commanded OFF device in the staging order, Device “B”, shall be commanded ON while alarming Device “A” remains commanded ON.
 - b. If Device B fails to prove status (i.e. it also goes into alarm), it shall remain commanded on and the preceding step shall be repeated until the quantity of devices called for by the lead/lag logic have proven on.
 - c. When either the required number of devices proves on or all devices are commanded on, set alarming devices to the last positions in the lead/lag staging order sequenced reverse chronologically (i.e. the device that alarmed most recently is sent to last position).
 - d. Staging order of non-alarming devices shall follow the even wear logic. A device in alarm can only automatically move up in the staging order if another device goes into alarm.
 - e. Devices in alarm shall run if so called for by the lead/lag staging order and present stage.
 - 2) Hand Operation: If a device is on in Hand (e.g., via an HOA switch or local control of VFD), the device shall be set to the lead device and a Level 4 alarm shall be generated. The device will remain as lead until the alarm is reset by the operator. Hand operation is determined by:
 - a) Fans and Pumps
 1. Status point not matching its on/off point for 15 seconds after a time delay of 60 seconds when device is commanded off.
6. Occupancy Status
 - a. Occupancy status of all spaces shall be via the Lighting Control BACnet interface.
 - b. Where a zone serves more than one room, “unoccupied” (or “unpopulated” per Guideline 36 terminology) means all rooms are unoccupied and “occupied” (populated) means any room is occupied.
 - c. In case of the network connection with the Lighting Controls is lost, occupancy status shall default to “occupied” if the Zone Group is in Occupied Mode and “unoccupied” for any other Zone Group Mode.
 7. VAV Box Controllable Minimum
 - a. This section is used to determine the lowest possible VAV box airflow setpoint (other than zero) allowed by the controls (*V_m*) used in VAV box control sequences. The minimums shall be stored as software points that may be adjusted by the user but need not be adjustable via the graphical user interface.
 - b. Option 1: If the VAV box controller can control to 0.004” per Paragraph 2.9H.5.c., the minimum setpoint *V_m* shall be determined from the table below if the VAV box manufacturer is listed:

Inlet	Titus	Krueger	Price	MetalAire High Gain	ETI
4	15	15	20	15	15
6	30	35	30	30	30
8	55	60	55	50	55

Inlet	Titus	Krueger	Price	MetalAir High Gain	ETI
10	90	90	95	85	90
12	120	130	135	110	130
14	190	175	195	155	180
16	245	230	260	210	235
24x16	455	445	490	N/A	415

c. Option 2: The minimum setpoint V_m shall be determined per Guideline 36.

C. Electricity Demand Limiting

1. Sliding Window: The demand control function shall utilize a sliding window method selectable in increments of one minute, up to 60 minutes, 15 minute default.
2. Demand Levels: Demand time periods shall be set up as per utility rate schedule. For each On/Off/Partial-Peak period, three demand level limits can be defined. When the measured demand exceeds the limit, the Demand Limit Level switch for that level shall be set; when demand is more than 10% (adjustable) below the limit for a minimum of 15 minutes, or the time is no longer within the On/Off/Partial-Peak window, the switch shall be reset. These levels are used at the zone level (see Zone Control sequences) to shed demand.
3. In addition to setpoint reset logic triggered by Demand Levels as described below, include Demand Shed commands to the lighting control system via BACnet interface for each Demand Level. The response to each Demand Shed command shall be programmed into the lighting control system under Division 26.

D. Zones

1. Fully comply with ASHRAE Guideline 36-2018 Section 5.2 Generic Ventilation Zones.
 - a. Use Title 24 for ventilation logic.
 - 1) Add the following to 5.2.1.4.2
 - a) c. If no value or if "AUTO" is entered in VAV box schedules for Occupied Minimum Airflow Setpoint (V_{min}), V_{min} shall be set equal Zone-Abs-OA-min
 - b. Fully implement Time Averaged Ventilation (TAV) 5.2.2 and use it when VAV minimum, V_{min}^* , is below the lowest allowed by the controls (V_m).
2. Fully comply with ASHRAE Guideline 36-2018 Section 5.3 Generic Thermal Zones.
 - a. Default setpoints:

Zone type	Occupied		Unoccupied	
	Heat	Cool	Heat	Cool
VAV zones with ceiling fans	70°F	79°F	60°F	90°F
VAV exterior	70°F	75°F	60°F	90°F
VAV interior	70°F	73°F	60°F	90°F
Electrical and mechanical	60°F	85°F	60°F	85°F
IDF/MDF	60°F	80°F	60°F	85°F

E. Zone Groups

1. Fully comply with ASHRAE Guideline 36-2018 Section 5.4 Zone Groups.
2. Unless otherwise specified by Owner, the following Zone Groups shall be created:

Zone Group Name	AH Tag	Terminal Unit Tags	Default Schedule
1st Floor	AH-C/H	VAV-1-x	WD: 6am to 8pm WE: 8am to 10pm HOL: off

2 nd Floor	AH-C/H	VAV-2-x	WD: 6am to 8pm WE: 8am to 10pm HOL: off
3 rd Floor	AH-C/H	VAV-2-x	WD: 6am to 8pm WE: 8am to 10pm HOL: off

- F. VAV Cooling-only boxes
1. Fully comply with ASHRAE Guideline 36-2018 Section 5.5 unless otherwise noted below.
 2. Parameters
 - a. Design Information (see VAV Box schedule):
 - 1) V_{cool-max}, zone maximum cooling airflow setpoint
 - 2) V_{min}, zone occupied minimum airflow setpoint (optional; If V_{min} airflow setpoint is not entered in schedules, V_{min} will be dynamically calculated using Paragraph 3.13D.1.a.1).)
 - 3) V_{occ-min}, zone minimum outdoor airflow for occupants, per Title 24 prescribed airflow-per-occupant requirements
 - 4) V_{area-min}, zone minimum outdoor airflow for building area, per Title 24 prescribed airflow-per-area requirements
 - 5) Whether occupied-standby mode is allowed per Title 24.
- G. Dual Duct VAV Boxes – Snap Acting Control
1. Fully comply with ASHRAE Guideline 36-2018 Section 5.11. unless otherwise noted below.
 2. Parameters
 - a. Design Information (see VAV Box schedule):
 - 1) V_{cool-max}, zone maximum cooling airflow setpoint
 - 2) V_{min}, zone occupied minimum airflow setpoint (optional; If V_{min} airflow setpoint is not entered in schedules, V_{min} will be dynamically calculated using Paragraph 3.13D.1.a.1).)
 - 3) V_{heat-max}, zone maximum heating airflow setpoint
 - 4) V_{occ-min}, zone minimum outdoor airflow for occupants, per Title 24 prescribed airflow-per-occupant requirements
 - 5) V_{area-min}, zone minimum outdoor airflow for building area, per Title 24 prescribed airflow-per-area requirements
 - 6) If occupied standby is allowed
- H. Dual Duct VAV Terminal Unit – Mixing Control with Inlet Airflow Sensors
1. Fully comply with ASHRAE Guideline 36-2018 Section 5.12. unless otherwise noted below.
 2. Parameters
 - a. Design Information (see VAV Box schedule):
 - 1) V_{cool-max}, zone maximum cooling airflow setpoint
 - 2) V_{min}, zone occupied minimum airflow setpoint (optional; If V_{min} airflow setpoint is not entered in schedules, V_{min} will be dynamically calculated using Paragraph 3.13D.1.a.1).)
 - 3) V_{heat-max}, zone maximum heating airflow setpoint
 - 4) V_{occ-min}, zone minimum outdoor airflow for occupants, per Title 24 prescribed airflow-per-occupant requirements
 - 5) V_{area-min}, zone minimum outdoor airflow for building area, per Title 24 prescribed airflow-per-area requirements
 - 6) If occupied standby is allowed

- I. VAV Cooling-only boxes to Thermafuser
 1. Design airflow rates shall be as scheduled on plans:
 - a. Zone maximum cooling airflow setpoint (Vcool-max)
 - b. Zone occupant component of minimum outdoor air setpoint (Vocc-min)
 - c. Zone building area component of minimum outdoor air setpoint (Varea-min)
 - d. If occupied standby is allowed
 2. Zone minimum outdoor air setpoints (used at AHU level minimum outdoor air controls)
 - a. Zone-Abs-OA-min is equal to
 - 1) Varea-min if the zone has a CO₂ sensor
 - 2) Varea-min if the zone has an occupancy sensor and the zone is unoccupied
 - 3) Zone-Des-OA-min otherwise.
 - b. Zone-Des-OA-min is equal to the larger of Varea-min and Vocc-min.
 3. Zone minimum airflow setpoint (Vmin*) set to zero
 4. DP setpoint set by TAB contractor; default = 0.2"
 5. Active maximum and minimum setpoints shall vary depending on the mode of the Zone Group the zone is a part of:

Setpoint	Occupied	Cool-down	Setup	Warm-up	Setback	Unoccupied
Cooling maximum	Vcool-max	Vcool-max	Vcool-max	0	0	0
Minimum	0	0	0	0	0	0

6. Control logic
 - a. The zone thermostat is not used for direct zone control but is used for resets and space temperature alarms. In Occupied Mode, it shall control to 75F cooling, 60F heating. See Paragraph 3.13D
 - b. A PID loop shall maintain duct DP at DP setpoint; its output is the active airflow setpoint ranging from the Minimum endpoint at 0% to the Cooling Maximum endpoint at 100%.
 - 1) Enable the loop when
 - a) The Zone Group is in Occupied mode and, if the zone has occupancy sensor(s), the zone is occupied.
 - b) The Zone Group is in Cooldown or Setup modes.
 - 2) When the loop is enabled, the VAV damper shall be modulated by a control loop to maintain the measured airflow at the active set point.
 - 3) Loop is disabled and damper is closed otherwise.
7. Alarms
 - a. Fully comply with ASHRAE Guideline 36-2018 Section 5.5.6.
8. Testing/Commissioning Overrides
 - a. Fully comply with ASHRAE Guideline 36-2018 Section 5.5.7.
9. System Requests
 - a. Fully comply with ASHRAE Guideline 36-2018 Section 5.5.8.

- J. Ceiling Fans
 1. Zone mode, zone state, cooling setpoint, and heating loop output shall be that of the associated VAV zone.
 2. Setpoints (adjustable)
 - a. Cfan-min = the minimum speed signal that causes the fan to visibly rotate
 - b. Cfan-max = 60%
 - c. Tfan-min = current cooling setpoint temperature minus 3°F
 - d. Tfan-max = current cooling setpoint temperature
 3. Ceiling fan shall be off except as follows:

- a. In Occupied or Warmup Modes, if the VAV zone heating loop output is greater than 30% and the heating fan supply air temperature is greater than the room temperature by at least 5°F, the ceiling fan shall operate for destratification at Cfan-min.
 - b. In Occupied Mode, if the VAV zone heating loop output is 0 (Zone State is not Heating), the ceiling fan shall operate when the space temperature is above Tfan-min with speed varying proportionally from Cfan-min at Tfan-min up to Cfan-max at Tfan-max.
 - 4. User override controls:
 - a. Local fan control includes a 0-2 hour windup timer and speed potentiometer.
 - b. While timer is on, and the VAV Zone Group is in Occupied Mode, fan shall run at the speed indicated by the potentiometer overriding other logic.
 - 5. Alarms
 - a. Generate a Level 4 maintenance alarm when fan has operated for more than 3000 hours. Reset interval counter when alarm is acknowledged.
 - a. Fan alarm is indicated by the status input being different from the output command for 15 seconds.
 - 1) Commanded on, status off: Level 2. Do not evaluate alarm until the device has been commanded on for 15 seconds.
 - 2) Commanded off, status on: Level 4. Do not evaluate the alarm until the device has been commanded off for 60 seconds.
 - 6. Testing/Commissioning Overrides: Provide software points that interlock to a system level point to
 - a. Force ceiling fan to any user defined speed
- K. Air Handling Unit System Modes:
- 1. Fully comply with ASHRAE Guideline 36-2018 Section 5.15 unless otherwise noted.
- L. Cooling VAV Air Handler
- 1. Fully comply with ASHRAE Guideline 36-2018 Section 5.16 unless otherwise noted.
 - 2. Parameters
 - a. Design Information:
 - 1) Temperature Setpoints
 - a) Min_ClgSAT, lowest cooling supply air temperature setpoint: 55°F.
 - b) Max_ClgSAT, highest cooling supply air temperature setpoint: 65°F.
 - c) OAT_Min, the lower value of the OAT reset range: 50°F.
 - d) OAT_Max, the higher value of the OAT reset range: 70°F.
 - 2) Ventilation Setpoints
 - a) AbsMinOA: the design outdoor airflow rate when all zones with CO2 sensors or occupancy sensors are unpopulated: per AHU schedule
 - b) DesMinOA: the design minimum outdoor airflow with areas served by the system are occupied at their design population: per AHU schedule
 - 3) Economizer High Limit: Paragraph 3.1.4.3.2 (California Title 24 economizer high limit requirements)
 - a) California Climate Zone: 3
 - b) High limit option: Fixed Dry Bulb + Differential Dry Bulb
 - b. TAB Information
 - 1) Duct design maximum static pressure, Max_DSP to be determined by Section 230593 Testing, Adjusting and Balancing.
 - 2) Minimum Fan Speed: Per Paragraph 3.14D.8
 - 3. Use the following options/revisions:
 - a. Supply fan control: Section 5.16.1 modified as follows:
 - 1) Staged supply fan controls
 - a) VFD Fan groups shall be lead/lag controlled per Paragraph 3.13B.5.

- b) When fans are enabled, start the lead supply fan. When %-supply airflow (totalized enabled VAV box readings divided by design AHU airflow) exceeds stage-up setpoint (below) for 15 minutes (adjustable) then the next lag supply fan shall run. All VFDs receive the same speed signal. When %-airflow falls below the stage-up setpoint for 15 (adjustable) minutes then last lag fan shall be staged off.

VFD Stage	Stage up Flow
1	0%
2	45%

- b. Supply Air Temperature Control:
 - 1) Per Figure 5.16.2.3-1, except:
 - a) When switching from Heating Mode to Cooling Mode and vice versa, wait the longer of the nominal timing of the changeover valve and 5 minutes (adj.) since the 2-way control valve was last shut prior to releasing the control valve to open (the intent of this logic is twofold: to avoid sending chilled water into the hot water system before the changeover valve is fully indexed, and to give the fluid trapped in the coil time to reach neutral temperature before being passed to the other loop).
 - b) Control valve output action shall be direct-acting when in Cooling Mode and reverse acting when in heating mode.
 - c. Minimum outdoor air setpoint and control: per Title 24
 - d. Minimum Outdoor Air Control: Section 5.6.16 except replace Figure 5.16.6.3 with the following where the cold duct minimum outdoor air “dump” damper is mounted on the cooling supply air main discharging to the mechanical room plenum.

- 1) The “dump” damper shall be capable of generating static pressure requests. Fully comply with ASHRAE Guideline 36-2018 Section 5.5.8.2 with “airflow” referring to the measured minimum outdoor airflow.
- e. Relief Fan Control. Section 5.16.9 modified as follows:
 - 1) Relief fans shall be lead/lag controlled per Paragraph 3.13B.5.

M. Heating VAV Air Handler

- 1. Fully comply with ASHRAE Guideline 36-2018 Section 5.17 unless otherwise noted.

2. Parameters
 - a. Design Information:
 - 1) Temperature Setpoints
 - a) Max_HtgSAT, highest heating supply air temperature = 95°F
 - b. TAB Information
 - 1) Duct design maximum static pressure, Max_DSP to be determined under Section 230593 Testing, Adjusting and Balancing.
 - 2) Minimum Fan Speed: Per Paragraph 3.14D.8
3. Use the following options/revisions:
 - a. Supply fan control: Section 5.17.1 modified as follows:
 - 1) Staged supply fan controls
 - a) VFD Fan groups shall be lead/lag controlled per Paragraph 3.13B.5.
 - b) When fans are enabled, start the lead supply fan. When %-supply airflow (totalized enabled VAV box readings divided by design AHU airflow) exceeds stage-up setpoint (below) for 15 minutes (adjustable) then the next lag supply fan shall run. All VFDs receive the same speed signal. When %-airflow falls below the stage-up setpoint for 15 (adjustable) minutes then last lag fan shall be staged off.

VFD Stage	Stage up Flow
1	0%
2	45%

- N. Building Hot Water Pumps
 1. Pumps shall be lead/lag controlled per Paragraph 3.13B.5.
 2. Building HW system enable/disable
 - a. Enable the building HW system when they have been disabled for at least 10 minutes and:
 - 1) Number of building Heating Hot-Water Plant Requests > I (I = Ignores shall default to 0, adjustable), and
 - 2) OAT < HW-LOT (default to 70F, adjustable)
 - b. Disable the building HW system when they have been enabled for at least 3 minutes and:
 - 1) Number of Heating Hot-Water Plant Requests ≤ I for 3 minutes, or
 - 2) OAT > HW-LOT + 1°F
 3. When the HW system is enabled, the building DP control loop shall be enabled. The loop shall be a reverse-acting loop maintaining the differential pressure (DP) sensor at setpoint. The output of the loop shall range from 0 to 100% and mapped to pump speed and the hot water control valve software point HW-VLV-DP as shown in the figure and described below:

- a. Point HW-VLV-DP is mapped from 0% to 100% as the DP loop output ranges from 0% to 50%.
 - b. Once the valve is wide open (DP loop at 50%), the lead pump shall start and its speed mapped from its minimum speed (see Paragraph 3.14D.8) to 100% as the DP Loop signal ranges from 50% to 100% as shown in the figure. The lead pump shall stop when the valve is below 50% open and the pump has run for a minimum of 5 minutes.
 - c. Lag pump shall be staged as a function of HW flow ratio (HWFR = actual flow divided by total plant design flow). When HWFR is above 47% for 10 minutes, start the lag pump. Both pumps shall receive the same speed signal when both are on. When HWFR is below 47% for 15 minutes, or the lead pump is commanded off, shut off the lag pump.
 - d. Differential pressure setpoint shall be DP-MAX, the design DP setpoint determined under 230593 Testing, Adjusting and Balancing.
4. HW Flow Limit
- a. Flow limit setpoint shall be the total pump design flow rate listed on drawings. The limit will ensure that one building does not take more flow than they are entitled to, starving other buildings.
 - b. When the pumping system is enabled, a proportional-only flow limiting loop shall be enabled to maintain measured flow at the flow limit setpoint. The output of the loop shall be a software point HW-VLV-FL ranging from 0 to 100%.
5. The signal to the HW valve from the central plant shall be the smaller of the signal determined from the pressure control HW-VLV-DP and the flow limiting loop HW-VLV-FL.
6. Alarms
- a. Generate a Level 4 maintenance alarm when pump has operated for more than 3000 hours. Reset interval counter when alarm is acknowledged.
 - b. Pump alarm is indicated by the status input being different from the output command for 15 seconds.
 - 1) Commanded on, status off: Level 2. Do not evaluate alarm until the device has been commanded on for 15 seconds.
 - 2) Commanded off, status on: Level 4. Do not evaluate the alarm until the device has been commanded off for 60 seconds.
 - c. Low differential pressure, below setpoint by 2 psi for 10 minutes with system enabled for 15 minutes.

- O. Domestic Water Heating Plant
 - 1. Recirculation pump shall operate when any AH unit serving the area that includes the toilet rooms served by the recirc pump is in Occupied Mode.
 - 2. Alarms
 - a. Generate a Level 4 maintenance alarm when pump has operated for more than 3000 hours. Reset interval counter when alarm is acknowledged.
 - b. Pump alarm is indicated by the status input being different from the output command for 15 seconds.
 - 1) Commanded on, status off: Level 2. Do not evaluate alarm until the device has been commanded on for 15 seconds.
 - 2) Commanded off, status on: Level 4. Do not evaluate the alarm until the device has been commanded off for 60 seconds.
 - c. Hot water supply temperature less than 110°F when recirculation pump is proven on: Level 2.
 - d. DHW heater alarm: Level 2

- P. Toilet Exhaust Fan
 - 1. Exhaust fans shall operate when any of the associated system supply fans is proven on and any associated Zone Group is in the occupied mode.
 - 2. Alarms
 - a. Generate a Level 4 maintenance alarm when fan has operated for more than 3000 hours. Reset interval counter when alarm is acknowledged.
 - b. Fan alarm is indicated by the status input being different from the output command for 15 seconds.
 - 1) Commanded on, status off: Level 2. Do not evaluate alarm until the device has been commanded on for 15 seconds.
 - 2) Commanded off, status on: Level 4. Do not evaluate the alarm until the device has been commanded off for 60 seconds.

- Q. Metering Summaries
 - 1. Provide metering summary separately for the following metering systems:
 - a. Electrical power
 - b. Potable water
 - 2. Include all submeters including those mapped from equipment (e.g. VFDs, water treatment system, etc.)
 - 3. Include “virtual meters” where loads are based on subtraction from or addition of other loads including:
 - a. Electricity
 - 1) All HVAC equipment. Sum of all HVAC equipment meters (including those in VFDs)
 - 2) Lighting loads
 - a) Each floor: Subtract plug load submeter from total floor power meter.
 - b) Sum of all interior lighting loads
 - c) Sum of all lighting including all exterior and garage lighting
 - 3) Plug loads: Sum of all plug loads
 - 4. For each metering system:
 - a. Provide the system 1-line riser diagram on a summary graphic with links to subsections of the system by floor and major system.
 - b. On each subsection, indicate meter and virtual meter location with a title indicating end-use.
 - c. Through a hyperlink, show a screen summarizing meter data including:
 - 1) Details of what is being metered
 - 2) Pie chart or other graphical format
 - 3) Summary of power on the following basis:

- a) Current
 - b) Past day
 - c) Past month
 - d) Past year and year-to-date
 - 5. Summary dashboards:
 - a. For both electricity and water
 - b. Pie chart or other graphical format showing total whole building consumption with a breakdown of the consumption by end-use, including the percentage of the total.
- R. Equipment not controlled or monitored by BAS system
 - 1. Equipment Room Transfer Fans
 - a. Set setpoint to energize fan when space temperature rises above 80°F with 2°F differential.
- S. Miscellaneous Alarms
 - 1. Points in Hand (Operator Override) via Workstation command (including name of operator who made the command) or via supervised HOA switch at output: Level 4
 - 2. Equipment alarm (for equipment with alarm contacts such as VFDs, AC units): Level 2
 - 3. Failure or disconnection of a sensor as indicated by signal widely out of range: Level 2.
 - 4. Panel or LAN failure: Level 2
 - 5. Loss of communication with any device via Gateway (e.g. VFD) for more than 30 seconds: Level 2 (alarm shall indicate which specific device is not responding).

3.14 SYSTEM COMMISSIONING

- A. Sequencing. The following list outlines the general sequence of events for submittals and commissioning:
 - 1. Submit Submittal Package 0 (Qualifications) and receive approval.
 - 2. Submit Submittal Package 1 (Hardware and Shop Drawings) and receive approval.
 - 3. Initiate installation of BAS hardware, devices and wiring.
 - 4. Develop point database and application software.
 - 5. Simulate sequencing and debug programming off-line to the extent practical.
 - 6. Submit Submittal Package 2 (Programming and Graphics) and receive approval.
 - 7. Complete installation of BAS hardware, devices and wiring.
 - 8. Install point database and application software in field panels.
 - 9. Submit Submittal Package 3 (Pre-Functional Test Forms) and receive approval.
 - 10. Perform BAS Pre-functional Tests (start up, calibration and tuning) and submit completed forms as Submittal Package 4 (Pre-Functional Test Report) for approval.
 - 11. Receive BAS Pre-functional Test Report approval and approval to schedule Functional Tests.
 - 12. Field test application programs prior to functional testing.
 - 13. Submit Package 5 (Post-Construction Trend Points List) in format specified for review and approval.
 - 14. Receive approval of successful Trend Log configuration, or reconfigure as required.
 - 15. Prepare and initiate commissioning Trend Logs.
 - 16. Perform and record functional tests and submit Submittal Package 6 (Functional Test Report) for approval.
 - a. Some tests may not be possible due to weather conditions. These tests may be deferred to post-occupancy period.
 - 17. Assist in TAB tests and determining setpoints as specified in Section 230593 Testing, Adjusting and Balancing.
 - 18. Assist in Title 24 Acceptance Testing as specified in Section 230800 Mechanical System Commissioning.

19. Submit Package 7 (Training Materials) and receive approval.
 20. Receive BAS Functional Test Report approval and approval to schedule Demonstration Tests.
 21. Perform Demonstration Tests to Commissioning Provider and Owner's Representatives and submit Demonstration Test Report.
 22. Receive acceptance of Demonstration Tests.
 23. Train Owner personnel on BAS operation and maintenance.
 24. Substantial Completion
 25. Submit Package 8 (Post-Construction Trend Logs) in format specified for review and approval.
 26. Receive approval of successful Trend Log tests, or retest as required.
 27. Complete all items in Completion Requirements per Paragraph 1.8B.
 28. Provide administration level password access to the Owner.
 29. Final Acceptance
 30. Begin Warranty Period.
 31. Prepare and initiate continuous Trend Logs per Paragraph 2.12A.4.
 32. Receive amended BAS Functional Test Report approval.
 33. Two months prior to end of Warranty Period, submit Package 9 (End-of-Warranty Trend Logs) in format specified for review and approval.
 34. Receive approval of successful Trend Log tests, or retest as required.
 35. Revise and submit record documents and O&M Manuals.
 36. Update all software as specified.
 37. End of Warranty Period
- B. Assist Commissioning Provider/Coordinator as specified in Section 019100 Commissioning, including attending commissioning meetings.
- C. Coordinate with Work specified in Section 230800 Mechanical Commissioning and Division 26 Electrical Commissioning.
- D. Pre-functional tests
1. General
 - a. Inspect the installation of all devices. Review the manufacturer's installation instructions and validate that the device is installed in accordance with them.
 - b. Verify proper electrical voltages and amperages, and verify that all circuits are free from faults.
 - c. Verify integrity/safety of all electrical connections.
 - d. Verify that shielded cables are grounded only at one end.
 - e. Verify that all sensor locations are as indicated on drawings and are away from causes of erratic operation.
 2. Test Documentation
 - a. Prepare forms to document the proper startup of the BAS components.
 - b. All equipment shall be included on test forms including but not limited to
 - 1) Wiring: End-to-end checkout of all wiring at terminations. Power to all controllers and actuators. Confirmation of emergency power where specified.
 - 2) Digital Outputs: Proper installation, normal position, response to command at CU
 - 3) Digital Inputs: Proper installation, device test, response at CU
 - 4) Analog Outputs: Proper installation of devices, verification of maximum and minimum stroke.
 - 5) Analog Inputs: Proper installation of sensors, calibration
 - 6) Panels: Confirmation of location, power source (electrical circuit used), confirmation of emergency power where specified.

- 7) Alarms and Safeties: Verification of alarm routing to all specified devices and correct hierarchy. Example: confirm alarm routing to cell phones, email, servers, remote workstations. Confirm that appropriate alarm levels are routed to appropriate devices.
 - 8) Loop Tuning: Document setting of P/I parameters for all loops, chosen setpoints, time delays, loop execution speed.
 - 9) Network Traffic: Document speed of screen generation, alarm and signal propagation in system with all required commissioning trends active.
 - c. Each form shall have a header or footer where the technician performing the test can indicate his/her name and the date of the test.
 - d. Submit blank forms for approval in Submittal Package 3.
 - e. Complete work, document results on forms, and submit for approval as Submittal Package 4 (Pre-Functional Test Report).
3. Digital Outputs
 - a. Verify that all digital output devices (relays, solenoid valves, two-position actuators and control valves, magnetic starters, etc.) operate properly and that the normal positions are correct.
 4. Digital Inputs
 - a. Adjust setpoints, where applicable.
 - 1) For current switches used as status on fans, adjust current setpoint so that fan status is OFF when fan discharge damper (if present) is fully closed and when belt is broken (temporarily remove belt).
 - 2) For current switches used as status on pumps, adjust current setpoint so that pump status is OFF when pump is dead-headed (temporarily close discharge valve).
 - 3) For differential pressure sensors on pumps and fans, set so that status is on when pump operating with all valves open (out on its curve).
 5. Analog Outputs
 - a. Verify start and span are correct and control action is correct.
 - b. Check all control valves and automatic dampers to ensure proper action and closure. Make any necessary adjustments to valve stem and damper blade travel.
 - c. Check all normal positions of fail-safe actuators.
 - d. For outputs to reset other manufacturer's devices (for example, chiller setpoint) and for feedback from them, calibrate ranges to establish proper parameters.
 6. Analog Input Calibration
 - a. Sensors shall be calibrated as specified on the points list. Calibration methods shall be one of the following:
 - 1) Factory: Calibration by factory, to standard factory specifications. Field calibration is not required.
 - 2) Handheld: Field calibrate using a handheld device with accuracy meeting the requirements of Paragraph 2.9N.7.
 - b. The calibrating parameters in software (such as slope and intercept) shall be adjusted as required. A calibration log shall be kept and initialed by the technician indicating date and time, sensor and hand-held readings, and calibration constant adjustments and included in the Pre-functional Test Report.
 - c. Inaccurate sensors must be replaced if calibration is not possible.
 7. Alarms and Interlocks
 - a. A log shall be kept and initialed by the technician indicating date and time, alarm/interlock description, action taken to initiate the alarm/interlock, and resulting action, and included in the Pre-functional Test Report.
 - b. Check each alarm separately by including an appropriate signal at a value that will trip the alarm.
 - c. Coordinate with Division 26 to test fire and life safety systems alarm contacts.

- d. Interlocks shall be tripped using field contacts to check the logic, as well as to ensure that the fail-safe condition for all actuators is in the proper direction.
 - e. Interlock actions shall be tested by simulating alarm conditions to check the initiating value of the variable and interlock action.
8. Variable Frequency Drive Minimum Speed
- a. Minimum speed for VFD-driven fans and pumps shall be determined in accordance with this Paragraph. Tests shall be done for each piece of equipment, except that for multiple pieces of identical equipment used for identical applications, only one piece of equipment need be tested with results applied to all. Note that for fans and pumps, there is no minimum speed required for motor cooling. Power drops with cube of speed, causing motor losses to be minimal at low speeds.
 - b. This work shall be done only after fan/pump system is fully installed and operational.
 - c. Determine minimum speed setpoint as follows:
 - 1) Start the fan or pump.
 - 2) Manually set speed to 6 Hz (10%) unless otherwise indicated in control sequences. For cooling towers with gear boxes, use 20% or whatever minimum speed is recommended by tower manufacturer.
 - 3) Observe fan/pump in field to ensure it is visibly rotating.
 - a) If not, gradually increase speed until it is.
 - 4) The speed at this point shall be the minimum speed setpoint for this piece of equipment.
 - 5) Record minimum speeds in log and store in software point as indicated in Guideline 36.
9. Tuning
- a. Tune all control loops to obtain the fastest stable response without hunting, offset or overshoot. Record tuning parameters and response test results for each control loop in the Pre-functional Test Report. Except from a startup, maximum allowable variance from set point for controlled variables under normal load fluctuations shall be as follows. Within 3 minutes of any upset (for which the system has the capability to respond) in the control loop, tolerances shall be maintained (exceptions noted)

Controlled Variable	Control Accuracy
Duct Pressure	±0.1 inches w.g.
Building and relief plenum	±0.01 inches w.g.
Airflow and water flow	±10%
Space Temperature	±1.5°F
Condenser Water Temperature	±2°F
Chilled Water Temperature	±1°F
Hot Water Temperature	±3°F
Duct Temperature	±2°F
Water Differential Pressure	±1.5 psi
Others	±2 times reported accuracy

10. Interface and Control Panels
- a. Ensure devices are properly installed with adequate clearance for maintenance and with clear labels in accordance with the Record Drawings.
 - b. Ensure that terminations are safe, secure and labeled in accordance with the Record Drawings.
 - c. Check power supplies for proper voltage ranges and loading.
 - d. Ensure that wiring and tubing are run in a neat and workman-like manner, either bound or enclosed in trough.
 - e. Check for adequate signal strength on communication networks.

- f. Check for standalone performance of controllers by disconnecting the controller from the LAN. Verify the event is annunciated at Operator Interfaces. Verify that the controlling LAN reconfigures as specified in the event of a LAN disconnection.
 - g. Ensure that buffered or volatile information is held through power outage.
 - h. With all system and communications operating normally, sample and record update and annunciation times for critical alarms fed from the panel to the Operator Interface.
 - i. Check for adequate grounding of all BAS panels and devices.
11. Operator Interfaces
- a. Verify that all elements on the graphics are functional and are properly bound to physical devices or virtual points, and that hot links or page jumps are functional and logical.
 - b. Verify that the alarm, logging, paging, emailing etc. are functional and per requirements.
- E. Testing, Adjusting, and Balancing (TAB) Coordination
- 1. Coordinate with Work performed under Section 230593 Testing, Adjusting, and Balancing. Some balancing procedures require the BAS to be operational and require Contractor time and assistance.
 - 2. Calibration Software
 - a. Software shall be provided free of charge on at least a temporary basis to allow calibration of terminal box airflow controls and other Work specified under Section 230593 Testing, Adjusting, and Balancing.
 - b. Software shall be provided for installation on POT(s) provided by Others or Contractor shall loan a POT or handheld device with software installed for the duration of Work specified under Section 230593 Testing, Adjusting, and Balancing.
 - c. Provide sufficient training to those performing Work specified under Section 230593 Testing, Adjusting, and Balancing to allow them to use the software for balancing and airflow calibration purposes. Contractor shall include a single training session for this purpose.
 - 3. Setpoint Determination
 - a. Perform pre-functional tests described in Paragraph 3.14D before assisting in setpoint determination.
 - b. Coordinate with Work performed under Section 230593 Testing, Adjusting, and Balancing to determine fan and pump differential pressure setpoints, outdoor air damper minimum positions and DP setpoints, etc. as indicated in Section 230593 Testing, Adjusting and Balancing.
 - 4. Coil Valve Leak Check
 - a. Coordinate with Work performed under Section 230593 Testing, Adjusting, and Balancing to provide control valve leak check tests.
- F. Functional Tests
- 1. Test schedule shall be coordinated with the Commissioning Provider, Commissioning Coordinator, and Owner's Representative.
 - 2. Functional tests may be witnessed by Owner's Representative at the Owner's option.
 - 3. All approved Functional Tests shall be conducted by the Contractor with results confirmed and signed by the Contractor's start-up technician.
 - 4. Test documentation
 - a. Owner's Representatives will prepare functional testing forms after Submittal Package 2 has been reviewed and approved. Tests will be designed to test all sequences in a formal manner with simulations and expected outcomes.
 - b. Review tests and recommend changes that will improve ease of testing or avoid possible system damage, etc. and provide to Owner's Representative.

- c. Complete work, document results on forms, and submit for approval as Submittal Package 6 Functional Test Report. Tutorials for using the functional test Excel workbook can be found [here](#).

G. Demonstration Test

1. Demonstration tests consist of a small representative sample of functional tests and systems randomly selected by the Commissioning Provider. Tests will be designed to occur over no longer than 2 working days.
2. Schedule the demonstration with the Commissioning Provider and Owner's Representative at least 1 week in advance. Demonstration shall not be scheduled until the Functional Test Report has been approved.
3. The Contractor shall supply all personnel and equipment for the demonstration, including, but not limited to, instruments, ladders, etc. Contractor-supplied personnel shall be those who conducted the Functional tests or who are otherwise competent with and knowledgeable of all project-specific hardware, software, and the HVAC systems.
4. The system will be demonstrated following procedures that are the same or similar to those used in the Pre-Functional and Functional Tests. The Commissioning Provider will supply the test forms at the site at the start of the tests.
5. Demonstration tests may be witnessed by Owner's Representative at the Owner's option.
6. Contractor shall conduct tests as directed by and in the presence of the Commissioning Provider and complete test forms. Commissioning Provider will document the test results as the Demonstration Test Report after tests are complete.
7. Demonstration Tests shall be successfully completed and approved prior to Substantial Completion.

H. Trend Log Tests

1. Trends shall be fully configured to record and store data to the server for the points and at the interval listed in Paragraph 2.11 as follows:
 - a. Commissioning: Configure trends prior to functional testing phase. Retain configuration until post-construction commissioning trend review has been completed successfully and accepted by the Owner's representative. Trends shall be deactivated after acceptance.
 - b. Continuous: After system acceptance, configure trends for the purpose of long term future diagnostics. Configure trends to overwrite the oldest trends at the longest interval possible without filling the server hard disk beyond 80%.
2. Post-Construction Trend Test
 - a. Trend logging shall not commence until Demonstration Tests are successfully completed.
 - b. Hardware Points. Contractor shall configure points to trend as indicated in the Commissioning Trend column listed in Paragraph 2.11 points.
 - c. Software Points. Include the following in trends of systems and zones whose hardware points are being trended as called for above. Time interval shall be the same as associated hardware point.
 - 1) All setpoints and limits that are automatically reset, such as supply air temperature and fan static pressure setpoints, plus the points that are driving the reset, such as zone level cooling and static pressure requests
 - 2) All setpoints that are adjustable by occupants
 - 3) Outputs of all control loops, other than those driving a single AO point that is already being trended
 - 4) System mode points (e.g. Warm-up, Occupied, etc.)
 - 5) Global overrides such as demand shed signals
 - 6) Calculated performance monitoring points, such as chiller efficiency

- d. Submit for review and approval by the Commissioning Provider a table of points to be trended along with trend intervals or change-of-value a minimum of 14 days prior to trend collection period, as Submittal Package 5.
 - e. Trends shall be uploaded to the CSS in data format specified in Paragraph 2.11C.3.
 - f. Trend logs of all points indicated above shall be collected for a 3 week Trend Period.
 - g. At the completion of the Trend Period, data shall be reviewed by the Contractor to ensure that the system is operating properly. If so, data shall be submitted to the Owner in an electronic format agreed to by the Owner and Contractor (such as flash drive or via direct access to the CSS via the internet) as Submittal Package 8.
 - h. Data will be analyzed by the Commissioning Provider.
 - i. The system shall be accepted only if the trend review indicates proper system operation without malfunction, without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these specifications. If any but very minor glitches are indicated in the trends, steps f to h above shall be repeated for the same Trend Period until there is a complete Trend Period of error free operation.
 - j. After successfully completing the Post-Construction Trend Tests, the Contractor shall configure all points to trend as indicated in the Continuous Trend column listed in Paragraph 2.11 points list.
3. End-of-Warranty Trend Tests
- a. Archive trends up to the CSS without overwriting stored data for the entire Warranty Period.
 - b. At the completion of the End-of-Warranty Trend Period, data shall be submitted to the Owner in an electronic format agreed to by the Owner and Contractor (such as flash drive or via direct access to the CSS via the internet) as Submittal Package 9.
 - c. Data will be reviewed by Commissioning Provider at approximately 30 days prior to the end of the Warranty Period.
 - d. The system shall be accepted and warranty period considered complete only if the trend review indicates proper system operation without malfunction, without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these specifications. If any but very minor glitches are indicated in the trends, steps 2.f to 2.h above shall be repeated until there is a complete Trend Period of error free operation.
- I. Remedial Work
- 1. Repair or replace defective Work, as directed by Owner's Representative in writing, at no additional cost to the Owner.
 - 2. Restore or replace damaged Work due to tests as directed by Owner's Representative in writing, at no additional cost to the Owner.
 - 3. Restore or replace damaged Work of others, due to tests, as directed by Owner's Representative in writing, at no additional cost to the Owner.
 - 4. Remedial Work identified by site reviews, review of submittals, demonstration test, trend reviews, etc. shall be performed to the satisfaction of the Owner's Representative, at no additional cost to the Owner.
 - 5. Contractor shall compensate Owner's Representatives and Commissioning Provider on a time and material basis at standard billing rates for any additional time required to witness additional demonstration tests or to review additional BAS trends beyond the initial tests, at no additional cost to the Owner.

3.15 TRAINING

- A. Coordinate schedule and materials with Commissioning Provider.

- B. Interim Training
 - 1. Provide minimal training so the operating staff can respond to occupant needs and other operating requirements during start-up and commissioning phase.

- C. Formal Training
 - 1. Provide training sessions for four building engineers.
 - 2. Submit training materials as Submittal Package 7.
 - 3. Training shall be conducted after all commissioning is complete and systems are fully operational.
 - 4. Primary System Training
 - a. See Laney Central Utility Plant scope.
 - 5. On-Site Job Specific Training
 - a. Include 40 hours total of on-site training to assist personnel in becoming familiar with site-specific issues, systems, control sequences, etc.
 - b. Owner shall be permitted to videotape training sessions.
 - c. Training may be in non-contiguous days at the request of the Owner.
 - 6. During the warranty period, provide unlimited telephone support for all trained operators.

- D. Training materials shall include step-by-step instructions (including illustrations, screen captures, etc.) for how to perform all task identified in Paragraph 3.15C such that a new Operator, who has not attended the training in person and has minimal familiarity with this BAS system, can easily follow the instructions and successfully perform all of the identified tasks. One copy of training material shall be provided per student. An electronic copy of the materials shall be stored on the OWS.

- E. The instructor(s) shall be factory-trained instructors experienced in presenting this material.

END OF SECTION

SECTION 260500
BASIC ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Work included in this Section: All materials, labor, equipment, services, and incidentals necessary to provide and install the Electrical Work as shown on the drawings and as specified hereinafter, including, but not limited to the following:
1. Electrical service provisions as outlined on the drawings, including temporary power for construction.
 2. Main switchboard, distribution switchboards, distribution panels, panels, transformers, circuit breakers, and feeders.
 3. Branch circuit wiring, wiring devices and connections to all equipment requiring electrical service.
 4. Lighting fixtures completely lamped, including switches, raceways and wiring.
 5. Emergency egress/exit illumination system.
 6. Mechanical equipment power connections, and motor starters where noted.
 7. Low voltage lighting control system and programming.
 8. Transient voltage suppression system.
 9. Medium voltage switchgear, transformers, and distribution system.
 10. All required incidental work, such as roof flashing, electrical testing, title 24 acceptance testing, and temporary power.
 11. Any other electrical work as might reasonably be implied as required, even though not specifically mentioned herein or shown on the drawings.
 12. It is the intent of the drawings and specifications that systems be complete and, except as otherwise noted, be ready for operation.

1.2 RELATED WORK

- A. Division 1 - General Requirements
- B. Division 9 - Finishes
- C. Division 23 - Mechanical

1.3 INCORPORATED DOCUMENTS

- A. Requirements of the General Conditions, Supplementary Conditions, and Division 1 Sections apply to all work in this Section, unless modified herein.
- B. Published specifications, standard tests or recommended methods of trade, industry or government organizations apply to work of this Section where cited by abbreviations noted below, unless modified herein.
1. 2019 California Code of Regulations.
 2. 2019 California Building Standards Administrative Code, Part 1, Title 24, C.C.R.
 3. 2019 California Building Code (CBC).
 4. 2019 California Electrical Code (CEC).
 5. 2019 California Mechanical Code (CMC).
 6. 2019 California Plumbing Code (CPC).
 7. California Energy Code, Part 6, Title 24, C.C.R.

8. 2019 California Fire Code (CFC).
9. 2019 California Green Building Standards (CALGreen) Code.
10. Underwriters' Laboratories, Inc. (UL).
11. Local Utility Company regulations.

C. All State and Municipal Codes and Ordinances.

1.4 CONDITIONS AT SITE:

- A. Visit to site is required of all bidders prior to submission of bid. All will be held to have familiarized themselves with all discernible conditions and no extra payment will be allowed for work required because of these conditions, whether specifically mentioned or not.
- B. Lines of other services that are damaged as a result of this work shall promptly be repaired at no expense to the Owner to the complete satisfaction of the Owner.

1.5 QUALITY ASSURANCE

- A. Conformance:
 1. All work shall conform to the applicable requirements of Article 1.3 above.
 2. The Contractor shall notify the Architect, prior to submission of bid, about any part of the design, which fails to comply with abovementioned requirements.
 3. If after contract is awarded, minor changes and additions are required by aforementioned authorities, even though such work is not shown on the drawings or covered in the specifications, they shall be included at Contractor's expense.
- B. Coordination:
 1. The Contractor shall become familiar with the conditions at the job site, and with the drawings and specifications and plan the installation of the electrical work to conform with the existing conditions and that shown and specified so as to provide the best possible assembly of the combined work of all trades.
 2. The Contractor shall work out in advance all "tight" conditions, involving all trades and if found necessary, supplementary drawings shall be prepared by this Contractor, for the Architect's approval, before work proceeds in these areas. No additional costs will be considered for work, which must be relocated due to conflicts with the work of other trades.
 3. The Contractor shall coordinate and verify all backbox, device, lighting fixture, or equipment mounting requirements with the devices or equipment to be installed, prior to rough in.

1.6 SUBMITTALS

- A. Product Data:
 1. Comply with the provisions of Section 013300 - Submittals.
 2. Within 15 days after award of the Contract, submit:
 - a. Complete electrical, lighting, and signal systems material list of all items proposed to be furnished and installed under this Division. Provide manufacturers data sheets for all devices, raceways, fixtures, equipment, and related products to be used for the Division 26 work.
 - b. Manufacturers' specifications and other data required demonstrating compliance with the specified requirements.
 - c. Manufacturers' recommended installation procedures which, when approved by the Architect, shall become the basis for inspecting and accepting or rejecting actual installation procedures used on the work.

3. Shop Drawings: Furnish shop drawings and/or equipment cuts for the following:
 - a. Light fixtures
 - b. Main Switchboard, distribution switchboards, distribution panels, panel boards, and transformers. Panel board submittals shall include diagrams of the circuit breaker arrangements in the panels. Arrange circuit breakers in panels exactly as shown on the panel schedules in the construction documents.
 - c. Disconnect switches
 - d. Motor starters
 - e. Low voltage lighting control system
 - f. Arc flash, Short Circuit, and Protective Device Coordination Study.
 - g. Power and signal concealed service floor boxes, and furniture panel infeed boxes.
 - h. Mechanical and Plumbing equipment. The Electrical Contractor shall review the Mechanical and Plumbing Submittals, and verify the voltage, wire size and overcurrent protection required. Also provide the Electrical Engineer with a copy of the submittals for their review.
 - i. Transient Voltage Surge Suppression system if specified herein and/or indicated on the drawings.
 - m. Medium voltage transformers, and cable if specified herein and indicated on the drawings.
 - n. Emergency Generator and Automatic Transfer Switches.
4. Test Reports:
 - a. Factory Tests: As specified for specific equipment.
 - b. Field Tests: Performance tests as specified for specific equipment.
 - c. Megger Tests: As specified under TESTING.
 - d. Special Seismic Certification documentation as per CBC Section 1616A and ASCE/SEI 7-10 requirements for all equipment defined as 'critical' with an importance factor of 1.5 in Paragraph 1.10.M.3 of this Section.
 - f. Manufacturer's Seismic Certification or Project-Specific Design of Supports and Attachments for all other equipment and fixtures as per CBC Section 1616A and ASCE/SEI 7-10 requirements.
5. Maintenance and Operating Manuals:
 - a. Systems Description: Description of operating procedures.
 - b. Controls: Diagrams and description of operation of each system.
 - c. Equipment: Manufacturer's brochures, ratings, certified shop drawings, maintenance data, and parts lists with part numbers. Mark each sheet with equipment identification number and actual installed condition.
 - d. Materials and Accessories: Manufacturer's brochures, parts lists with part numbers, and maintenance data where applicable. Mark each sheet with identification number of system and location of installation.
 - e.
6. Record Documents: "As-builts": As specified under Paragraph 3.2 of this Section.

1.7 DELIVERY, STORAGE AND HANDLING

- A. Protection: Use all means necessary to protect the materials of this Section before, during, and after installation and to protect the work and materials of all trades.
- B. Delivery and Storage: Deliver all materials to the job site in their original containers with all labels intact and legible at time of use. Store in strict accordance with approved manufacturers' recommendations.

- C. Replacements: In the event of damage, immediately make all repairs and replacements necessary to the approval of the Architect and at no additional cost to the Owner.
- D. This Contractor shall personally, or through an authorized representative, check all materials upon receipt at jobsite for conformance with approved shop drawings and/or plans and specifications.

1.8 SCHEDULING/SEQUENCING

- A. Place orders for all equipment in time to prevent any delay in construction schedule or completion of project. If any materials or equipment are not ordered in time, additional charges made by equipment manufacturers to complete their equipment in time to meet the construction schedule, together with any special handling charges, shall be borne by this Contractor.
- B. The Contractor shall coordinate production and delivery schedule for all Owner-supplied equipment with the equipment suppliers to ensure that all Owner-supplied equipment is delivered to site in coordination with the construction schedule and in such a manner as to cause no delays in completion of the Contract as scheduled.

1.9 REQUIREMENTS

- A. The contract drawings indicate the extent and general arrangements of the conduit wiring systems, etc. If any departures from the contract drawings are deemed necessary by the Contractor, details of such departures and the reasons therefore shall be submitted as soon as practicable, and within thirty-five (35) days after award of the electrical contract.
- B. Unless material list and data is received as a complete and all-inclusive submittal within the stipulated time all items shall be provided as specified, with no deviations permitted.
- C. Any and all additional costs incurred by the substitution of electrical material or equipment, or installation thereof, whether architectural, structural, plumbing, mechanical or electrical, shall be borne by the Contractor under this Section.
- D. Burden of proof of equality of any substitution for a specified product is the responsibility of this Contractor.
- E. Where required by Architect to ascertain equality of substitute product, Contractor may be requested to provide the specified item and the submitted substitution for comparison, at no additional cost to the Owner.

1.10 SEISMIC CERTIFICATION AND INSTALLATION OF EQUIPMENT

- A. See Architectural and Structural Drawings and Specifications for description of Occupancy Group and Seismic Design Category applicable to this project.
- B. Provide Special Seismic Certification per CBC Section 1616A and ASCE/SEI 7-10 for all equipment and components defined as critical with an importance factor 1.5 in Paragraph 1.10.M.3 of this Section.
- C. Special Seismic Certification shall require either certification through approved analytical method or approved shake table testing in accordance with Section 13.2.5 of ASCE/SEI 7-10 or experience data in accordance with Section 13.2.6 of ASCE/SEI 7-10.

- D. Manufacturer's Seismic Certification or Project-Specific Design of Supports and Attachments for all other equipment and fixtures as per CBC Section 1616A and ASCE/SEI 7-10 requirements.
- E. Provide seismic restraints per applicable code and as specified or indicated. Design restraints to prevent permanent displacement in any direction caused by lateral motion, overturning, or uplift.
- F. Rigidly Supported Equipment, Conduits, and Raceways.
- G. Lighting:
 - 1. Fasten lighting fixtures in suspended ceilings to ceiling grid system or otherwise support from the structures as specified herein and as per details indicated on the Drawings. Comply with National Electric Code (NEC) Article 410.
 - 2. Suspension systems for light fixtures shall allow fixtures to swing a minimum of 45 degrees from the vertical in all directions without contacting obstructions.
 - 3. Free-swinging suspension systems shall have a safety wire or cable attached to the fixture and structure at each support. The wire shall be capable of supporting four times the weight of the lights.
 - 4. Point-source fixtures: provide slack wires to structure at two diagonal corners.
 - 5. Troffer fixtures: provide hold-down clip at each fixture corner, and slack wires to structure at two diagonal corners.
 - 6. Supports for pendants: Provide diagonal seismic wire restraints per Code.
- H. Components supported by chains or simply suspended from above are not required to meet lateral seismic force requirements and seismic relative displacement requirements provided that they cannot be damaged or cannot damage any other component when subject to seismic motion. They must have ductile or articulating connections to the structure at the point of attachment.
- I. Electrical Cabinets:
 - 1. Electrical cabinet design shall conform to National Electrical Manufacturers Association (NEMA) 250 and NEMA ICS6 standards. Cutouts in the lower shear panel that do not appear to have been made by the manufacturer and significantly reduce the strength of the cabinet are not permitted unless analysis demonstrates that the remaining strength is sufficient.
 - 2. Single freestanding cabinets shall have a minimum of four anchor bolts designed and specified with one anchor located at each corner.
 - 3. Multiple sections of cabinets or enclosures located adjacent to each other shall be bolted together. Minimum acceptable bolting is three bolts in the front and back along the adjacent vertical faces - 6 bolts total.
 - 4. Multiple cabinets bolted together to form a section or line-up shall have at a minimum two anchors specified for each cabinet, one at the front and one at the rear.
 - 5. Base anchorage shall be installed through anchor points designated by the Manufacturer. The largest bolt diameter for the anchor hole provided in the equipment shall be provided.
 - 6. A latch or fastener to prevent opening during an earthquake event and damaging the cabinet and internal components shall secure all doors.
 - 7. Slide-out components in electrical control panels, etc., shall have a latching mechanism to hold contents in place.
 - 8. Attached cabling shall have adequate slack or flexibility between the cabinets and surrounding structure supporting the conduit to preclude severing of the cabling due to differential seismic displacements.

- J. The design load shall include the effects of loading on the equipment imposed by attached utility or service lines that are also attached to separate structures.
- K. The attachment of additional external items is not permitted unless such items have either been provided by the Manufacturer, or analysis shows that their effects are supported by design.
- L. Conduit and their connections shall be constructed of ductile materials unless otherwise approved by the Architect. Conduits and their connections constructed of non-ductile materials (e.g., cast iron, no-hub pipe and plastic) shall have brace lengths reduced to one-half that allowed for ductile material.
 - 1. All trapeze assemblies supporting conduit shall be braced to resist CBC design forces considering the total weight of the elements on the trapeze.
 - 2. Seismic restraint spacing shall be in accordance with hanger spacing.
- M. Critical Equipment:
 - 1. Design with importance factor of 1.5.
 - 2. Provide Special Seismic Certification for all equipment and components and their installation per CBC and ASCE/SEI requirements.
 - 3. Critical Equipment shall include the following:
 - a. Emergency Generator and Automatic Transfer Switches if specified herein and/or indicated on the drawings.
 - b. Emergency power systems switchboards, distribution panels, transformers, and panelboards if specified herein and/or indicated on the drawings.
 - c. Low Voltage Relay Panels on Emergency Power
- N. Seismic Design Submittals: For all Critical Equipment included in paragraph 26 05 00.1.10.M.3.
 - 1. The Manufacturer of each item of critical equipment shall arrange for the testing or analysis by an approved agency of each component and assembly and its mounting system or anchorage.
 - 2. The Manufacturer shall submit a Certificate of Compliance for each item for approval by the Architect and by the Authority Having Jurisdiction.
 - 3. Based on Manufacturer's approved submittal, Contractor shall retain the services of a State of California registered Structural Engineer to prepare final installation details and drawings for equipment supports and attachments.
 - 4. Submit drawings of the equipment showing dimensions, support equipment, connections, and the proper anchorage locations.
 - 5. Equipment weight and weight distribution (e.g., center of gravity in elevation and plan).
 - 6. Thickness of sheet metal bases.
 - 7. Seismic Vibration Isolation Devices: Manufacturer's product information indicating class and type. Indicate load ratings as published manufacturer's data or shop drawings. Indicate proper orientation of devices on plan.
 - 8. Inertia bases and support frames.
 - 9. Specific details of restraints including anchor bolts and welds and maximum load at each location.
- O. Independent Supports: An independent means of secure support shall be provided for all wiring methods in non-fire-rated assemblies. Where independent support wires are used, they shall be distinguishable by color, tagging, or other effective means.

1.11 DESCRIPTION OF DEMOLITION AND REPLACEMENT WORK

- A. This project includes the demolition and replacement, modification, or enhancement of existing facilities. As such, the project scope for this contractor shall include all associated electrical, lighting, and signal system upgrades and demolition/removal work at the existing buildings(s)

and/or site. The intent is that all systems will be complete and functional at the completion of this contract and that all old systems, equipment, feeders, circuits, wiring, and related devices (no longer used) be completely and neatly removed. Where discrepancies between the drawings and existing conditions are noted, the Architect or Owner shall be notified immediately for resolution.

- B. As with every renovation project, the electrical work will include (and require) exploration and other field work on a daily basis to complete the new designed equipment and connections within the constraints of the existing building and existing site conditions.
- C. The contractor shall include as part of the base bid, sufficient labor hours to provide such exploration and field work throughout the duration of the project. Change orders for miscellaneous coordination of existing conditions will not be approved unless specific and latent conditions are uncovered that warrant such additional compensation or require additional work not shown on the drawings or included in the specifications, or implied by the designed conditions.
- D. New raceways and wiring to new and renovated equipment are to be installed unless otherwise noted. Where raceways are installed in accessible concealed locations (i.e. unfinished spaces or electrical / mechanical / attic spaces), EMT with wire shall be used. Where new wiring is required to be routed through existing walls and ceilings that cannot readily be accessible for new conduit, MC cable or flex conduit and wiring may be installed, fished through and secured in each space as required by Code. Non-metallic sheathed cable shall not be utilized on this project.
- E. All new raceways shall be installed concealed and all new equipment installed flush, unless otherwise noted on the drawings or in these specifications.

1.12 GUARANTEE

- A. This Contractor shall guarantee that all work executed under this Section will be free from defects of materials and workmanship for a period of one (1) year or as per the General Conditions of this project, whichever is longer. Dates shall be from the date of final acceptance of the building. The contractor shall further guarantee that he will, at his own expense, repair and replace all such defective work, and all other work damaged thereby, which becomes defective during the term of the guarantee. Such repair or replacement shall be guaranteed for one (1) year from the date of repair or replacement.

1.13 PERMITS AND INSPECTIONS

- A. This Contractor shall arrange for and obtain all required permits and inspections.
- B. Do not allow or cause any of the work to be covered or enclosed until it has been tested and/or inspected.

1.14 IDENTIFICATION

- A. Switchgear, switchboards, distribution panels, and feeder circuit breakers therein, panels, disconnect switches, motor starters, transformers, motor disconnect switches, cabinets, and other apparatus used for the operation of, or control of circuits, appliances or equipment, shall be properly identified by means of engraved laminated plastic descriptive nameplates mounted on apparatus using stainless steel screws. Nameplates shall have white letters with black background and be submitted to the Architect for approval. Cardholders in any form are not acceptable.

- B. Provide p-touch style labeling of circuit designations for all receptacles on the project.
- C. Each branch circuit of panel boards to have a permanently fixed number with load directory, mounted under celluloid on inside of cabinet door, showing circuit numbers and typewritten description of equipment supplied by breakers. Where changes are made to existing panelboards, newly typewritten circuit directories shall be prepared to replace existing directories.
- D. Provide label on all motors: "Caution. Automatic equipment. May start at any time."
- E. Provide silk-screened or engraved identification labels on all switch box covers identifying specific loads that are not readily apparent to the user, including electroshades, projection screens, exhaust fans, audio-visual controls, etc.. Submit proposed labels to Architect for approval prior to manufacture of labels.
- F. Provide identification of all pull boxes, junction boxes, and conduit stub-ups on the project as outlined below:
 - 1. For Power Feeders:
 - a. Stencil cover with identifying circuit number.
 - b. Lettering 1" high.
 - c. Color of lettering black.
 - d. Place lettering on cover in neat manner; run parallel to long sides of box.
 - 2. For branch circuits, grounding, communication, signal, and control systems boxes and blank conduit stub-outs:
 - a. Paint inside back of each j-box, front of each cover, and ends of each blank conduit stub-out with identifying system color as listed below:

1) 277/480-volt	Orange
2) 120/208-volt	Blue
3) Telephone/Data	Grey
4) Ground system	Green
5) Lighting control	Orange/White
6) Emergency Power 277V	Orange/Red
7) Emergency Power 120V	Blue/Red

PART 2 - PRODUCTS

2.1 GENERAL

- A. Refer to applicable Division 26 Sections for complete products specifications.

2.2 MATERIALS

- A. Materials of the same type or classification, used for the same purpose, shall be the product of the same manufacturer.

2.3 ACCEPTABLE MANUFACTURERS

- A. Materials shall be of make mentioned elsewhere in this specification. All materials shall be the best of their several kinds, perfectly new and approved by the Underwriters' Laboratories.
- B. Where material, equipment, apparatus or other products are specified by manufacturer, brand name, type or catalog number, such designation is to establish standards of desired quality, style and utility and shall be the basis of the bid. Materials so specified shall be furnished

under the contract unless changed by written approval of the Architect. Where two or more designations are listed, choice shall be optional with this Contractor, but this Contractor must submit his choice for final approval.

2.4 POSTED OPERATING INSTRUCTIONS

- A. Furnish approved operating instructions for systems and equipment where indicated in the technical sections for use by operation and maintenance personnel. The operating instructions shall include wiring diagrams, control diagrams, and control sequence for each principal system and equipment. Print or engrave operating instructions and frame under glass or in approved laminated plastic. Post instructions as directed. Attach or post operating instructions adjacent to each principal system and equipment including startup, proper adjustment, operating, lubrication, shutdown, safety precautions, procedure in the event of equipment failure, and other items of instruction as recommended by the manufacturer of each system or equipment. Provide weather-resistant materials or weatherproof enclosures for operating instruction exposed to the weather. Operating instruction shall not fade when exposed to sunlight and shall be secured to prevent easy removal or peeling.

2.5 CATALOGED PRODUCTS/SERVICE AVAILABILITY

- A. Materials and equipment shall be current products by manufacturers regularly engaged in the production of such products. Products shall have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period shall include applications of equipment and materials under similar circumstances and of similar size. The 2-year period shall be satisfactorily completed by a product for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures. Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6,000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished. The equipment items shall be supported by service organizations which are reasonable convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Examine the areas and conditions under which the work of this Section will be installed. Correct conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Drawings:
 - 1. The general arrangement and location of wiring and equipment is shown on the electrical drawings and shall be installed in accordance therewith, except for minor changes required by conflict with the work of other trades.
 - 2. The Contractor shall coordinate and verify all backbox, device, lighting fixture, or equipment mounting requirements with the devices or equipment to be installed, prior to rough in.
 - 3. Drawings indicate the circuit and panel which supplies each device or fixture. Provide and install conduit and conductors to make all connections from panel to nearest device and from first device to additional devices on same circuit. Conduit size and fill shall satisfy NEC requirements. Do not exceed 4 #12 or 3 #10 conductors in a ½" conduit, 7 #12 or 5 #10 in a ¾" conduit, and 11 #12 or 9 #10 in a 1" conduit, unless otherwise noted.

Provide common handle-tie on breakers for multi-wire branch circuits (with common neutral), per NEC. If more than three current carrying conductors are installed in one conduit, conductor size shall be increased as required per NEC. Do not share neutrals for branch circuits.

4. Drawings indicate the location of all light switches. Where fixtures in a room are controlled by more than one switch, the same lower case letter is drawn adjacent to a switch and each fixture controlled by that switch. Where no lower case letter is adjacent to a switch, all fixtures in the room are controlled by that switch. Provide and install conduit and wire from fixture to switch and between fixtures as required to accomplish switching shown. Do not route branch circuit wiring for light fixtures through switch boxes. Where dimming controls are specified, provide required dimming control wiring in addition to power wiring from control device to all controlled light fixtures. Provide separate conduit for dimming control wiring unless otherwise indicated on the drawings.
 5. Drawings indicate location of all signal outlet boxes. Provide and install conduit system as required and complete system wiring, unless otherwise noted.
 6. Control wiring is generally not shown on the plans. Contractor shall refer to control diagrams and provide and install all wiring and raceways required to make all interconnections.
 7. All branch circuit wiring No. 12 or No. 10 as noted, all control wiring No. 14, except as noted next to "slash marks" on the drawings, or as noted under "Wire," as specified herein.
 8. All dimensions, together with locations of doors, partitions, etc. are to be taken from the Architectural Drawings, verified at site by this Contractor.
 9. Maintain "as-built" records at all times, showing the exact location of concealed conduits and feeders installed under this contract, and actual numbering of each circuit. Upon completion of work and before acceptance can be considered, this Contractor must forward to the Architect, updated CAD plans, corrected to show the electrical work as actually installed.
 10. Branch circuit conductors shall be #12 minimum and #10 minimum for runs longer than 150 feet.
- B. Measurements: Before ordering any material or closing in any work, verify all measurements on the job. Any differences found between dimensions on the drawings and actual measurements shall be brought to the Architect's attention for consideration before proceeding.

3.3 FIELD QUALITY CONTROL

- A. All workmanship shall be first class and carried out in a manner satisfactory to and approved by the Architect.
- B. This Contractor shall personally, or through an authorized and competent representative, constantly supervise the work and so far as possible keep the same foreman and workmen on the job throughout.

3.4 COORDINATION

- A. In electrical rooms, where electrical equipment is located at walls with brace framing, provide and install steel channel supports for mounting of electrical equipment away from wall to avoid conflict with brace framing. Steel channel supports shall be Unistrut or equal, and shall include all channels, bases, fittings, etc., as required for a complete installation.
- B. In electrical rooms, Contractor is responsible for installation of electrical equipment within the space provided. Contractor shall provide ¼" scale plans of electrical room layouts, and

elevations of steel channel supports (where used or required) of electrical equipment for review and approval prior to any installation or rough-in

3.5 INSTALLATION/APPLICATION/ERECTION

- A. All electrical raceways and devices shall be installed concealed (for raceways) and/or flush mounted (for devices), unless otherwise noted. Provide cut-in boxes and "fish" flexible MC or flex conduit and wire through existing walls to remain, unless shown otherwise on plans. Cut and patch to facilitate such installation to match adjacent and original finish.
- B. All cutting, repairing and structural reinforcing for the installation of this work shall be done by the General Contractor in conformance with the Architect's requirements.

3.6 EMERGENCY POWER SOURCES

- A. All emergency source circuits shall be installed in separate raceways (from normal power), per 2017 NEC 700.10(B), or the applicable code at the time of permitting.

3.7 TEMPORARY LIGHTING AND POWER

- A. Provide and install temporary lighting and power systems for the duration of construction, of adequate size to accommodate the required lighting and power loads. Coordinate with other trades to insure adequate sizing.
- B. Provide distribution equipment as required to support all construction activities.

3.8 FIRE STOPPING AND FIRE RATED PENETRATIONS

- A. All electrical equipment mounted in, on, or through fire rated construction shall be installed to maintain the fire rating of the construction.
- B. Provide fire rated pads (or other suitable assembly) around all electrical junction boxes in fire rated walls/ceilings/floors to maintain the fire rating.
- C. Provide fire rated construction around all recessed light fixtures and/or panel board / cabinets mounted flush in fire rated walls to maintain the fire rating. Coordinate depth of construction with other trades to avoid conflicts.
- D. Conduit sleeves shall be provided as a means of routing cables through fire-rated walls or floors. Openings in sleeves and conduits used for system cables and those which remain (empty) spare shall be sealed with an approved fireproof, removable sagging material. Sleeves which pass vertically from floor to floor shall be sealed in a similar manner using an approved re-enterable system. Additional penetrations through rated assemblies necessary for passage of tel/data wiring shall be made using an approved method and permanently sealed after installation of cables.

3.9 ADJUSTING AND CLEANING

- A. All electrical equipment, including existing equipment not "finish painted" under other sections, shall be touched up where finished surface is marred or damaged.
- B. All equipment, lighting fixtures, etc., shall be left in clean condition, with all shipping and otherwise unnecessary labels removed there from.

3.10 SCHEDULES

- A. Coordination: Coordinate installation of electrical items with the schedule for other work to prevent unnecessary delays in the total Work.

3.11 WARNING SIGN MOUNTING

- A. Provide the number of signs required to be readable from each accessible side, but space the signs a maximum of 30 feet apart.

3.12 PAINTING OF EQUIPMENT

- A. Factory Applied: Electrical equipment shall have factory-applied painting systems which shall, as a minimum, meet the requirements of NEMA ICS 6 corrosion-resistance test, except equipment specified to meet requirements of ANSI C37.20 shall have a finish as specified in ANSI C37.20.
- B. Field Applied: Paint electrical equipment as required to match finish or meet safety criteria. Painting shall be as specified in the respective equipment section.

3.13 TESTS

- A. Testing and inspection: See Section 260800 - Testing.

END OF SECTION

SECTION 260513

MEDIUM VOLTAGE DISTRIBUTION

PART 1 - GENERAL

1.1 APPLICABLE PUBLICATIONS

- A. The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.
- B. American National Standards Institute (ANSI) Publication (Latest Edition):
 - C2 National Electrical Safety Code
- C. Institute of Electrical and Electronic Architects, Inc. (IEEE) Publication (Latest Edition):
 - 48 Standard Test Procedures and Requirements for Alternating Current Cable Terminations 2.5KV through 765KV
 - 386 Separable Insulated Connectors for Power Distribution Systems Above 600V.
 - 400 Field Testing and the Evaluation of Insulation for Shielded Power Cable Systems
- D. National Fire Protection Association (NFPA) Publication (Latest Edition):
 - 70 National Electrical Code (NEC)
- E. Underwriter's Laboratories, Inc. (UL) Publications (Latest Edition):
 - UL 1072
- F. State of California Public Utilities Commission (Cal. P.U.C.) Publication:
 - G.O. 128 Rule for construction of Underground Electric Supply and Communication Systems.
- G. AEIC CS6-96: Specifications for Ethylene Propylene Rubber Insulated Shielded Power Cables Rated 69 kV
- H. ASTM B8-04: Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
- I. ICEA S-93-639/NEMA WC74: Shielded Power Cables Rated 5 – 46 kV
- J. ICEA S-97-682: Utility Shielded Power Cables Rated 5 - 46 kV

1.2 SUBMITTALS

- A. Submittals: Submit the following information for approval:
 - 1. Manufacturer's Data and Shop Drawings:
 - a. Conduit
 - b. Medium Voltage Cables
 - c. Medium Voltage Splice Kits

- d. Medium Voltage Terminating Kits
 - e. Medium Voltage Connectors
 - f. Terminators
 - g. Fault Indicators
2. Manufacturer's and Installer's Experience: Submit evidence documenting manufacturer's ten-year experience in medium voltage cable and accessories manufacturing. Submit manufacturer's data on electrical cable and terminations. Contractor shall submit a list of previous work evidencing at least five years experience in medium voltage cable installation of similar type. Submit name and experience record of each person to be engaged in medium voltage cable work. Only those persons accepted by the Owner will be permitted to engage in medium voltage cable work.
 3. Cable Test Reports:
 - a. Three copies of factory test records on a per-reel basis shall be furnished at the time of cable shipment. The data shall include the following items: Purchase order and date; description of cable; description of sample high voltage test; dielectric loss and P.F. test; bending test; marked length and actual conductor resistance at 25 degrees C.; insulation resistance in megohms at the testing temperature of each reel length of cable or insulation resistance in megohms at the standard temperature of 15.5 degrees C. per 1000 feet of the cable supplied in this order; sheath integrity and thickness.
 - b. The maximum current carrying capacities and maximum safe operating temperatures on the basis of 3 equally loaded single conductor cables in underground ducts at 100 percent and at 75 percent load factors, and on the basis of 90 RHO, 20 degrees C. ambient and 80 degrees C. conductor temperatures, shall be stated. (Three cables in one duct.)
 4. Certificates:
 - a. Workmen's Competency: Submit high voltage cable Splicer/Terminator certification of competency and experience 30 days before splices or terminations are made in high voltage cables. Splicer/Terminator experience during the immediate past 3 years shall include performance in splicing and terminating cables of the type and classification being provided under this contract.
 - b. Before assigning any cable splicer to work covered by this specification, the Contractor shall provide the Owner with the names of the cable splicer to be employed, together with satisfactory proof that each splicer has had at least 3 years experience in splicing high-voltage cables and is experienced with the type and rating of cables to be spliced.
 5. Contractor to submit a medium voltage cable pulling plan complete with calculations and layout. Cable pulling plan shall include but not be limited to the actual calculations of jam ratios, sidewall bearing pressures and maximum pulling tensions using pulling eyes or cable grips for each run. Also, provide cable information on the plan and diagram of each pull run.
 6. Contractor to provide submittal of lubricants.
 7. Submit shipping and handling protocol.

1.3 COORDINATION AND SCHEDULING

- A. Coordinate with the Owner for the interception of existing underground medium voltage distribution conductors where indicated on the drawings. Comply with all Owner requirements for splicing and rerouting of existing conductors.
- B. It is the responsibility of the Contractor to arrange for all services with the Owner and to ensure that all conduit and other service provisions are as required by the Owner prior to

installation of these service provisions. No extra payments will be made to the Contractor as a result of his failure to fully coordinate with the Owner.

- C. Location of existing utilities: Although the Architect has endeavored to show all underground or above ground utilities at the project site, all utility locations are not necessarily known nor shown. The Contractor is cautioned that the utilities encountered at the site include communication cables and electrical cables conducting high voltage, as indicated. When excavating in the vicinity of such cables, special precautions are to be observed by the Contractor at his own cost and shall include the following: All cables and their enclosure ducts shall be exposed by careful hand excavation so as not to damage the ducts or cables nor cause injury to persons, and suitable warning signs, barricades, and safety devices shall be erected whenever necessary or appropriate.
- D. Provide schedule notification to the Owner 5 working days prior to medium voltage testing.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Materials and equipment shall conform to the Owner's Standards and to the specifications herein. Electrical ratings shall be as indicated.

2.2 MATERIALS

- A. Conduit:
 - 1. See Section 262700.
- B. Tape: UL 510. Plastic insulating tape shall be capable of performing in a continuous temperature environment of 80 degrees C.
- C. Power Wire and Cable:
 - 1. Wire and Cable Conductor Sizes: American Wire Gauge (AWG) designates wire and cable conductor sizes. Conductors shall be copper. Insulated conductors shall bear the date of manufacture imprinted on the wire insulation with other identification. Wire and cable manufactured more than 6 months before delivery to the job site shall not be used. Provide conductor identification within each enclosure where a tap, a splice or a termination is made.
- D. Medium Voltage Wires and Cables: 15KV single conductor, Class B concentric stranded copper, compact round type, bare or annealed uncoated copper per ASTM B-496, size as noted on the drawings. Underwriters' Laboratories shall list Cable as 15,000-volt power cable type MV-105, the cable shall bear the U.L label, and shall be rated for installation in wet or dry conditions. Cables shall be designed to operate continuously at 105 degrees C for normal operation; 140 degrees C for emergency overload conditions, and 250 degrees C for short circuit conditions.
 - 1. Strand Screen: Extruded semi-conducting EPR (ethylene propylene rubber) layer over conductors.
 - 2. Insulation: The insulation shall be type EPR, 133 percent insulation level, 220 mils.
 - 3. Insulation Screen: The insulation shall be screened by an extruded semi-conducting EPR layer. The thickness shall be in accordance with the referenced standards.
 - 4. Shield: 5 mil bare copper tape helically applied with 12.5% nominal overlap.
 - 5. Medium voltage shield drain wrap half-lapped shall not exceed 12.5%.
 - 6. Outer jacket: Black polyvinyl chloride jacket, 80 mils, surface printed, water, oil, alkali, and sunlight resistant.

7. Strand Screen, Insulation, Insulation Screen, and Jacket shall meet ICEA S-93-639 / NEMA WC74, ICEA S-97-682, AEIC CS8 and U.L 1072 standards.
8. The manufacture, reeling, testing, certification and shipping of this cable shall be in accordance with IEEE-48 standards.
9. All factory serial numbers of reels and all other markings must match identically with those shown on the Factory test certificates.
10. Each reel must have one pulling-eye attached to outer cable end.
11. Medium voltage conducting thermosetting compound shall be compatible with both the insulation and the conductor and have an allowable operating temperature equal to that of the insulation.
12. Cable ratings shall include medium voltage emergency overloads for up to 1,500 hours cumulative through the life of the cable.
13. The cable must be free stripping without the use of heat cutting or the need of machine removal.
14. Cable Warranty: 40 years from date of shipment.
15. Provide stranded copper ground conductor in each conduit with phase conductors. Size for ground conductor shall be as indicated in Section 26 24 00 or on the drawings.

E. Terminations and splices shall be rated as follows:

Voltage: BIL: 110kV, 1.2 X 50 microseconds

Withstand: 50kV, 60 Hz, 1 minute
75kV, DC, 15 minutes

Corona: 19 kV extinction

Current: Continuous: Equal to cable ampacity – see drawings
8-hour overload: 150% of cable ampacity

Momentary: 25,000 amps, RMS, 12 cycles
10,000 amps, RMS, .5 seconds
3,500 amps, RMS, 3.0 seconds

Production

Tests: Applied Potential: 50kV, 60 Hz, 1 minute
Corona: 19kV extinction
Test Point: Verify operation

F. Medium Voltage Terminations (Indoor):

1. Medium Voltage Cable Terminations: IEEE 48 Class 1. The manufacturer shall provide all components, materials and complete instructions for installations, which shall include stress relief devices.
2. Terminators: Shall be modular, molded rubber type: IEEE 48 Class I. Provide terminator as specified herein for terminating single conductor, solid insulated, nonmetallic jacketed type cables for service voltage up to 15 KV. The terminator shall consist of stress control, ground clamp, non-tracking rubber skirts, crimp-on connector, rubber cap, and serial lug. Separate parts of copper or copper alloy shall not be used in contact with aluminum or aluminum alloy parts in the construction and installation of the terminator.

G. Medium Voltage Terminations (Outdoor):

1. Terminators shall be 600 ampere, non-loadbreak, separable elbow type, Elastimold Type 655LR or equal, with shield terminator with appropriate shield adapt kit.

2. Terminators shall be fully shielded, fully submersible, designed for energized operation.
 3. Terminators shall be of the materials and construction to ensure dead front construction, shielding, and proper creep path length and water seal. An integral voltage test point and a reinforced pulling ring of stainless steel shall enable the elbow connector to be removed with a shotgun tool. The crimp-type connector for the cable conductor shall meet all requirements of TDJ-162 for Class "A" connectors. A copper pin incorporating Belleville washers at the engagement point with conductor contact shall ensure the integrity of the electrical connection and result in the total connector system meeting Class "A" connector requirements. A stainless steel hold down bail shall mechanically lock the elbow connector onto the bushing.
 4. All separable connectors and junctions shall comply with IEEE-386.
- H. Splices: Splicing shall be allowed only with the prior permission of the Owner and will be allowed only if cable cannot be installed in one continuous piece without splice. Splices shall be made using a "kit" which shall be the product of one manufacturer and shall have the approval in writing of the manufacturer of the cable, which is to be spliced. Splice shall be suitable for continuous immersion in water. Kit shall be modular, molded rubber type, and shall be as manufactured by Raychem HVS-1520S Series for Heat-Shrinkable splice and Elastimold 655LR Series Separable Connector for elbow splice, or approved equal.
1. Molded Kits shall be fully shielded, fully submersible, designed for energized operation.
 2. Connectors shall be shielded, with proper creep path length and water-seal. The crimp-type connector for the cable conductor shall meet all requirements of TDJ-162 for Class "A" connectors.
- I. Fault Indicators:
1. At elbow connectors provide and install Cooper Power Systems Type TPR or approved equal test point reset fault indicators. Fault indicators shall not trip due to mechanical forces caused by handling. An electric pulse shall turn the indicator's display. When line voltage is restored, the indicator shall reset in approximately 3 minutes. A semi-conductive molded rubber housing, epoxy encapsulated electronic componentry and sealed target window shall make indicator suitable for submersible applications.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Cable installation shall conform to NFPA 70 and ANSI C2:
1. Ends of cable shall be taped immediately after cutting to prevent moisture from entering the cable. Where the cable is not expected to be connected for at least 72 hours, the tape shall also be varnished.
 2. Cables shall be in one piece without splices between connections except where the distance exceeds the lengths in which the cable is furnished.
 3. Bends in cables shall have an inner radius not less than 12 times the cable diameter.
 4. Leave a horizontal slack of approximately 3 feet on each end of cable runs, on each side of connection boxes, and at all points where connections are brought to equipment. Leave additional slack to make necessary connections.
 5. Ground cable shielding, metallic sheath, and armor at each cable joint or splice by means of braided tinned copper wire connected to equipment grounding conductor. See Section 262400. Connections to metallic cable sheaths shall be by means of tinned terminals soldered to ground wires and to cable sheaths. Care shall be taken in soldering not to damage metallic cable sheaths or shields. Ground wires shall be neatly and firmly attached to pullbox walls and the amount of exposed bare wire shall be held to a minimum.

- B. Cable Pulling: Test raceways with a mandrel and thoroughly swab out to remove foreign material before the pulling of cables. Pull cables down grade with the feed-in point at the pullbox or equipment enclosure of the highest elevation. Use flexible cable feeds to convey cables through the pullbox opening and into the raceway runs. Cable slack shall be accumulated at each junction box where space permits by training the cable around the interior to form one complete loop. Minimum allowable bending radii shall be maintained in forming such loops.
1. Lubricants for assisting in the pulling of jacketed cables shall be those specifically recommended by the cable manufacturer. Cable lubricants shall be soapstone, graphite, or talc for plastic jacketed cables. The lubricant shall not be deleterious to the cable sheath, jacket, or outer coverings.
 2. Cable pulling tensions: Use a dynamometer and do not exceed a value of $TM =$ number of conductors in the run, times the cross sectional area in circular mills, times the constant .011, or the maximum pulling tension recommended by the cable manufacturer, whichever is lower.
 3. Installation of Cables in Pullboxes: Do not install cables utilizing the shortest route, but route along those walls providing the longest route and the maximum spare cable lengths. Form all cables to closely parallel walls, not to interfere with conduit entrances, and support on brackets and cable insulators at a maximum of 18 inches separation. Support cable splices by racks on each side of the splice. Locate splices to prevent cyclic bending in the spliced sheath. Install cables at middle and bottom of cable racks, leaving top space opening for future cables, except as otherwise indicated for existing installations. Provide one spare three-insulator rack arm for each cable rack in each pullbox.
 4. Use nylon or manila rope.
 5. Cable racks, supports and related fittings to be UL listed, cable iron insulators to be dry processed glazed porcelain, use industry standard equipment.
- C. Observation by Owner's representative: pulling set up and approved pulling plan, pulling operation.
- D. Cable Terminating: Protect terminations of insulated power cables from accidental contact, deterioration of coverings and moisture by the use of terminating devices and materials. Install all terminations of insulated power cables, cable splices, and high voltage terminations in accordance with the manufacturer's requirements. Make terminations using materials and methods as indicated or specified herein or as designated by the written instructions of the cable manufacturer and termination kit manufacturer.
- E. Splices in Medium Voltage Cables: Splices shall be made only in pullboxes and only where approved in advance by the Owner. Splices in Shielded Cables: Splices in shielded cables shall include covering the spliced area with metallic tape, or like material, to the original cable shield and by connecting it to the cable shield on each side of the splice. Provide a copper ground connection as part of the splice installation. Wire shall be trained to the sides of the enclosure in a manner to avoid interference with the working area.
- F. Cable in Underground Duct:
1. The duct shall have a minimum slope of 3 inches in each 100 feet away from buildings and toward manholes and other necessary drainage points, and shall run in straight lines except where a change of direction is necessary. As each conduit run is completed, a testing mandrel not less than 12 inches long with a diameter 1/4 inch less than the inside diameter of the duct shall be drawn through the duct; after which a brush, having stiff bristles, shall be drawn through until the conduit is clear of all particles of earth, sand or gravel; conduit plugs shall then immediately be installed. Provide a plastic warning tape in the backfill approximately 12 inches below grade.

- The tape shall be yellow plastic with integral warning legend repeated continuously throughout the entire length of the tape.
2. Except at conduit risers, accomplish changes in direction of runs exceeding a total of 10 degrees, either vertical or horizontal, by long sweep bends having a minimum radius of curvature of 25 feet. Sweep bends may be made up of one or more curved or straight sections or combinations thereof. Manufactured bends shall have a minimum radius of 18 inches for use with conduits of less than 3 inches in diameter, a minimum radius of 36 inches for ducts of 3 inches in diameter and larger, and a minimum of 48 inch radius for medium voltage applications.
 3. Use end bells where duct lines enter pullboxes or handholes and rigid steel exposed in pullboxes or handholes. During construction, protect partially completed duct lines from the entrance of debris such as mud, sand and dirt by means of suitable conduit plugs.
 4. Removal of Ducts: Where duct lines are removed from existing manholes, close the openings to waterproof the manhole. Chip out the wall opening to provide a key for the new section of wall.
 5. Multiple duct runs shall maintain 3-inch minimum separation between runs. Provide plastic spacers at maximum 5 feet-0 inch centers to maintain 3 inch spacing between conduits. Drive two reinforcing bars to anchor the conduits at 10 feet-0 inch centers to prevent floating during concrete pour.
 6. Do not install plastic conduit in rock base. Provide double wrapped galvanized rigid steel elbows on runs greater than 100 feet or on runs with more than two 90-degree elbows.
 7. Install 3" minimum concrete encasement on duct banks that include two or more raceways in a single trench. Drive two reinforcing bars to anchor the conduits at 10 feet-0 inch centers to prevent floating during concrete pour.
 8. Burial depth - Concrete encased: 30-inch minimum for 600V or lower systems to top of concrete encasement.
 9. Color mix on medium voltage ductbanks to be 10-lbs red oxide per yard of concrete.
 10. Manholes shall be left in a clean condition with all debris removed and with all cables supported on approved cable supports. All stubs for manholes shall be concrete encased and shall extend 5 inches beyond manholes.
 11. Underground Structures: Precast concrete - risers and tops to conform to ASTM C 478. Precast units (ACI 318) shall be the product of a manufacturer regularly engaged in the manufacture of precast concrete pullboxes. Pullboxes shall be the type noted on the drawings. Top, walls, and bottom shall consist of reinforced concrete. Walls and bottom shall be of monolithic concrete construction. Duct entrances and windows shall be located near the corners of structures to facilitate cable racking. Covers shall fit the frames without undue play. Steel and iron shall be formed to shape and size with sharp lines and angles. Castings shall be free from warp and blow holes that may impair their strength or appearance. Exposed metal shall have a smooth finish and sharp lines and arises. Provide all necessary lugs, rabbets, and brackets. Set pulling-in irons and other built-in items in place before depositing concrete. A pulling-in iron shall be installed in the wall opposite each duct line entrance. The words "HIGH VOLTAGE" and "M.H.-XX" (confirm manhole number with Owner) shall be cast in, or welded on, the top of pullbox cover - see drawings for details. Cable racks, including rack arms and insulators, shall be adequate to accommodate the cable. All steel covers, frames, and steel fittings shall be galvanized. Penthead security bolts shall secure steel cover.
 - a. Metal Frames, Covers and Gratings: Full traffic covers shall satisfy the ASSHTO H-20 loading criteria, and pedestrian traffic covers shall satisfy the ASSHTO H-10 loading criteria.

- b. Drainage Pipe and Fittings: Cast-iron, extra strength. Drains shall be cast-iron, coated or uncoated, plain pattern, bottom outlet with perforated or slotted hinged cover.
- G. Transformer or Concrete Pullbox Grounding: See Section 26 24 00. Install ground rod in manholes and in transformer compartment, and connect properly to the cable shielding, metallic sheath, and armor at each cable joint or splice by means of braided tinned copper wire. Ground rods shall be protected with a double wrapping of pressure-sensitive plastic tape for a distance of 2 inches above and 6 inches below concrete penetrations.

3.2 LABELING

- A. Label medium voltage conductors, splices, and terminations as per Section 260500 and as detailed on Drawings.

3.3 SERVICES INSTALLATION

- A. Electric Service: Arrange with the Owner for scheduling of splicing into existing medium voltage site distribution system where indicated on the drawings. Furnish and install all materials and labor necessary for complete installation as noted on drawings, and as required by the Owner.

3.4 EARTHWORK

- A. See Section 262700.

3.5 TESTING

- A. Perform inspection and tests per NETA ATS-2017 Section "Cables-Medium Voltage-69kV Maximum" and per Owner's requirements.
- B. All medium voltage cables, cable splices, junctions and jumpers shall be subjected to dielectric-absorption and high voltage test after the installation has been completed.
- C. Provide schedule notification to the Owner 5 working day prior to testing.
- D. Each medium voltage power cable shall be tested with a 2,500 volt insulation resistance test set and readings recorded each 15 seconds for the first 3 minutes until fully charged and then at 1 minute intervals for 3 minutes with a minimum reading of 200 megohms at 60° F and corrected accordingly at all other temperatures.
- E. For each medium voltage cable: An initial voltage shall be applied and increased in no less than 5 uniform steps up to the maximum test voltage for 15 KV system to 63 KVDC and hold for 5 minutes.
- F. Ensure that terminator voltage limits are not exceeded. Investigate any readings exceeding 10 micro-amps for every 1,000 feet of cable.
- G. Perform a shield continuity test on each power conductor by ohmmeter method. Contractor to investigate resistance values in excess 10 ohms per 1,000 feet of cable.
- H. All cables failing tests or with evidence of damage shall be removed and replaced in their entirety (no splices), at no cost to the Owner.

- I. Contractor shall assist in testing by providing test equipment, labor and technical personnel.
- J. Contractor to provide equipment that will allow for proper bailing to avoid premature connection failure.
- K. Test Fault Indicators and verify correct operation per Manufacturer's instructions.
- L. See Section 260800 for additional requirements.

THIS PAGE INTENTIONALLY LEFT BLANK.

SECTION 260573
PROTECTION & COORDINATION STUDIES

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Short-circuit analysis.
- B. Protective device evaluation.
- C. Coordination study.
- D. Arc Flash study.

1.2 REFERENCE STANDARDS

- A. IEEE 242 - IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems; 2001.
- B. IEEE 399 - IEEE Recommended Practice for Industrial and Commercial Power Systems Analysis; 1997.
- C. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements

1.3 QUALITY ASSURANCE

- A. Study Preparer Qualifications: Electrical testing agency regularly engaged in arc flash, short circuit, and coordination studies, with at least 5 years experience in work of this type, and employing professional electrical engineers licensed in the State in which the Project is located to perform the studies.
- B. Computer Software for Study Preparation: Use the latest edition of commercially available software utilizing specified methodologies.
 - 1. SKM Systems Analysis
 - 2. Operation Technology, ETAP
 - 3. Power Analytics Corporation
- C. Contractor Responsibility: Provide all project-related data needed by study preparer, including equipment, wire sizes, insulation types, conduit types, and actual circuit lengths.
- D. Owner's Responsibility: Provide data on relevant Owner power distribution equipment.

1.4 PROTECTIVE DEVICES

- A. Provide protective devices of ratings and settings as required so that the protective device closest to the fault will open first.
- B. In addition to requirements specified elsewhere, provide overcurrent protective devices having ratings and settings in accordance with results of this analysis.

PART 2 - PRODUCTS

2.1 SHORT-CIRCUIT ANALYSIS, PROTECTIVE DEVICE EVALUATION, COORDINATION, AND ARC FLASH STUDY

- A. Scope of Services: Provide a current and complete short-circuit study, equipment interrupting or withstand evaluation, protective device coordination, and arc flash evaluation study for the electrical distribution system..
1. Study shall include all portions of electrical distribution system. Normal and emergency system connections and those which result in maximum fault conditions shall be adequately covered in the study.
 2. The study shall be performed by Emerson Network Power, or equal. Study shall be prepared and signed by a California registered Electrical Engineer.
 3. In the case of additions or modifications to existing distribution systems, the scope of the Study shall include all new portions of the distribution system, and all existing devices upstream of the distribution system modifications all the way to the facility main service switchboard.
- B. Submittals:
1. Submit Study to Architect for review prior to receiving final acceptance of distribution equipment shop drawings or prior to release of equipment for manufacture. If formal completion of Study may cause delay in equipment manufacture, acceptance from Architect may be obtained for preliminary submittal of sufficient study data to ensure that selection of device ratings and characteristics will be satisfactory.
- C. Short-Circuit Study:
1. The study shall be in accordance with applicable ANSI and IEEE Standards.
 2. The study input data shall include the utility company's primary short-circuit single-and three-phase contribution, with the X/R ratio, the resistance and reactance components of each branch impedance, motor and generator contributions, base quantities selected, and all other applicable circuit parameters.
 3. Short-circuit momentary duties and interrupting duties shall be calculated on the basis of maximum available fault current at each switchgear bus, switchboard, distribution switchboard, panelboard, and other significant locations through the system.
- D. Equipment Evaluation Study:
1. An equipment evaluation study shall be performed to determine the adequacy of circuit breakers, controllers, surge arresters, switches, and fuses by tabulating and comparing the short-circuit ratings of these devices with the available fault currents. Any problem areas or inadequacies in the equipment shall be promptly brought to the Architect's attention.
- E. Protective Device Coordination Study:
1. A protective device coordination study shall be performed to select or to check the selections of power fuse ratings, protective relay characteristics and settings, ratios and characteristics of associated voltage and current transformers, and low-voltage breaker and fuse trip characteristics and settings.
 2. The coordination study shall include all voltage classes of equipment and protective devices. The phase and ground overcurrent protection shall be included, as well as settings for all other adjustable protective devices.
 3. The time-current characteristics of the specified protective devices shall be plotted on appropriate log-log paper. The plots shall include complete titles, representative one-line diagram and legends, significant motor starting characteristics, complete parameters of transformers, complete operating bands of low-voltage circuit breaker trip curves, relay

curves and fuse curves. The coordination plots shall indicate the types of protective devices selected, proposed relay taps, time dial and instantaneous trip settings, ANSI transformer magnetizing inrush and withstand curves per ANSI C37.91, cable damage curves, symmetrical and asymmetrical fault currents. All requirements of the current National Electrical Code shall be adhered to. Reasonable coordination intervals and separation of characteristics curves shall be maintained. The coordination plots for phase and ground protective devices shall be provided on a complete system basis. Sufficient curves shall be used to clearly indicate the coordination achieved to each main breaker or fused device, each feeder breaker, and each primary protective device.

4. The selection and settings of the protective devices shall be provided separately in a tabulated form listing circuit identification, IEEE device number, current transformer ratios, manufacturer, type, range of adjustment, and recommended settings. A tabulation of the recommended power fuse selection shall be provided for all fuses in the system. Discrepancies, problem areas, or inadequacies shall be promptly brought to the Architect's attention.

F. Arc Flash Evaluation Study:

1. An arc flash evaluation study shall be performed to determine, in coordination with the Owner's safety policy, the required personal protective equipment (PPE) when working on energized equipment.
2. The arc flash evaluation study shall comply with all NFPA 70E and OSHA requirements for calculating and identifying incident energy levels and the corresponding PPE that would be required in each instance.
3. The calculated incident energy levels and recommended PPE for each location shall be summarized in a tabulated form listing location, circuit identification, and PPE. Discrepancies, problem areas, or inadequacies shall be promptly brought to the Architect's attention.
4. Arc flash calculations shall be based on values of fault current magnitudes identified in the short-circuit analysis and the associated clearing times of the over current protective devices determined by the coordination study. The settings recommended by the coordination study shall be the basis of arc flash calculations.
5. Calculation methods shall comply with IEEE Standard 1584 "IEEE Guide for Performing Arc-Flash Hazard Calculations".
6. Per IEEE Standard 1584, a maximum arc time of two seconds shall be utilized to limit incident energy values.
7. Recommended settings of all protective equipment based on the short circuit and equipment coordination study shall be implemented prior to attaching arc flash hazard labels to the equipment.
8. All electrical equipment shall be field marked to indicate where a flash hazard exists in compliance with NEC 110-116. Labels shall be submitted for approval prior to application. Labels shall be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

G. Study Report:

1. The results of the power system study shall be summarized in a final report. Five (5) bound copies of the final report shall be submitted to the Architect.
2. The report shall include the following sections:
 - a. Description, purpose, basis, written scope, and a single-line diagram of the portion of the power system which is included within the scope of study.
 - b. Tabulations of circuit breaker, fuse, and other equipment ratings versus calculated short-circuit duties, and commentary regarding same.
 - c. Protective device time versus current coordination curves, tabulations of relay and circuit breaker trip settings, fuse selection, and commentary regarding same.

- d. Fault current tabulations including a definition of terms and a guide for interpretation.
- e. Tabulation of appropriate tap settings for relay seal-in units.
- f. Tabulation of arc flash study incident energy levels and PPE requirements.

PART 3 - EXECUTION

3.1 FIELD QUALITY CONTROL

- A. Provide the services of a qualified field engineer and necessary tools and equipment to test, calibrate, and adjust the installed protective devices to conform to requirements determined by the coordination analysis.
- B. Adjust installed protective devices (including existing upstream devices in the case of modifications or additions to an existing distribution system) having adjustable settings to conform to requirements determined by the coordination analysis.
- C. Submit report showing final adjusted settings of all protective devices.

END OF SECTION

SECTION 260800
TESTING

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Work Included in This Section: All materials, labor, equipment, services, and incidentals necessary to perform the testing and inspection of the electrical work, including but not limited to the general systems noted below:
 - 1. Grounding system.
 - 2. Lighting system.
 - 3. Distribution system.
 - 4. Lighting control system.
 - 5. Title 24 Acceptance Testing.

- B. Test additional work where specified in other Sections of these specifications or where indicated on the drawings (provide all materials, labor, equipment, services, and incidentals necessary to perform the testing and inspection of this Electrical Work):
 - 1. Medium voltage switchgear, transformers, and distribution system.
 - 2. Emergency Generator and Automatic Transfer Switches.

- C. Any other electrical work as might reasonably be implied as required, even though not specifically mentioned herein or shown on the drawings.

- D. All work shall comply with Sections 260500 and 262700.

- E. In addition to the general system tests and inspections indicated above, the Contractor shall perform the following inspections and tests. The Contractor shall provide all material, equipment, labor, and technical supervision to perform such tests and inspections:
 - 1. System Grounding.
 - 2. Switchgear, Switchboards, Distribution Panels, Panelboards.
 - 3. Feeders.

- E. In addition to the general system tests and inspections indicated above, the Contractor shall retain the services of a recognized corporately and financially independent testing firm (Emerson Network Power or equal) for the purpose of performing the following inspections and tests. The testing firm shall provide all material, equipment, labor, and technical supervision to perform such tests and inspections:
 - 1. System Grounding.
 - 2. Switchgear, Switchboards, Distribution Panels, Panelboards.
 - 3. Feeders.

- E. The purpose of these tests is to assure that all tested electrical equipment is operational and within industry and manufacturer's tolerances and is installed in accordance with design specifications.

1.2 APPLICABLE CODES, STANDARDS, AND REFERENCES

- A. All inspections and tests shall be in accordance with the International Electrical Testing Association - Acceptance Testing Specifications ATS-2017 (referred to herein as NETA ATS-2017).

1.3 QUALIFICATIONS

- A. Qualifications of the Testing Firm shall be as listed in NETA ATS-2017.

PART 2 - PRODUCTS

2.1 THIS ARTICLE DOES NOT APPLY TO TESTING.

PART 3 - EXECUTION

3.1 GENERAL

- A. Final test and inspection to be conducted in presence of the Authority having Jurisdiction (AHJ) or Inspector of Record (IOR). Test shall be conducted at the expense of, and managed by, the Contractor, at a mutually agreed time. Submit written test report of all tests, with test result values and overall outcome.
- B. All portions of the electrical installation shall be inspected and tested to ensure safety to building occupants, operating personnel, conformity to code authorities and Contract Documents, and for proper system operation.

3.2 INSPECTIONS AND TESTS

- A. Tests: Field tests shall be performed and reports submitted, as per Section 260500, Part 1.
 - 1. Final Inspection Certificates: Prior to final payment approval, deliver to the Owner, with a copy to the Architect, signed certificates of final inspection by the appropriate local authority having jurisdiction.
- B. Grounding System:
 - 1. All ground connections shall be checked and the entire system shall be checked for continuity. The resistance of grounding electrodes in the system shall be measured using a 3 point fall-of-potential method. The maximum ground resistance shall be three ohms. If the measured ground resistance exceeds three ohms, install (1) additional ground rod, bonded and interconnected with the grounding electrode system.
 - 2. Ground tests shall meet or exceed the requirements of the National Electric Code.
- C. Lighting Systems:
 - 1. The interior and exterior lighting systems shall be checked for proper local controls and operation of entire installation, including the operation of the low voltage lighting control system.
- D. Power Distribution System:
 - 1. Test main switchboard, distribution boards, panel boards, and transformers for grounds and shorts with mains disconnected from feeders, branch circuits connected and circuit breakers closed, all fixtures in place and permanently connected and grounding jumper to neutral lifted and with all wall switches closed.
 - 2. Test each individual circuit at each panelboard with equipment connected for proper operation. Inspect the interior of each panel.
 - 3. Check verification of color coding, tagging, numbering, and splice make-up.
 - 4. Verify that all conductors associated with each circuit are in same conduit.
 - 5. Demonstrate that all lights, jacks, switches, outlets, and equipment operate satisfactorily and as called for.
 - 6. Test proper functioning of the ground fault protective system(s).

7. Perform megger tests of all distribution system feeders prior to energizing. All Cables failing megger tests or with evidence of damage shall be removed and replaced in their entirety (no splices), at no cost to the Owner. Damaged cables may not be field repaired without specific approval of the Architect.
- E. Lighting Control System: Verify that all equipment, components, and devices function as specified. Refer to Section 265700 for additional testing requirements.
- F. Where the following systems are specified herein and/or indicated on the drawings, verify that all equipment, components, and devices function as specified and meet all additional testing as described in related individual Sections of this specification:
 1. Medium voltage switchgear, transformers, and distribution system.
 2. Emergency Generator and Automatic Transfer Switches.
- J. Title 24 Acceptance Testing: Contractor shall complete the requirements for Title 24 Acceptance Testing, as per CA Title 24, Part 6.
 1. Perform testing requirements as per Title 24 Lighting Acceptance requirements. Testing shall include construction inspection of installed controls, occupancy / motion sensor testing, manual daylighting controls testing, automatic time switch controls testing, and demand response system interface, as applicable.
 2. Complete and submit all required forms for complete Acceptance Testing.
 3. Obtain required review and approval of Acceptance Forms to allow final certificate of occupancy to be granted.

SECTION 261202

THREE-PHASE PADMOUNTED TRANSFORMER

PART 1 - GENERAL

1.1 APPLICABLE PUBLICATIONS

- A. The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.
- B. American National Standards Institute (ANSI) Publications:
- C2 National Electric Safety Code
 - C57.12.26 Pad-Mounted Compartmental-Type, Self-Cooled, Three-Phase Distribution Transformers, Separable Insulated High Voltage Connectors; High Voltage 24,940 GRDY/14400 Volts and below; 2500 kVA and Smaller
 - Z35.1 Specifications for Accident Prevention Signs
- C. American Society for Testing and Materials (ASTM) Publications (Latest Edition):
- D 92 Test Method for Flash and Fire Points by Cleveland Open Cup
 - D 117 Test Method for Electrical Insulating Oils of Petroleum Origin
 - D 877 Test Method for Dielectric Breakdown Voltage of Insulating Liquids Using Disk Electrodes
 - D 3487 Mineral Insulating Oil Used in Electrical Apparatus, Standard Specification
- D. Institute of Electrical and Electronic Engineers, Inc. (IEEE) Publication (Latest Edition):
- 386 Separable Insulated Connectors for Power Distribution Systems Above 600 V
- E. National Fire Protection Association (NFPA) Publication (Latest Edition):
- 70 National Electrical Code
- F. Nema 210.

1.2 SUBMITTALS

- A. Catalog Information and Shop Drawings: Indicate ratings, capacity, and detailed arrangement of components.
1. Distribution Transformer
 2. Primary Fuses
 3. Primary Oil-Immersed Switches
- B. Certificates:
1. Certified Test Report of Transformer Manufacturer

2. Provide CBC 2019 compliant seismic installation. See Section 260500 for all certification and submittal requirements.
- C. Equipment bushings, dead-end plugs, dead break junctions and grounding connectors shall be submitted to and approved by the Architect before ordering.

PART 2 - PRODUCTS

2.1 MATERIALS AND EQUIPMENT

- A. Distribution Padmount Compartmental-Type Transformer: The unit shall be suitable for loop connection and shall contain the transformer, six 200A universal bushing wells, three two position rotary oil-immersed load break - load make switches including an A and a B loop switch and a transformer winding switch, primary current limiting fusing, and primary overload fusing in a weather resistant, tamper-resistant enclosure, arranged for padlocking, with a full tank and compartment weather cover. Transformer shall conform to ANSI C57.12.26. High voltage and low voltage compartments shall be isolated from each other in a manner to require a separate unlatching or unbolting action to give access to the high voltage compartment. (Note: provide radial connection where indicated on the drawings).
- B. Transformer shall conform to Owner's Standards, including testing and adjustment requirements.
- C. Transformer: Dead front, three phase, two winding, 60 Hz, 65 degree C rise, oil insulated, self-cooled type rated as indicated on the drawings, with two 2-1/2% full capacity taps above and below rated primary voltage. Basic Insulation Level shall be 125 kV on the primary side, and 30 kV minimum on the secondary side. High voltage winding shall be 12.47 kV delta (or 12.00 kV where indicated on the drawings). Low voltage shall be 277/480 V grounded wye, 4-wire. Windings shall be copper. Transformer tank shall be sealed except for bolted handhole access. Provide lifting lugs. Provide external tap changing for de-energized operation only. Locate the changer control handle within the high voltage compartment and provide position indicator and method of securing the control handle against unintentional operation. Switch indicating plate shall be readable from 5 feet away. Tank Construction: Liquid immersed transformer shall have a totally bolted gasketed cover with a weather cover over the compartment and over the tank.
- D. The transformer tank and compartment shall be assembled as an integral unit for mounting on a pad. There shall be no exposed screws, bolts, or other fastening devices, which are externally removable. There shall be no openings through which foreign objects such as sticks, rods, or wires might contact live parts. The construction shall limit the entry of water (other than flood water) into the compartment so as not to impair the operation of the transformer.
- E. Full-height, air-filled high voltage and low voltage terminal compartments with full-height and full-width hinged door for each compartment shall be located side-by-side separated by a steel barrier, with the high voltage compartment on the left (as viewed from the front of the transformer). To facilitate making connections and permit cable pulling, the doors and compartment hood shall be removable. Removable doorsill on compartments shall be provided to permit rolling or skidding of unit into place over conduit studs in foundation.
- F. Mineral Oil: ASTM D 3487, Type II tested in accordance with ASTM D 117.
- G. Transformer: Provide the accessories listed below:

1. Bronze drain and sampling valve: 1-inch trade size minimum, with FPT plugged discharge
 2. Filter press connections
 3. Ground pads
 4. Provision for lifting and jacking
 5. Top liquid dial-type thermometer without alarm contacts
 6. Pressure-vacuum gauge
 7. Pressure-relief device
 8. Oil fill connection: Capped, 1.25-inch trade size minimum
 9. Oil level gauge: With normal level at full load rated temperature rise indicated
 10. Oil temperature gauge: Calibrated in degrees C, with full load temperature rise indicated
 11. 4 extra hold down pads compliant with CBC 2019 seismic requirements
- H. High-voltage switches: Provide internal, oil-immersed rotary, gang-operated, load break - load make switches. Minimum switch rating shall be load-break and make, 200A continuous; make and latch 10,000A symmetrical; 6,000A minimum for 1 second.
- I. Primary Fusing:
1. Internal Fault Protection: Provide current limiting fusing in dry well, air-insulated, with non-load break fuse holders inserted in the transformer tank. Provide an integral warning notice and safety baffle to prevent fuse removal unless the transformer is de-energized. Fuse values shall be 150 percent of full load current and fuses shall be Class E.
 2. "Weak-link" primary fusing is not acceptable in lieu of current limiting primary fusing.
 3. Overload Protection: Expulsion fuses, dead front Bay-O-Net type.
 4. Provide a spare set of (3) fuses of each type in original cartons.
- J. A-B Loop Switches: Provide primary loop switches (both switches normally closed, to maintain loop).
- K. Enclosure: Enclosure shall be constructed in accordance with ANSI C57.12.26.
- L. Finish - Prior to prime coating, all welds shall be ground smooth. Rust inhibiting prime coat over cleaned and degreased surfaces. Vinyl paint for finish coat on all surfaces. Color shall be Munsell No. 7GY3.29/1.5 Green.
- M. Latches - Three Point Vault Style, chromium plated with 4-inch handle and provisions for padlocking.
- N. Grounding Pads - Steel ground pad welded to tank wall in primary and secondary compartment. Each pad drilled and tapped for two 3/8 inch (min.) steel bolts.
- O. Termination compartment dimensions shall be as follows:
1. Height: Maximum of 66 inches or the transformer height plus 2 inches (approx.)
 2. Depth: 18 inches minimum, 24 inches maximum.
 3. Width: Primary Compartment 42 inches min.; Secondary Compartment 24 inches min.
- P. The nameplate shall comply with ANSI C57.12.26 except that the number of gallons of coolant shall be shown.
- Q. Transformer shall be as manufactured by Eaton-Cutler Hammer, Schneider-Square D, ABB, Cooper, or approved equal.

- R. High Voltage Separable Connectors: Provide well bushings with 15 kV inserts for separable connector terminations – see Section 260513 for connector requirements.
- S. Secondary Connections - Spade bushings: National Electrical Manufacturers Association (NEMA) drilled copper terminal, 1.75 inch hole spacing. Provide secondary bus supports using an insulating material to prevent spade from bending due to cable weight. Hi-press lugs only for cable termination.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Padmounted transformer installation shall conform to the Manufacturer's shop drawings and mounting instructions and shall include securing it to a concrete pad by at least four anchor bolts. Completed installation shall conform to the requirements of ANSI C2.

3.2 FIELD TESTS

- A. Testing of medium voltage equipment shall be performed in conjunction with the Manufacturer's representative.
- B. Coordinate with the factory representative and provide all assistance required in the start-up and testing of the equipment.
- C. Perform inspection and tests per NETA ATS-2017 Section "Transformers - Liquid-Filled". Laboratory tests on the insulating fluid for the following items are not required: Specific gravity, power factor, water content, dissolved gas analysis, total combustible gas content. The following tests are not required; winding-resistance tests on each winding in final tap position, percent oxygen tests on the nitrogen gas blanket.
- D. Field testing requirements for transformer to include ASTM D877 dielectric liquid test, ASTM D971 interfacial tension test and ASTM D1533 moisture content test.
- E. See Section 260800, "TESTING", for additional requirements.

END OF SECTION

SECTION 262400
SERVICE AND DISTRIBUTION SYSTEM

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Work Included in This Section: All materials, labor, equipment, services and incidentals necessary to install the electrical work as shown on the drawings and as specified hereinafter, including but not limited to the work listed below.
- B. Temporary power for construction.
- C. Main switchboard, Distribution Switchboards, Distribution Panels, Transformers, Distribution System, Panel Boards, Grounding, and Overcurrent Protective Devices.
- F. All required incidental work, such as excavating, backfilling, testing, and temporary power.
- G. Any other electrical work as might reasonably be implied as required, even though not specifically mentioned herein or shown on the drawings.
- H. All work shall comply with Sections 260500 and 262700.

1.2 RELATED WORK

- A. Division 09 - Finishes
- B. Division 23 - Heating, Ventilating, and Air Conditioning

1.3 SUBMITTALS

- A. Comply with the provisions of Section 260500 - Submittals.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Refer to Section 260500, Part 2 - Products
- B. All new equipment shall match existing.
- C. List of Equipment Manufacturers:
 - Switchboards and Motor Control Centers
 - Eaton-Cutler Hammer, General Electric, Industrial Electric Manufacturing, Schneider-Square D.
 - Panelboards and Distribution Panel
 - Same manufacturer as Main Switchboard.
 - Dry-type Transformers

Eaton-Cutler Hammer, Schneider-Square D, General Electric.

2.2 MATERIALS

- A. Provide and install conduits for primary cables by utility company, concrete pad and grounding for utility company transformer, and conduit for secondary service to main switchboard. Comply with all Utility Co. requirements.
- B. Furnish and install telecommunications service conduits and pullboxes; install conduits to main point-of-entry backboard as indicated on the drawings. All work shall conform to utility company requirements and to Section 262700.
- C. Grounding:
 - 1. Provide and install grounding system as noted on the drawings.
 - 2. Grounding electrode conductor: bare stranded copper type, #4/0 minimum.
 - 3. Install ground wires in rigid conduit.
 - 4. All grounding electrode conductor connections "thermite" or "cad-weld" welded.
 - 5. Use approved pressure type solderless connector or use fusion welding for all connections to and bonding of grounding electrode system. All connections shall be visible, readily accessible for testing purposes. Grounding electrode conductor between the grounding electrode and service equipment: Minimum #4/0.
 - 6. Furnish and install solid copper or copper-clad 5/8" x 10'-0" ground rod(s). Where multiple ground rods are shown, install a minimum of 20'-0" apart. Install ground rods in accessible boxes with covers. Furnish and install 2-#4/0 bare copper cables between multiple ground rods and main switchboard ground bus.
 - 7. Terminate grounding conduits at equipment with ground bushing, with ground wire connected through bushing.
 - 8. Provide No. 12 stranded (green) THHN conductor from outlet box to ground screw of every receptacle.
 - 9. Ground all isolated sections of metallic raceways.
 - 10. Provide #12 minimum stranded (green) THHN conductor sized per NEC, or as noted, connected continuously throughout branch circuit for all circuits, bonded to panel ground bus, and to all electrical devices and equipment enclosures.
 - 11. Grounding electrode installed as follows:
 - a. Place #4/0 bare copper cable in foundation trench; tensioned, supported in such a manner that it cannot be less than two (2) inches from bottom or side of concrete when foundation concrete is poured; not less than one hundred feet of conductor. Embed in foundation with a loop at approximate center, brought out at top of foundation at location of building service equipment for connection to service equipment and for bonding to other parts of the grounding electrode system.
 - b. Use approved pressure type solderless connector or use fusion welding for all connections to grounding electrode. Connection visible, readily accessible for testing purposes. Grounding electrode conductor between the grounding electrode and service equipment: Minimum #4/0.
 - c. Connect grounding electrode system to metallic water service entry metallic cold water pipe (if available) with nonferrous clamp and bare copper cable (sized as required) in conduit. Connection shall be accessible for inspection.
 - d. Connect grounding electrode system to effectively grounded building steel as indicated on the drawings. Use exothermic weld, connection shall be accessible for inspection.
 - e. After installation, test system using the three-point fall of potential method only. Record results and submit to Architect for approval. If resistance to ground exceeds three ohms, install an additional ground rod, bonded and interconnected to the grounding electrode system.

- f. Connect ground bar of separately derived systems (e.g all dry-type transformers) to effectively grounded building steel at the closest possible accessible location, or if building is concrete, or the steel is not effectively grounded, to the main switchboard ground bus: Use #4/0 copper conductor for all connections.
- D. Main Switchboard, Distribution Switchboards, and Distribution Panels:
1. General: Switchboard shall be group-mounted type, metal enclosure with ground bus and insulated full capacity neutral bus.
 2. Equipment:
 - a. The switchboard shall be braced for a short circuit current as indicated on the drawings. Bracing shall be per NEMA and UL standards.
 - b. The switchboard shall comply with all the requirements of the Utility Company.
 3. The switchboard shall be pad-mounted, self-supporting, dead-front and rear, front-operated, front-connected, distribution type. Nema 1 (indoor) or Nema 3R (outdoor). The enclosure shall be 90 inches high, made of cold rolled steel on a structural shape, or formed, steel frame and shall be mounted on two 3-inch, 5-pound continuous channel iron sills, which shall be closed at the ends between the two channels.
 4. This contractor is responsible for the complete installation of the switchboard within the space provided (both vertical and horizontal) and shall verify and/or coordinate all dimensions prior to ordering equipment. Proper allowances should be included to allow complete installation and erection.
 5. The switchboard shall be a minimum of 24 inches deep and shall be constructed of National Electrical Code (NEC) gauge steel.
 6. For all switchboards or distribution panels rated 1,200 Amps or higher, provide an arc energy reduction measure in compliance with NEC 240.87(B), to reduce arc clearing time.
 7. The switchboard shall be provided with a cable pull section at the top of the switchboard. Provide a minimum 12 inches of vertical clearance between the cable terminal lugs bolted to the switchboard busses and the top and bottom of the switchboard enclosure. Horizontal pull sections and gutters shall be kept free and clear of busses. Where busses cross vertical pull sections, the busses shall be insulated.
 8. All connections between bus bars shall be of a bolted type using Belleville washers. Clamps will not be accepted. All bus bars shall be accurately formed, and all holes shall be made in a manner which will permit bus bars and connections to be fitted into place without being forced.
 9. The design of all current-carrying devices or parts of the switchboard shall conform to the standard specified in the related sections of Underwriters' Laboratories, Inc. (UL) No. UL-891 and National Electric Manufacturer's Association (NEMA) Standard PB-2, except as these characteristics may be modified herein.
 10. Bus bars, connection bars and wiring on the back of the switchboard shall be arranged so that maximum accessibility is provided for cable connections from the front.
 11. Ampere ratings for rectangular bus bars shall be in accordance with the temperature rise standard of National Electric Manufacturer's Association (NEMA) and the Underwriters' Laboratories, Inc. (UL).
 12. The enclosure shall be chemically cleaned by parkerizing, bonderizing or phoshorizing as a unit after all welding has been completed. The enclosure shall then be painted with a rust-resisting primer coat of paint and shall be finished with a coat of light gray, baked enamel.
 13. Each section shall be bussed for the full connected load of that section. Extend bussing to spare circuit breaker "Spaces." Drill busses for future circuit breakers, and provide breaker connector hardware where indicated on the drawings or where required for ready installation of future circuit breakers.
 14. Provide copper bus bars and connections with silver-plated contact surfaces.
 15. The contact surfaces and studs of all devices to which bus connections are made shall also have silver-plated surfaces.

16. Locate ground bus, with a cross-section equal to at least 25 percent of the capacity of the main bus rating, in the back of the switchboard and extend bus throughout the length of the switchboard assembly. Ground each housing of the assembly directly to this bus.
18. Rigidly support all bus and connection bars and current transformers.
19. Fit all nuts and connections with locking devices to prevent loosening.
20. Provide load connections with solderless lugs. Factory-install all devices shown on Drawings as specified herein.
21. Provide ground fault protection for all main breakers or feeder breakers rated at 1000A or higher at 277/480V 3PH, and when otherwise indicated on the single line diagram or where otherwise noted on the drawings. Protection shall consist of a current sensor, relaying device, and the appropriately sized overcurrent protection device.
22. Provide a bonding strap from the equipment ground bus to the neutral bus.
24. Provide transient voltage surge protection, integral to or adjacent to the switchboard when indicated on the plans or where otherwise noted in the specifications herein. Refer to Section 264300.
25. Distribution Panels shall comply with all relevant requirements of the above paragraphs - minimum 12" deep, for floor or wall-mounting.
26. All equipment shall be door in door construction.

E. Panelboards:

1. Surface (or flush where indicated on the drawings) mounted, with branch circuits as indicated on the drawings.
2. Enclosures: code gauge galvanized sheet steel with welded full flange end pieces, stretcher- leveled steel trim, backpan and door.
3. Bussing of copper with silver-plated contact surfaces.
4. Trims on surface-mounted cabinets secured with nickel-plated screws with cup washers, bottom of all trims to have lugs for resting on cabinet flange.
7. Panels shall be 20 inches minimum in width, provided with approved gutter space, barriers and adjustable supports. Doors mounted with concealed hinges provided with combination spring latch and lock. Doors and trims and surface mounted cabinets primed and finished with one coat baked on gray enamel. All visible panel enclosures and covers in finished (occupied) areas shall be painted to match adjacent wall finish.
8. Breakers on same phase to be aligned horizontally. Each panel provided with quantity (5) spare handle locks. Install handle locks on all breakers serving fire alarm equipment.
9. Each branch circuit of panelboards to have a permanently fixed number with one word directory, mounted under celluloid on inside of cabinet door, showing circuit numbers and typewritten description of outlets controlled by breakers. Color code mains and each breaker terminal, same as conductor insulation.
10. Each panel shall be equipped with a copper ground bus.
11. All panels shall be fully bussed to accept future circuit breakers, with breaker hardware provided where indicated on the drawings.
12. Panel board submittals shall include diagrams of the circuit breaker arrangements in the panels. Arrange circuit breakers in panels exactly as shown on the panel schedules in the construction documents - no deviations permitted.
13. All panels shall be door in door construction.

F. Circuit Breakers:

1. General: Circuit breakers shall be molded case rated for 480 or 240 volts, multiple or single pole and amperage rating as shown on the drawings, bolt on, manually operated with "de-ion" arc chutes.
2. For all circuit breakers rated 1,200 Amps or higher, provide an arc energy reduction measure in compliance with NEC 240.87(B), to reduce arc clearing time.

3. Main circuit breaker shall be shall be rated to interrupt the available short circuit current - 65,000 amps RMS unless otherwise indicated on the drawings.
 4. Distribution circuit breakers shall be rated for the amps interrupting capacity noted on the drawings or U.L. series rated with the main circuit breaker.
 5. Branch circuit breakers shall be rated for the amps interrupting capacity or U.L. series rated with the distribution and main circuit breakers, General Electric type THQB or equal, minimum 10,000 A.I.C for 120/208 volt; type TEY or equal, minimum 14,000 A.I.C for 277/480 volt.
 6. Branch breakers feeding dwelling unit Bedroom 15 and 20 Amp branch circuits shall be arc-fault circuit-interrupting type (per NEC 210-12).
- G. Dry-Type Transformers:
1. Ventilated type.
 2. Dry-type general distribution transformers shall meet the California Title 24 requirements for energy efficiency standards and DOE 10 - CFR, Part 431 (2016) for energy efficient transformers.
 3. Transformer shall be 3 phase, 60 Hertz. Primary winding shall be Delta connected and secondary winding shall be Wye connected. The temperature rise at rated voltage and full load shall not exceed 150 degrees C with a 220 degrees C U.L. Component Recognized Insulation System. The windings shall be aluminum or copper.
 4. The higher voltage winding shall have quantity (6) 2.5% taps - (2) FCAN and (4) FCBN. Set secondary voltage for 120/208V.
 5. Transformer terminals shall be front connected for ease of installation and maintenance.
 6. Where the transformers are installed outdoors provide weatherproof drip cover, rodent screen and a weathertight rating of the enclosure.
- H. 'K' Type Transformers:
1. The transformers shall be marked with a label stating "Suitable for Non-Sinusoidal Current Load with K Factor of 13 (or higher where indicated on the drawings) per UL Guide Specifications.
 2. Transformers shall be 3 phase, 60 Hertz. Primary winding shall be Delta connected and secondary winding shall be Wye connected. The temperature rise at rated voltage and full load shall not exceed 150 degrees C with a 220 degrees C U.L. Component Recognized Insulation System. The windings shall be aluminum or copper.
 3. The higher voltage winding shall have quantity (6) 2.5% taps - (2) FCAN and (4) FCBN. Set secondary voltage for 120/208V.
 4. A copper electrostatic shield shall be inserted between the primary and secondary windings. The primary and secondary conductors shall all be individually insulated, as small in size as possible, and transposed where necessary to keep eddy current losses at an absolute minimum. The primary winding conductor shall be of sufficient size to limit the temperature rise to its rated value even with the circulating 3rd harmonic current. The secondary neutral shall be twice the ampacity of the secondary phase conductors. The Basic Impulse Level of all windings shall be 10 KV. The core flux density shall be well below the saturation point to prevent core saturation caused by the harmonics even with a 10% primary overvoltage.
 5. Transformer terminals shall be front connected for ease of installation and maintenance.
 6. Transformers shall meet DOE 10 - CFR, Part 431 (2016) for energy efficient transformers.
- I. Magnetic starters: shall be rated in accordance with latest published NEMA standards for size and horsepower rating, Eaton-Cutler Hammer A-200 series or equal. Provide with overload sensor in each phase, hand-off-auto switch, red "run" pilotlight, in NEMA 1, NEMA 4X, or NEMA 3R enclosure or in motor control center where indicated. Coil shall be rated 120 VAC. Starters shall be across-the-line nonreversing unless otherwise noted.

1. Contacts: Across-the-line magnetic starters shall be equipped with double break silver alloy contacts. All contacts shall be replaceable without removing power wiring or removing starter from panel. The starter must have straight-through wiring.
2. Coils: Coils shall be of molded construction. All coils shall be replaceable from the front without removing the starter from the panel.
3. Overload Relays and Thermal Units: Overload relays shall be the melting alloy type with a replaceable control circuit module. Thermal units shall be of one-piece construction and interchangeable. The starter shall be inoperative if the thermal unit is removed.

PART 3 - EXECUTION

3.1 REFER TO SECTION 260500 FOR DETAILS OF WORK UNDER THIS SECTION.

3.2 INSTALLATION/APPLICATION/ERECTION

- A. Excavate and trench as necessary for the electrical installation, and when the work has been installed, inspected and approved, backfill all excavations with clean earth from excavation, or imported sandy soil in maximum 8" (eight-inch) layers, moisten and machine tamp to 95% compaction, and restore the ground and/or paving or floor surfaces to their original condition.
- B. Switchboards and Distribution Panels Installation: Mount as detailed on the drawings.
- C. Motor Connections:
 1. Install motor circuits complete for all motors by other trades
 2. Furnish and install all disconnect switches, outlet boxes, etc., as required by code.
 3. All motor and temperature control low voltage wiring shall be installed and connected by Division 23 Section of specifications, unless otherwise indicated on electrical drawings.
- D. Motor Starters Installation:
 1. Deliver starters to site without thermal overload elements. Determine nameplate rating of each motor, after motor and starter installation, select thermal element rating from measured motor running current and install proper elements in starters.
 - a. Submit chart denoting motor designation, motor H.P., motor running current (N.P.), actual running current fuse/breaker size and thermal element catalog number. Take readings of motor running currents in conjunction with Division 23 - Heating, Ventilating, and Air Conditioning.

3.3 TESTS

- A. Testing and Inspection: See Section 260800 - Testing.

END OF SECTION

SECTION 262700
BASIC ELECTRICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Work included in this Section: All materials, labor, equipment, services, and incidentals necessary to install the electrical work as shown on the drawings and as specified hereinafter, including but not limited to the work listed below:
 - 1. Raceways, feeders, branch circuit wiring, wiring devices, safety switches and connections to all equipment requiring electric service.
- B. Any other electrical work as might reasonably be implied as required, even though not specifically mentioned herein or shown on the drawings.
- C. All work shall comply with Section 260500.

1.2 RELATED WORK

- A. Division 09 - Finishes
- B. Division 23 - Motors and Mechanical Equipment Installation

1.3 SUBMITTALS

- A. Comply with the provisions of Section 260500.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Refer to Section 260500, Basic Electrical Requirements, Part 2 - Products.
- B. List of Equipment Manufacturers:

Conduit and Conduit Fittings

Allied Tube and Conduit, Wester Tube and Conduit, LTV Steel Tubular, National Electric Products, AFC, Republic Steel Corporation, Rome Cable Corporation, United States Steel Corporation, Killark Electric Manufacturing Company, Raco, VAW Aluminum Company, Bridgeport, Steel City, Thomas & Betts, Carlon, O.Z. Gedney, Appleton, Regal.

Wire and Cable (600V)

American Wire Company, General Wire and Cable Corporation, Okonite Company, Rome Cable Corporation, Cerrwire, American Insulated Wire, AFC Cable Systems, Essex, Simplex Wire and Cable Company, Southwire.

Solderless Lugs and Grounding Connections

Burndy Engineering Company Inc, O.Z. Gedney Company Inc, Penn Union Electric Corporation, Thomas and Betts Company Inc.

Pull Boxes, Gutters, Special Cabinets

Schneider-Square D Company, Columbia Electric Manufacturing Company, General Electric Company, Eaton Inc.

Outlet Boxes

Appleton Electric Company, Killark Electric Manufacturing Company, Lew Electric Fittings Company, National Electric Products Corporation, Raco, Steel City Electric Company, Carlon, Bowers.

Wiring Devices

Leviton, Arrow-Hart, Cooper, Hubbell, Lutron, Bryant.

Conduit Racks, Hangers

General Electric Company, Killark Electric Manufacturing Company, Caddy, National Electric Products Corporation, Republic Steel Corporation, Rome Cable Corporation, United States Steel Corporation, VAW Aluminum Company, Superstrut, B-Line.

Safety Switches (Disconnect and Fusible)

Schneider-Square D Company, Eaton-Cutler Hammer Inc, General Electric Company.

Fuses

Bussman Manufacturing Company, Chase-Shawmut Company.

Firestopping

3M, Nelson.

2.2 MATERIALS

- A. Raceways: Only the raceways specified below shall be utilized on this project. Substitutions shall be pre-approved in writing. All bare conduit ends (stub-ups or stub-outs) shall be provided with bushed ends or manufactured insulated throat connectors:
1. Rigid Type - hot dip galvanized or sherardized steel, use on all interior and exterior locations, below grade or in concrete slab, and to 18" on either side of structural expansion joints in floor slabs, with completely watertight, threaded fittings throughout. Compression fittings are not acceptable.
 - a. All rigid steel conduit couplings and elbows in soil or concrete or under membrane to be ½ lap wrapped with Scotch #50 tape and threaded ends coated with T&B #S.C.40 rust inhibitor prior to installation of couplings.
 - b. ½ lap wrap all rigid steel conduit stub-ups from slab or grade to 6" above finished grade level with Scotch #50 tape.
 2. In lieu of rigid steel conduit for power and control raceways and branch circuit conduits in soil or concrete slabs, "Schedule 40" PVC with Schedule 80 PVC conduit elbows and stub-ups may be used with code size (minimum No. 12) ground wire. A "stub-up" is considered to terminate 6" above the finished surface.
 - a. Schedule 80 PVC conduit shall be used in all concrete footings or foundations and to 18" of either side of footings or foundation walls.

- b. Schedule 80 PVC conduit shall be used in all concrete masonry unit (CMU) walls or columns.
 - c. All conduit runs in concrete floor slabs (where allowed) shall be installed to comply with all applicable CBC and structural codes to maintain the structural integrity of the floor slab. Where conflicts occur, alternate routing shall be provided at no additional cost to the Owner.
 - d. Where schedule 80 PVC is coupled to schedule 40 or other raceways with differing interior dimensions, each end shall be reamed with a reaming tool to reduce the edge profile for protection of the passing conductors during the pull.
3. Intermediate metal conduit may be used in all exposed interior locations, except that electrical metallic tubing may be used in some locations as noted below. Utilize steel compression type fittings for all exposed conduit runs, unless otherwise noted. Die-cast zinc fittings are unacceptable.
 4. Electrical metallic tubing may be used exposed in interior electrical and mechanical rooms, in interior unfinished spaces, and in interior concealed and furred spaces, made up with steel watertight or steel set screw type fittings and couplings. EMT shall not be used in under-building crawl spaces or other areas subject to moisture. Set screws shall have hardened points. Die-cast zinc fittings are unacceptable.
 5. Surface mounted rectangular non-metallic dual service raceways; Wiremold #5400 (Ivory) or equal with all required compatible activation covers, bezels, inserts, and blank plates for a complete installation. Refer to drawings for outlet quantities in raceway and feed points. All raceway fed flush from rear with horizontal j-boxes, unless otherwise noted.
 6. Flexible conduit shall be used in the following instances:
 - a. For all motor, transformer and recessed fixture connections, minimum ½"; "Seal tite" type used outdoors and in all wet locations, provide with code size (minimum No. 12) bare ground wire in all flexible conduit.
 - b. Where existing conditions preclude the installation of EMT in existing walls to remain, provide and install cut-in type boxes and "fish" flexible MC or flexible conduit and wire through existing walls to remain, unless shown otherwise on plans.
 - c. With the exception of the above, flexible conduit shall not otherwise be used on this project.
 7. All conduit cuts (factory or field cut) shall be perfectly square to the length of the conduit and cut ends shall be reamed with a reaming tool to provide a smooth edge to the passing conductors and to remove all burrs and scrapes. Use of a hand file is not acceptable.
 8. All electrical raceways shall be installed concealed, unless otherwise noted. Cut and patch to facilitate such installation to match adjacent and original finish. All exposed conduits, where required, shall be installed parallel to building members.
 9. All emergency source circuits shall be installed in separate raceways (from normal power), per 2017 NEC 700.10(B), or the applicable code at the time of permitting.
 10. Fasten conduits securely to boxes with locknuts and bushings to provide good electrical continuity.
 11. Provide chrome escutcheon plates at all exposed wall, ceiling and floor conduit penetrations.
 12. Support individual suspended conduits with heavy malleable strap or rod hangers; supports for ½ inch or ¾ inch conduit placed on maximum 7-foot centers; maximum 10-foot centers on conduits 1 inch or larger.
 13. Support multiple conduit runs from Kindorf B907 channels with C-105 and C-106 straps.
 14. Conduit bends - long radius.
 15. Flash conduits through roof, using approved roof jack; coordinate with General Contractor.
 16. To facilitate pulling of feeder conductors, install junction boxes as shown or required.
 17. All empty conduits on the project shall be provided with a nylon pull rope to allow pulling of future conductors intended for the specific raceway. Provide plastic wire-tie style

- nameplate tags on each end of pull rope with printed identification of conduit use and the location of the opposite end of the rope. Pull ropes for telecommunications service conduits shall meet the utility company requirements.
18. Where conduits pass through structural expansion joints in floor slab, rigid galvanized conduit shall be used 18" on either side of joint, complete with Appleton expansion couplings and bonding jumpers, or equal. All above grade expansion joint crossings shall also utilize expansion joint couplings or flex conduit transitions as required for each particular installation. Installed condition shall allow for a minimum deflection of raceway and wire (in any direction) equal to the structural expansion joint dimension (building to building). No solid conduits shall be allowed to cross expansion joints without proper provisions for building and seismic movement.
 19. Minimum cover of conduits in ground outside of building - 36 inches, unless otherwise noted.
 20. Provide and install exterior wall conduit seals and cable seals in the locations listed below. Coordinate installation and scheduling with other trades:
 - a. Conduit seals through exterior wall or slab (below grade): O.Z. Gedney series "FSK" in new cast in concrete locations, series "CSM" in cored locations.
 - b. Conduit seals through exterior wall or slab (above grade): O.Z. Gedney series "CSMI."
 - c. Cable seals at first interior conduit termination after entry through exterior wall or slab: O.Z. Gedney series "CSBI." Coordinate quantity of conductors at each location.
- B. Outlet Boxes and Junction Boxes. Verify all backbox requirements with devices to be installed prior to rough-in.
1. One piece steel knockout type drawn boxes, unless otherwise noted, sized as required for conditions at each outlet or as noted.
 2. Flush-mounted boxes equipped with galvanized steel raised covers for device mounting flush with finished surface. Provide extension rings as required on all acoustical or additional wall treatment areas to bring top of cover flush with finished surface (coordinate with architectural drawings). Devices shall be capable of being tightly mounted to boxes without distorting or bending device or mounting hardware.
 3. Boxes for fixture outlets: 4-inch octagon or larger as required, or as noted.
 4. Switch and receptacle outlets - not smaller than 4-inch-square in furred walls, with raised cover for single device; ganged where required.
 5. Outlet and switch boxes for wet locations, cast aluminum FS or FD type with cast aluminum gasketed spring lid cover. Weatherproof "Bell" type boxes are not acceptable.
 6. All connectors from conduit to junction or outlet boxes shall have insulated throats. Connectors shall be manufactured with insulated throats as integral part. Insertable insulated throats are unacceptable.
 7. Outlet boxes for telecommunications, 4" square or larger as required or noted, multi-ganged for voice, data, and other services where indicated on the drawings.
 8. Conduit Bodies: Malleable iron type, with lubricated spring steel clips over edge of conduit body, O-Z/Gedney type EW, or equal.
 10. Pull boxes: All site pull boxes shall be flush in-ground concrete, with engraved covers identifying service use (i.e. electrical, communications, etc.). Boxes shall be Nema 250, Type 6, outside flanged, with recessed cover for flush mounting, by Christy or equal, with required depth to provide box and conduit depths shown or required.
 - a. Provide concrete covers for all boxes in planted or paved areas (up to available concrete cover size).
 - b. Provide galvanized steel covers for all larger boxes (when concrete is not available), or in traffic areas. No cast iron covers.

- c. Provide bolted covers and slab bottoms (with grouted perimeter) or vault type boxes for all electrical distribution and signal system pull boxes used for site distribution, to prevent rodent entry. No collar type boxes with dirt or gravel bottoms
 - d. Provide drain hole at bottom of all vault type boxes, with loose aggregate base below, for proper drainage.
 - e. All covers to be completely flush with finished adjacent surfaces.
 - f. Provide galvanized steel H20 rated covers and installation of box rated for H20 in all traffic areas.
 - g. Provide pullboxes per utility company specifications for all electrical primary and secondary services and for telecommunications service runs. Verify exact size and type prior to order with each utility company.
- C. Wire and Cable (line voltage and signal systems):
1. 600-volt class where used for or run with line voltage power wiring, insulation color coded, minimum No. 12 AWG for power branch circuits, No. 14 for power control circuits, and wiring size and type as directed by signal system manufacturer for each signal system.
 2. All conductors shall be copper.
 3. Size and insulation type:
 - a. Use 75 degree C insulation ratings on this project, regardless of insulation allowable ratings, unless specifically indicated otherwise on the drawings.
 - b. Standard locations: #12 to #1 AWG: THWN/THHN dual rated for all wet and dry locations; #1/0 through #4/0 AWG: XHHW (55 Mils) for all wet and dry locations; 250MCM and larger: XHHW (65 Mils). All wire sizes used shall be based on a 75 degree insulation rating, unless specifically used with 90 degree rated breakers and devices.
 - b. All wiring (power and signal) installed underground between buildings, or in wet or damp locations, shall be outside listed and rated for wet locations.
 - c. High temperature and non-standard locations: Provide wire type and insulation category suitable for area of use as defined in NEC Article 310.
 - d. Photovoltaic applications: provide 90 degree C insulation ratings.
 4. Conductors No. 8 and larger and as otherwise noted on drawings shall be stranded. Power conductors No. 12 and No. 10 shall be solid or stranded. Power conductors No. 14 or smaller shall be solid.
 5. Provide signal system wiring for each system to meet the system manufacturers requirements and recommendations for each device or equipment type. Signal wiring systems shall be provided with shielding and/or insulation type and cable quantities as directed by the manufacturer, and meet all NEC requirements for locations used.
 6. Install all wiring branch circuits and feeders (low voltage and line voltage) in conduit unless noted otherwise on the drawings. Contractor shall mandrel all feeders and pass a "sock" (or utilize other suitable means) through each raceway prior to pull to remove all water and construction debris. All raceways shall be completely clear of any obstructions or debris and all cut ends shall be reamed, prior to pull. Utilize pulling compound on all runs to insure minimum friction and pulling tension.
 7. Megger test all feeders prior to energizing. See section 26 08 00 for additional information.
 8. Approximately balance branch circuits about the neutral conductors in panels.
 9. Connections to devices from "thru-feed" branch circuit conductors to be made with pigtails, with no interruption of the branch circuit conductors.
 10. Neutral conductor identified by white outer braid, with different tracers of "EZ" numbering tags used where more than one neutral conductor is contained in a single raceway.
 11. Neatly arrange and "marlin" wires in panels and distribution panelboards with "T and B Ty- rap" or approved equal plastic type strapping.

12. All wire and cable shall bear the Underwriters' Label, brought to the job in unbroken packages; wire color-coded as follows:

<u>Voltage</u>	<u>Phasing</u>	<u>A</u>	<u>B</u>	<u>C</u>	<u>N</u>
120/208	3PH4W	Black	Red	Blue	White
2083PH	3W	Black	Red	Blue	--
277/480	3PH4W	Brown	Orange	Yellow	White
4803PH	3W	Brown	Orange	Yellow	--

13. The equipment grounding conductor shall be insulated copper; where it is insulated, the insulation shall be colored green.
14. Label each wire of each electrical system in each pull box, junction box, outlet box, terminal cabinet, and panelboard in which it appears with "EZ" numbering tags indicating the connected circuit numbers.
15. Properly identify the "high leg" of 4-wire delta connected systems (in each accessible location) as required by NEC 110.15 and 230-56.
16. Provide permanently affixed adhesive labels with machine printed lettering (min. 1/8" high) at junction boxes serving fixtures that are supplied by (2) electrical sources (i.e. normal and emergency lighting). Label to read "CAUTION - This light fixture is powered by (2) separate sources. The normal power source breaker and the emergency power source breaker must be turned off before servicing this light fixture."
17. Install feeder cables in one continuous section unless splices are approved by Architect. Exercise care in pulling to avoid damage or disarrangement of conductors, using approved grips. No cable shall be bent to smaller radius than the spool on which it was delivered from the manufacturer. Color code feeder cables at terminals. Provide identifying linen tags in each pullbox.
- D. Switches: Model numbers are Hubbell, color to be selected by architect, unless otherwise noted. All switches to utilize screw terminals for wire connections - no plug-in terminations:
1. Single Pole - No. HBL1221
 2. Two Pole - No. HBL1222
 3. Three Way - No. HBL1223
 4. Momentary contact - No. HBL1557
 5. Momentary contact Keyed - No. HBL1556L
 6. Keyed, - No. HBL1221L
 7. Pilot Light (on with load on) - Hubbell No. 1221-PLC
 8. Motor Rated Double Pole (30A) - Hubbell No. 7832
 9. Motor Rated Three Pole (30A) - Hubbell No. 7810.
 10. Low voltage Data line switches - Refer to lighting control system (for compatibility)
- E. Receptacles: Mounting straps and contacts shall be one piece design, constructed of minimum .050" solid brass. Base shall be high strength, heat resistant, glass reinforced nylon. Device shall accept up to #10 wire, side or back wired with screw terminals - no plug-in terminations. Hubbell, Leviton, Pass & Seymore, or equal. Color to be selected by architect, unless otherwise noted. Numbers listed below are Hubbell:
1. 15A 3PG 125 volt duplex - No. HBL5262
 2. 20A 3PG 125 volt duplex - No. HBL5362
 3. 20A 3PG 125 volt ground fault interrupter receptacle; GFI receptacles shall conform to the 2006 UL requirements to a) interrupt power to the unit in the event of internal failure, or b) provide an audible or visual indication of internal failure of the GFI; No. GF20 or equal. Through wiring to down stream GFI designated receptacles is not acceptable.
 4. 15A 3PG 125 volt half controlled duplex receptacle - No. BR15C1(color), with permanent "controlled" marking, factory applied.

5. 20A 3PG 125 volt half controlled duplex receptacle - No. BR20C1(color), with permanent "controlled" marking, factory applied.
 6. 15A 3PG 125 volt full controlled duplex receptacle - No. BR15C2(color), with permanent "controlled" marking, factory applied.
 7. 20A 3PG 125 volt full controlled duplex receptacle - No. BR20C2(color), with permanent "controlled" marking, factory applied.
 8. GFI Module (blank face), no indicator light, 20A – No. GFBF20 or equal.
 9. All receptacles located in exterior or wet locations shall be corrosion resistant with UV stabilized body.
- F. Plates: Leviton, or equal, except as noted:
1. The color of all faceplates shall match the color of the devices installed under/in the faceplate, except as specifically noted otherwise.
 2. For flush outlet boxes, for switches, and receptacles: nylon, color to be selected by architect, unless otherwise noted.
 3. Plates for surface-mounted outlets: galvanized steel unless otherwise noted.
 4. Weatherproof duplex receptacle plates for exterior locations with ground fault interrupter receptacles in type FS or FD boxes – Hubbell #WPFS26 or compatible equal. Verify cover compatibility with box type and device installed.
 5. Weatherproof "in-use" cover, vertical or horizontal mount, for exterior with GFCI receptacles. Die-cast metal alloy, TayMac MX series or equal with openings to match installed devices.
 6. Locking plates for duplex receptacles where noted; Pass & Seymour #WP26-L (non-weather proof).
 7. Locking plates for duplex exterior GFCI receptacles (or in wet or damp locations); Heavy duty cast aluminum flush cover with locking latch and key, Pass & Seymour #4600 with appropriate mounting plate for type of device installed. Coordinate backbox requirements and finished wall trim-out with wall installer prior to rough-in to insure an adequate and neat trim appearance upon completion.
 8. Plates for flush tele/data boxes: white nylon or as otherwise directed - provide and install at each tele/data outlet plate to match duplex power outlet plate, for jack installation under Section 27 00 00. Where the power and tele/data outlet boxes are shared the plate shall be continuous in multi-gang locations. See drawings.
- G. Equipment Disconnects: All disconnects shall be located to allow proper code required clearance in each area. Locations shown on drawings are diagrammatic only. The contractor shall coordinate exact locations in the field (with other trades) prior to rough-in to insure proper clearances.
1. Motor Disconnect Switches and Safety Switches: General Electric Company Heavy Duty Type "THD", cover interlocked with operating handle so that cover cannot be opened with switch in closed position and switch cannot be closed with cover in open position. 240V or 480V rating, single or multi-pole as required or as noted on drawings, in Nema 1 enclosure indoors or Nema 3R enclosure outdoors unless otherwise noted. Provide dual element motor circuit fuses sized as recommended by equipment manufacturer (for final equipment actually installed).
 2. Code required disconnects: Provide a local disconnect in addition to the branch circuit protection device for all equipment as required by code (whether shown or not). Disconnects shall consist of a motor rated switch (or disconnect) for all motor loads less than 3/4HP or other suitable disconnect sized to match branch circuit conductors and load current of equipment, with number of poles as required.
- H. Lugs and Connectors: Thomas and Betts "lock-tite", for No. 4 and larger wire; 3M "Scotchlock" fixed spring screw-on type wire connectors with insulator for No. 6 and smaller wire.

1. All splices shall be made up with screw-on type connectors - no plug-in or push-in style connectors acceptable. Wires shall be solidly twisted together with electricians pliers before screw-on connector is installed to ensure a proper connection in the event of wire nut failure. No exceptions.
 2. Connectors listed or labeled for "no wire twisting required" are not an acceptable substitute for actual wire twisting.
 3. Utilize porcelain type connectors in all high temperature environments (above 105 degrees Celsius).
- I. Splice Insulation: "Scotch" electrical tape with vinyl plastic backing or rubber tape with protective friction tape for interior work.
1. Splices in electrical cables of 600 volt insulation class in underground system duct shall be made only in accessible locations such as pullboxes, light pole handholes, etc., using a compression connector on the conductor and by insulating and waterproofing (for exterior and underground locations) by one of the following methods:
 - a. Cast type splice insulation shall be provided by means of a molded casting process employing a thermosetting epoxy resin insulating material which shall be applied by a gravity poured method or by a pressure injected method. The component materials of the resin insulation shall be in a packaged form ready for convenient mixing after removing from the package. Do not allow the cables to be removed until after the splicing material has completely set.
 - b. Gravity poured method shall employ materials and equipment contained in an approved commercial splicing kit which includes a mold suitable for the cables to be applied. When the mold is in place around the joined conductors, the resin mix shall be prepared and poured into the mold. Do not allow cables to be moved until after the splicing materials have completely set.
- J. Identification: Refer to Section 260500.
- K. Firestopping: as manufactured by 3M Fire Protection Products or equal.
1. Fire-rated and smoke barrier construction: Maintain barrier and structural floor fire and smoke resistance ratings including resistance to cold smoke at all penetrations, connections with other surfaces or types of construction, at separations required to permit building movement and sound vibration absorption, and at other construction gaps.
 2. Systems or devices listed in the UL Fire Resistance Directory under categories XHCR and XHEZ may be used, providing that it conforms to the construction type, penetration type, annular space requirements and fire rating involved in each separate instance, and that the system be symmetrical for wall penetrations. Systems or devices must be asbestos free.

2. 3 MULTI-SERVICE FLOOR BOXES COMBO - AV / TEL / POWER

- A. Application: For use indoors as a multi-service (telecommunications, audiovisual, power) outlet box to house wiring, cabling, termination, connectors, and receptacles installed within a cast concrete floor
- B. Box Construction: Seam welded 14 gauge steel
- C. Compliances:
 1. Floor boxes shall be listed by a nationally recognized testing laboratory to UL 514A for Class 2 and Class 3 power-limited circuits (such as data and signal) providing bonding without the use of bonding jumpers, and remote control) circuits and for

- telecommunications circuits in accordance with NFPA 70 Article 314 for use in tile, terrazzo, carpet, and wood covered floors.
 - 2. Floor box assemblies shall meet the scrub water exclusions requirements of UL 514A for use in tile, terrazzo, carpet, and wood covered floors.
- D. Load Capacity: Floor box assembly (back box, cover, etc) shall be rated to 300 lbs (minimum) static load.
- E. Features:
- 1. Suitable for cast-in-place concrete applications
 - 2. 8 gangs, minimum
 - 3. Knock-outs (or punch-outs) for easy creation of holes to accept conduit connectors
 - 4. Permit access to conductors behind terminations (for maintenance)
- F. Cover Finish: Coordinate with Architect
- G. Manufacturers:
- 1. FSR Inc or equal.
 - a. #FL-500P-4-B; c-i-p floor box, 4-in depth

2.4 MULTI-SERVICE FLOOR BOXES COMBO - TEL / POWER

- H. Application: For use indoors as a multi-service (telecommunications, power) outlet box to house wiring, cabling, termination, connectors, and receptacles within a cast concrete floor
- 1. Floor boxes shall permit access to conductors for maintenance
 - 2. Floor boxes shall come with knock-outs or punch-outs for easy creation of holes to accept conduit connectors.
- I. Compliances:
- 1. Floor boxes shall be listed by a nationally recognized testing laboratory to UL 514A for Class 2 and Class 3 power-limited circuits (such as data and signal) providing bonding without the use of bonding jumpers, and remote control) circuits and for telecommunications circuits in accordance with NFPA 70 Article 314 for use in tile, terrazzo, carpet, and wood covered floors.
 - 2. Floor box assemblies shall meet the scrub water exclusions requirements of UL 514A for use in carpet and wood covered floors.
- J. Construction: Seam welded 14 gauge steel.
- K. Cover Finish: Coordinate with Architect.
- L. Manufacturer:
- 1. Wiremold or equal.
 - a. #RFB-4; c-i-p floor box, 3-7/8 in depth, 4 gangs

2.5 MULTI-SERVICE POKE-THRUS COMBO - AV / TEL / POWER

- M. Application: For use indoors as a multi-service (telecommunications, audiovisual, power) outlet to house wiring, cabling, termination, connectors, and receptacles
- 1. Poke thrus shall permit access to conductors for maintenance.

- N. Compliances:
 1. Poke thrus shall be listed by a nationally recognized testing laboratory for the purpose.
 2. Poke thrus shall comply to UL 514A for Class 2 and Class 3 power-limited circuits (such as data and signal) providing bonding without the use of bonding jumpers, and remote control) circuits and for telecommunications circuits in accordance with NFPA 70 Article 314 for use in tile, terrazzo, carpet, and wood covered floors.
 3. Poke thrus shall meet (or exceed) UL 514A requirements for scrub water test.
- O. Fire Rating:
 1. Poke thrus shall be listed by a nationally recognized testing laboratory as a rated penetrating device.
 2. The poke-thru outlet shall maintain the rating of the concrete slab/deck within allowable penetration methods.
 3. Poke thrus shall provide at least two-hour fire rating.
- P. Load Capacity: Floor box assembly (back box, cover, etc) shall be rated to 300 lbs (minimum) static load. Wiremold Evolution poke-thru is rated to 1,000 lbs
- Q. Construction:
 1. Body shall be fabricated of steel (or die cast) non-flammable materials.
 2. Body shall include integral intumescent material for firestopping feature.
 3. Stubs shall be fabricated of listed EMT.
 4. Boxes shall fabricated of welded steel and shall be listed for the purpose.
- R. Cover Finish: Coordinate with Architect.
- S. Manufacturer:
 1. Wiremold or equal.
 - a. "Evolution" 6AT series poke-thru; 6 inch diameter

1.6 MULTI-SERVICE WALL BOXES FOR FLAT PANEL DISPLAYS

- A. Application: indoor use as a multi-service (telecommunications, audiovisual, power) outlet box to house wiring, cabling, termination, connectors, and receptacles and serve a flat panel display
- B. Listings: Wall boxes shall be listed by a nationally recognized testing laboratory to UL 514A.
- C. Fabrication Material: Backbox: Seam welded 14 gauge steel; Cover: 1/16" steel, electro-painted
- D. Outlet box shall feature capacity for the following:
 1. Power: 1 duplex receptacle, duplex or decora style
 2. Telecom/Network: 2 network jacks (refer to section 271513 for jack information)
 3. AV: _ positions for AAP (or equivalent) modules
 4. Conduit Connections: _ positions for 1.25-inch conduits at top, _ positions for 1.25-inch conduits at bottom, _ positions for 1.25-inch conduits at each side,
- E. Manufacturers:
 1. FSR or equal.
 - a. #PWB-250; in-wall multi-service box for flat panel display

1.7 STEEL OUTLET BOXES AND COVERS FOR TELECOM AND AV

- A. Application: For use indoors as outlet box, backbox, and/or junction box of low voltage systems to house wiring, cabling, terminations, and connectors; may also house and support components.
1. Outlet boxes shall permit access to conductors for maintenance
 2. Outlet boxes shall come with knock-outs or punch-outs for easy creation of holes to accept conduit connectors.
- B. Compliances:
1. Outlet boxes shall meet the requirements of CEC Article 314.
 2. Outlet boxes shall be listed by a nationally recognized testing laboratory to UL 514A for Class 2 and Class 3 power-limited circuits (such as data and signal) providing bonding without the use of bonding jumpers, for remote control circuits, and for telecommunications circuits in accordance with NEC Article 314.
 3. Outlet boxes shall be manufactured compliant to NEMA: FB-1 and OS-1.
 4. Outlet boxes shall be fire resistant and suitable for use in rated spaces (reference: UL Fire Resistance Directory / "Orange Book").
- C. Material and Finish:
1. Material: <AISI/SAE 1008 Steel source: OZ Gedney or equal, hot rolled, pre-galvanized steel, minimum spangle, AISI C-1008 source.
 2. Thickness: CEC 314.40(B) / 1.59 mm (0.0625in), minimum
 3. Finish: G60 hot dip zinc galvanized (0.60 oz/sq ft), meeting ASTM A123, or pre-galvanized (continuous sheet galvanizing) meeting per ASTM A653
 4. Finish Thickness: ~0.0005 inches
- D. Telecom and AV Square Box and Covers/Rings – 5"
1. Dimensions: 5 in square x 2.875 in deep
 2. Volume: 64 in³
 3. Outlet box shall come equipped with integrated cable management/slack support.
 4. Manufacturers:
 - a. Randl Industries or equal.
 - 1) #T-55017; "5 Square" outlet box, knockouts: one 1" + one 1-1/4" per side, one 1/2" per back
 - 2) #TB-55057; "5 Square" outlet box with side mounting bracket, knockouts: one 1" + one 1-1/4" on 3 sides, one 1/2" per back
 - 3) #D-51G000; one gang cover for "5 Square" outlet box, flat
 - 4) #D-51G034; one gang cover for "5 Square" outlet box, 3/4" raised

PART 3 - EXECUTION

3.1 REFER TO BASIC ELECTRICAL REQUIREMENTS - SECTION 260500 FOR WORK UNDER THIS SECTION.

3.2 TESTS

- A. Testing and Inspection: See Section 260800 - Testing.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK.

SECTION 263200

EMERGENCY ELECTRIC GENERATOR

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Provide a complete Emergency Generator plus accessories in a single common housing, as noted herein and as indicated on the Drawings. Accessories will include the Generator, Base Tank, Integral 50% rated Load Bank, and Acoustic Enclosure.
- B. Provide CBC 2019 compliant seismic installation. See Section 260500 for all certification and submittal requirements.
- C. Manufacturer shall be responsible for providing a complete assembly of all components in one overall housing with base tank, which is certified to comply as an integrated assembly with CBC 2019 requirements.
- D. Manufacturer shall provide technical assistance to Owner in securing all required local Air Quality Management District permits for installation of the Emergency Generator, including review and inclusion of existing engine generators where applicable on the same site in site analysis.
- E. The Contractor shall include a Manufacturer-provided three-year engine-generator maintenance agreement as described herein as part of the bid. The maintenance agreement shall include an annual 2-hour full load test using a portable load bank.

1.2 SUBMITTALS

- A. Refer to Section 260500 for procedure.
- B. Tests and Reports (Test Requirements are detailed in Paragraph 1.4).
 - 1. Provide certified test reports of the following:
 - a. Factory tests.
 - b. Field Tests: Test reports shall include dates performed, method of testing, test results, test interpretation and recommended action.
- C. Shop Drawings and Product Data
 - 1. The following list includes the required Shop Drawing information that shall be submitted for the generator:
 - a. Physical dimensions and weights.
 - b. CBC Special Certificate of Compliance with importance factor of 1.5 for all components and overall assembly.
 - c. Brake horsepower of engine.
 - d. Fuel consumption.
 - e. Cooling requirements.
 - f. Noise db level. Provide details of acoustical housing and factory testing to prove acoustical housing performance (71dbA at 7 meters).
 - g. Electrical characteristics of generator, voltage regulator, and battery charger.
 - h. Load graphs.
 - i. Control panel.
 - j. Elevation.

- k. Wiring and control diagrams.
 - l. Engine and generator details, including governor and base fuel tank.
 - m. Location of available parts and service.
 - n. Confirmation that engine meets the latest required EPA Tier Exhaust Emission Compliance Statement, complies with latest CARB requirements for emergency standby equipment, and complies with the local Air Quality Management District requirements.
 - o. Details of base tank fill connection, including overfill basin.
 - p. Details of primary tank venting, primary and secondary tank emergency relief venting, high fuel alarm panel and sensing, and tank labeling.
 - q. Passive diesel particulate filter.
 - r. 50% of full-capacity load bank, integral to the generator line-up and located within the generator enclosure.
- D. Maintenance and operating instruction manuals, six bound copies, including approved shop Drawings, parts list, list of recommended spare parts, sources of purchase and similar information.
- E. The Load Bank manufacturer shall submit for review technical data including features, performance, electrical characteristics, physical characteristics, ratings, accessories, and finishes. Shop drawings shall include dimensional plans and mounting details sufficient to properly install the load bank. Load bus configuration and load connections termination area shall be clearly identified. Electrical schematic drawings shall be provided to detail the operation of the load bank and the provided safety circuits. Over-current protection and control devices shall be identified and their ratings marked. An interconnection drawing shall be included for control wiring related to the load bank.

1.3 GUARANTEE

- A. Provide a written guarantee against all defects in materials and application, which prevent proper functioning for one (1) year from date of acceptance of the project.

1.4 TESTS

- A. Certified copies of factory test giving guaranteed performance characteristics to meet the Specifications should be furnished by the Manufacturer. The unit shall be tested at the Manufacturer's plant for performance of all functions including a 2-hour full load test, using 0.8pf reactive to 1.0pf resistive load banks and until all temperatures have been stabilized for at least 30 minutes.
- B. The Manufacturer shall have field tests made of the generator and wiring systems in place by a qualified factory technician. The complete engine generator set with all of its appurtenances shall be tested after installation for all functions, including a 2-hour full load test with full-rated resistive (1.0pf) load bank. The Manufacturer shall supply all equipment necessary for the tests.
- C. Testing of fuel system – see Part 3 of this Section.

1.5 FUNCTION

- A. The emergency generator shall function to start automatically immediately upon power failure of the normal power supply, assume full load within ten (10) seconds and automatically switch into the emergency power system. The unit shall be automatically removed from the line upon resumption of normal power and stopped five (5) minutes later.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General:

1. Provide and install a complete emergency power system, including power plant powered by diesel engine driven generator and operated by means of a signal from an automatic transfer switch. The system shall be complete, tested and meet all the functional requirements of a fully automatic emergency power source serving full load power stabilized at rated voltage and frequency within three seconds after normal power source failure.
2. The diesel engine generating set shall be fully automatic and shall be complete with starting and control equipment, base fuel-tank, skid-mounted batteries, charger, acoustical enclosure, and other equipment necessary to provide a complete, fully automatic system.
3. Arrange for the services of a factory erection engineer for checking installation, making specified and all other necessary tests, making initial start, instructing operating personnel in operating unit through all of its functions to ensure that the unit is performing in accordance with the intentions of the Specifications.
4. Generator set shall be provided with a vertical scoop on discharge.
5. Manufacturers: Cummins-Onan, Kohler, or Caterpillar. The Kohler unit shall utilize a Detroit Diesel engine – no other engine manufacturer will be accepted for a Kohler unit.
6. Generator set shall be provided with a passive diesel particulate filter (DPF) mounted above engine-generator in a common housing with the generator set.
7. Provide integral 50%-of-rated-generator-KW capacity load bank within the generator enclosure and all associated controls.

B. Power Plant:

1. Rating shall be based on continuous standby power rating of the generator and with capabilities to carry 100% full load without damage to the engine, generator or components, and with capabilities for starting the largest motor scheduled for the standby power system while carrying full connected load at an altitude of 350 feet above sea level. Full load power ratings shall be as indicated on the drawing, continuous standby at 0.8 PF at 277/480V 3PH 4W or 120/208V 3PH 4W where indicated on the drawings.
 - a. Voltage regulation shall be +/-0.5% for any constant load between no load and rated load.
 - b. Frequency regulation shall be isochronous from steady state no load to steady state rated load.
 - c. The diesel engine generator set shall be capable of single step load pick up of 100% nameplate KW and power factor, less applicable derating factors, with the engine-generator set at rated operating temperature.
 - d. Under motor starting conditions the generator set shall be capable of sustaining a minimum of 90% of rated no load voltage with the specified KVA load at near zero power factor applied to the generator set.
 - e. Maximum transient voltage dip shall not exceed 35 percent below rated on application of the single largest surge load step.
2. Provide unit and all accessories in a common weatherproof acoustical enclosure, with a common base for unit capable of skidding into place. Provide sound absorbing insulation on interior of weatherproof enclosure to produce overall sound rating noted above. All accessories, including muffler shall be concealed within common generator

enclosure. If a diesel particulate filter is specified, it shall be concealed within the enclosure.

2. Provide minimum 18" flexible section in all electrical, fuel and exhaust lines at connection to power plant.
3. Provide flexible steel disc coupling to engine-generator.
4. Provide lifting brackets.
5. Provide a CBC 2019 compliant and certified vibration isolation system. The vibration isolation system shall be designed to withstand the seismic forces from ground motions and installation shall comply with critical equipment (importance factor = 1.5) requirements. CBC conforming vibration isolators shall be provided and installed at the bolt-down locations between the skid and the base fuel tank.

C. Engine:

1. The engine shall be 4-cycle design, water-cooled; series turbo charged with after cool, having no inherent unbalanced reciprocating forces. Operating speed shall be 1800 RPM.
2. Starting by battery-driven starter. Include cranking sequencer, which shall give three (3) start attempts before locking out over-cranking protection.
3. Governor shall be isochronous electronic as required to maintain generated frequency at 60 Hz. at 75% full load within a steady state band-width of (+/-) 0.25%. Frequency shall not vary over 3% from no load to full load. Governors using engine crankcase lube oil will not be acceptable. Governor shall be type EFC, Electronic Isochronous.
4. Provide fuel and lubrication systems for diesel engine, complete with replacement element type air cleaner; primary and secondary fuel filter and oil filter; full pressure lubrication system with positive displacement lube oil pump and spring-loaded bypass valve; lube oil cooler; engine driven fuel transfer pump; extended base-mounted fuel tank, sight gauge, automatic float switch to maintain fuel level, and high-fuel and low-fuel alarm dry contacts for local and remote indication. Provide base fuel tank rupture basin contacts (2 sets) for local and remote alarm. Point of fuel fill at the base tank shall have provisions for spill containment. Provide shop drawings indicating spill containment system.
5. Provide a cooling system with sufficient capacity for cooling engine when generator is delivering 100% full load for four hours at ambient of 40 degrees C at an altitude of 350 feet. Include water-circulating pump and thermostatic valve to maintain recommended engine temperature; radiator with drain and air vent and fan with protective guard; jacket water corrosion resistant heating elements (wattage as specified by engine manufacturer, rated at 208V 1PH or 3PH). Radiator shall be filled with antifreeze solution of strength as recommended by Manufacturer. Exhaust air shall be discharged vertically, using a scoop design.
6. All areas within 24 inches of the muffler shall be covered with 6 lb. density mineral wool. All piping shall be schedule 40 black pipe.
 - a. The exhaust system, piping, and insulation shall be factory supplied and installed. Extend black standard weight iron pipe from the engine with 18" flexible connection between engine and muffler. The muffler shall be installed within the same overall enclosure as the engine-generator.
7. Provide a unit-mounted battery for engine start, 24-volt DC with a capacity of not less than 160-ampere hours at 20-hour rate. The battery shall also be sized for six starts of 30-second cranking duration each, with ambient 15 degree F, mounted on earthquake-proof tray on pad with all necessary battery cables, hydrometer and enclosure-mounted voltage-regulated battery charger in Nema 3R enclosure with float, taper, and equalize charge settings and with DC voltmeter, DC ammeter and circuit for low voltage alarm. Battery shall be lead-acid type.
8. Auxiliary switches for over-speed trip and automatic over-speed shut down at a speed 10% greater than the normal specified operating RPM. The engine shall shut down on

over-speed, low oil pressure, high oil temperature and high water temperature by means of auxiliary switches, actuating signal lights and alarms.

9. Temporary batteries may be used for testing, but new, unused batteries shall be furnished after final testing is complete and before acceptance. New batteries shall be used for one generator start to demonstrate adequacy of final battery installation.
10. Engine exhaust emissions shall meet the latest adopted EPA Tier Exhaust Emission Compliance Statement, the latest CARB requirements for emergency standby applications, and the local Air Quality Management District standards.
11. Provide a DPF - concealed within enclosure.

D. Diesel Particulate Filter: The DPF shall be a passive continuously regenerating type as manufactured by Johnson Matthey, or equal.

1. DPF shall meet latest EPA and CARB requirements and be on the CARB-approved and verified list for latest emissions standards.
2. It shall meet all applicable CARB requirements for after-treatment of engine-generator emissions.
3. The DPF shall solely use the heat of the engine exhaust and not require any supplemental heat source. The DPF shall regenerate and remain continuously operational even if the KW load on the engine-generator is no more than 25% of nominal.
4. The DPF shall be supplied with a monitoring device which shall log exhaust temperature and backpressure when the engine is running. Back pressure and pressure on the engine shall be continuously monitored as they increase due to build up of the ash layer in the filter. The monitoring device shall derive 24 volt DC power from engine-generator control panel – all connected complete by Manufacturer. It shall have an RS232 interface and be provided with software to download the data onto a portable computer. It shall have alarm points which can be set to indicate the increase in backpressure based upon the Manufacturers' specifications.
5. The DPF shall be housed within a carbon steel, fully insulated, corrosion resistant shell with removable cover panels for full access to the diesel particulate filters mounted inside. The DPF stainless steel shell shall in turn be mounted within the common overall generator housing, with housing access panels aligning with the shell access panels to the filters.
6. The DPF shall have critical-grade sound attenuation.

E. Generator:

1. Rated for continuous standby service, complying with NEMA standards.
2. Brushless, balanced 4-pole revolving field type with rotating rectifier exciter mounted on end of shaft, single ball bearing support to starter housing, rotor connected by semi-flexible steel disc coupling to engine flywheel to assure permanent alignment free of injurious tensional vibrations at speeds up to 125% of synchronous. Rated for 105 degrees Centigrade rise.
3. Generator insulation shall be in accordance with latest NEMA standards using minimum Class H materials. All insulation system components shall meet NEMA MG1 temperature rise limits for Class H insulation system. Actual temperature rise measured by resistance method at full load shall not exceed 105 degrees centigrade.
4. A permanent magnet generator (PMG) shall provide excitation power for immunity to voltage distortion caused by non-linear loads. The PMG shall sustain excitation power for optimum motor starting and to sustain short circuit current at approximately 300% of rated current for not more than 10 seconds.
5. Voltage regulator of static solid state design to give (+/-) 2% regulation from no-load to full load; instantaneous voltage dip less than 20% of rated when full load at rated power factor suddenly applied; and recovery to stable operation of voltage within 1% of rated within four seconds. The voltage regulator shall be of the asynchronous pulse width

modulated type and shall be insensitive to severe load-induced waveshape distortion from SCR or thyristor circuits such as those used in UPS and motor speed control equipment. Manual adjustment of (+/-) 5% of normal to be included by a lockable device or screwdriver slot in rheostat shaft. All voltage sensing shall be 3-phase.

a. The automatic voltage regulator shall be temperature compensated, solid-state design. The voltage regulator shall control build up of AC generator voltage to provide a linear rise and limit overshoot. The regulator shall include a torque-matching characteristic, which shall use differential rate of frequency change compensation to use the maximum available engine torque and provide optimal transient load response. Regulators, which use a straight line fixed volts per hertz characteristic, are not acceptable.

6. Shielding of generator, exciter and regulator to prevent radio frequency interference.
7. The generator, exciter, and voltage regulator shall be designed and manufactured by the engine-generator set manufacturer so that the characteristics shall be matched to the torque wave of the engine to provide the fastest possible system recovery from transient load changes and to prevent engine stall during transient overload conditions.

F. Control Equipment:

1. Panel mounted with vibration isolators to plant frame. Top of panel shall not exceed 6'-6" above slab with generator mounted to a 30" high base tank on top of a 3" high pad.
2. The generator set shall be provided with a microprocessor-based control system, which shall be designed, to provide automatic starting, monitoring and control functions for the generator set. The control system shall also be designed to allow local monitoring and control of the generator set and remote monitoring and control as described in this Specification. The control panel shall be mounted on the generator set.
3. The control panel shall be vibration isolated and prototype tested to verify the durability of all components in the system under the vibration conditions encountered.
4. The control panel shall be UL508 labeled, CSA282-M1989 certified and meet IEC8528 part 4. All switches, lamps and meters shall be oil-tight and dust-tight and the enclosure door shall be gasket. There shall be no exposed points in the control panel (with the door open) that operate in excess of 50 volts. The controls shall meet or exceed the requirements of Mil-Std 461C part 9 and IEC Std 801.2, 801.3 and 801.5 for susceptibility, conducted and radiated electromagnetic emissions. The entire control shall be tested and meet the requirements of IEEE587 for voltage surge resistance.
5. The generator set mounted control panel shall include the following features and functions:
 - a. Three position control switch labeled RUN/OFF/AUTO: In the RUN position the generator set shall automatically start and accelerate to rated speed and voltage. In the OFF position the generator set shall immediately stop, bypassing all time delays. In the AUTO position the generator set shall be ready to accept a signal from a remote device to start and accelerate to rated speed and voltage.
 - b. Red "mushroom-head" push-button EMERGENCY STOP switch: Depressing the emergency stop switch shall cause the generator set to immediately shut down and be locked out from automatic restarting.
 - c. Push-button RESET switch: The RESET switch shall be used to clear a fault and allow restarting the generator set after it has shut down for any fault condition.
 - d. Push-button PANEL LAMP switch: Depressing the panel lamp switch shall cause the entire panel to be lighted with DC control power. The panel lamps shall automatically be switched off 10 minutes after the switch is depressed or after the switch is depressed a second time.
 - e. Generator Set Metering: The generator set shall be provided with a metering set with the following features and functions:

- (1) 2.5-inch, 90-degree scale analog voltmeter, ammeter, frequency meter and kilowatt (KW) meter. These meters shall be provided with a phase select switch and an indicating lamp for upper and lower scale on the meters. Ammeter and KW meter scales shall be color coded in the following fashion: readings from 0-90% of generator set standby rating: green; readings from 90-100% of standby rating: amber; readings in excess of 100%: red.
 - (2) Digital metering set, 0.5% accuracy, RMS type to indicate generator voltage, frequency, output current, output KW, KW-hours and power factor. Generator output voltage shall be available in line-to-line neutral voltages and shall display all three-phase voltages (line to neutral or line to line) simultaneously.
- f. Generator Set Alarm and Status Indication: The generator set shall be provided with alarm and status indicating lamps to indicate non-automatic generator status and existing alarm and shutdown conditions. The lamps shall be high-intensity LED type. The lamp condition shall be clearly apparent under bright room lighting conditions. The generator set control shall indicate the existence of the following alarm and shutdown conditions on a digital display panel.
- (1) Low oil pressure (alarm)
 - (2) Low oil pressure (shutdown)
 - (3) Oil pressure sender failure (alarm)
 - (4) Low engine temperature (alarm)
 - (5) High engine temperature (alarm)
 - (6) High engine temperature (shutdown)
 - (7) Engine temperature sender failure (alarm)
 - (8) Low coolant level (alarm or shutdown--selectable)
 - (9) Fail to crank (shutdown)
 - (10) Over-crank (shutdown)
 - (11) Over-speed (shutdown)
 - (12) Low DC voltage (alarm)
 - (13) High DC voltage (alarm)
 - (14) Weak battery (alarm)
 - (15) Low fuel-base tank (alarm)
 - (16) High AC voltage (shutdown)
 - (17) Low AC voltage (shutdown)
 - (18) Under frequency (shutdown)
 - (19) Over current (warning)
 - (20) Over current (shutdown)
 - (21) Short circuit (shutdown)
 - (22) Ground fault (alarm)
 - (23) Under frequency (alarm)
- In addition, provisions shall be made for indication of two customer-specified alarm or shutdown conditions. The non-automatic indicating lamp shall be red and shall flash to indicate that the generator set is not able to automatically respond to a command to start from a remote location.
- g. Engine Status Information: The following information shall be available from a digital status panel on the generator set control:
- (1) Engine oil pressure (psi or kPA)
 - (2) Engine coolant temperature (degrees F or C; both left and right bank temperature shall be indicated on V-block engines)
 - (3) Engine oil temperature (degrees F or C)
 - (4) Engine speed (rpm)
 - (5) Number of hours of operation (hours)
 - (6) Number of start attempts

- (7) Battery voltage (DC volts)
 - h. The Generator Control Panel shall monitor the status of each Automatic Transfer Switch. The monitoring for each Automatic Transfer Switch shall be:
 - (1) ATS Normal Position
 - (2) ATS Emergency Position
 - i. The ATS status for each switch shall also be displayed on the Generator Remote Annunciator.
 - 6. Control Functions: The control system provided shall also include a cycle cranking system, which allows for user selected crank time, rest time and number of cycles. Initial settings shall be for 3 cranking periods of 15 seconds each with 15-second rest periods between cranking periods.
 - 7. The control system shall include an idle mode control, which allows the engine to run in idle mode in the RUN position only. In this mode the alternator excitation system shall be disabled.
 - 8. The control system shall include an engine governor control which functions to provide steady state frequency regulation as noted elsewhere in this Specification. The governor control shall include adjustments for gain; damping and a ramping function to control engine speed and limit exhaust smoke while the unit is starting. The governor control shall be suitable for use in paralleling applications without component changes.
 - 9. The control system shall include time delay start (adjustable 0-300 seconds) and time delay stop (adjustable 0-600 seconds) functions.
 - 10. The control system shall include sender failure monitoring logic, which is capable of discriminating between failed senders or wiring components and an actual failure conditions.
- G. Remote Indicator Panel: The remote annunciator panel shall be surface or flush-mountable with micarta label reading "Engine Operator Conditions," and with the following devices:
- 1. Green pilot light with engraving to indicate "ENGINE RUNNING."
 - 2. One audible alarm with silencing switch to indicate engine start failure for any of the following reasons:
 - a. High water temperature.
 - b. Low oil pressure.
 - c. Over-speed.
 - d. Over-crank.
 - e. Low battery voltage.
 - f. Low-level fuel alarm.
 - 3. Remote indicator panel shall include an amber light indication for each of the following:
 - a. Control switch not in auto position.
 - b. Low water temperature.
 - c. ATS in normal position (for each ATS).
 - d. ATS in emergency position (for each ATS).
 - 4. Each of the functions listed previously in Paragraphs 2.(a) through (f) shall be indicated by a separate red warning light and each warning light shall be so engraved.
- H. Fuel System: The fuel system shall conform to NFPA 30 and 37. The fuel system shall be complete and shall consist of a dual filtering system, and engine fuel pump. The engine shall start, operate, and stop on DF-2 fuel.
- 1. Fuel Filtering System: The fuel filtering system shall consist of a strainer, located between the storage tank and the fuel transfer pump, and a duplex fuel filter, located between the engine fuel pump and the engine. The filtering system shall be capable of removing from the fuel system flakes, dirt, metallic chips, carbon, water, or other foreign matter, which would be harmful to the engine. The filtering system shall be easily accessible for quick-and-easy replacement of the filter element and cleaning of

the strainer. Components of the filtering system shall be the standard products of the engine Manufacturer.

2. Engine Fuel Pump: The engine fuel pump shall be a positive-displacement, engine-driven pump capable of supplying an adequate quantity of fuel to the engine under all operational conditions. Solenoid shut-off valve in fuel line discharge side of pump shall be interlocked with the emergency engine shutdown circuitry.
3. Fuel Tank: The fuel tank shall be skid mounted under the engine, and shall be capable of providing an immediate fuel supply to the engine fuel pump. The tank shall be no more than 30" high. The tank shall be provided with a flexible tubing suction line to the engine, an excess fuel return line from the engine to the tank, a fuel gauge, a vent, a drainpipe, and high and low-level float switches for activating the low-level alarms. Usable fuel tank capacity shall not exceed 660 gallons – see drawings for exact capacity of fuel tank. The tank shall be a full double wall, U.L. listed design and shall be factory tested in accordance with the requirements of U.L. 142. The outer containment cavity shall be equipped with an emergency leak-detection float switch for the leak detection and alarm system. The tank shall as a minimum include the following:
 4. Primary tank venting shall be provided and shall be a minimum of 1.25" nominal inside diameter. The primary vent shall be extended thru the roof of the generator enclosure to a height not less than 12 feet above grade. The normal vent shall have a screened mushroom style cap.
 5. Emergency relief venting shall be provided for both the primary and secondary tanks. Rain protected, open style rupture basins are not acceptable. These vents shall be extended thru the roof of the generator enclosure to a height of not less than 12 feet above grade. The extended emergency vents shall be capped with U.L. listed pressure relief type caps designed to open at 2.5 PSI. Materials used for vent pipes, supply and return piping, valves and fittings shall conform to Article 79, Division VII.
 6. A 5 gallon capacity overflow basin shall be provided around the fill pipe and shall include a means of draining spills back into the main tank. The fill pipe shall be extended down into the fuel tank and terminate within 6" of the bottom of the tank.
 7. The high fuel sensor shall be wired to an audible and visual local alarm that shall be activated at 90% of the tank capacity. The alarm panel shall be mounted at the fill location and shall include a reset/silence for the alarm and light that will automatically reset the controller for the next fill. An "off switch" is not acceptable.
 8. The tank shall include labels to indicate "Diesel Fuel". The lettering shall be 3" high, half-inch stroke, red letters on a white background outlined in red.
 9. All of the above items shall be submitted for approval. Do not release the fuel tank for manufacture until it has been approved.
- I. Output Circuit Breakers:
 1. Provide engine-generator mounted circuit breakers for each automatic transfer switch, and where indicated on the drawings one for a portable load bank, with ratings as noted on the Drawings. Breaker handles shall not exceed 6'-6" above grade when engine-generator is mounted to a 30" high base fuel tank on top of a 3 inch high structural isolation pad.
- J. Weather Protective Sound Attenuated Enclosure:
 1. The generator set and accessories, including muffler and load bank, shall be completely housed in a weather protective and sound attenuated enclosure. The enclosure shall have a cambered roof to prevent rain accumulation, shall include stainless steel hardware to prohibit rust, and shall include stainless steel retainers to hold doors securely in place. The enclosure sound level shall be as specified herein. The generator set, enclosure, load bank and sub-base fuel tank shall be U.L 2200 listed as a package.

2. Material used for the enclosure shall be 14-gage steel for panels and 12-gage steel for posts. Three hinged lockable access doors shall be provided on each side, with hold-open retainers as indicated in Paragraph 1 above. Non-hygroscopic sound insulating materials shall be provided on the interior walls. Rodent barriers shall be provided on inlet and outlet sides. Louvers shall be fixed. The enclosure shall attach to the sub-bases fuel tank. Oil and coolant drains shall be run to the exterior of the enclosure. Interior valves on the oil and coolant lines shall be provided for ease of service.
3. The enclosure shall completely house the muffler on the generator set.
4. Provide sheet metal scoop on radiator output, to direct the radiator exhaust air directly up and vertically out of the generator enclosure. Provide screen on output of scoop to prevent dirt, leaves, and bird incursions. Provide drain on floor of scoop to drain off any water. Provide access door in scoop for cleaning of any accumulated debris. Scoop shall be factory-mounted as part of the engine-generator package. Provide detailed shop drawings of scoop with engine-generator submittals.

K. Load Bank

1. The total capacity of the load bank shall be 50% of rated generator KW.
2. The load step resolution shall be a nominal 20% of the load bank rating.
3. The load bank shall be designed for continuous duty cycle operation with no limitations.
4. Radiator/Duct mounted load banks are designed as a supplemental load to the generator set, and shall be sized at 50% of generator nameplate kW rating.
5. The load bank shall be suitable for installation on the generator radiator core, within the radiator exhaust ductwork, or on the roof of the generator set enclosure. Due to the high radiator exhaust from the generator, the load bank shall be constructed of heavy gauge aluminized steel per ASTM A463. Aluminized steel shall provide superior corrosion protection and extended service life, with a better tolerance to high heat exposure compared to the more common galvanized steel.
6. The main input load bus, load step relays, fuses and control relays shall be located within the load bank enclosure. The load bank shall have a self-contained 2" flange on the top and bottom edges for mounting. Load banks with a depth of 13" shall have provisions for overhead lifting and duct adaptors.
7. The load bank shall be designed for installation and operation outdoors. Load bank shall have a screened exhaust or a louver. Load bank shall be painted ASA-61 grey and have a baked polyester powder coated finish with a film thickness of 2.8 +/- 0.4 mils per coat.
8. Load elements shall be ASCO Helidyne, helically wound chromium alloy rated to operate at approximately 1/2 of maximum continuous rating of wire. Elements must be fully supported across the entire length within the air stream by segmented ceramic insulators on stainless steel rods. Element supports shall be designed to prevent a short circuit to adjacent elements or to ground. The change in resistance due to temperature shall be minimized by maintaining conservative watt densities.
9. The overall tolerance of the load bank shall be -0% to +5% kW at rated voltage. A -5%,+5% rating shall allow the load bank to deliver less than rated kW and shall not be used. The load bank must deliver full rated kW at rated voltage.

10. Sealed wire type elements (which have the internal resistance wire totally enclosed) prevent internal cooling of the element wire and shall not be used.
11. The engine generator shall provide sufficient air to cool the load bank. The load bank shall have a static pressure drop of approximately 0.1" H₂O at design velocity (50 ft.min).
12. An over-temperature switch shall be provided to sense the load bank exhaust. The switch shall be electrically interlocked with the load application controls to prevent load from being applied in the event of an over-temperature condition.
13. To provide for major fault protection, branch fuses shall be provided on all three phases of switched or load steps. Branch fuses shall be current limiting type with an interrupting rating of 200K A.I.C.
14. The exterior of the load bank shall have appropriate warning/caution statements on access panels.
15. Building Management Interface: Load bank control module shall have provisions to interface with existing building management system. Modbus communications protocol shall allow integration of load bank with building supervisory and monitoring systems through a PLC, HMI or SCADA systems. Interface shall be directly from an Ethernet port within load bank.
16. Manual controls shall be provided via a control panel housed in a NEMA 4 type wall mount enclosure in the generator enclosure. The control panel shall contain a power on indication light and an overtemperature alarm light and also the following manual controls:
 - a. Power ON/OFF switch
 - b. Master load ON/OFF switch.
 - c. Load step switches for ON/OFF application of individual load steps.
17. A standard remote load dump circuit shall be provided as part of the load bank control circuit. Provisions shall be provided to remove the load bank off-line from the operation of a remote normally closed set of auxiliary contacts from a transfer switch or other device. In the event of the remote contact opening, all load shall be removed.
18. Installation and operation manuals shall be provided with the equipment and shall include complete details for the installation, commissioning, operation, and maintenance of the load bank. The manuals shall include the electrical schematic and interconnect drawings for the power and control wiring for the load bank and all control devices. A complete parts list with part numbers, device identification, and rating shall be included in the manuals. The original manufacturer's name and part number shall be included in the parts listing. The manuals shall be provided electronically on a USB drive.
19. The load bank shall be fully tested using a test specification written by the supplier. Tests shall include electrical functional testing, verifying conformance to assembly drawings and specifications. Each load step shall be cold resistance checked to verify proper calibration of resistive

load steps and proper ohmic value. The manufacturer shall maintain this data on file for inspection purposes by the purchaser. Tests using high potential equipment shall be performed to ensure isolation of the load circuits from the control circuits and to determine isolation of the load circuits from the load bank frame. Tests of all safety circuits shall be performed to verify conformance to the specification. All electrical circuits shall have a high potential insulation resistance test performed at twice rated voltage plus 1000 VAC to assure insulation integrity.

- 20.** The load bank shall be manufactured by a firm regularly engaged in the manufacture of load banks and who can demonstrate at least twenty five (25) years of experience with at least twenty five (25) installations of load banks similar or equal to the ones specified herein. ASCO Power Technologies or approved equal. A 2-year warranty shall be provided for both the resistors and the load bank.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. The engine-generator set shall be mounted on a rigid steel chassis suitable for installation on seismic isolators.
- B. The Contractor shall assist the Owner in preparing and submitting a permit-to-construct application to the local Air Quality Management District for installation of the engine-generator. The Contractor shall pay for permit and permit approval fees, and the Owner shall pay for annual operational fees. Granting of such permit will require a site-specific screening application followed by an analysis by the local Air Quality Management District.
- C. Load tests shall be run as required in Paragraph 1.4 of this Section to the generator rated load after generator installation is complete. The Manufacturer shall provide auxiliary load banks for full-load testing of the generator. Manufacturer shall schedule the tests with the Owner so that final tests may be witnessed. Verify correct reading and operation of all meters, indicators and controls.
- D. Readings required during both preliminary and final tests requested in Paragraph 1.04 shall be taken and shall include the following:
1. Frequency.
 2. Voltage.
 3. Current.
 4. Wattage.
 5. Ambient temperature.
 6. Water temperature.
 7. Oil pressure and temperature.
- E. Protection: Provide protection facilities and procedures to prevent damage and deterioration.
- F. Verify utility phase rotation prior to connection of the Generator to the distribution system. Modify the Generator output phase rotation to match the Utility Company.
- G. The Manufacturer shall perform the following fuel tank tests at the site after the installation is complete, but before the fuel is delivered. Tests shall be conducted in the presence of the Owner and shall include as a minimum the following:
1. Primary tank shall be pneumatically tested at 5 psig for 30 minutes; during which time the connections to the primary tank shall be soap tested.

2. Secondary tank shall be pneumatically tested at 3 psig for 30 minutes; during which time the connections to the secondary tank shall be soap tested.
 3. Primary piping shall be pneumatically tested at 150 percent of the maximum operating pressure for 30 minutes; during which time all fittings shall be soap tested.
 4. Secondary piping, if provided, shall be pneumatically tested at 5 psig for 30 minutes, with soap testing.
 5. Other secondary containment shall be liquid tight as demonstrated by a 24-hour standing water test.
 6. Correct operation of the leak detection system shall be demonstrated.
- H. The DPF manufacturer's authorized factory representative shall verify correct installation of the DPF and filter at the site prior to engine-generator start-up and shall perform all testing and commissioning of the DPF in conjunction with the engine-generator testing after the installation is complete. Tests shall be conducted in the presence of the Owner.

3.2 INSTRUCTION AND MAINTENANCE

- A. Instruct the Owner's personnel in the proper use, operation and maintenance of the generator, fuel tank and load bank. Review emergency provisions, including emergency access and procedures to be followed at time of failure in operation and other building emergencies. Train Owner's personnel in the procedures to be followed, checking for the source of an operational failure or malfunction.
- B. Instruct the Owner's personnel in the proper use, operation and maintenance of the DPF, including maintenance and replacement of the filters and periodic use of a portable load bank to maintain DPF in optimum condition.
- C. Maintenance Period: Starting at the date of acceptance of the Work, provide complete systematic inspection and maintenance for the first three years. Furnish trained experts and equipment to check, adjust, lubricate and otherwise maintain the generator set in operation without defects or deterioration. Replace or repair materials and parts, which become defective or deteriorated for any reason.
- D. Furnish a factory-trained Engineer for a minimum of one working day prior to final acceptance of the generator installation, or as needed to satisfy Owner that the system is functioning properly. Testing and training for the new engine-generator installation will take place at non-standard times. Training and testing will take place on weekends, and could be scheduled on holidays and in the middle of the night, at the discretion of the Owner. Provisions shall be made in the bidding for this contract for such scheduling requirements.
- E. Provide 3 year Manufacturer maintenance Contract, for the new engine-generator installation. This shall include two site visits per year and annual load-bank testing as specified in Paragraph 1.1 of this Section.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK.

SECTION 263601
AUTOMATIC TRANSFER SWITCHES

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Provide quantity of automatic transfer switches as indicated on the drawings and as specified herein.

1.2 SUBMITTALS

- A. Refer to Section 260500 and Division 1 for procedure.
- B. Shop Drawings and Product Data, including complete wiring diagrams, including system interconnections.
- C. Test and Test Report for each Automatic Transfer Switch:
 - 1. Visual and Mechanical Inspection:
 - a. Inspect for physical damage.
 - b. Compare equipment nameplate information and connections with single line diagram and report any discrepancies.
 - c. Check switch to ensure positive interlock between normal and alternate sources.
 - d. Check tightness of all cable connections and bus joints.
 - e. Perform manual transfer operations.
 - f. Electrical Tests for Automatic Transfer Switch:
 - 1) Perform insulation resistance tests phase-to-phase and phase-to-ground with switch in both source positions.
 - 2) Set and calibrate in accordance with the Manufacturer's recommendations.
 - (a) Voltage-sensing relays.
 - (b) Transfer time delay relays.
 - (c) Engine shutdown relays.
 - 3) Perform automatic transfer by:
 - (a) Simulating loss of normal power.
 - (b) Return to normal power.
 - 4) Monitor and verify correct operation and timing:
 - (a) Normal voltage-sensing relays.
 - (b) Engine start sequence.
 - (c) Time delay upon transfer.
 - (d) Alternate voltage-sensing relays.
 - (e) Automatic transfer operation.
 - (f) Interlocks and limit switch function.
 - (g) Timing delay and retransfer upon normal power restoration.
 - (h) Engine shutdown feature.
 - (i) Correct functioning of auto-exercising controller.
- D. Maintenance and operating instruction manuals. Submit four bound copies including approved Shop Drawings, parts list, list of recommended spare parts, sources of purchase and similar information.

1.3 REFERENCE STANDARDS

- A. The following Specifications and standards, except as hereinafter modified, are incorporated herein by reference and form a part of this Specification to extend the indicated by the references thereto. Except where specific date is given, issue in effect (including amendments, addenda, revisions, supplements, and errata) on the bid date shall be applicable. In text such Specifications and standards are referred to by basic designation only.
- B. National Fire Protection Association (NFPA)
 - 1. No. 70 National Electrical Code (NEC)
- C. Underwriters' Laboratories, Inc. (UL):
 - 1. No. 1008 Automatic Transfer Switches
 - 2. No. 489 Molded Case Circuit Breakers
- D. National Electrical Manufacturers Association (NEMA):
 - 1. ICS 2.447 Industrial Control and Systems
- E. American National Standards Institute (ANSI):
 - 1. V37-90a Guide for Surge Withstand Capability (SWC) Tests

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. ASCO
- B. Russelectric
- C. Onan
- D. Kohler
- E. Caterpillar

2.2 AUTOMATIC TRANSFER SWITCH, GENERAL

- A. Each automatic transfer switch (ATS) shall be 3-pole or 4-pole as indicated on the drawings and rated as indicated on the drawings. Transfer switch shall be listed and labeled under UL-1008 as a device for use on emergency generator systems. ATS shall be mounted in a Nema 1 or Nema 3R enclosure as indicated on the drawings. ATS shall be the standard product of a company engaged in manufacturing automatic transfer switches for at least 10 years. ATS shall be manufactured so that no rear or side access is required.

2.3 CONSTRUCTION AND PERFORMANCE

- A. Transfer Switch shall consist of completely enclosed multi-pole contact assembly and a separate control logic panel. The contact assemblies shall be operated by a stored energy mechanism, and be energized only momentarily during transfer providing inherently double throw switching action. Control power for all transfer operations shall be derived from the line side of the source to which the load is being transferred.
- B. Transfer Switch shall be positively interlocked mechanically and electrically to prevent simultaneous closing of both sources under either automatic or manual operation. A neutral

position shall not be possible under normal electrical operation except that the switch shall be provided with a Delayed Transition accessory for switching highly inductive loads. Transfer Switch shall have a manual neutral position for load circuit maintenance. A Transfer Switch position indicator shall be visible from the front of the switch to show to which source the transfer switch is connected.

- C. Transfer switch shall be capable of being operated manually under full load conditions. Manual operation shall be accomplished via integrally mounted pushbutton operators located on the face of the contact assemblies. Removable manual operation handles and handles which will move in the event the electrical operator becomes energized while performing a manual transfer operation are not acceptable. The manual operator shall provide the same contact-to-contact transfer time as provided under normal automatic operation to prevent possible flashovers from switching the main contacts slowly. In addition, provisions shall be provided to allow disengagement of the electrical operator during manual operation.
- D. Transfer Switch shall have four extra sets of normally open and normally closed auxiliary contacts, which indicate ATS positions.
- E. A solid state sensing and control logic panel shall be separately mounted from the power-switching portion of the Transfer Switch. The two Sections shall be connected together by control cables with plug-in connectors. The control Section shall be capable of being disconnected from the power Section for maintenance purposes.
- F. The logic circuit shall utilize differential sensing solid-state components mounted on printed circuit boards to accomplish proper operation and to perform functions such as timing and voltage and frequency monitoring. LED's on each PC card shall indicate the proper operation of each function furnished. Construction shall be such that functions cards are individually replaceable without requiring replacement of the complete solid-state package. Cards for plug-in modifications shall be available for field installation with retention of the UL label.
- G. Where indicated on the drawings, ATS shall be provided with power meter, Square D PM850 or equal, with network card for communications interface with Owner's power management system.

2.4 SEQUENCE OF OPERATION

- A. Upon reduction of phase-to-phase voltage of the normal source to 80% of nominal, and after a time delay of 1-90 seconds (adjustable to meet field conditions) to override momentary dips and/or outages, the auxiliary engine start contacts shall close to initiate starting of the Emergency Generator.
- B. After the Generator has reached 90% of nominal voltage and frequency, and after a time delay, ATS shall transfer the load to the Generator. Provide an under-voltage / under-frequency monitor for the Emergency/Standby Source.
- C. When the Normal Source has been restored to 90% of rated voltage, and after a time delay adjustable from 0.5-30 minutes (to insure the integrity of the Normal Power Source), the load shall be retransferred to the Normal Source.
- D. A time delay module shall be provided in the ATS, adjustable 0.5-30 minutes, to delay shutdown of the Emergency/Standby Power Source after retransfers to allow the generator to run unloaded for cool-down.

- E. If the Emergency Generator should fail while carrying the load, transfer to the Normal Power supply shall be made instantaneously upon restoration of the Normal Source to satisfactory conditions.
- F. ATS shall be provided with a Delayed Transition timer, adjustable 0-120 seconds. The ATS shall pause during transfer with both sources disconnected from the load, to allow back-EMF from large inductive loads to decay. Methods, which use relative phase-angle differences to control transfer, are not acceptable.
- G. ATS shall be provided with 4 sets of Auxiliary Contacts to indicate 'Normal' or 'Emergency' Position of the ATS.

2.5 ADDITIONAL ACCESSORIES/SPARE PARTS

- A. Provide an engine exercise timer in the ATS indicated on the drawings which shall automatically start the engine periodically. Timer shall be digital, with lithium battery back up. Provide a selector switch to select exercise with load transfer or without load transfer. The timer shall include a failsafe circuit, such that if the engine fails during exercise the ATS will immediately retransfer to the Normal source.
- B. Provide pilot lights to indicate to which source the load is connected, and to indicate the availability of each power source.
- C. The transfer switch shall be rated for the short circuit currents noted on the Drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Refer to Section 260500 for details of Work under this Section, including seismic installation requirements.
- B. Testing: See Section 260800 and Section 263214.

END OF SECTION

SECTION 264300
SURGE PROTECTIVE DEVICE
(SPD)

PART 1 GENERAL

1.1 WORK INCLUDED

- A. The Basic Electrical Requirements, Section 26 05 00, are part of this Section, and the contract for this work, and apply to this Section as fully as if repeated herein.
- B. This specification describes the mechanical and electrical requirements for a Surge Protective Device and noise filter herein known and shown on all drawings as SPD. The SPD shall be suitable for application in category C3, B3/C1, and B3 environments (see Part 2 of this Section for specific application) as described in ANSI/IEEE C62.41. The SPD shall be of parallel design and provide surge protection in all modes as well as electrical high frequency noise filtering for high exposure locations as defined in ANSI/IEEE C62.41-1991.
- C. The unit shall be UL 1449 2nd Addition Listed (including 2005 Revisions) as a Surge Protective Device and UL 1283 Listed as an Electromagnetic Interference Filter.

1.2 SUBMITTALS

- A. Comply with the requirements of Section 01 33 00.
- B. Submit all related SPD specifications, electrical and mechanical drawings, maintenance manuals and U.L. 1449 surge suppression ratings for the SPD.
- C. Equipment Manual: Furnish with the submittal and with each unit delivered an equipment manual (3 copies) that details the installation, operation and maintenance instructions for the specified unit.
- D. Drawings: Electrical and mechanical drawings (3 copies) shall be provided with the submittal and with each unit delivered that show unit dimensions, weights, mounting provisions, connection details and layout diagram of the unit.
- E. UL 1449 Listing/Clamp Voltages: Manufacturer shall provide data showing UL 1449 product listing. Manufacturer shall also submit certified documentation of applicable Location Category Testing in full compliance with Nema LS 1-1992, paragraphs 2.2.10 and 3.10.
- F. Single Pulse Surge Current Capacity Testing: Certified documentation of the unit*s Single Pulse Surge Current Capacity Testing shall be included in the submittal.
- G. Minimum Repetitive Surge Current Capacity Testing: Certified documentation of the unit*s Minimum Repetitive Surge Current Capacity Testing shall be included in the submittal.
- H. Spare Parts: A list of customer-replaceable spare parts shall be included in the submittal and with each unit delivered. All spare parts shall be quickly and easily field-replaceable.
- I. Diagnostic Signature Card: Each SPD unit shall include a Diagnostic Signature Card listing factory-established benchmark suppression voltage values for all modes of protection. The

suppression voltage values shall be established during final production line testing utilizing a DTS-2 Diagnostic Test Set. This Diagnostic Signature Card shall provide space for subsequent field testing allowing comparison of the initial factory benchmark testing with subsequent field testing suppression voltage values.

1.3 QUALITY ASSURANCE

- A. Manufacturers Qualifications: Firms regularly engaged in the manufacture of SPD products for categories C3, B3/C1, and B3 (ANSI/IEEE C62.41) and whose products have been in satisfactory service for not less than 5 years.

1.4 CODES AND STANDARDS

- A. UL compliance and labeling: Listed per UL 1449 and UL 1283.
- B. ANSI/IEEE compliance: Comply with ANSI/IEEE C62.41 (Categories C3, B3/C1 and B3 as applicable - see Part 2 of this Section) and C62.45.
- C. NEC compliance: Comply with NEC as applicable to construction and Article 280 for installation.
- D. National Electrical Manufacturers Association (NEMA LS1-1992)
- E. The SPD shall be capable of surviving 1000 sequential Category C3, B3/C1, or B3 surges (as applicable - see Part 2 of this Section) without failure. Follow IEEE test procedures established in C62.45.

PART 2 PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. List of Equipment Manufacturers:
Current Technology, Liebert, L.E.A. Dynatech or equal.
- B. Surge Suppressor shall be Current Technology or approved equal with options as listed in paragraph 2.02-L below:
 - 1. Switchboards, Distribution Panels, or other distribution equipment rated 1600A and above (Category C3):
 - a. 300,000A Single Surge Current Capacity (L-N / L-G / N-G / L-L)
 - b. Type SEL300-120/208V-3GY-DM-L2 for 120/208V systems.
 - 2. Switchboards, Distribution Panels, or other distribution equipment rated 1000A or 1200A (Category C3 for service entrance or B3/C1):
 - a. 250,000A Single Surge Current Capacity (L-N / L-G / N-G / L-L)
 - b. Type TG250-120/208-3GY-DM-L2 for 120/208V systems.

3. Switchboards, Distribution Panels and other distribution equipment rated 800A or less with no upstream SPD protection (Category B3/C1):
 - a. 200,000A Single Surge Current Capacity (L-N / L-G / N-G / L-L)
 - b. Type TG200-120/208V-3GY-DM-L2 for 120/208V systems.
4. Switchboards, Distribution Panels and other distribution equipment rated 800A or less with upstream SPD protection (Category B3):
 - a. 150,000A Single Surge Current Capacity (L-N / L-G / N-G / L-L)
 - b. Type TG150-120/208-3GY-DM-L1 for 120/208V systems.
5. Branch Circuit Panelboards with up-stream SPD protection (Category B3):
 - a. 80,000A Single Surge Current Capacity (L-N / L-G / N-G / L-L)
 - b. Type TG80-120/208V-3GY-DM-L1 for 120/208V systems.
6. Branch Circuit Panelboards with integral SPD protection (Category B3):
 - a. 80,000A Single Surge Current Capacity (L-N / L-G / N-G / L-L)
 - b. Type EGPE2-80-120/208V-3GY WYE for 120/208V systems

2.2 SPD GENERAL

- A. The SPD maximum continuous operating voltage (MCOV) shall be capable of sustaining 115% of the nominal rms voltage continuously without degradation. All suppression filter systems maximum continuous operating voltages shall be in compliance with test and evaluation procedures outlined in NEMA LS 1-1992.
- B. Operating frequency range shall be 47 to 63 Hertz.
- C. Protection Modes. All protected modes shall be as defined per NEMA LS 1-1992, paragraph 2.2.7. SPD shall provide protection in all modes, including Line-to-Neutral, Line-to-Ground, Line-to-Line and Neutral-to-Ground protection.
- D. The rated single pulse surge current capacity for each mode of protection of the unit shall be as indicated in Paragraph 2.01.B of this Section.
- E. In compliance with NEMA LS 1-1992, suppression filter systems shall be single pulse surge current tested in all modes at surge currents up to 150% of the product design rating by an industry-recognized independent test laboratory. The test shall include an ANSI/IEEE C62.41-1991 Category C1 surge defined as a 1.2 X 50 Fsec, 6000V open circuit voltage waveform and an 8 X 20 Fsec, 3000A short circuit current waveform to benchmark the unit's suppression voltage, followed by a single pulse surge of maximum rated surge current magnitude with an approximated 8 X 20 Fsec waveform. To complete the test, another Category C1 surge shall be applied to verify the unit's survival. Survival is achieved if the suppression voltage measured from the two category C1 surges does not vary by more than 10%. Test results shall be submitted.

- F. Per ANSI/IEEE C62.41 and ANSI/IEEE C62.45-1992, all suppression filter systems shall be repetitive surge current capacity tested in every mode utilizing a 1.2 x 50 Fsec, 20 KV open circuit voltage, 8 x 20 Fsec, 10 KA short circuit current Category C3 bi-wave at one minute intervals without suffering either performance degradation or more than 10% deviation of clamping voltage at a specified surge current. Test results shall be submitted.
- G. Suppression filter systems EMI-RFI noise rejection or attenuation values shall be in compliance with test and evaluation procedures outlined in NEMA LS-1-1992.

Attenuation Frequency	100KHz	1MHz	10MHz	100MHz
Insertion loss (ratio)	50-1	350-1	500-1	250-1
Insertion loss (dB)	34	51	54	48

- H. SPD systems clamping voltages shall be in compliance with test and evaluation procedures outlined in NEMA LS 1-1992. Maximum clamping voltages shall be as follows:

System Voltage	Mode	A3 Ringwave	B3 Ringwave	B3/C1 Comb. Wave	C3 Comb. Wave
120/208	L-G	355	420	410	775
	N-G	220	290	380	550
	L-L	440	540	750	1400

- I. The unit shall be installed with coordinated UL 489 or UL 198 listed or recognized overcurrent protection devices.
- J. The SPD shall have a response time no greater than .5 nanoseconds, for any of the individual protection modes.
- K. The SPD shall use LED indicators which provide indication of suppression failure as well as optically isolated N.C dry contacts for remote monitoring.
- L. SPD Product Characteristics:
 1. SPD Units for connections to equipment rated 1600A and above: The SPD shall include an engineered solid-state high performance suppression system utilizing a predetermined number of selenium cells and arrays of non-linear voltage dependent metal oxide varistors with similar operating characteristics. The suppression system shall not utilize gas tubes, spark gaps, silicon avalanche diodes. The suppression system shall not incorporate non-field replaceable components which may degrade performance or long term reliability of the suppression system.
 2. SPD Units for connections to switchboards and panels rated 1200A and below: The SPD shall include an engineered solid-state high performance suppression system utilizing arrays of non-linear voltage dependent metal oxide varistors. The suppression system shall not utilize gas tubes, spark gaps, silicon avalanche diodes. The suppression system shall not incorporate non-field replaceable components which may degrade performance or long term reliability of the suppression system.

3. Each SPD shall include a high frequency extended range power filter and shall be UL 1283 listed as an Electromagnetic Interference Filter. The filter shall reduce fast rise-time, high frequency, error-producing transients and electrical line noise to harmless levels, thus eliminating disturbances which may lead to electronic system upset. The filter shall provide minimum noise attenuation values as specified in Paragraph 2.2.G of this Section.
4. All internal wiring associated with the suppression filter system and subject to surge currents shall utilize low-impedance copper bus bar. All internal connections associated with the suppression filter system and subject to surge currents shall be made with compression or mechanical solderless-type lugs and shall be bolted to the bus bars in order to reduce overall system impedance. No plug-in component modules, quick-disconnect terminals, non-field replaceable fusing or printed circuit boards shall be used in surge current-carrying paths.
5. The unit shall include long-life, solid state, externally visible status indicators that monitor the on-line status of each phase of the unit.
6. The unit shall incorporate an integral test point allowing easy off-line diagnostic testing verifying the operational integrity of the unit's suppression filter system. Field testing shall permit proactive testing to ensure performance and long term reliability. Testing shall include injection of an impulse into the off-line suppression filter system to verify the suppression performance values established at final factory testing and recorded on the Diagnostic Signature Card. Indicator lights monitoring fuse condition or power available which inform the user of failure after the fact do not meet the intent of this specification.
7. The SPD shall include an integral non-fused safety interlocked disconnect switch with an externally mounted manual operator.
8. The SPD shall include a battery-powered audible alarm that detects and provides notification of any single or multiple phase failure of the suppression filter system. The unit shall also include a status indicator for each phase that extinguishes to indicate a failure mode and an LED that flashes to indicate any alarm condition. The alarm shall have a silence switch and a test switch for ensuring positive function and shall have an alarm disable LED that illuminates when the alarm is disabled. The monitoring unit shall have an easily replaceable, commonly available battery for backup to ensure audible alarm function in the event of a total power failure. The unit shall have a battery backup monitor light which shall illuminate when the battery requires replacement. To monitor on-line status, the monitoring package shall also include two sets of form C dry contacts (N.O. or N.C.) to facilitate connection to remote monitoring facilities. The contacts shall be normally open or normally closed and shall change state upon the failure of the suppression system or power loss in any combination of all three phases.

PART 3 EXECUTION

3.1 GENERAL

- A. Refer to Section 260500 for details of work under this section.

3.2 TESTING

- A. Upon completion of installation, a factory-certified local service technician shall provide testing services. The following tests shall be performed:

1. Voltage measurements from Line-to-Ground, Line-to-Neutral, Line-to-Line and Neutral-to-Ground at the time of the testing procedure.
 2. Impulse injection to verify the system suppression voltage tolerances for all suppression paths. Impulse testing shall be completed while the unit is off-line to isolate the unit from the distribution system.
- B. Test results shall be recorded and compared to factory benchmark test parameters supplied with each individual unit. A copy of the start-up test results and the factory benchmark testing results shall be supplied to the engineer and the owner for confirmation of proper suppression filter system function. In addition, the integrity of the neutral-ground bond shall be verified through testing and visual inspection.

3.3 GUARANTEE

- A. The manufacturer shall provide a 5 year warranty from date of installation against failure of each SPD unit.

END OF SECTION

SECTION 265101
LIGHTING

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Luminaires (i.e., lighting fixtures): Refer to the Luminaire Schedule and provide a complete and working facility Lighting System. Catalog numbers in the Luminaire Schedule are design series references and may not represent the exact catalog number as specified or as required for particular installations. Provide complete luminaires to correspond with the number of LEDs, power supply, wattage, mounting hardware, ceiling type, trim, size, and special requirements as specified in the Luminaire Schedule for each luminaire type. Additional features, accessories, and options specified, described, scheduled, or necessary for installation shall be included.
- B. LEDs and power supplies.
- C. Lighting controls, including occupancy sensors. See Section 265700 for Low Voltage Lighting Control System.
- D. Exit and Emergency Egress lighting where indicated and where required.
- E. Supports for outlet boxes and luminaires, including seismic restraint slack wires for recessed luminaires in suspended ceilings per code and backing in walls as required to keep luminaires secure and level.

1.2 INCORPORATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.
- B. Section 260500 and 262700 apply to all work in this section.
- C. Division 03: Concrete (Bases for pole-mounted luminaires as noted in Luminaire Schedule).
- D. Division 09: Painting and Finishes (cutting of holes in finished surfaces for recessed luminaires).

1.3 RELATED WORK

- A. Ceiling Access panels where required for access to equipment, outlets, transformers, etc., located above suspended ceilings, sheet rock or plaster ceilings. Coordinate with the Architect and other trades.

1.4 SUBMITTALS

- A. Submit under provisions of Division 1 and Section 260500.
- B. Submit (6) six sets of submittals for review by the project team unless otherwise noted in these specifications. The submittals shall include the following information:
 - 1. Product Index: The following information shall be included in the product index.
 - a. Luminaire Type. The index shall list, in alphabetical order, each luminaire type per the Luminaire Schedule.

- b. Manufacturer's Catalog Number. Outstanding information required to make a complete catalog number shall be clearly identified in the index.
 - c. Where a pole is included with the luminaire, include the catalog number of the pole in addition to that of the luminaire.
 - d. LED Data. Provide the Manufacturer's name for each LED array including wattage, color temperature, lumen output, and color rendering index.
2. Manufacturer's literature for every luminaire listed on the Luminaire Schedule.
 - a. Catalog Information:
 - 1) Luminaire Data Sheet: The manufacturer's cut sheet shall include the following:
 - (a) Photometrics: Candlepower distribution curve or table with horizontal readings at 0, 22.5, 45, and 90 degrees and vertical readings from 0 to 180 degrees in 5 degree increments in accordance with the Illuminating Engineering Society published test procedures.
 - (b) Catalog Number Nomenclature
 - (c) Coefficient of Utilization Tables
 - (d) Luminaire Line Drawing
 - (e) Power supply (each type)
 3. Data sheets for power supplies. Indicate luminaire types on applicable power supply data sheets.
 4. Data sheets for wallbox controls and other products specified in this section.
 5. Shop Drawings:
 - a. Provide shop drawings of suspension details for luminaires recessed in, mounted on, or suspended from hung ceilings. Details shall clearly illustrate proposed methods for supporting luminaires independent of the suspended ceiling system.
 - b. Detailed shop drawings of pendant mounted luminaires constructed with linear metal housings containing the following information.
 - 1) Support mechanism, including swivel canopies.
 - 2) Trim details.
 - 3) Closure piece details.
 6. Samples:
 - a. Provide samples of luminaire trim where "Finish as selected by Architect" is indicated on the Luminaire Schedule. Submit two finish samples, 75 mm x 75 mm (3" x 3") minimum, of all custom color, decorative metal, or anodized aluminum finishes. Samples must be approved in writing by the Architect prior to ordering.
 - b. Submit sample of custom luminaires: complete and operational, equipped with 120V, 6 foot cord and 3 prong grounded plug. Luminaire shall be fabricated and finished as specified, full size, using specified materials & equipment. Submit one luminaire to Owner's representative for review prior to production.
- C. For Any Luminaires Substituted For Those Specified:
1. Refer to Division 1 - Product Requirements, for all substitution procedures.
 2. Provide independent testing laboratories, Inc., or equal, photometric test report for each Luminaire type and lamp combination listed on the Luminaire Schedule. Test reports shall be based on Illuminating Engineering Society published test procedures and shall contain polar coordinate candlepower distribution curves in five lateral planes for luminaires with asymmetric distributions and luminaire luminance data for vertical angles above 45 degrees from nadir. Test results shall indicate luminaire efficiency for the lamp and aperture assembly specified. Luminaires with efficiencies more than 2% below the values of specified luminaires are not acceptable and will be rejected.
 3. Provide photometric calculations for each room or area where a substituted luminaire is proposed. Such calculations shall be made using comprehensive lighting software, such as AGI32, and include point-by-point illuminance values at IES recommended heights, average illuminance, and maximum-to-minimum and average-to-minimum uniformity

ratios. Room dimensions, configurations (including sloping ceilings), room surface reflectances, light loss factors, and heights of suspended luminaires shall match the heights specified in the contract documents.

4. Due to the variety of lumen outputs and light distributions of LED Luminaires, substitutions will require additional review on the part of the Engineer or Architect to ascertain the equivalency of the substituted luminaires. Substitutions will be reviewed to determine their aesthetic, construction, and photometric equivalency to maintain similar design impact and performance in their intended environment. The Engineer and Architect have not included such unknown and unquantifiable review time in their scope of work and are not compensated by the Owner for such services. The Contractor shall reimburse the Engineer and Architect for labor costs to review substitutions.
5. Prior approval does not guarantee final approval by the Engineer. The Contractor shall be responsible for providing luminaires that meet or exceed the quality and performance of the specified products in their entirety. All deviations in quality and performance from the specified products must be listed and individually signed off by the engineer.
6. The Owner reserves the right to reject a proposed substitution based on their agent's professional judgment as to the utility, quality, performance, visual appropriateness, or finish of substitutions.

1.5 OCCUPANCY SENSORS

A. Equipment Qualification

1. Wall switch products must be capable of withstanding the effects of inrush current. Submittals shall clearly indicate the method used.
2. Contractor's work to include all labor, materials, tools, appliances, control hardware, sensor, wire, junction boxes and equipment necessary for and incidental to the delivery, installation and furnishing of a completely operational occupancy sensor lighting control system, as described herein.
3. Contractor and Contractor's Supplier shall examine all general specification provisions and drawings for related electrical work required as work under Division 26.
4. Contractor shall coordinate all work described in this section with all other applicable plans and specifications, including but not limited to wiring, conduit, luminaires, HVAC systems and building management systems.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver products to site and store in unopened cartons in protected location. Inspect products immediately and report all damage accordingly.

1.7 GUARANTEE AND WARRANTIES

- A. All work performed under this section must be guaranteed to be free of defects in products or workmanship for one year after date of acceptance by Owner, unless noted otherwise in General Conditions.
- B. Warranties:
 1. Electronic power supplies must be warranted against failure for at least five years after date of substantial completion.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Provide luminaires as indicated in Luminaire Schedule; if conflict exists between Luminaire Schedule and Specifications, the more stringent requirement shall take precedence.
- B. Provide luminaires new and complete with mounting accessories, junction boxes, trims, and lamps.
- C. Provide products with UL labels appropriate to intended installation conditions, or with labels from other testing laboratories whose results are acceptable to local inspector, showing compliance with UL standards. Labels must be concealed from normal viewing angles.
- D. All products of same type by same manufacturer.

2.2 SOLID STATE LUMINAIRES

- A. Housing, where applicable:
 - 1. Steel bonderized or equal rust protected, or aluminum, rigid construction. Minimum gauge thickness shall be as follows:
 - a. Interior locations: No. 20-gauge steel, No. 16-gauge aluminum.
- B. Finish:
 - 1. Baked enamel finish (except when otherwise specified).
 - a. Concealed interior surfaces (this applies to interior hardware, circuit boards, etc.) matte black.
 - b. Concealed exterior surfaces: matte black.
 - c. Visible surfaces: color and texture as specified below for each luminaire type or as selected.
- C. Light Emitting Diode (LED) requirements:
 - 1. Correlated color temperature (CCT) for phosphor-coated white LEDs must have one of the following designated CCTs, as specified on the Luminaire Schedule, and fall within the following binning standards.
 - a. 3000K defined as 3045 +/- 175K
 - b. 3500K defined as 3465 +/- 245K
 - c. 4000K defined as 3985 +/- 275K
 - 2. Color spatial uniformity shall be limited to variations in chromaticity for different directions (i.e. changes in viewing angle) within 0.004 from the weighted average point on the CIE 1976 (u',v') diagram.
 - 3. Color maintenance shall be limited to a maximum change in chromaticity of 0.007 on the CIE 1976 (u',v') diagram over the lifetime of the product.
 - a. Color rendering index: Color rendering index to be determined using ANSI C78.377-2008 and applicable IESNA standards.
 - b. Laboratory tests must be produced using specific module(s)/array(s) and power supply combination that will be used in production.
 - c. Manufacturers must provide a test report from a laboratory accredited by NVLAP or one of its MRA signatories
 - 4. Lumen depreciation
 - a. Lumen depreciation to be measured using IESNA LM-80-08 and TM-21-11 standard for IES approved method of measuring lumen maintenance of LED light sources.

- b. Phosphor-coated white LED modules/arrays shall deliver at least 70% of initial lumens for a minimum of 50,000 hours when installed in-situ and operated at 100% output and the maximum specified operating temperature.
 - c. Colored LED modules/arrays shall deliver at least 50% of initial lumens for a minimum of 50,000 hours when installed in-situ and operated at 100% output and the maximum specified operating temperature.
 - 5. Acceptable LED manufacturers:
 - a. Cree
 - b. Nichia
 - c. Osram Opto Semiconductors
 - d. Philips Lumileds
 - e. Soraa
 - f. Xicato
- D. Luminaire Efficacy:
 - 1. Luminaire efficiency shall be measured using IESNA LM-79-08 standard for electrical and photometric measurements of solid state lighting products.
 - 2. Manufacturer shall provide published luminaire efficacy, which is defined as luminaire light output divided by luminaire input power measured in a 25 degree Celsius environment. Efficacy shall include power supply, thermal, optical, and luminaire losses.
- E. Thermal Management:
 - 1. Solid state luminaire shall not exceed LED manufacturer's maximum junction temperature requirements when operated in-situ at luminaire manufacturer's maximum ambient operating temperature and 100% light output.
 - 2. Solid state luminaires shall be thermally protected using one or more of the following thermal management techniques:
 - a. Metal core board
 - b. Gap pad
 - c. Internal monitoring firmware
 - 3. Solid state luminaire housing shall be designed to transfer heat from the LED board to the outside environment.
- F. Power Supplies (LED Drivers) requirements:
 - 1. Power factor of 0.90 or greater for primary application
 - 2. Input current shall have Total Harmonic Distortion (THD) of less than 20%.
 - 3. Minimum operating temperature of minus 20 degrees Celsius or below when used in luminaires intended for outdoor applications.
 - 4. Operating frequency equal to or greater than 120 Hz.
 - 5. Operate with sustained input variations of +/- 10% (voltage and frequency) with no damage to the driver.
 - 6. Tolerate sustained open circuit and short circuit output conditions without damage and without need for external fuses or trip devices.
 - 7. Output shall be regulated to +/- 5% across published load range.
 - 8. Class A sound rating.
 - 9. Outputs shall have current limiting protection.
 - 10. Operate LEDs at constant and regulated current levels. LEDs shall not be overdriven beyond the diode manufacturer's specified nominal voltage and current.
- G. Solid State Lighting Controls:
 - 1. Control interface to dimmable power supplies shall consist of one of the following:
 - a. Line Voltage Dimming. Controls to be rated for magnetic or electronic low voltage transformer operation.

- b. Low voltage (0-10V) control. Controls to be compatible with either current sink or current source operation.
 - 2. Dimmable LED power supplies shall use pulse width modulation (PWM) or constant current reduction (CCR) to regulate power to LEDs.
 - a. PWM power supplies shall have 12-bit or greater resolution to obtain flicker-free operation throughout their dimming range.
 - b. PWM power supplies shall be provided in luminaires that will be dimmed lower than 40% and must maintain consistent color temperature.
 - c. CCR power supplies shall be provided in areas that have strict electromagnetic interference (EMI) requirements, high motion activity, or rotating machinery.
- H. System Installation
 - 1. Hardwired connections to solid state luminaires shall be reverse polarity protected and provide high voltage protection in the event connections are reversed or shorted during the installation process.
 - 2. All solid state luminaires (100% of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing. Solid state lighting installations shall be UL Listed as a low-voltage lighting system including, but not limited to, luminaire, power supply, controller, keypad, and wiring.
- I. Warranty
 - 1. Luminaires, drivers, and controllers for solid state lighting systems shall be covered by a five-year warranty against defects in workmanship or material. Warranty shall include in-warranty service program providing for payment of authorized labor charges incurred in replacement of inoperative in-warranty equipment.

2.3 LUMINAIRE CONSTRUCTION

- A. Sheet metal: materials and thicknesses shall be 20 gauge (0.7 mm or 0.027") min., free of dents, scratches, oil-can, or other defects.
- B. Painted luminaires: exposed weld marks, joints, and seams shall be filled and sanded smooth before finishing.
- C. All edges cleaned and dressed to remove sharp edges or burrs.
- D. Extrusions: 1/10" min. wall thickness, smooth and free of tooling lines, with cast end plates that exactly match extrusion profiles.
- E. Castings: smooth, free of pits, scales, gate marks, or blemishes.
- F. Spinings shall have 1/32" min. thickness, smooth, free of spinning lines or blow-back, with clean edges.
- G. Welds: Follow recommendations of American Welding Society. All welds continuous and free of spatter, residue, or warping.
- H. No light leaks visible in finished room. Ensure that downlight housings mounted in wood slat ceilings are not visible from below. Field paint exterior of housing with high temperature paint if necessary.
- I. Exposed end plates and joiners, with concealed fasteners.

- J. End-to-end mounted luminaires: Verify row configurations and provide joiners, aligning splines, and trims to suit.
- K. Hardware:
 - 1. Steel or aluminum interior luminaires: cadmium-plated hardware.
 - 2. Steel or aluminum exterior luminaires: stainless steel hardware.
 - 3. Stainless steel luminaires: stainless steel hardware.
 - 4. Copper alloy luminaires: brass hardware.
- L. Raceways: Where used for through wiring, luminaires must be approved for use as raceways.

2.4 RECESSED LUMINAIRES

- A. Point-source luminaires: provide pre-wired junction box and thermal protection, and provide slack wires to structure at two diagonal corners.
- B. Troffer-type and flat panel luminaires: provide hold-down clips and slack wires to structure as detailed on the drawings. The detail will take precedence.
- C. Verify ceiling construction details and provide luminaire housings and trims to suit.
- D. Non-accessible ceilings: Provide access to junction boxes, ballasts, transformers, and battery packs through luminaire apertures; no access panels in ceiling.
- E. Mounting frames: To prevent rusting, provide galvanized steel or cast aluminum frames for installation in damp locations or in plaster ceilings.
- F. Adjustable luminaires shall be provided with rotation and tilt locking devices.

2.5 PENDANTS

- A. Cable-mounted: 1 X 7 strand 3/32" diameter stainless steel aircraft cable, factory crimped, independently tested and verified to exceed 1500 pounds.
 - 1. Verify mounting heights for each luminaire and provide cable lengths and coordinate cord lengths with manufacturer as required prior to ordering luminaires. Provide aircraft cable adjuster nipple with locking jaws.
- B. Supports: Carry luminaire weight to structure and provide horizontal bracing from suspension points to ceiling framing to prevent sideways shifting. Provide diagonal seismic restraint wires per code.

2.6 TRIMS

- A. Trims must fit tightly and be held in by gravity, spring clips, or mechanical fasteners. Trims must not drop out under normal conditions or seismic forces which do not exceed the design criteria of the building.
- B. Aluminum parabolic cones shall be smooth, properly shaped, with Alzak finish in colors as indicated.
 - 1. No hot spots or lamp images visible at angles shallower than lamp shielding angle.
 - 2. Self-flange cones must bend parallel to ceiling and cover ceiling hole without additional trim ring. Unpainted flange, shall have the same finish as cone interior.
 - 3. Cones and louvers for fluorescent luminaires must have permanent anti-iridescence treatment.

- C. Lenses, diffusers, and patterned glass: glass or virgin acrylic as noted, with patterns as noted.
 - 1. Finished thickness 2 mm (1/10") min. unless noted otherwise.
 - 2. Linear runs over 1200 mm (4'-0") long shall be in equal-length pieces.

2.7 FINISHES

- A. Steel Reflectors: Unless otherwise specified, the reflector surface finish shall be of synthetic white enamel or polyester powder coating. Finish shall show no indication of chipping, cracking, flaking or any other sign of loss of adhesion. The initial reflection factor shall be not less than 88 percent averaging 5 randomly selected points on the reflector. After 100 hours of exposure to the radiation of a glass enclosed carbon arc lamp, such as a Fade-O-Meters, the reflectance of the exposed portion shall not be less than 5 percent and finish shall show no appreciable color change. The carbon arc lamp shall be operated at appreciable color change. The carbon arc lamp shall be operated at 13 plus or minus 0.5 amperes at 140 volts. The reflector shall be placed ten inches from the arc and the lamp so ventilated that the temperature of the exposed portion does not exceed 105 degrees F.
- B. Aluminum Reflectors: Reflecting surfaces shall be provided with either a specular or diffuse finish as indicated. Reflection factors shall be not less than 83 percent for specular reflecting surfaces. Each reflecting surface shall be protected by dense coating of oxide weighing not less than 5.0 milligrams per square inch, applied by an anodic process. The reflector shall be given a sealing treatment that will prevent staining of the reflecting surface when subjected to a stain test. All aluminum reflectors & louvers shall be a low iridescent equivalent to that provided by Coil Anodizers.
- C. Non-Reflecting Surfaces: Unless otherwise specified, the finish on all non-reflecting exterior surfaces shall be aluminum oxide or aluminum; white, gray or aluminum paint on steel; nickel or chromium plating on copper alloy. Fastening devices shall be nickel, chromium, cadmium or zinc plated. All painted surfaces shall be free of tears, star marks, blisters, pinholes, chipping and any other defects that may impair appearance or serviceability.

2.8 LAMPS

- A. Relamp luminaires or replace LED boards and power supplies at no cost to owner if lamps or LEDs exhibit color variation, flicker, or burn out within 90 days of substantial completion date.
- B. LEDs:
 - 1. LED quantity, wattage, and color temperature as specified for each LED luminaire.
 - 2. 3500 deg. K color temperature for interior luminaires, 3000 deg. K for exterior luminaires, unless otherwise specified.

2.9 DRIVERS AND TRANSFORMERS

- A. General:
 - 1. Verify input voltages and match to branch circuit voltages.
 - 2. Remote drivers or transformers: Provide suitable enclosures and mounting hardware, and install in accessible, ventilated locations.
 - a. Secondary wiring: provide number and size of conductors as required, with 3% max. voltage drop between transformer and last lamp.
 - b. Keep transformers at least 300 mm (12") apart and do not stack vertically.
 - c. If load served by remote driver or transformer is not obvious to a future service technician, provide permanently affixed descriptive label at remote driver or transformer, clearly describing load served.

- B. LED Drivers:
 - 1. High power factor, thermally-protected.
 - 2. Compatible with LED lamps being used.
 - 3. Capable of dimming LED source without perceptible flicker or stroboscopic effects.

2.10 EMERGENCY LIGHTING AND EXIT SIGNS

- A. Emergency lighting:
 - 1. Provide lighting for paths of egress as required by Code.
- B. Exit signs shall be edge or back lit LED, surface-mounted on ceiling or wall, or integrated into ground mounted bollard.
 - 1. Fabricated aluminum construction, no light leaks around canopy. Plain box, with no decorative trim.
 - 2. Letters shall be 20mm (3/4") stroke, 150 mm (6") high, with concealed knockouts for left or right arrows, brightness and evenness of illumination per code, green color.
 - a. Green LED lamps located at interior perimeter for indirect illumination of stencil letters.
 - b. Provide finish as specified in the Luminaire Schedule.
 - c. Knock out the arrows as indicated on the plans.
- G. Emergency luminaires supplied by a separate emergency power source.
 - 1. For luminaires supplied by a separate emergency power source, provide "switched" control of the emergency designated lamps to allow complete "off" control when required by the user. The switched control shall include an automatic transfer feature to automatically turn "on" the emergency designated lamps upon the normal source power failure.
 - 2. Automatic transfer function shall be provided using a UL 924 listed relay, LVS Inc. #EPC-A or equal, suitable for mounting in a standard 4" square j-box (min. 2.5" deep). Transfer relay shall provide automatic diagnostic test feature which shall maintain power to the emergency designated lamps for 15 seconds after the room is switched off via the respective light switch or control relay. Emergency designated lamps shall turn off after the 15 second test period and shall come back on when the control device is turned back on to restore full lighting to the space.
 - 3. Provide (1) transfer module per "switched" zone.
- H. Emergency luminaires supplied by a dimmer panel and/or emergency source.
 - 1. For luminaires supplied by a dimmed power source, provide "dimmed" control of the emergency designated lamps to allow normal dimming control with the normal lamps. The dimmed control shall include an automatic transfer feature to automatically turn "on" the dimmed lamps to full light output upon the normal source power failure.
 - 2. Automatic transfer function shall be provided using a UL 924 listed relay, LVS Inc. #EPC-D (2-wire dimmed), #EPC-D-U (3-wired dimmed) or equal, suitable for mounting in a standard 4" square j-box (min. 2.5" deep).
 - 3. Provide (1) transfer module per "dimmed" zone.

2.11 WALL-BOX DIMMERS

- A. Provide dimmer controls as specified on the drawings and in Specifications Section 26 57 00.
- B. Ganging and Labeling:
 - 1. Labels: text as indicated 3 mm (1/8") high, all capital letters, engraved on device faceplate, filled with black paint and wiped clean.

2.12 OCCUPANCY SENSORS

A. General

1. Wall switch sensors shall be capable of detection of occupancy at desktop level up to 300 square feet, and gross motion up to 1000 square feet.
2. Wall switch sensors shall accommodate loads from 0 to 800 watts at 120 volts; 0 to 1200 watts at 277 volts and shall have 180° coverage capability.
3. Wall switch products shall utilize Zero Crossing Circuitry which increases relay life, protects from the effects of inrush current, and increases sensor's longevity.
4. Wall switch sensors shall have no leakage current to load, in manual or in Auto/Off mode for safety purposes and shall have voltage drop protection.
5. Where specified, wall switch sensors shall provide a field selectable option to convert sensor operation from automatic-ON to manual-ON.
6. Where specified, vandal resistant wall switch sensors shall utilize a hard lens with a minimum 1.0mm thickness. Products utilizing a soft lens will not be considered.
7. Passive infrared sensors shall utilize Pulse Count Processing and Digital Signature Analysis to respond only to those signals caused by human motion.
8. Passive infrared sensors shall utilize mixed signal ASIC which provides high immunity to false triggering from RFI (hand-held radios) and EMI (electrical noise on the line), superior performance, and greater reliability.
9. Passive infrared sensors shall have a multiple segmented Lodif Fresnel lens, in a multiple-tier configuration, with grooves-in to eliminate dust and residue build-up.
10. Where specified, passive infrared and dual technology sensors shall offer daylighting foot-candle adjustment control and be able to accommodate dual level lighting.
11. Dual technology sensors shall be corner mounted to avoid detection outside the controlled area when doors are left open.
12. Dual technology sensors shall consist of passive infrared and ultrasonic technologies for occupancy detection. Products that react to noise or ambient sound shall not be considered.
13. Ultrasonic sensors shall utilize Advanced Signal Processing to adjust the detection threshold dynamically to compensate for constantly changing levels of activity and air flow throughout controlled space.
14. Ultrasonic operating frequency shall be crystal controlled at 25 kHz within $\pm 0.005\%$ tolerance, 32 kHz within $\pm 0.002\%$ tolerance, or 40 kHz $\pm 0.002\%$ tolerance to assure reliable performance and eliminate sensor cross-talk. Sensors using multiple frequencies are not acceptable.
15. All sensors shall be capable of operating normally with electronic ballasts, PL lamp systems and rated motor loads.
16. Coverage of sensors shall remain constant after sensitivity control has been set. No automatic reduction shall occur in coverage due to the cycling of air conditioner or heating fans.
17. All sensors shall have readily accessible, user adjustable settings for time delay and sensitivity. Settings shall be located on the sensor (not the control unit) and shall be recessed to limit tampering.
18. In the event of failure, a bypass manual override shall be provided on each sensor. When bypass is utilized, lighting shall remain on constantly or control shall divert to a wall switch until sensor is replaced. This control shall be recessed to prevent tampering.
19. All sensors shall provide an LED as a visual means of indication at all times to verify that motion is being detected during both testing and normal operation.
20. Where specified, sensor shall have an internal additional isolated relay with Normally Open, Normally Closed and Common outputs for use with HVAC control, Data Logging and other control options. Sensors utilizing separate components or specially modified units to achieve this function are not acceptable.

21. All sensors shall have UL rated, 94V-0 plastic enclosures.
- B. Circuit Control Hardware - CU
1. Control Units - For ease of mounting, installation and future service, control unit(s) shall be able to externally mount through a 1/2" knock-out on a standard electrical enclosure and be an integrated, self-contained unit consisting internally of an isolated load switching control relay and a transformer to provide low-voltage power. Control unit shall provide power to a minimum of two (2) sensors.
 2. Relay Contacts shall have ratings of:
 - a. 13A - 120 VAC Tungsten
 - b. 20A - 120 VAC Ballast
 - c. 20A - 277 VAC Ballast
 3. Control wiring between sensors and controls units shall be Class II, 18-24 AWG, stranded U.L. Classified, PVC insulated or TEFLON jacketed cable suitable for use in plenums, where applicable.
 4. Minimum acceptable wire gauge from the circuit control hardware relays shall be #14 AWG.
- C. Acceptable Manufacturers
1. The Watt Stopper, or Pre-Approved Equal: For pre-approval, provide all the information listed under "submittals" a minimum of ten (10) working days prior to initial bid date.
 2. The listing of any manufacturer as "acceptable" does not imply automatic approval. It is the sole responsibility of the Contractor to ensure that any price quotations received and submittals made are for sensors that meet or exceed the specifications and the requirements of the contract documents.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Architectural Reflected Ceiling Plans and Elevations shall govern exact location and mounting conditions for all luminaires. Contractor shall coordinate luminaire mounting and compatibility with ceiling construction and other trades.
- B. Coordinate work with other trades. Location of lighting has priority over location of new framing (except major structural members), ducts, diffusers, sprinklers, speakers, smoke detectors, and other obstructions.
- C. If obstructions are encountered which prevent installation of luminaires according to drawings, notify Architect immediately and do not proceed until conflict has been resolved.
- D. Coordinate the location of luminaires in mechanical or unfinished spaces. Locations shown on Drawings may be adjusted by the Contractor to suit conditions. Install luminaires to avoid obstructions and maximize light output, 2100 mm (7'-0") min. mounting height.
- E. In Elevator Machine Rooms, locate the luminaires so that the illumination level at the floor is not less than 200 lx (19 fc). Illuminate areas in front of and behind (if accessible) controllers, machines and other elevator equipment.
- F. In Elevator Pits, locate the luminaires so that the illumination level at the pit floor is not less than 100 lx (10 fc).
- G. Coordinate the location of any exposed conduit used to feed luminaires with the Architect prior to installation.

3.2 INSTALLATION

A. General:

1. Contractor shall be responsible for handling and installation of luminaires including all supports, hangers and hardware necessary for a complete installation. Luminaires shall be clean, plumb, level in straight lines, without distortion. Luminaires must be installed so they do not shift during relamping or adjustment. Remedy any light leaks which may develop after installation of recessed or enclosed luminaires.
2. Install luminaires at locations and heights as indicated, in accordance with luminaire manufacturer's written instructions, applicable requirements of NEC, NECA's "Standard of Installation", NEMA standards, and with recognized industry practices to ensure that luminaires fulfill requirements.
3. Point-source luminaires shall be located as dimensioned, or in center of tile or on tile joint as drawn; 6 mm (1/4") max. off-center tolerance.
4. Linear luminaires shall have 3 mm (1/8") max. horizontal or vertical alignment variation in any 5 m (16-ft.) portion of run.
5. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torqueing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Stds. 486 A and B, and the National Electrical Code.
6. Clean luminaires of dirt and construction debris upon completion of installation. Clean fingerprints and smudges from lenses.
7. Remove and replace luminaires that may have been damaged during construction at no additional cost to the Owner.
8. Protect installed luminaires from damage during remainder of construction period.
9. Provide equipment grounding connections for luminaires as indicated. Tighten connections to comply with tightening torques specified in UL 486 A to assure permanent and effective grounds.
10. Install luminaires, lamps, lenses, etc., after building is enclosed, weather tight and environmental conditions are nominally the same as expected for the complete spaces. All lenses, glass, reflectors, and refractors shall be clean and free of chips, cracks, and scratches.
11. All wall mounted luminaires and all ceiling mounted surface luminaires including exit lights shall be fed through a luminaire Stud/Hickey/Nipple assembly and with provisions to prevent luminaire turning.
12. Installation of exit signs shall be coordinated with other trades to ensure signs are visible as intended.
13. All junction box cover plates for the lighting branch circuit system shall be clearly marked with a permanent ink felt pen identifying the branch circuit and control relay (panel number, circuit number, lighting control cabinet designation and control relay number) contained in the box.
14. Provide permanently affixed adhesive labels with machine printed lettering (min. 1/8" high) at junction boxes serving luminaires that are supplied by (2) electrical sources (i.e. normal and emergency lighting). Label to read "CAUTION - This luminaire is powered by (2) separate sources. The normal power source breaker and the emergency power source breaker must be turned off before servicing this luminaire."

B. Recessed Luminaires:

1. The contractor shall verify the fire rating of the ceiling system and wall in which the luminaires are to be mounted. Where luminaires are installed in fire rated ceilings or walls, provide fire rated enclosures around and over luminaires to maintain ceiling fire rating. No additional cost shall be allowed for failure to include such enclosures and installation in the bid.

2. Holes for Recessed Point-Source Luminaires: Cut holes to follow luminaire housings exactly so no gaps will be visible after trims are installed.
 3. Install bottom of housing aligned with finished ceiling.
 4. Keep ceiling insulation at least 75 mm (3") away from luminaires. Exception: luminaires with insulated contact (IC) rating shall be permitted to be in contact with insulation.
 5. Install trims after painting of spaces. Install trims tightly, with no gaps or light leaks.
 6. Seismic restraints: Provide and install slack wires and hold-down clips per code.
 7. Wallwashers:
 - a. Orient wallwasher housings according to manufacturer's instructions to maximize brightness on the upper portion of the wall.
- C. Ceiling-Mounted and Pendant Luminaires:
1. Provide support for outlet boxes and suspension points so luminaires can be installed securely, including seismic supports per code.
 - a. Luminaire weight less than 23 kg (50 lb) at each suspension point: hang from strap or stud on outlet box, or at non-feed points, provide 1/4"-20 stud projecting 20 mm (3/4") below ceiling.
 - b. Luminaire weight 23 kg (50 lb) or more at each suspension point: hang directly from structure, either independent of outlet box or from stud extending through outlet box to structure, unless the outlet box is listed for not less than the weight to be supported. Boxes used as the sole support of luminaires weighing more than 50 pounds must be listed and marked by the manufacturer with the maximum weight.
 2. Pendants:
 - a. Provide horizontal bracing from suspension points to ceiling framing to prevent sideways shifting.
 - b. Provide diagonal seismic restraint wires above ceiling per code.
 - c. Furnish suspended luminaires with universal joint type hanger canopy (and longitudinal sway adapter at each stem connection point for linear luminaires), to permit 45 degree swivel on 360 degree circle from Nadir at canopy (and 45 degree longitudinal movement at sway adapter).
 - d. Luminaires over 450 mm (18") wide shall be provided with supports at all corners.
 - e. Install pendants plumb and level.
 - f. Verify luminaire weights and provide backing in ceiling as required.
- D. Wall-Mounted Luminaires:
1. Mounting heights shown on Drawings are measured from finished floor to centerline of outlet box or recessed housing, unless otherwise noted.
 2. Verify luminaire weights and provide backing in wall as required. Luminaires must not droop or tilt away from wall.
 3. Wet locations: install sealant between luminaire and outlet box.
 4. In circulation areas, wall-mounted luminaires must not project more than 100 mm (4") from wall if mounted above 685 mm (27") and below 2030 mm (80").

3.3 LIGHTING CONTROLS

- A. Install controls so that all operable parts are at 48 inches (1220 mm) maximum height.
- B. Lighting controls to include occupancy sensors in most spaces (for local control) and relay system lighting control for larger common spaces as indicated on the drawings.
- C. Occupancy sensors shall initially be set as follows:
 1. Maximum sensitivity.
 2. Maximum time delay (or 20 minutes).

3. Manual-on operation.
 4. Automatic off operation.
 5. Aim all adjustable sensors to properly cover room areas.
- D. Timeclock System shall initially be set to control the low voltage relays as per the Relay Panel Schedule LCP.
1. Assign all interior relays to an automatic off sweep, with flick warn (except those noted as "NL"). Off time shall be set to an Owner-determined time in the evening, after dark or normal business operations.
 2. On/Off signals may originate from BAS system, which shall be inter-connected to the Lighting Control System where indicated on the drawings.
 3. Assign all interior relays noted as "NL" to be on 24 hours per day. No automatic relay operation.
 4. Assign "after hours" and "Weekend / Holiday" hours to match normal business calendar and times.
 5. All interior relays shall be allowed to be overridden by use of the local dataline switches for a maximum of 2 hours (per Title 24) when used after hours or on Weekends / Holidays. If used during these times, automatic shut-off shall re-activate at the end of the 2-hour period.
 6. All interior relays shall be allowed to be overridden by use of the local dataline switches when used during normal business hours. Standard timeclock operation shall resume with the next scheduled timeclock function for each relay.
 7. Assign all exterior relays for automatic on operation with the astro-dial feature, set to 30 minutes before sunset. Latitude = 37.5 degrees North / Longitude = 122 degrees West.
 8. Assign exterior relays noted as "astro-on, astro-off" for automatic off operation with the astro-dial feature, set to 30 minutes after sunrise. Latitude and Longitude as noted above.
 9. Assign exterior relays noted as "astro-on, timeclock-off" for automatic off operation with the normal timeclock feature, set to an owner determined time in the late evening.
 10. Assign exterior relays noted as "NL" or "On All Night" for astro-dial operation, for automatic on 30 minutes before sunset and automatic off 30 minutes after sunrise.

3.4 DELIVERY, STORAGE, & HANDLING:

- A. Deliver luminaires in factory-fabricated containers or wrappings, which properly protect luminaires from damage. Inspect luminaires immediately upon delivery to ensure correct shipment without damage.
- B. Store luminaires in original packaging. Store inside well-ventilated area protected from weather, moisture, soiling, extreme temperatures, humidity, laid flat and blocked off ground.
- C. Handle luminaires carefully to prevent damage, breaking, and scoring of finishes. Do not install damaged units or components; replace with new. Protection wrapping on louvered (parabolic) luminaires shall not be removed until luminaires are ready for operation.

3.5 SEQUENCING AND SCHEDULING:

- A. General:
 1. Coordinate with other work including wires/cables, electrical boxes and fittings, and raceways, to properly interface installation of luminaires with other work.
 2. Sequence lighting installation with other work to minimize possibility of damage and soiling during remainder of construction.

3.6 PROJECT CLOSEOUT

- A. Clean luminaires and remove plaster and paint spatters.
- B. Clean fingerprints and dust from downlight reflectors. Refer to manufacturer's instructions.
- C. Verify that luminaires and controls are working at time of final acceptance by Owner.
 - 1. Repair or replace lighting control devices that are inoperable.
 - 2. Repair or replace LED modules or entire LED luminaires that are inoperable.
 - 3. Repairs and/or replacements shall be at no additional cost to the Owner.
- D. Test emergency lighting system for 90 minutes in presence of Owner's representative, check each luminaire for proper operation at end of 90-minute test, then recharge for 24 hours and briefly test each luminaire again for proper operation.
- E. Install and aim adjustable lighting as directed by Architect.
 - 1. Provide personnel, lifts, ladders, and walkie-talkies as required.
 - 2. Aiming will occur at night, outside of normal working hours, at times as approved by the Architect.
- F. Prepare two copies of a Lighting Systems Maintenance Manual consisting of the following in a hardcover binder. Deliver to Architect. After review, Architect will deliver one copy to Owner.
 - 1. One complete set of approved submittals, including product data and shop drawings.
 - 2. Luminaire cleaning instructions, including chemicals to be used or avoided.
 - 3. Instructions for code-required testing and maintenance of emergency lighting system.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK.

SECTION 265601
SITE LIGHTING

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Luminaires
- B. LEDs
- C. Power Supplies/Drivers
- D. Poles
- E. Pole bases
- F. Controls and wiring

1.2 SYSTEM DESCRIPTION

- A. Furnish all labor, materials, apparatus, tools, equipment transportation, temporary construction and special or occasional services as indicated on the Drawings or described in these Specifications and as required to make a complete working site lighting system.
- B. Illumination levels shall be in accordance with recommendations by the Illuminating Engineering Society (IES) and all applicable state and local codes.

1.3 INCORPORATED DOCUMENTS

- A. Section 260500 and Section 265101 apply to all work in this Section.

1.4 SUBMITTALS

- A. Catalog Information:
 - 1. Luminaire (each type) with photometric pattern.
 - 2. Contactors.
 - 3. Power Supply or Driver (each type)
 - 4. Poles.
 - 5. Brackets.
- B. Shop Drawings.
- C. Laboratory Test: Determine soil density relationships for compaction of backfill material in accordance with ASTM D1557, Method D.

PART 2 - PRODUCTS

2.1 MATERIAL AND EQUIPMENT

- A. Provide new materials and equipment unless otherwise specifically indicated or specified. Materials shall be listed by Underwriter's laboratories, Inc. (U.L.) and bear evidence of such approval where applicable.

- B. Luminaires: Site luminaires shall be weatherproof. Reflectors and refractors shall provide the light configuration indicated and conforming to IES recommendations.
- C. Luminaires and poles shall be finished in epoxy enamel designed to withstand the effects of salt spray. Lens shall be securely attached to the lens frame for security during maintenance and relamping.
- D. Lighting Contactors: NEMA ICS 2. Electrically operated, magnetically held unit in NEMA enclosure, rated poles and ratings as indicated on Drawings. Units shall have silver alloy double breaker contacts and coil clearing contacts and shall require no arcing contacts. On-off selector switch.
- E. Poles, Brackets, Pole Bases and Attachments: Shall be rated for service with wind velocities of 100 mph considering the force exerted by the wind on the maximum exposure of the fixture luminaire selected.
- F. Poles shall be anchor base type round, height and style as indicated, finished to match luminaire, complete with handhole and gasketed cover, anchor bolts with leveling and locking screws, grounding connection, and matching base cover.
- G. Concrete pole bases shall be cast-in-place reinforced concrete as indicated with anchor bolts and conduit entries as per manufacturer. Concrete shall be rated 3,000 PSI at 28 day test.
- H. Concrete:
 - 1. Concrete for electrical requirements shall be at least 3,000 psi concrete with 1-inch maximum aggregate conforming to the requirements of Division 3 for Cast-In-Place concrete.

2.2 SOLID STATE LUMINAIRES

- A. Housing, where applicable:
 - 1. Steel bonderized or equal rust protected, or aluminum, rigid construction. Minimum gauge thickness shall be as follows:
 - a. Interior locations: No. 20-gauge steel, No. 16-gauge aluminum.
- B. Finish:
 - 1. Baked enamel finish (except when otherwise specified).
 - a. Concealed interior surfaces (this applies to interior hardware, circuit boards, etc.) matte black.
 - b. Concealed exterior surfaces: matte black.
 - c. Visible surfaces: color and texture as specified below for each luminaire type or as selected.
 - d. Exterior luminaire finish: refer to Luminaire Schedule.
- C. Light Emitting Diode (LED) requirements:
 - 1. Correlated color temperature (CCT) for phosphor-coated white LEDs must have the following designated CCT and fall within the following binning standard:
 - a. 3000K defined as 3045 +/- 175K
 - 2. Color spatial uniformity shall be limited to variations in chromaticity for different directions (i.e. changes in viewing angle) within 0.004 from the weighted average point on the CIE 1976 (u',v') diagram.
 - 3. Color maintenance shall be limited to a maximum change in chromaticity of 0.007 on the CIE 1976 (u',v') diagram over the lifetime of the product.

- a. Color rendering index: Color rendering index to be determined using ANSI C78.377-2008 and applicable IESNA standards.
 - b. Laboratory tests must be produced using specific module(s)/array(s) and power supply combination that will be used in production.
 - c. Manufacturers must provide a test report from a laboratory accredited by NVLAP or one of its MRA signatories
4. Lumen depreciation
- a. Lumen depreciation to be measured using IESNA LM-80-08 standard for IES approved method of measuring lumen maintenance of LED light sources.
 - b. Phosphor coated white LED module(s)/array(s) shall deliver at least 70% of initial lumens for a minimum of 35,000 hours when installed in-situ and operated at 100% output and the maximum specified operating temperature.
 - c. Colored LED module(s)/array(s) shall deliver at least 50% of initial lumens for a minimum of 35,000 hours when installed in-situ and operated at 100% output and the maximum specified operating temperature.
5. Acceptable LED manufacturers:
- a. Cree
 - b. Nichia
 - c. Osram Opto Semiconductors
 - d. Philips Lumileds
 - e. Sora
 - f. Xicato
- D. Luminaire Efficacy:
- 1. Luminaire efficiency shall be measured using IESNA LM-79-08 standard for electrical and photometric measurements of solid state lighting products.
 - 2. Manufacturer shall provide published luminaire efficacy, which is defined as luminaire light output divided by luminaire input power measured in a 25 degree Celsius environment. Efficacy shall include power supply, thermal, optical, and luminaire losses.
- E. Thermal Management:
- 1. Solid state luminaire shall not exceed LED manufacturer's maximum junction temperature requirements when operated in-situ at luminaire manufacturer's maximum ambient operating temperature and 100% light output.
 - 2. Solid state luminaires shall be thermally protected using one of more of the following thermal management techniques:
 - a. Metal core board
 - b. Gap pad
 - c. Internal monitoring firmware
 - 3. Solid state luminaire housing shall be designed to transfer heat from the LED board to the outside environment.
- F. Power Supply/Driver requirements:
- 1. Power factor of 0.90 or greater for primary application
 - 2. Input current shall have Total Harmonic Distortion (THD) of less than 20%.
 - 3. Minimum operating temperature of minus 20 degrees Celsius or below when used in luminaires intended for outdoor applications.
 - 4. Output operating frequency to be equal to or greater than 120 Hz.
 - 5. Operate with sustained input variations of +/- 10% (voltage and frequency) with no damage to the driver.
 - 6. Tolerate sustained open circuit and short circuit output conditions without damage and without need for external fuses or trip devices.
 - 7. Output shall be regulated to +/- 5% across published load range.

8. Class A sound rating.
9. Outputs shall have current limiting protection.
10. Operate LEDs at constant and regulated current levels. LEDs shall not be overdriven beyond the diode manufacturer's specified nominal voltage and current.
11. Inrush currents not exceeding peak currents in NEMA 410.

G. System Installation

1. Hardwired connections to solid state luminaires shall be reverse polarity protected and provide high voltage protection in the event connections are reversed or shorted during the installation process.
2. All solid state luminaires (100% of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing. Solid state lighting installations shall be UL Listed as a low-voltage lighting system including, but not limited to, luminaire, power supply, controller, keypad, and wiring.

HI. Warranty

1. Luminaires, drivers, and controllers for solid state lighting systems shall be covered by a minimum five-year warranty against defects in workmanship or material. Warranty shall include in-warranty service program providing for payment of authorized labor charges incurred in replacement of inoperative in-warranty equipment.

2.3 LUMINAIRE CONSTRUCTION

- A. Sheet metal: materials and thicknesses shall be 20 gauge (0.7 mm or 0.027") min., free of dents, scratches, oil-can, or other defects.
- B. Painted luminaires: exposed weld marks, joints, and seams shall be filled and sanded smooth before finishing.
- C. All edges cleaned and dressed to remove sharp edges or burrs.
- D. Extrusions: 1/10" min. wall thickness, smooth and free of tooling lines, with cast end plates that exactly match extrusion profiles.
- E. Castings: smooth, free of pits, scales, gate marks, or blemishes.
- F. Spinings shall have 1/32" min. thickness, smooth, free of spinning lines or blow-back, with clean edges.
- G. Welds: Follow recommendations of American Welding Society. All welds continuous and free of spatter, residue, or warping.
- H. No light leaks visible. Field paint exterior of housing with high temperature paint if necessary.
- I. Exposed end plates and joiners, with concealed fasteners.
- J. Hardware:
 1. Steel or aluminum exterior luminaires: stainless steel hardware.
 2. Stainless steel luminaires: stainless steel hardware.
 3. Copper alloy luminaires: brass hardware.
- K. Raceways: Where used for through wiring, luminaires must be approved for use as raceways.

PART 3 - EXECUTION

3.1 INSTALLATION:

- A. Refer to Section 262700, Part 2.2, for wiring and splicing requirements.
- B. Underground cable installation shall conform to National Electrical Code except as otherwise specified or indicated.
- C. Contractor Damage: The Contractor shall promptly cause repairs to be made to any indicated utility lines or systems damaged by his operation.
- D. Under roads and paved areas, ducts shall be EPC-80-PVC polyvinyl chloride conduit.
- E. Cables shall be in one piece without splices between connections except where the distance exceeds the lengths in which the cable is furnished.
- F. Bends in cables shall have an inner radius of not less than 12 times the cable diameter.
- G. Horizontal slack of approximately 3 feet shall be left in the ground on each end of cable runs, on each side of connection and at all points where connections are to be made above ground level.
- H. Earthwork: Earthwork for electrical requirements shall conform to the requirements of Division 31.
- I. Coordinate work with other trades. Pre-ship anchor bolts and templates for use in preparing bases for installation. After leveling luminaires, pack grout between mounting plate and concrete footing. Provide weep holes to prevent accumulation of moisture inside pole base.

3.2 TESTS

- A. Test under provisions of Division 1, Section 260800, and Section 265101.
- B. The Owner shall be notified at least three working days in advance of the Contractor's proposed date of the tests to permit scheduling, and to permit witnessing of the tests. The Contractor shall furnish the Owner with three copies of the results of the tests.
- C. Circuits: The Contractor shall test each circuit, all controllers, and components of the system for proper operation. The Contractor shall furnish the Owner with three copies of the test results.
- D. Compaction Tests: Backfill shall be tested for compaction in accordance with ASTM D1556.
- E. Operating Test: Contractor shall operate the system in the presence of the Owner proving the proper operation.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK.

SECTION 265700
LOW VOLTAGE LIGHTING CONTROL SYSTEM
(NETWORK, DEMAND RESPONSE, BMS INTEGRATION)

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

- A. Furnish all labor, materials, apparatus, tools, equipment transportation, temporary construction and commissioning services as indicated on the Drawings or described in these Specifications and as required to make a complete working facility lighting control system.
- B. Integrated Low Voltage Lighting Control System:
 - 1. The low voltage lighting control system shall consist of relay panels, digital device Segment Manager and LMCS system configuration software.
 - 2. The system shall accept program changes from the LMCS system configuration software for date and time, location, holidays, event scheduling, button binding and group programming.
- C. Requirements are indicated in Section 262700 for raceways and electrical boxes and fittings required for installation of control equipment and wiring.
- D. Provide CBC 2019 compliant seismic installation. See Section 260500 for all certification and submittal requirements.

1.2 INCORPORATED DOCUMENTS

- A. Sections 260500, 262700, 265101 and 265601 apply to all Work in this Section.
- B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.

1.3 QUALITY ASSURANCE

- A. Manufacturers: Firms regularly engaged in manufacture of lighting control equipment and ancillary equipment, of types and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years.
- B. Installer Qualifications: Installer shall be one who is experienced in performing the Work of this Section, and who has specialized in installation of Work similar to that required for this project.
- C. Component Pre-testing: All components and assemblies are to be factory pre-tested prior to installation.
- D. System Support: Factory applications engineers shall be available for telephone support.
- E. NEC Compliance: Comply with NEC as applicable to electrical wiring Work.
- F. NEMA Compliance: Comply with applicable portions of NEMA standards pertaining to types of electrical equipment and enclosures.
- G. UL Approvals: Remote panels are to be UL listed under UL 916 Energy Management Equipment.

- H. CSA Approvals: Remote panels are to be CSA listed.
- I. FCC Emissions: All assemblies are to be in compliance with FCC emissions Standards specified in Part 15 Subpart J for Class A application.
- J. All System components shall be California Title 24 compliant, where applicable.

1.4 SUBMITTALS

- A. Submit under provisions of Division 1 and 260500.
 - 1. Bill of Materials: Complete list of all parts needed to fully install selected System components.
 - 2. Shop Drawings: Submit dimensional Drawings of all lighting control system components and accessories.
 - 3. One Line Diagram: Submit a one-line diagram of the system configuration.
 - 4. Typical Wiring Diagrams: Submit typical wiring diagrams for all components including, but not limited to, relay panels, relays, digital low voltage switches, digital occupancy sensors and digital daylighting controls.

1.5 MANUFACTURERS

- A. Integrated Low Voltage Lighting Control System:
 - 1. The basis of the specified system is the Watt Stopper Digital Lighting Management (DLM) or an equal. Any other system to be considered must submit descriptive information 10 days prior to bid.
- B. Prior approval does not guarantee final approval by the electrical engineer. The contractor shall be completely responsible for providing a system meeting this specification in its entirety. All deviations from this specification must be listed and individually signed off by the engineer.
- C. The Owner reserves the right to reject a proposed substitution based on his agent's professional judgment as to the utility, visual appropriateness, or finish of substitutions.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Delivery: Deliver materials in Manufacturer's original, unopened, undamaged packages with intact identification labels.
- B. Storage and Protection: Store materials away from exposure to harmful weather conditions and at temperature and humidity conditions recommended by Manufacturer.

1.7 GUARANTEE AND WARRANTIES

- A. All Work performed under this Section must be guaranteed to be free of defects in products or workmanship for one year after date of acceptance by Owner, unless noted otherwise in General Conditions.

PART 2 – PRODUCTS

2.1 DIGITAL LIGHTING MANAGEMENT DLM

- A. Description
 - 1. Lighting Control System shall include Dimming / Switching Room Controllers, Digital Occupancy Sensors, Digital Daylight Sensors, Digital Dimmers / Switches, Network

Components and Relay Panels. All project components shall be UL listed and consist of the following:

2. Lighting Control Panel Enclosure Tub: NEMA 1, NEMA 3R, or NEMA 4 as indicated on the drawings, sized to accept an interior with 1-8 relays, 1-24 relays and six (6) four pole contactors, or 1-48 relays with six (6) four pole contactors.
3. Cover: Surface or Flush as required, hinged and lockable and with restricted access to line voltage section. A final typed wiring schedule directory card shall be affixed to the cover's back.
4. Interior: Barrier included for separation of high voltage (class 1) and low voltage (class 2) wiring. The interior shall include intelligence boards, power supply, mechanically latched control relays and multi-pole contactors. The interiors shall include the following features:
 - a. Screwless, removable, plug-in connections for all low voltage terminations.
 - b. Digital inputs (four RJ-45 jacks) shall support 1-, 2-, 3-, 4-, and 8-button digital switches, digital occupancy sensors and digital daylight sensors.
 - c. Each relay shall be capable of individual ON/OFF control by a low voltage switch and / or occupancy sensor input.
 - d. The system shall monitor true relay status; the relay status shall be displayed at the onboard pilot LED and monitored by the system electronics.
 - e. Stagger the On and OFF sequence of the relays.
 - f. Heavy Duty Relays – Mechanically latching contacts with single moving part design for improved reliability. Relays to have the following characteristics:
 - 1) 30 amp NEMA 410 electronic ballast rated and 20 amp tungsten, rated for 50,000 ON/OFF cycles at full load. Support #12-#14 AWG solid or stranded wire and rated for 120 and 277 volts; 20 amp NEMA 410 electronic ballast rated and 20 amp tungsten 347 volts.
 - (a) 30 VAC isolated contacts for status feedback and pilot light indication.
 - (b) 14,000 amp short circuit current rating.
 - (c) Contactors shall be DIN rail mounted, four pole standard, normally open or normally closed, electrically held with 120 or 277 volt coil voltage to match panel control power voltage. Contractors shall be compatible with all lighting, ballast and HID loads and be rated for 277 volt 20 amp tungsten and 600 volt 30 amp ballast loads.
5. Power Supply: Multi-voltage transformer assembly with enough power to supply all electronics, occupancy sensors, dataline switches, pilot lights, and photocells as necessary to meet the project requirements. Power supply to have internal over-current protection with automatic reset and metal oxide varistor protection.
6. Multiple panels shall be able to be networked together for global control. The LMCP panels shall be networked together over a MS/TP 3-conductor connection.

2.2 GROUP, CHANNEL, SCHEDULE AND PATTERN CONTROL

A. Description

1. The lighting control panel shall support schedule, group, and photocell control functions via the network as configured using the LMCS Configuration Software.
2. Group Status: Each group pushbutton shall include an LED status indication. The LED shall be ON whenever all of the relays within the group are ON; and shall go OFF when all of the relays within the group go OFF. The LED will be green when in a "mixed" state. Each channel shall also have an associated dry contact closure and pilot contact which tracks the LED operation described above.

B. Features

1. Individual relays shall be able to be assigned to more than one channel, and the channel status shall be annunciated appropriately.

2. Each channel shall also have an input for connecting switch or dry contacts for controlling a channel. Inputs shall accept 2 or 3-wire maintained or momentary inputs, and groups shall be controllable by: an on-board group pushbutton switch, low voltage switch, digital switch, digital occupancy sensor, digital photocell, or time of day.
3. Screwless, removable, plug-in terminals will be provided for all low voltage wiring connections.

2.3 NETWORK CLOCK

A. Description

1. Provide an eight channel integral network clock that connects to the system using the digital MS/TP three conductor data communications wire network described in Section 2.10.
2. The clock shall be used to schedule any of the eight global channel groups (Section 2.03) in the relay panel network. The clock shall support all of the energy saving features required of ASHRAE 90.1 – 2001, IECC 2003, as well as all state and local energy codes.
3. The clock shall provide astronomic capabilities, time delays, blink warning, daylight savings, and holiday functions and shall include a battery back-up for the clock function and EEPROM for program retention. Clocks that require multiple events to meet local Code lighting shut off requirements shall not be allowed.
4. The clock shall allow unique scenario and time delays. Scenarios shall include:
 - a. Scheduled ON / OFF
 - b. Manual ON / Scheduled OFF
 - c. Manual ON / Auto Sweep OFF (for AS-100 Switches)
 - d. Astro ON / OFF (or Photo ON / OFF)
 - e. Astro and Schedule ON / OFF (for Photo and Schedule ON / OFF)

B. Features

1. Runs event-based schedule routines independently (does not require BAS or Segment Manager).
2. Supports astronomical, time-based event types
3. Retains memory and time for a minimum of 10 years.

2.4 DIGITAL SWITCHES

A. Description

1. Intelligent digital switching shall operate on the DLM Category 5e local network. Switches shall be available in single, dual, quad, or octal (1-button, 2-button, 4-button, or 8-button) designs. All devices shall mount in a standard single-gang box
2. Each button in a switch shall be able to be individually programmed. Programming shall be done by the LMCT-100 handheld configuration tool. Each button shall control any one of the following options:
 - a. Any individual relay in any single panel.
 - b. Any group of relays in any single panel.
 - c. Any group of relays in the system.

B. Features

1. Switches shall be constructed of non-breakable Lexan on all exposed parts and shall include a matching screwless Lexan wall plate.
2. Individual buttons shall be custom engraved with a maximum of 15 characters (including spaces) on two lines, where shown on plans.
3. Multiple digital switches wired to control the same relay or relay group shall indicate the same status automatically.

4. Each switch shall also include a locator light illuminating the switch for easy location in the dark.
5. Switches can be configured to follow a "Cleaning" scenario. This specific scenario shall prevent the cleaners from overriding OFF any relays turned ON by the occupant.

2.5 DIGITAL OCCUPANCY SENSORS

A. Description

1. Digital Occupancy Sensors – Self-configuring, digitally addressable and calibrated occupancy sensors with LCD display and two-way active infrared (IR) communications.

2.6 DIGITAL PHOTOSENSORS

A. Description

1. Digital Photosensors – Single-zone closed loop, multi-zone open loop and dual-loop daylighting sensors with two-way active infrared (IR) communications shall provide switching, bi-level, tri-level or dimming control for daylight harvesting.

2.7 DIGITAL DIMMING / SWITCHING ROOM CONTROLLERS

A. Description

1. Digital controllers for lighting and plug loads shall automatically bind the room loads to the connected devices in the space without commissioning or the use of any tools. Room and plug load controllers shall be provided to match the room lighting and plug load control requirements. The controllers shall be simple to install, and shall not have dip switches or potentiometers, or require special configuration for standard Plug n' Go applications. The control units shall include the following features.
2. Automatic room configuration to the most energy-efficient sequence of operation based upon the devices in the room.
3. Simple replacement – Using the default automatic configuration capabilities, a room controller may be replaced with an off-the-shelf.
4. Multiple room controllers connected together in a local network must automatically prioritize each room controller, without requiring any configuration or setup, so that loads are sequentially assigned using room controller device ID's from highest to lowest.
5. Device Status LEDs to indicate:
 - a. Data transmission
 - b. Device has power
 - c. Status for each load
 - d. Configuration status
6. Quick installation features including:
 - a. Standard junction box mounting
 - b. Quick low voltage connections using standard RJ-45 patch cable
7. Based on individual configuration, each load shall be capable of the following behavior on power up following the loss of normal power:
 - a. Turn on to 100%
 - b. Remain off
 - c. Turn on to last level
8. Each load shall be configurable to operate in the following sequences based on occupancy:
 - a. Auto-on/Auto-off (Follow on and off)
 - b. Manual-on/Auto-off (Follow off only)
9. The polarity of each load output shall be reversible, via digital configuration, so that on is off and off is on.

10. BACnet object information shall be available for the following objects:
 - a. Load status
 - b. Electrical current
 - c. Total watts per controller
 - d. Schedule state – normal or after-hours
 - e. Demand response control and cap level
 - f. Room occupancy status
 - g. Total room lighting and plug loads watts
 - h. Total room watts/sq ft
 - i. Force on/off all loads
 11. UL 2043 plenum rated
 12. Manual override and LED indication for each load
 13. Dual voltage (120/277 VAC, 60 Hz). 120/277 volt models rated for 20A total load, derating to 16A required for some dimmed loads (forward phase dimming); plug load controllers shall carry application-specific UL 20 rating for receptacle control.
 14. Zero cross circuitry for each load
 15. All digital parameter data programmed into an individual room controller or plug load controller shall be retained in non-volatile FLASH memory within the controller itself. Memory shall have an expected life of no less than 10 years.
- B. On/Off Room Controllers shall include:
1. One or two relay configuration
 2. Efficient 150 mA switching power supply
 3. Three RJ-45 DLM local network ports with integral strain relief and dust cover
 4. WattStopper product numbers: LMRC-101, LMRC-102
- C. On/Off/Dimming enhanced Room Controllers shall include:
1. Real time current monitoring
 2. Multiple relay configurations
 - a. One, two or three relays (LMRC-21x series)
 - b. One or two relays (LMRC-22x series)
 3. Efficient 250 mA switching power supply
 4. Four RJ-45 DLM local network ports with integral strain relief and dust cover
 5. One dimming output per relay
 - a. 0-10V Dimming - Where indicated, one 0-10 volt analog output per relay for control of compatible ballasts and LED drivers. The 0-10 volt output shall automatically open upon loss of power to the Room Controller to assure full light output from the controlled lighting. (LMRC-21x series)
 - b. Line Voltage, Forward Phase Dimming - Where indicated, one forward phase control line voltage dimming output per relay for control of compatible two-wire or three-wire ballasts, LED drivers, MLV, forward phase compatible ELV, neon/cold cathode and incandescent loads. (LMRC-22x series)
 - c. Each dimming output channel shall have an independently configurable minimum and maximum calibration trim level to set the dimming range to match the true dynamic range of the connected ballast or driver.
 - d. The LED level indicators on bound dimming switches shall utilize this new maximum and minimum trim.
 - e. Each dimming output channel shall have an independently configurable minimum and maximum trim level to set the dynamic range of the output within the new 0-100% dimming range defined by the minimum and maximum calibration trim.
 - f. Calibration and trim levels must be set per output channel.
 - g. Devices that set calibration or trim levels per controller are not acceptable.

- h. All configuration shall be digital. Devices that set calibration or trim levels per output channel via trim pots or dip-switches are not acceptable.
- 6. Each load shall have an independently configurable preset on level for Normal Hours and After Hours events to allow different dimmed levels to be established at the start of both Normal Hours and After Hours events.
- 7. Fade rates for dimming loads shall be specific to bound switch buttons, and the load shall maintain a default value for any bound buttons that do not specify a unique value.
- 8. The following dimming attributes may be changed or selected using a wireless configuration tool:
 - a. Establish preset level for each load from 0-100%
 - b. Set high and low trim for each load
 - c. Set lamp burn in time for each load up to 100 hours
- 9. Override button for each load shall provide the following functions:
 - a. Press and release for on/off control
 - b. Press and hold for dimming control
- 10. WattStopper product numbers: LMRC-211, LRMC-212, LRMC-213, LMRC-221, LMRC-222

D. Plug Load Room Controllers shall include:

- 1. One relay configuration with additional connection for unswitched load
- 2. Configurable additive time delay to extend plug load time delay beyond occupancy sensor time delay (e.g. a 10 minute additive delay in a space with a 20 minute occupancy sensor delay shall ensure that plug loads turn off 30 minutes after the space is vacated).
- 3. Factory default operation shall be Auto-on/Auto-off, based on occupancy
- 4. Real time current monitoring of both switched and un-switched load (LMPL-201 only)
- 5. Efficient switching power supply
 - a. 150mA (LMPL-101)
 - b. 250mA (LMPL-201)
- 6. RJ-45 DLM local network ports
 - a. Three RJ-45 ports (LMPL-101)
 - b. Four RJ-45 ports (LMPL-201)
- 7. WattStopper product numbers: LMPL-101, LMPL-201.

2.8 DLM SEGMENT NETWORK (ROOM TO ROOM NETWORK).

- A. The segment network shall be a linear topology, BACnet-based MS/TP subnet to connect DLM local networks (rooms) and LMCP relay panels for centralized control.
 - 1. Each connected DLM local network shall include a single network bridge (LMBC-300), and the network bridge shall be the only room-based device that is connected to the segment network.
 - 2. Network bridges, relay panels and segment managers shall include terminal blocks, with provisions for separate "in" and "out" terminations, for segment network connections.
 - 3. The segment network shall utilize twisted pair, shielded, cable as specified by the lighting control manufacturer. The maximum cable run for each segment shall be 4,000 feet. Conductor-to-conductor capacitance of the twisted pair shall be less than 30 pf/ft and have a characteristic impedance of 120 Ohms.
 - 4. Network signal integrity will require that each conductor and ground wire be correctly terminated at every connected device.
 - 5. Substitution of manufacturer-specified cable must be pre-approved: Manufacturer may not certify network reliability and may void warranty, if non-approved cable is installed, and if terminations are not completed according to manufacturer's specific requirements.
 - 6. Segment networks shall be capable of connecting to BACnet-compliant BAS (provided by others) either directly, via MS/TP, or through NB-ROUTERS, via BACnet/IP or

BACnet/Ethernet. Systems whose room-connected network infrastructure require gateway devices to provide BACnet data to a BAS are unacceptable.

B. WattStopper Product Number: LM-MSTP, LM-MSTP-DB

2.9 CONFIGURATION TOOLS

- A. A wireless configuration tool shall facilitate optional customization of DLM local networks using two-way infrared communications, while PC software shall connect to each local network via a USB interface.
- B. Features and functionality of the wireless configuration tool shall include but not be limited to:
1. Two-way infrared (IR) communication with DLM IR-enabled devices within a range of approximately 30 feet.
 2. High visibility organic LED (OLED) display, pushbutton user interface and menu-driven operation.
 3. Ability to read and modify parameters for room controllers, occupancy sensors, wall switches, daylighting sensors, network bridges and relay panels, and identify room devices by type and serial number.
 4. Ability to save up to eight occupancy sensor setting profiles, and apply profiles to selected sensors.
 5. Temporarily adjust light level of any load(s) on the local network, and incorporate those levels in scene setting. Set room mode for testing of Normal Hours (NH) and After Hours (AH) parameter settings.
 6. Adjust or fine-tune daylighting settings established during auto-configuration, and input light level data to complete configuration of open loop daylighting controls.
 7. Set room mode for testing of Normal Hours (NH) and After Hours (AH) parameter settings.
 8. Verify status of building level network devices.
- C. WattStopper Product Numbers: LMCT-100, LMCI-100/LMCS-100

2.10 NETWORK BRIDGE

- A. The network bridge module shall connect a DLM local network to a BACnet-compliant segment network for communication between rooms, relay panels and a segment manager or BAS. Each local network shall include a network bridge component to provide a connection to the local network room devices. The network bridge shall use industry standard BACnet MS/TP network communication and an optically isolated EIA/TIA RS-485 transceiver.
1. The network bridge shall be provided as a separate module connected on the local network through an available RJ-45 port.
 2. Provide Plug n' Go operation to automatically discover room devices connected to the local network and make all device parameters visible to the segment manager via the segment network. No commissioning shall be required for set up of the network bridge on the local network.
 3. The network bridge shall automatically create standard BACnet objects for selected room device parameters to allow any BACnet-compliant BAS to include lighting control and power monitoring features as provided by the DLM room devices on each local network. BACnet objects shall be created for the addition or replacement of any given in-room DLM device for the installed life of the system. Products requiring that an application-specific point database be loaded to create or map BACnet objects are not acceptable. Systems not capable of providing BACnet data for control devices via a dedicated BACnet Device ID and physical MS/TP termination per room are not acceptable. Standard BACnet objects shall be provided as follows:
 - a. Read/write the normal or after hours schedule state for the room

- b. Read the detection state of each occupancy sensor
- c. Read the aggregate occupancy state of the room
- d. Read/write the On/Off state of loads
- e. Read/write the dimmed light level of loads
- f. Read the button states of switches
- g. Read total current in amps, and total power in watts through the room controller
- h. Read/write occupancy sensor time delay, PIR sensitivity and ultrasonic sensitivity settings
- i. Activate a preset scene for the room
- j. Read/write daylight sensor fade time and day and night setpoints
- k. Read the current light level, in foot-candles, from interior and exterior photosensors and photocells
- l. Set daylight sensor operating mode
- m. Read/write wall switch lock status
- n. Read watts per square foot for the entire controlled room
- o. Write maximum light level per load for demand response mode
- p. Read/write activation of demand response mode for the room
- q. Activate/restore demand response mode for the room

B. WattStopper product numbers: LMBC-300

2.11 SEGMENT MANAGER

- A. For networked applications, the Digital Lighting Management system shall include at least one segment manager to manage network communication. It shall be capable of serving up a graphical user interface via a standard web browser utilizing either unencrypted TCP/IP traffic via a configurable port (default 80) or 256 bit AES encrypted SSL TCP/IP traffic via a configurable port (default 443).
- B. Each segment manager shall have integral support for at least three segment networks. Segment networks may alternately be connected to the segment manager via external routers and switches, using standard Ethernet structured wiring. Each router shall accommodate one segment network. Provide the quantity of routers and switches as shown on the plans.
- C. Operational features of the Segment Manager shall include the following:
 - 1. Connection to PC or LAN via standard Ethernet TCP/IP with the option to use SSL encrypted connections for all traffic.
 - 2. Easy to learn and use graphical user interface, compatible with latest version of Internet Explorer, or equal browser. Shall not require installation of any lighting control software to an end-user PC.
 - 3. Log in security capable of restricting some users to view-only or other limited operations.
 - 4. Automatic discovery of DLM devices and relay panels on the segment network(s). Commissioning beyond activation of the discovery function shall not be required to provide communication, monitoring or control of all local networks and lighting control panels.
 - 5. After discovery, all rooms and panels shall be presented in a standard navigation tree format. Selecting a device from the tree shall allow the device settings and operational parameters to be viewed and changed by the user.
 - 6. Ability to view and modify room device operational parameters. It shall be possible to set device parameters independently for normal hours and after hours operation including sensor time delays and sensitivities, and load response to sensor including Manual-On or Auto-On.
 - 7. Ability to set up schedules for rooms and panels, view and override current status of panel channels and relays, and assign relays to groups. Schedules shall automatically set

- controlled zones or areas to either a normal hours or after hours mode of operation. Support for a minimum of 100 unique schedules, each with up to four time events per day. Support for annual schedules, holiday schedules and unique date-bound schedules.
8. Ability to group rooms and loads for common control by schedules, switches or network commands.
 9. Ability to monitor connected load current and display power consumption for areas equipped with room controllers incorporating the integral current monitoring feature.
 10. Provide capabilities for integration with a BAS via BACnet protocol. At a minimum, the following points shall be available to the BAS via BACnet IP connection to the segment manager: room occupancy state; room schedule mode; room switch lock control; individual occupancy sensor state; room lighting power; room plug-load power; load ON/OFF state; load dimming level; panel channel schedule state; panel relay state; and Segment Manager Group schedule state control.
 11. The Segment Manager shall allow access and control of the overall system database via Native Niagara AX FOX connectivity. Systems that must utilize a Tridium Niagara controller in addition to the programming, scheduling and configuration server are not acceptable.
- D. Segment Manager shall support multiple DLM rooms as follows:
1. Support up to 120 network bridges and 900 digital in-room devices (LMSM-3E).
 2. Support up to 300 network bridges and 2,200 digital in room devices, connected via network routers and switches (LMSM-6E).
- E. WattStopper Product Numbers: LMSM-3E, LMSM-6E, NB-ROUTER, NB-SWITCH, NB-SWITCH-8, NB-SWITCH-16.

2.12 PROGRAMMING, CONFIGURATION AND DOCUMENTATION SOFTWARE

- A. PC-native application for optional programming of detailed technician-level parameter information for all DLM products, including all parameters not accessible via BACnet and the handled IR configuration tool. Software must be capable of accessing room-level parameter information locally within the room when connected via the optional LMCI-100 USB programming adapter, or globally for many segment networks simultaneously utilizing standard BACnet/IP communication.
- B. Additional parameters exposed through this method shall include but not be limited to:
1. Occupancy sensor detection LED disable for performance and other aesthetic spaces where blinking LEDs present a distraction.
 2. Six occupancy sensor action behaviors for each controlled load, separately configurable for normal hours and after hours modes. Modes include: No Action, Follow Off Only, Follow On Only, Follow On and Off, Follow On Only with Override Time Delay, Follow Off Only with Blink Warn Grace Time, Follow On and Off with Blink Warn Grace Time.
 3. Separate fade time adjustments per load for both normal and after hours from 0 - 4 hours.
 4. Configurable occupancy sensor re-trigger grace period from 0 - 4 minutes separate for both normal hours and after hours.
 5. Separate normal hours and after hours per-load button mode with modes including: Do nothing, on only, off only, on and off.
 6. Load control polarity reversal so that on events turn loads off and vice versa.
 7. Per-load DR (demand response) shed level in units of percent.
 8. Load output pulse mode in increments of 1 second.
 9. Fade trip point for each load for normal hours and after hours that establishes the dimmer command level at which a switched load closes its relay to allow for staggered On of switched loads in response to a dimmer.

- C. Generation of reports at the whole file, partial file, or room level. Reports shall include but not be limited to:
 - 1. Device list report: All devices in a project listed by type.
 - 2. Load binding report: All load controller bindings showing interaction with sensors, switches, and daylighting.
 - 3. BACnet points report: Per room Device ID report of the valid BACnet points for a given site's BOM.
 - 4. Room summary report: Device manifest for each room, aggregated by common BOM, showing basic sequence of operations.
 - 5. Device parameter report: Per-room lists of all configured parameters accessible via hand held IR programmer for use with O&M documentation.
 - 6. Scene report: All project scene pattern values not left at defaults (i.e. 1 = all loads 100%, 2 = all loads 75%, 3 = all loads 50%, 4 = all loads 25%, 5-16 = same as scene 1).
 - 7. Occupancy sensor report: Basic settings including time delay and sensitivity(ies) for all occupancy sensors.

- D. Network-wide programming of parameter data in a spreadsheet-like programming environment including but not limited to the following operations:
 - 1. Set, copy/paste an entire project site of sensor time delays.
 - 2. Set, copy/paste an entire project site of sensor sensitivity settings.
 - 3. Search based on room name and text labels.
 - 4. Filter by product type (i.e. LMRC-212) to allow parameter set by product.
 - 5. Filter by parameter value to search for product with specific configurations.

- E. Network-wide firmware upgrading remotely via the BACnet/IP network.
 - 1. Mass firmware update of entire rooms.
 - 2. Mass firmware update of specifically selected rooms or areas.
 - 3. Mass firmware upgrade of specific products.

- F. WattStopper Product Number: LMCS-100, LMCI-100

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Integrated Low Voltage Lighting Control System:
 - 1. Digital Switches and/or photocells shall be mounted in the spaces as indicated on the Drawings. Each low voltage wire shall be labeled clearly indicating which relay panel it connects to. Use only Watt Stopper pre-terminated LMRJ series Cat 5e cable as indicated on the Drawings. All relays and switches shall be tested after installation to confirm proper operation and the loads recorded on the directory card in each panel.
 - 2. The relay panels shall be mounted in electrical closets as indicated on the Drawings. The numbered relays in the panel shall be wired to control the power to each load as indicated on the Panel Wiring Schedules included in the Drawings. All power wiring shall be identified with the circuit breaker number controlling the load. If multiple circuit breaker panels are feeding into a relay panel, wires shall clearly indicate the originating panel's designation.

3.2 PRE-INSTALLATION MEETING

- A. Manufacturer shall provide a factory authorized representative to provide a functional overview of the lighting control system prior to products being installed.
 - 1. Discuss functionality and integration of all products per design requirements.

2. Confirm location of occupancy sensors and photocells as required.
3. Confirm low voltage control wires meet specification.
4. Explain adjustment options and verify specification requirements for each device.

3.3 PROGRAMMING

- A. Set / program lighting controls per relay schedules on drawings, with input from Owner for exact times required for each operation.
- B. All programming shall comply with Title 24 requirements (i.e. automatic control and override limits).
- C. For relays controlling halogen and metal halide lamps, a minimum 15 minute off period is required per day to mitigate potential for non-passive end of life failure. Review programming schedules and program this off-cycle for relays otherwise scheduled for continuous operation. Coordinate timing of off-cycle with Owner.
- D. Test all programming for proper operation of each relay at scheduled times.

3.4 SYSTEM STARTUP

- A. The Manufacturer shall provide a factory authorized technician to commission and confirm proper installation and operation of all system components.
- B. Contractor shall provide system documentation after the equipment has been installed:
 1. Lighting control operational summary sheet.
 2. Programming record sheet.
 3. System Installation and Operation Manual shall be provided to the owner.

3.5 TRAINING

- A. Manufacturer shall provide factory authorized application engineer to train Owner personnel in the operation and programming of the lighting control system for the first (2) two days of occupancy; then (1) one week later, and again (1) month later.

3.6 TESTS

- A. Test under provisions of Section 260500 and 260800.
- B. The Owner shall be notified at least three working days in advance of the Contractor's proposed date of the tests to permit scheduling, and to permit witnessing of the tests. The Contractor shall furnish the Owner with three copies of the results of the tests.
- C. Circuits: The Contractor shall test each circuit, all controllers, and components of the system for proper operation. The Contractor shall furnish the Owner with three copies of the test results.
- D. Operating Test: Contractor shall operate the system in the presence of the Owner proving the proper operation of the system and all components.

END OF SECTION

SECTION 270000

BASIC COMMUNICATIONS REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

- A. This section includes general administrative and procedural requirements for Division 27, and is intended to supplement, not supersede, the general requirements specified in Division 00.
- B. The requirements described herein include the following:
 - 1. References
 - 2. Definitions
 - 3. Submittals
 - 4. Quality Assurance
 - 5. Delivery, Storage, and Handling
 - 6. Scheduling
 - 7. Warranty
 - 8. Product Substitutions
 - 9. Project Management and Coordination Services
 - 10. Permits and Inspections
 - 11. Field Quality Control
 - 12. Project Closeout and Record Documents
- C. Related Items
 - 1. General and Supplementary Conditions: General provisions of the Prime Contract and Divisions 00 and 01 apply to Division 27.
 - 2. Consult other Divisions and Sections, determine the extent and character of related work, and coordinate Work of Division 27 with that specified elsewhere to produce a complete and operable installation.
 - 3. Section 270526, "Communications Grounding and Bonding"
 - 4. Section 270528, "Communications Building Pathways"
 - 5. Section 270536, "Communications Building Pathways – Cable Tray"
 - 6. Section 270811, "Communications Twisted Pair Testing"
 - 7. Section 270821, "Communications Optical Fiber Testing"
 - 8. Section 271100, "Communications Equipment Rooms"
 - 9. Section 271313, "Communications Backbone ISP Twisted Pair Cabling"
 - 10. Section 271314, "Communications Backbone OSP Twisted Pair Cabling"
 - 11. Section 271323, "Communications Backbone ISP Fiber Optic Cabling"
 - 12. Section 271324, "Communications Backbone OSP Fiber Optic Cabling"
 - 13. Section 271513, "Communications Horizontal Twisted Pair Cabling"
 - 14. Section 274116, "Integrated Audiovisual"
 - 15. Section 275133, "Two-Way Communications System for Accessible Means of Egress"

1.2 REFERENCES

- A. General
 - 1. Codes, standards, and industry manuals/guidelines listed by reference, including revisions by issuing authority, form a part of this specification section to extent indicated.

Consider such codes and/or standards a part of this specification as though fully repeated herein.

2. Standards listed are identified by issuing authority, authority abbreviation, designation number, title or other designation established by issuing authority. Standards subsequently referenced herein are referred to by issuing authority abbreviation and standard designation.
 3. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid unless otherwise specifically stated.
- B. Codes: Perform work and furnish materials and equipment under Division 27 in accordance with applicable requirements of the latest edition of governing codes, rules and regulations including but not limited to the following minimum standards, whether statutory or not:
1. California Code of Regulations (CCR):
 - a. Title 8, "Industrial Relations"
 - 1) Chapter 3.22, "California Occupational Safety and Health Regulations (CAL/OSHA)"
 - b. Title 24, "California Building Standards Code"
 - 1) Part 1, "California Building Standards Administrative Code"
 - 2) Part 2, "California Building Code" (CBC)
 - 3) Part 3, "California Electrical Code" (CEC)
 - 4) Part 11, "California Green Building Standards Code" (CALGreen)
 2. National Fire Protection Agency (NFPA)
 - a. NFPA 75, "Protection of Information Technology Equipment"
 3. Other applicable national, state, and local binding building and fire codes
- C. Standards: Perform work and furnish materials and equipment under Division 27 in accordance with the latest editions of the following standards as applicable:
1. Building Industry Consulting Services International (BICSI):
 - a. "Telecommunications Distribution Methods Manual" (TDMM)
 - b. "Customer-Owned Outside Plant Design Manual"
 - c. "Wireless Design Reference Manual" (WDRM)
 - d. "Network Design Reference Manual" (NDRM)
 2. EIA testing standards
 3. National Electrical Contractors Association (NECA):
 - a. ANSI/NECA 1-2015, "Standard Practices for Good Workmanship in Electrical Construction"
 4. Telecommunications Industry Association (TIA):
 - a. ANSI/TIA-568.0-D, "Generic Telecommunications Cabling for Customer Premises"
 - b. ANSI/TIA-568.1-D, "Commercial Building Telecommunications Cabling Standards"
 - c. ANSI/TIA-568.2-C, "Balanced Twisted Pair Telecommunications Cabling and Components"
 - d. ANSI/TIA-568.3-D, "Optical Fiber Cabling Components"
 - e. ANSI/TIA-569-D, "Telecommunications Pathways and Spaces"
 - f. ANSI/TIA/EIA-598-D, "Optical Fiber Cable Color Coding"
 - g. ANSI/TIA-606-C, "Administration Standard for Telecommunications Infrastructure"
 - h. ANSI-TIA-607-C, "Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises"
 - i. ANSI/TIA-758-B, "Customer-Owned Outside Plant Telecommunications Infrastructure Standard"
 - j. ANSI/TIA-1005-A, "Telecommunications Infrastructure Standard for Industrial Premises"

1.3 DEFINITIONS

- A. The definitions of Divisions 00 and 01 shall apply to Division 27 sections.
- B. In addition to those definitions of Divisions 00 and 01, the following list of terms as used in this specification defined as follows:
1. "AFF": Above Finished Floor
 2. "As directed": As directed or instructed by the Owner, or their authorized representative
 3. "AHJ": Authority Having Jurisdiction
 4. "Cabling": installed media ready for electronic or optical signal circuit use; a complete media connection comprised of cables, termination apparatus (patch panels, blocks, connectors), outlets, connecting media (path cord, crossconnects), labeling
 5. "CBC": California Building Code (CCR Title 24 Part 2)
 6. "CCR": California Code of Regulations
 7. "CEC": California Electrical Code (CCR Title 24 Part 3)
 8. "Connect": To install patch cords, equipment cords, crossconnect wire, etc. to complete an electronic or optical signal circuit
 9. "Cord": a length of cordage having connectors at each end. The term "Cord" is synonymous with the term "Jumper" and "Lead"
 10. "Engineer": TEECOM
 11. "First-In-Place": a single unit of work for the Owner's and Engineer's review and written approval prior to proceeding with the work of the entire project
 12. "Furnish": To purchase, procure, acquire, and deliver complete with related accessories
 13. "General Contractor": <name><successful bidder>
 14. "Identifier": A unique code assigned to an element of the Telecommunications infrastructure that links it to its corresponding record
 15. "Install": To set in place, join, unite, fasten, link, attach, set up or otherwise connect together and test before turning over to the Owner, parts, items, or equipment supplied by contractor or others. Make installation complete and ready for regular operation
 16. "IOR": Inspector Of Record
 17. "ISP": Inside Plant
 18. "LED": Light Emitting Diode
 19. "MSDS": Material Safety Data Sheets
 20. "NEC": National Electrical Code (NFPA 70)
 21. "NEMA": National Electrical Manufacturers Association
 22. "NFPA": National Fire Protection Agency
 23. "NIC": Not In Contract (work or equipment)
 24. "OFCL": Owner-furnished contractor-installed; coordinate the integration of components furnished by the Owner; provide mounting hardware, cable, connectors, etc. to ensure proper integration of OFCL equipment
 25. "OFE": Owner Furnished Equipment
 26. "OSP": Outside Plant
 27. "Owner": <name>
 28. "Owner's Representative": <name>
 29. "PDF": portable document format (electronic file format / *.pdf)
 30. "Pigtail": a length of cordage having connectors at one end
 31. "Provide": To furnish, transport, install, erect, connect, test and turn over to the Owner, complete and ready for regular operation
 32. "UL": Underwriters Laboratories

1.4 SYSTEM DESCRIPTION AND PROJECT CONDITIONS

- A. In circumstances where the Specifications and Drawings conflict, the Drawings shall govern quantity and the Specifications shall govern quality.

1.5 SUBMITTALS

- A. Submit required submittals to the General Contractor in the quantities and formats as required under the general contract. In the absence of requirements, provide as described in the following with reference to quantity and format.
- B. Failure to comply with requirements in part or whole shall constitute grounds for non-review and/or rejection of resubmittal packages.
- C. Resubmittals: For resubmittals, include a cover letter that lists actions taken and revisions made to each product in response to the Engineer's submittal review comments. Lack of this actions-taken cover letter shall constitute grounds for non-review and/or rejection of resubmittal packages.
- D. Obtain written approval from the Engineer for the product data submittal, the shop drawing submittal, and other required pre-construction submittals prior to materials and equipment purchase order and prior to installation.
- E. Submittal Description: Product Data
 - 1. Electronically submit the product data submittal via cloud-based project management application (such as Proliance) or as a file transfer (such as Dropbox).
 - 2. File Format:
 - a. File format shall be PDF, either as a single compiled PDF file or as a PDF portfolio.
 - b. PDF files should be produced from original electronic media, not scans of printed media. If scans from prints are the only option, annotate electronically, not on the prints prior to scanning.
 - c. Page size should be letter (8.5"x11").
 - 3. Organization:
 - a. Organize the Content in the following order:
 - 1) Cover
 - 2) Table of Contents (TOC)
 - 3) Statement of compliance
 - 4) Product information
 - 5) Seismic calculations (as required)
 - b. Clearly and precisely indicate the submitted product and accessories by part number using an electronic annotation (arrow, rectangle, oval, etc.). Where the product data presents "part number builds", list the exact part number of the submitted products and accessories.
 - c. Add page numbers in numerical order with no gaps to each page that correctly correspond to the TOC.
 - d. Add bookmarks to the file to improve navigation.
 - 4. Content:
 - a. Cover: Include a cover that clearly displays the following information:
 - 1) Owner name
 - 2) Project name and address
 - 3) Submittal name (e.g., "Product Data Submittal for Telecommunications Equipment Rooms")
 - 4) Project submittal number

- 5) Contractor's submittal number (discretionary)
- 6) Submittal date; format: Month Day, Year (e.g., "January 1, 2020")
- 7) Specification section numbers included in the submittal (e.g., "Section 271100")
- 8) Contractor name and contact information
- b. Table of Contents (TOC): Include a TOC that lists materials by section number, article and paragraph number. Add a brief product description (what it is, size or color or other optional features), manufacturer and part number. List the submittal page number per product. Example heading for TOC:

Section	Article	Paragraph	Description	Manufacturer	Part #	Page #
---------	---------	-----------	-------------	--------------	--------	--------

- c. Statement of Compliance: Include a "Statement of Compliance" letter or memorandum on the submitter's company letterhead from the highest ranking employee assigned to this project stating the submittal has been reviewed (quality control check) and is in full compliance with the requirements of the contract documents, and listing the submittal's contents. Wet sign (and stamped, if applicable) the letter.
- d. Product Information: Include manufacturer's technical data, product literature, "catalog cuts", data sheets, specifications, and block wiring diagrams (if necessary) that clearly describe the product's characteristics, physical and dimensional information, electrical performance data, materials used in fabrication, material color and finish, and other relevant information such as test data, typical usage examples, independent test agency information, and storage requirements. Include products listed in the specifications, at a minimum. Include relevant products that will be installed, which are not listed in the specifications.

F. Submittal Description: Shop Drawings

- 1. Electronically submit the shop drawings submittal via cloud-based project management application (such as Proliance) or as a file transfer (such as Dropbox).
- 2. Format:
 - a. Use the same sheet size as the contract drawings.
 - b. Use the same title block as the contract drawings, modified to include contractor information.
 - c. Text: 3/32" - 1/8" high when plotted at full size.
 - d. Symbols should match those in the contract documents.
 - e. Screen background information.
 - f. Plot system components (symbols, outlet, devices, pathways, cable routes, etc.) and text using a heavier line weight sufficient enough to stand out against background information.
 - g. Scaling:
 - 1) Scale floor plans and reflected ceiling plans at 1/8"=1'-0"
 - 2) Scale enlarged room plans at 1/4"=1'-0"
 - 3) Scale wall elevations at 1"=1'-0"
 - 4) Scale rack elevations at 1"=1'-0"
- 3. Content:
 - a. Cover Letter: Accompany each shop drawing submittal with a cover letter stating that the shop drawings have been thoroughly reviewed by the Contractor and are in full compliance with the requirements of the contract documents. Have the person who prepared the submittal sign (and stamped, if applicable) the cover letter and include a drawing index.
 - b. Drawings: Shop drawing submittals shall consist of symbols list, point-to-point diagrams, block diagrams, riser diagrams, line diagrams, floor plans, reflected ceiling plans, enlarged room plans, wall and rack elevations, installation details,

- and other aspects of the system. Include detailed labeling examples for cables, outlets, termination apparatus, devices, equipment, etc.
4. As-built drawings shall accurately represent actual installed conditions and shall incorporate modifications made during construction.
 5. Electronically submit the as-built drawings submittal via cloud-based project management application (such as Proliance) or as a file transfer (such as Dropbox).
 6. Format:
 - a. Electronic files shall include native format and plotted PDF files. The file names shall include the sheet number.
 - b. Use the same sheet size as the approved shop drawings.
 - c. Use the same title block as the approved shop drawings.
 - d. Text: 3/32" - 1/8" high when plotted at full size.
 - e. Use symbols identical to the symbols shown on the approved shop drawings.
 - f. Screen background information.
 - g. Plot system components (symbols, outlet, devices, pathways, cable routes, etc.) and text using a heavier line weight sufficient enough to stand out against background information.
 7. Content:
 - a. Title Sheet, including symbols list and sheet index
 - b. Diagrams, such as (but not limited to) point-to-point diagrams, block diagrams, riser diagrams, line diagrams, and other diagrams that conceptually describe the system
 - c. Floor Plans and Reflected Ceiling Plans: Scale plans at 1/8"=1'-0". Plans shall show:
 - 1) Locations and identifiers of telecommunications outlets
 - 2) Routes, types, sizes, and quantities of pathways (such as cable trays, conduits, hangers, and other pathways)
 - d. Enlarged Rooms Layouts: Applicable rooms: BDF, IDFs. Room drawings shall show:
 - 1) Floor layouts – scaled at either 1/4"=1'-0" or 1/2"=1'-0", showing dimensioned placement of equipment cabinets/frames, rack bays, etc.
 - 2) Overhead layouts – scaled at either 1/4"=1'-0" or 1/2"=1'-0", showing dimensioned placement of overhead cable support (e.g., cable tray, cable runway, conduit sleeves, etc.)
 - 3) Rack elevations – scaled at 1"=1'-0", showing placement of termination apparatus and other equipment installed onto rack bays
 - 4) Wall Elevations – scaled at 1"=1'-0", showing dimensioned placement of termination apparatus (e.g., termination/crossconnect blocks)
- G. Submittal Description: Operation and Maintenance (O&M) Manual
1. Quantity and Media: Submit O&M Manual as described in Division 01. In the absence of requirements given, submit one packaged O&M Manual set and one electronic copy.
 2. Electronic Submission: Submit the product data submittal via cloud-based project management application (such as Proliance) or as a file transfer (such as Dropbox).
 3. Electronic Format:
 - a. File format shall be PDF, either as a single compiled PDF file or as a PDF portfolio.
 - b. PDF files should be produced from original electronic media, not scans of printed media. If scans from prints are the only option, annotate electronically, not on the prints prior to scanning.
 - c. Page size should be letter (8.5"x11") or full size for drawings.
 - d. Insert bookmarks to improve navigation through the file.
 4. Printed Format:
 - a. Package contents in a 3-ring binder with front cover and spine clear pockets for insertion of the submittal information.

- b. Page size should be letter (8.5"x11") or tabloid (17"x11") for drawings.
- c. Include tabbed separators to improve navigation through the manual.
- 5. Content and Organization:
 - a. Cover, showing the following information
 - 1) Owner name
 - 2) Project name and address
 - 3) Manual name (e.g., "Operation and Maintenance Manual for Telecommunications Cabling System")
 - 4) Date; format: Month Day, Year (e.g., "January 1, 2020")
 - 5) Contractor name and contact information
 - b. Table of Contents (TOC)
 - c. Product information (the final approved product submittal and updates through construction)
 - d. As-built drawings (the final approved as-built submittal)
 - e. Seismic calculations (the final approved product submittal)
 - f. Warranty Information
 - 1) Warranty certificate from the manufacturer and the contractor
 - 2) Instructions on making a warranty claim during the warranty period
 - 3) Contact information during the warranty period
 - 4) Contact information beyond the warranty period for maintenance and related service
 - g. Manufacturer's instructions for system or component use
 - h. Instructions and requirements for proper maintenance (according to the manufacturer) and as to maintain warranty

1.6 QUALITY ASSURANCE

- A. Manufacturer Qualifications
 - 1. Five continuous years, minimum, design and manufacture of the materials and equipment specified herein.
 - 2. Manufacturer(s) of products and equipment specified herein shall demonstrate that they have a quality assurance program in place to assure that the specifications are met. Include in the program, at a minimum, provisions for:
 - a. Incoming inspection of raw materials
 - b. In-process inspection and final inspection of the cable product
 - c. Calibration procedures of test equipment to be used in the qualifications of the product
 - d. Recall procedures in the event that out of calibration equipment is identified.
 - 3. Conform to government standards on quality assurance for applications within these specifications.
- B. Contractor Qualifications
 - 1. A current, active, and valid and C7 or C10 California State Contractors License
 - 2. Five, minimum, continuous years of experience
 - 3. Five, minimum, completed projects of similar scope and cost
 - 4. Evidence of technicians qualified for the work (such as successfully completed training by the cabling vendor or BICSI, etc.)
 - 5. IBEW / CWA union affiliation
- C. Materials
 - 1. Materials, support hardware, equipment, parts comprising units, etc., shall be new, unused, without defects and of current manufacturer, materials

2. Use specified products and applications, unless otherwise submitted and approved in writing.

D. Regulatory Requirements

1. Work and materials shall conform to the latest rules of National Board of Fire Underwriters wherever such standards have been established and shall conform to the regulations of the State Fire Marshal, OSHA and the codes of the governing local municipalities. Work under Division 27 shall conform to the most stringent of the applicable codes.
2. Provide the quality identified within these specifications and drawings when codes, standards, regulations, etc. allow Work of lesser quality or extent. The contract documents address the minimum requirements for construction.

E. Drawings

1. Follow the general layout shown on the contract drawings except where other work may conflict with the drawings.
2. Contract drawings for the work within this division are essentially diagrammatic within the constraints of the symbology applied.
3. Contract drawings do not fully represent the entire installation. Rather, they indicate the general route for pathways and cables and show general locations of outlets. Contract drawings might not expressly show every conduit, sleeve, hanger, etc.; regardless, a complete system is required.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery

1. Do not deliver products to the site until protected storage space is available.
2. Coordinate materials delivery with installation schedule to minimize storage time at jobsite.
3. Deliver materials in manufacturer's original, unopened, undamaged packaging and containers with identification labels (name of the manufacturer, product name and number, type, grade, UL classification, etc.) intact.
4. Immediately replace equipment damaged during shipping at no cost to the Owner, so as not to impact the construction schedule.

B. Storage and Protection

1. Store materials in clean, dry, ventilated space free from temperature and humidity conditions (as recommended by manufacturer) and protected from exposure to harmful weather conditions.
2. Comply with manufacturer's storage requirements for each product. Comply with recommended procedures, precautions or remedies as described in the MSDS as applicable.
3. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic.
4. Storage outdoors covered by rainproof material is not acceptable.
5. Provide heat where required to prevent condensation or temperature related damage.

C. Handling

1. Handle materials and equipment in accordance with manufacturer's written instructions. Handle with care to prevent damage, breakage, denting, and scoring.
2. Do not install damaged materials and equipment. Replace damaged equipment at no cost to the Owner.

1.8 SCHEDULING

- A. Unless otherwise specified, the construction schedules of the Sections within Division 27 may be combined into a single, overall schedule.
- B. Do not proceed without written approval from the Owner or Owner's Representative for schedule of this Work.

1.9 PROJECT MANAGEMENT AND COORDINATION

- A. Project Management and Coordination Services
 - 1. Provide a project manager for the duration of the project to coordinate this Work with other trades. Coordination services, procedures and documentation responsibility include, but are not limited to, the items listed in this section.
 - 2. Review of Shop Drawings Prepared by Other Subcontractors:
 - a. Obtain copies of shop drawings for equipment provided by others that require telecommunication service connections or interface with work.
 - b. Thoroughly review other trades' shop drawings to confirm compliance with the service requirements contained in the Division 27 contract documents. Document discrepancies or deviations as follows:
 - 1) Prepare memo summarizing the discrepancy
 - 2) Submit a copy of the specific shop drawing, indicating via cloud, the discrepancy
 - c. Prepare and maintain a shop drawing review log indicating the following information:
 - 1) Shop drawing number and brief description of the system/material
 - 2) Date of the review
 - 3) Name of the individual performing the review
 - 4) Indication if follow-up coordination is required
 - 3. Should existing conditions prohibit construction progress as submitted and approved, coordinate the adjusted installed locations with the other contractors (AV, electrical, etc).
- B. Concurrent Installation
 - 1. The network will be installed concurrent with the work of Division 27. Coordinate your work with the Owner's/network integrator's work. For example, coordinate scope and dates for rack and cabling (terminations) readiness to allow the network integrator to plan and schedule installation of the network equipment (for example, access switches).
- C. Role of the Engineer
 - 1. The network will be installed concurrent with the work of Division 27. Coordinate your work with the Owner's/network integrator's work. For example, coordinate scope and dates for rack and cabling (terminations) readiness to allow the network integrator to plan and schedule installation of the network equipment (for example, access switches).
- D. Use of Electronic Drawing Files
 - 1. Should the Contractor require the Engineer's electronic files to produce shop drawings and/or as-built drawings, the Engineer will require the Contractor sign a file release agreement.

1.10 WARRANTY

- A. As a minimum, warrant products and labor provided will, under normal use and service, be free from defects and faulty workmanship for period of 5 years from the date of acceptance. During the warranty period the entire system shall be kept in operating condition at no additional material or labor costs to the Owner. Also refer to specific sections for additional warranty requirements that supersedes the project's minimum warranty.
- B. Render service within 24 hours of system failure notification. Note deviations or improvements to this service at the time of bid and obtain written acceptance from the Owner, or Owner's Representative.
- C. Manufacturers of the major system components shall maintain a replacement parts department and provide testing equipment when needed. Provide complete replacement parts within 24 hours during the warranty period.
- D. Conformance to certain government standards on quality assurance may be required for some applications outlined in these specifications.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Materials used shall present no environmental or toxicological hazards as defined by current industry standards and shall comply with OSHA and EPA standards, other applicable federal, state, and local laws.
- B. Product numbers are subject to change by the manufacturer without notification. In the event a product number is invalid or conflicts with the written description, notify the Engineer in writing prior to ordering the material and performing installation work.

2.2 PRODUCT SUBMITTAL AT TIME OF BID

- A. At the time of bid, include a list of major products in the Contract documenting the intended cabling system solution, AV equipment, etc.

2.3 SUBSTITUTIONS

- A. Conform to the substitutions requirements and procedures outlined in Division 01.
- B. Only one substitution for each product specified will be considered.
- C. Where products are noted as "or equal", a product of equivalent design, manufacture, and performance will be considered. Submit product data (product information, catalog cuts, pertinent test data, etc.) to substantiate that the product is in fact equivalent to that specified. The burden of proof that the substituted product is equivalent to the specified product rests with the Contractor. Whenever material, process or equipment is specified in accordance with an industry specification (ANSI, TIA, etc.), UL rating, or other association standard, present an affidavit from the manufacturer certifying that the product complies with the particular standard

specification. When requested by the Engineer, submit supporting test data to substantiate compliance.

- D. Manufacturers' names and model numbers used in conjunction with materials, processes or equipment included in the contract documents are used to establish standards of quality, utility and appearance. Materials, processes or equipment that, in the opinion of the Engineer, are equivalent in quality, utility and appearance will be approved as substitutions to that specified when "or equal" follows the manufacturers' names or model number(s).
- E. When the Engineer accepts a substitution in writing, it is with the understanding that the Contractor guarantees the substituted product, component, article, or material to be equivalent to the one specified and dimensioned to fit within the construction according to contract documents. Do not provide substituted material, processes, or equipment without written authorization from the Engineer. Assumptions on the acceptability of a proposed substitution, prior to acceptance by the Engineer, are at the sole risk of the Contractor.
- F. Approved substitutions shall not relieve the Contractor of responsibilities for the proper execution of the work, or from provisions of the specifications.
- G. Pay expenses, without additional charge to the Owner, in connection with substitution materials, processes and equipment, including the effect of substitution on self, subcontractor's or another Contractor's work.

PART 3 - EXECUTION

3.1 PERMITS AND INSPECTIONS

- A. Furnish materials and execute workmanship for this work in conformance with applicable legal and code requirements.
- B. Perform tests required herein, or as may be reasonably required to demonstrate conformance with the Specifications or with the requirements of legal authority having jurisdiction.
- C. Arrange and pay for review/inspection from compliance officials responsible for enforcement of applicable codes and regulations to establish that the work is in compliance with requirements of reference codes indicated herein.

3.2 EXAMINATION

- A. Verify existing conditions, stated under other sections, are acceptable for installation in accordance with manufacturer's instructions.
- B. Verify cable routes and lengths prior to pulling cables. Immediately notify the Engineer if actual lengths are expected to exceed project's maximum length requirement(s).

3.3 FIELD QUALITY CONTROL

- A. Staffing: Provide a qualified foreman to supervise the crew performing the work and who is present at the job site at times work is being performed.

- B. Construction Meetings: Participate in construction coordination meetings throughout the course of construction to review the progress and to resolve issues and conflicts. Prepare and distribute meeting agenda for telecommunication issues prior to, and meeting notes after meetings, in a format acceptable to the Owner. Publish meeting notes within 3 business days following the meeting.
- C. Scheduling: Perform the work within the approved construction schedule. Keep the construction schedule current, based on the results of the construction meetings. At minimum, schedule shall document critical due dates, tasks, and milestones. Submit revised schedules for approval within 3 business days whenever there are modifications.
- D. Inspection: Inspect the work after installation. Keep areas of work accessible and notify code authorities, or designated inspectors, of work completion ready for inspection. Document completion and inspection as required.

3.4 INSTALLATION

- A. Complete work in conformance to applicable federal, state and local codes, and telephone standards.
- B. Complete work in a neat, high-quality manner, relative to common industry practices, and in accordance to NECA "Standard of Installation".
- C. Coordinate the entire installation throughout the construction team (general contractor and subcontractors).
- D. Manufacturer's Instructions: Comply with manufacturer's published installation instructions, product data, product technical bulletins, product catalog, and other instructions for installation. Maintain a file on the jobsite of MSDSs for each product delivered to jobsite packaged with an MSDS.
- E. Adjusting: Make changes and revisions to systems to optimize operation for final use. Make changes to systems such that defects in workmanship are corrected and completed systems pass the minimum test requirements.
- F. Protection: Protect installed products and finish surfaces from damage during construction.
- G. Repair/Restoration: Replace or repair work completed by others that you deface or destroy. Pay the full cost of this repair/replacement. Repair defects prior to system acceptance.

3.5 CLEANING

- A. Remove temporary coverings and protection of adjacent work areas. Remove unused, excess, and left over products, debris, spills, or other excess materials. Remove installation equipment.
- B. Leave finished work and adjacent surfaces in neat, clean condition with no evidence of damage.
- C. Repair or replace damaged installed products.
- D. Legally dispose of debris.

- E. Clean installed products in accordance with manufacturer's instructions prior to Owner's, or Owner's Representative's, punch walk.

3.6 PUNCH WALKS AND PUNCH LISTS

- A. Punching the work of individual sections of Division 27 may be combined when noted so.
- B. Execute a punch walk with the Engineer and the Owner or Owner's Representative to observe Work.
- C. Develop a punch list for items needing correction. Issue this punch list to Engineer.
- D. Correct the Work as noted on punch list.
- E. Execute follow up punch walk with the Engineer and the Owner or Owner's Representative to verify punch list items have been corrected.

3.7 SYSTEM ACCEPTANCE

- A. Complete corrections (punch list items) prior to submitting acceptance certificate.
- B. On completion of the acceptance test, submit system acceptance certificate to the Owner or Owner's Representative requesting their signature and return of the certificate. Issue copies of the signed certificate back to the Owner or Owner's Representative with copy to the Engineer.

3.8 TRAINING

- A. After acceptance, schedule a time convenient with the Owner, or Owner's Representative, for instruction in the configuration, operation, and maintenance of the system.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 270526

COMMUNICATIONS GROUNDING AND BONDING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Communications Grounding Backbone and bonding of communications infrastructure and equipment to Communications Grounding Backbone.
- B. Related Sections
 - 1. Comply with the Related Sections requirements of Section 270000.
 - 2. Section 260526, "Communications Grounding Backbone system"

1.2 REFERENCES

- A. Comply with the References requirements of Section 270000.
- B. In particular or addition to the codes and standards listed in Section 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. NFPA 70, "National Electrical Code", particularly the following Articles:
 - a. Article 250: Grounding
 - b. Article 770: Optical Fiber Cables and Raceways
 - c. Article 800: Communications Systems
 - 2. Underwriters Laboratories, Inc. (UL) UL 467: Grounding and Bonding Equipment
 - 3. Electronic Industries Association/Telecommunication Industry Association:
 - a. ANSI-TIA-607-C, "Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises"
 - 4. Institute of Electrical and Electronics Engineers, Inc. (IEEE):
 - a. IEEE 467, "IEEE Recommended Practice for Grounding of Industrial and Commercial Power Systems"
 - b. IEEE P1100, "IEEE Recommended Practice for Powering and Grounding Sensitive Electronic Equipment in Industrial and Commercial Power Systems"

1.3 DEFINITIONS

- A. Definitions as described in Section 270000 shall apply to this section.
- B. In addition to those Definitions of Section 270000, the following list of terms as used in this specification defined as follows:
 - 1. "BCT": Bonding Conductor for Telecommunications
 - 2. "CM" and "cmil": Circular Millionths of an inch
 - 3. "GE": Grounding Equalizer Conductor
 - 4. "MBRGB": Main Building Reference Grounding Busbar
 - 5. "PBB": Primary Bonding Busbar
 - 6. "SBB": Secondary Bonding Busbar
 - 7. "TBB": Telecommunications Bonding Backbone

8. "TBC": Telecommunications Bonding Conductor
9. "THHN": Thermoplastic High Heat-resistant Nylon-coated

1.4 SYSTEM DESCRIPTION

- A. Base Bid Work: The Work under this section includes furnishing materials, installation, and coordination through the General Contractor with other trades for a Communications Grounding Backbone and for bonding of telecommunications equipment and apparatus to the Communications Grounding Backbone.
- B. Communications Grounding Backbone System: The Communications Grounding Backbone System contains grounding busbars, grounding conductors, bonding conductors, and connecting devices (including but not limited to pressure connectors, lugs, clamps, or exothermic welds). These components, upon completion of installation and testing, shall provide the means of a low impedance path to earth for unintentional and/or stray voltages or spurious signals present on telecommunications media and equipment. The Communications Grounding Backbone System will consist of the following aspects (refer to Drawings for additional information)
 1. PBB: Locate the PBB in the EF/BDF with the following connections:
 - a. MBRGB, via BCT (refer to Drawings for wire size)
 - b. Each TBB
 - c. Ground bushings installed on each entrance conduit opening within the space, via TBC
 - d. Overhead cable support within the space, via TBC
 - e. Dedicated power panel's ACEG within the space serving communication equipment, via TBC
 - f. Metallic pathways (conduits, surface raceway, etc.) within the space, via TBC
 2. TBB: TBB(s) are the primary bonding conductor between the PBB and other SBBs provided throughout a single building. The length of TBBs shall not exceed 500 feet. The TBB shall route from the BDF through each of the IDFs bonding each of the SBBs to the PBB. Maintain TBB continuity and do not break continuity in order to bond to a SBB.
 3. SBB: Locate the SBB in each IDF with the following connections:
 - a. TBB
 - b. Building steel, via TBC
 - c. Each entrance conduit into the space, via TBC and ground bushings
 - d. Overhead cable support within the space,, via TBC
 - e. Panelboard's ACEG within the space serving telecommunication equipment, via TBC
 - f. Metallic pathways (conduits, surface raceway, etc.) within the space, via TBC
- C. Performance Criteria for the Grounding Backbone:
 1. Resistance from any point of the communication grounding backbone system to the ground electrode and to earth shall not exceed 20 Ohms.
 2. Field test resistance and document, both electronically and printed, measured values.
- D. Bonding: Bonding consists of TBCs within telecommunications rooms from the PBB and SBBs to the following components:
 1. Rack bay
 2. Overhead cable support and vertical cable support
 3. Wall-mounted termination equipment
 4. Conduit ground bushings

5. Exit pathways
 6. Bonding jumpers between basketway, cable runway, and cable tray joints & splices, and between basketway/cable runway/tray and equipment racks
- E. Conductor Gauge Criteria:
1. Size BCT as the greater of either 2,000 cmil per linear foot up to 3/0 AWG or the largest TBB.
 2. Size TBB, and TBCs as 6 AWG minimum, then as 2,000 cmil per linear foot up to 3/0 AWG.

1.5 SUBMITTALS

- A. Comply with Submittal procedural, quantity, and format requirements of Section 270000.
- B. Submittal Requirements at Start Of Construction:
1. Product Data Submittal
 2. Shop Drawing Submittal(s), if the Contractor's installation intent differs from the Contract Documents or the design intent
- C. Substitutions
1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 270000.
- D. Submittal Requirements at Closeout: Submit to the Owner at the time of project closeout the following and before certificate of final payment is issued.
1. Test Report: Submit computer-generated test records of measured resistance values for inclusion into the Operation and Maintenance Manual.
 2. As-Built Drawings, consisting primarily of the Communications Grounding Backbone (not necessarily each bonded component or apparatus)

1.6 QUALITY ASSURANCE

- A. Comply with Quality Assurance requirements of Section 270000.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage and Handling requirements of Section 270000.

1.8 WARRANTY

- A. Warrant Work to perform as described within this Section for a period of 1 year. Correct deficiencies within 24 hours of notification.

PART 2 - PRODUCTS

2.1 GROUNDING AND BONDING CONDUCTORS

- A. Application: Suitable for indoor installation as a BCT, TBB, and/or TBC.
- B. Type: THHN (or THWN)
- C. Approvals:
 - 1. UL 83 as Type THHN
 - 2. Federal Specification A-A-59544, NEMA WC-5, UL-758
- D. Conductor: soft drawn annealed copper, stranded
- E. Gauge: Refer to System Description for conductor sizing criteria.
- F. Insulation: PVC, high-heat and moisture resistant
- G. Jacket: Nylon, abrasion, moisture, gasoline and oil resistant
- H. Color: green
- I. Flame Resistance: Meet the flame resistance requirements of IEEE 383, CSA FT-4 and UL VW-1.

2.2 CONNECTOR – “PARALLEL” TAP

- A. Application: H-type thick wall compression tap, for making conductor-to-conductor (e.g., TBB-to-TBC) permanent connection (pigtail, tapping, or splicing). Connectors shall be UL Listed.
- B. Manufacturers:
 - 1. Panduit
 - a. #HTCT2-2-1; “H-type” compression tap, run = #6-#2, tap = #2-#6.
 - b. #HTCT250-2-1; “H-type” compression tap, run = #2-250MCM, tap = #6-#2
 - 2. Or equal

2.3 CONNECTOR – “C” TAP

- A. Application: C-type copper thick wall compression tap, for making conductor-to-conductor (e.g., TBB-to-TBC) permanent connection (pigtail, tapping, or splicing). Connectors shall be UL Listed.
- B. Manufacturer:
 - 1. Panduit
 - a. #CTAPF4-12-C; CTAP for #6 AWG run –to– #6 AWG tap
 - b. #CTAPF2-12-C; CTAP for #2 AWG run –to– #6 AWG tap
 - c. #CTAPF1/0-12-L; CTAP for 1/0 AWG run –to– #6 AWG tap
 - d. #CTAPF2/0-12-Q; CTAP for 2/0 AWG run –to– #6 AWG tap
 - e. #CTAPF3/0-12-Q; CTAP for 3/0 AWG run –to– #6 AWG tap
 - 2. Or equal

2.4 GROUNDING BUSBAR - TINNED

- A. General: Busbar shall be UL listed.
- B. Standards: Compliant to ANSI-J-607-A
- C. Material: Solid copper, tinned cladding
- D. Holes: Predrilled, compatible with standard NEMA bolt hole sizing and spacing and with ANSI-J-607-A recommendations for 2-hole lugs.
- E. Mounting: Wall-mounted with standoffs. Standoffs shall insulate busbar from the mounting substrate.
- F. Manufacturer:
 - 1. Panduit
 - a. # GB4B0624TPI-1; busbar, 20"L x 4"W x 1/4"T, PBB hole pattern
 - b. # GB4B0612TPI-1; busbar, 12"L x 4"W x 1/4"T, PBB hole pattern
 - c. # GB2B0312TPI-1; busbar, 20"L x 2"W x 1/4"T, SBB hole pattern
 - d. # GB2B0306TPI-1; busbar, 12"L x 2"W x 1/4"T, SBB hole pattern
 - e. #GB2B0304TPI-1; busbar, 10"L x 2"W x 1/4"T, SBB hole pattern
 - 2. Or equal

2.5 CONNECTION TO STRUCTURAL STEEL

- A. Application: Exothermic welds shall be used for cable-to-cable, cable-to-ground rod, and cable-to-structural steel.
- B. Manufacturers:
 - 1. Cadweld
 - a. Each particular type of weld shall use a kit unique to that type of weld
 - 2. Or equal

2.6 CONNECTOR – COMPRESSION LUG

- A. Application: Conductor-to-busbar and/or –rack (or other flat surfaces) connection
- B. Type: compression lug, standard or long barrel, two-hole (1/4 inch diameter 5/8 inch on center)
- C. Manufacturers:
 - 1. Panduit
 - a. #LCC6-14JAW-L; for 6 AWG conductor
 - b. #LCC4-14ADW-L; for 4 AWG conductor
 - c. #LCC2-14AW-Q; for 2 AWG conductor
 - d. #LCC1-14AW-E; for 1 AWG conductor
 - e. #LCC1/0-14AW-X; for 1/0 AWG conductor
 - f. #LCC2/0-14AW-X; for 2/0 AWG conductor
 - 2. Or equal

2.7 CONNECTOR – SPLIT-BOLT, MECHANICAL TYPE

- A. Application: Conductor-to-conductor (or other round component) connection
- B. Type: split-bolt mechanical connector
- C. Material: high-strength copper alloy
- D. Manufacturers:
 - 1. Cooper B-Line
 - a. #WB2GC; split bolt bonding clamp
 - 2. Panduit
 - a. #SBC3-C; split bolt bonding clamp for #6 to #3 conductor
 - 3. Or equal

2.8 GROUND BUSHING

- A. Plated malleable iron body with 150 degree Centigrade molded plastic insulating throat and lay-in grounding lug.
- B. Manufacturers:
 - 1. OZ/Gedney BLG
 - 2. Thomas & Betts #TIGB series
 - 3. Or equal.

2.9 BONDING STRAPS

- A. Cable Runway Bonding Straps
 - 1. Application: makes multiple sections of cable tray conductively continuous
 - 2. Conductor: Flexible braided straps with factory terminated connectors.
 - 3. Manufacturers:
 - a. Chatsworth Products Inc
 - 1) #12061-001
 - b. Cooper B-Line
 - 1) #SB6691x7³/₄
 - c. OZ/Gedney
 - 1) Type BJ
 - d. Thomas & Betts
 - 1) #3840 series
 - e. Or equal
- B. Cable Tray Bonding Straps
 - 1. Application: makes multiple sections of cable runway conductively continuous
 - 2. Conductor: Flexible braided straps with factory terminated connectors.
 - 3. Manufacturers:
 - a. Cooper B-Line
 - 1) #99-N1
 - b. Thomas & Betts
 - 1) #FB95
 - c. Or equal.

2.10 ANTIOXIDANT JOINT COMPOUND

- A. Application: Compound to inhibit oxide forming at copper-to-copper, aluminum-to-aluminum or aluminum-to-copper connections.
- B. Manufacturer, or equal:
 - 1. Chatsworth Products Inc
 - a. #40168-801; antioxidant joint compound for copper-to-copper connections
 - b. #40166-801; antioxidant joint compound for aluminum-to-aluminum or aluminum-to-copper connections
 - 2. [Eaton] Cooper B-Line
 - a. #SBJCC; antioxidant joint compound for copper-to-copper connections
 - b. #SBJCA; antioxidant joint compound for aluminum-to-aluminum or aluminum-to-copper connections

2.11 LABELS

- A. Labels for Busbars
 - 1. Labels shall be machine-printable (such as by a laser printer or hand-held printer)
 - 2. Printable area should be approximately 2 inch wide x 0.5 inch high
 - 3. Printable area color shall be white
 - 4. Manufacturer:
 - a. Panduit
 - 1) #C200X100FJJ; laser/ink jet labels, white – for busbars
 - b. Or equal
- B. Labels for Conductors
 - 1. Labels shall be machine-printable (such as by a laser printer or hand-held printer)
 - 2. Labels shall be adhesive-backed and have a self-laminating feature
 - 3. Printable area should be 1 inch wide x 0.5 inch high, or larger
 - 4. Printable area color shall be white
 - 5. Manufacturer:
 - a. Panduit
 - 1) #S100X150YAJ; laser/ink jet labels, white – for #6 wires
 - 2) # S100X225YAJ; laser/ink jet labels, white – for #6 to #1/0 wires
 - b. Or equal

2.12 MISCELLANEOUS

- A. Wire Clamp
 - 1. Material: nylon, UV stabilized.
 - 2. Color: black
 - 3. Size: 0.25" holding diameter for 6 AWG; or size as required based on conductor size.
 - 4. Manufacturer:
 - a. Richco Inc.
 - 1) #N4B-BLK
 - b. Or equal

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of Section 270000.
- B. Work shall comply with the International Building Code, International Fire Code, National Electrical Code, UL 467, and ANSI-J-607-C standards, as well as local codes that may specify additional grounding and/or bonding requirements. If discrepancies between codes and/or standards arise, codes shall prevail, and then the more stringent requirement shall prevail, and as directed by the AHJ.
- C. Install components to manufacturer's instructions and recommendations and as required per UL listing.
- D. Identify grounding and bonding conductors and components according to local codes.
- E. Terminations must be accessible for inspection and maintenance during the life of the system.

3.2 EXAMINATION AND PREPARATION

- A. Prior to the start of this section's work, examine pathways and communications rooms for completeness, compatibility with the work of this section, and readiness for connections with the work of this section.

3.3 INSTALLATION

- A. BCT, TBB, and Conductors
 - 1. Install BCT, and TBB conductors in conduit and in a manner to protect them from physical damage.
 - 2. When routing BCT, or TBB conductors through metallic conduit 3 feet or longer, bond the conductor to the conduit at both ends using a #6 AWG bonding conductor as a pigtail, an irreversible connection (preferably exothermic weld) for the conductor-to-pigtail connection, and insulated ground bushings at the conduit ends.
 - 3. Install the BCT, or TBB conductor without splices.
 - a. In the event that a splice is necessary, notify the Engineer in writing. Do not proceed with splicing work until the Engineer has accepted in writing the installation of a splice.
 - b. Locate the splice in a telecommunications space and ensure accessibility.
 - c. Perform the splice using an exothermic weld and an irreversible compression-type connector.
 - 4. Where shown on the drawings, connect grounding conductors to structural steel using exothermic welds. Each particular type of weld shall use a kit unique to that type of weld.
- B. PBB and SBB Busbars
 - 1. Mount busbars as noted on Drawings and using insulating standoffs.
- C. Panelboard Bonding
 - 1. Where a panelboard is located in the same communications room as a PBB/SBB and serves that room, provide TBC between busbar and that panelboard's Alternating Current Equipment Ground (ACEG) bus (where equipped) or the enclosure.

D. Bonding

1. Provide TBC and appropriate grounding hardware between the nearest TMGB/TGB and the equipment racks / rack bay, overhead cable support, vertical cable support, telecommunication conduits, primary pathways that enter/exit the room (if applicable), and other metallic telecommunication infrastructure components. Refer to Drawings for additional information.
2. Minimum size: #6. If longer than 25 feet, size TBCs based on length using 2000 cmil per foot, up to 2/0 AWG.
3. Install TBCs in a manner that will protect them from physical and mechanical damage.
4. Routing:
 - a. Route TBCs in the shortest possible path, using right angles for turns and routed parallel to building lines. Route on outside edges of wall plywood. Do not cut across the middle of the plywood taking space away from other equipment or components.
 - b. Utilize a minimum 1-foot bend radius.
5. Connection to PBB/SBBs:
 - a. Thoroughly clean busbars prior to attaching connectors to the busbar.
 - b. Fasten connectors (e.g., lugs) to the busbar using matching size bolt, flat washer Belleville washer, and nut. Torque hardware set.
6. Rack Bay Bonding
 - a. Refer to Drawings for detailed diagrammatic requirements for bonding the rack bay.
 - b. Bond equipment racks, frames, frame bays, cabinets, server racks, and other similar support systems located within the same room or space as the PBB/SBB to the busbar.
 - c. Use approved connectors for TBC-to-rack, -frame, and -cabinet connections.
 - d. Rack bays may be bonded in series using either of the following configurations:
 - 1) Series: Provide a TBC from the SBB to the rack closest to the busbar; then provide a TBC to the other racks in the rack bay in series using a common lug/connection per rack. The rack shall not be used as a 'conductor' in the series connection.
 - 2) String: Provide one 'main' TBC from the SBB along the length of the rack bay, and provide a pigtail from the 'main' TBC per rack. Use an irreversible connection (such as "C" tap) for the 'main'-to-pigtail connection.
7. Overhead and Vertical Cable Support Bonding
 - a. Bond overhead and vertical cable support located within the same room or space as the PBB/SBB to the busbar.
 - b. Provide either UL listed connectors and splice plates or UL Listed bonding strap to bond sections of overhead cable support for ground continuity. This requirement applies to cable tray, basketray, runway sections and junctions within a single telecommunication room.
8. Metallic Surface Raceway Bonding
 - a. Bond metallic surface raceways for telecommunications cabling to approved electrical ground located within the same room or space as the surface raceway.

3.4 LABELING

A. General Requirements

1. Labeling, identifier assignment, and label colors shall conform to TIA/EIA-606-A Administration Standard and as approved by the Engineer before installation.
2. Permanently label TBCs. Affix label as close as practical to each end of the conductor.

- B. Label Format
 - 1. Provide permanent labels with machine-generated text; hand written labels will not be accepted.
 - 2. Labels on TBCs shall fully wrap around conductors with a self-laminating feature to provide permanent marking.

- C. Identifier Assignment
 - 1. Separate label fields of the identifier with a hyphen.
 - 2. Assign identifiers according to current practice and as approved by the Engineer before installation.
 - 3. BCT and TBB
 - a. First field: "BCT" or "TBB" (the conductor type).
 - b. Second field: a unique sequential number, for example, "01".
 - c. Example: "TBB-01"
 - 4. Ground Busbars
 - a. First field: "PBB" or "SBB" (the busbar type)
 - b. Second field: the room's identity (IDF identifier's suffix) where the busbar is installed; for example, "3A2.1".
 - c. Example: "SBB-3A2.1"
 - 5. TBC:
 - a. First field: "TBC" (the bonding conductor type).
 - b. Second field: The room identity where TBC exists; for example: "A1.1".
 - c. Third field: A unique sequential number; for example: "01", "02", etc.
 - d. Fourth field: describe the device, equipment, component, or raceway being bonded.
 - e. Example: "TBC-A1.1-01 (RACK BAY)"

3.5 GROUNDING BACKBONE RESISTIVITY MEASUREMENT

- A. Measure ground resistance from each ground busbar to earth; record measurement. Provide additional grounding electrodes, bonding, and other elements as required to comply with resistance limits specified in this Section.

- B. Submit computer-generated records of measured resistance values to Engineer for approval and for inclusion into the Operation and Maintenance Manual.

3.6 FINAL INSPECTION AND CERTIFICATION

- A. Punch the Work of this Section compliant to the requirements of Section 270000. Punching the Work of this Section may be combined with punching the rooms.

- B. Comply with system acceptance and certification requirements of Section 270000.

END OF SECTION

SECTION 270528

COMMUNICATIONS BUILDING PATHWAYS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Pathway systems within buildings to support low voltage systems - namely cable hangers and rated sleeves.
- B. Base Bid Work:
1. Provide materials and labor, whether explicitly mentioned herein or not, needed for complete pathway systems to satisfy the requirements of this section and the related drawings. "Complete" shall include primary components, supports, seismic bracing, bonding straps (as required), etc., necessary for a complete installation. This specification lists major equipment but not every accessory, support, fastener, etc., needed to complete the work.
 2. Install pathway systems in accordance with CEC, UL listing information, manufacturer's instructions, compliant to local inspections and seismic restraint requirements, NECA's "Standards of Installation" pertaining to general electrical installation practices and recognized industry practices, and in conformance to ANSI/TIA-569 standard and BICSI TDMM guidelines.
 3. Cable Hanger Systems
 - a. Provide a complete cable hanger system compliant with requirements of the CEC (in particular, compliant with the requirements of Article 300.11), in accordance with NECA's "Standards of Installation" (pertaining to general electrical installation practices), compliant with applicable portions of NFPA 70B, in accordance with manufacturer's instructions, and in accordance with recognized industry practices. A "complete system" shall include cable hangers, supports, anchors, fasteners, and other required accessories.
 - b. Provide cable hangers between primary pathways (or telecommunications rooms) and work area pathways and/or outlet locations at intervals up to 48 inches on center per a given route, at transitions downward/upward, and within 24 inches of an outlet stub/outlet location.
 - c. Supports:
 - 1) Provide dedicated supports for cable hangers. Do not support cable hangers on ceiling grid support wires. Do not share supports with other trades. Do not support hangers from ductwork, piping, or other equipment hangers.
 - 2) Support Wires:
 - a) Support wires shall consist of #12 drop wire (or as approved) with integral clip and fastener (such as power-actuated deck pin, beam flange, or other fastener appropriate for the use).
 - b) Secure support wires at both ends in accordance with CEC.
 - 3) Support Rods:
 - a) Support rods shall consist of 1/4 inch (6.3mm) or 3/8 inch (9.5mm) threaded or smooth rod and concrete anchor or beam flange clip or angled flange clip (as required for attachment to the building structure).

4. Spiral Wrap
 - a. Provide spiral wrap to support and dress cables from feed pathways to the point where the cables enter the furniture system.
5. Seismic Bracing: If required by code, provide seismic bracing and restraints to supports and pathways. Seismic bracing shall be approved by a structural engineer licensed in the state of California.

C. Related Sections

1. Comply with the Related Sections paragraph of section 270000.
2. Section 260533, "Raceways and Boxes for Electrical Systems"
3. Section 270536, "Communications Cable Trays"
4. Section 270526, "Communication Grounding and Bonding"
5. Section 271100, "Communication Rooms"

1.2 REFERENCES

- A. Comply with the References requirements of section 270000.
- B. In addition to those codes, standards, etc., listed in 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 1. Underwriters Laboratories (UL)
 - a. UL 5, "Standard for Surface Metal Raceways and Fittings"
 - b. UL 5A, "Nonmetallic Surface Raceways and Fittings"
 - c. UL 5C, "Standard for Surface Raceways and Fittings for Use with Data, Signal, and Control Circuits"
 2. Underwriters Laboratories (UL)
 - a. UL 467, "Grounding and Bonding Equipment"

1.3 DEFINITIONS

- A. Definitions of section 270000 apply to this section.
- B. In addition to those Definitions of section 270000, the following list of terms as used in this Section defined as follows:
 1. "Cable Hanger": A cable support component often shaped (section view) similar to the letter J (thus gaining the nickname "J hanger"), metallic (most often steel) or non-metallic (most often thermoplastic); available in different sizes (to support different quantities of cables) and with different attachment hardware suiting multiple installation methods (e.g., wire support, beam flange clip, etc.).
 2. "Cable Strap": A flexible cable support that generally 'wraps' around cables and 'latches' into a fixed position, most often textile, available in different sizes (to support different quantities of cables) and with different attachment hardware suiting multiple installation methods (e.g., wire support, beam flange clip, etc.).
 3. "CEC": California Electrical Code (CCR Title 24 Part 3)
 4. "Enclosure": The case or housing of apparatus, or the fence or walls surrounding an installation to prevent personnel from accidentally contacting energized parts or to protect the equipment from physical damage.
 5. "J Hanger" and "J Hook": nickname for cable hanger
 6. "NEC": National Electrical Code (NFPA 70)
 7. "NFPA": National Fire Protection Agency
 8. "UL": Underwriters Laboratories

1.4 SYSTEM DESCRIPTION

- A. Clearances (minimum):
 1. From fluorescent light fixtures, or other EMI sources = 6 inches (150 mm)
 2. From any motor = 48 inches (1,220mm)
 3. From flue, hot water, steam line or other non-insulated heat sources = 12 inches (300 mm)

1.5 SUBMITTALS

- A. General: Conform to Submittal requirements as described in section 270000.
- B. Quantity: Furnish quantities of each submittal as noted in section 270000.
- C. Submittal Requirements Prior to the Start of Construction:
 1. Product Data Submittal, showing product dimensions, fabrications materials, fabrication details, knockout sizes and locations, capacities, finishes, and accessories
 2. Shop Drawings Submittal, consisting of proposed changes to pathways (routes, types, sizes, etc.) compared to the contract documents
 3. Seismic Calculations for Anchoring and Bracing: Submit seismic calculations for support systems in conformance section 270000. Calculations shall be prepared and signed by a Structural Engineer registered in the state of California. If used, specify proof loads for drilled-in anchors.
- D. Submittal Requirements at Close Out:
 1. As-Built Drawings, showing the routes/locations, dimensions, types, sizes, quantities, etc., of pathways/pathway devices.
 2. O&M Manual, including as-builts, a parts list, repair information, and detailing ongoing maintenance requirements
- E. Substitutions
 1. Requests for substitutions shall conform to the general requirements and procedure outlined in section 270000.

1.6 QUALITY ASSURANCE

- A. Comply with Quality Assurance requirements of section 270000.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage and Handling requirements of section 270000.

1.8 WARRANTY

- A. Comply with Warranty requirements of section 270000.

PART 2 - PRODUCTS

2.1 HANGERS AND STRAPS

- A. Application: Suitable for indoor installation within ceiling space for the support of communications cables.
- B. Hanger shall be rated for use in air handling space.
- C. Hangers shall contain a closing loop, retainer, or latch to prevent cables from falling off the hanger.
- D. Manufacturer, or equal:
 - 1. Eaton B-Line
 - a. #BCH21-W2; for drop wire installation
 - b. #BCH32-W2; for drop wire installation
 - c. #BCH21; for wall installation
 - d. #BCH32; for wall installation
 - 2. Panduit
 - a. #JM JH2-X20; cable hanger

2.2 DROP WIRE

- A. Application: Suitable for indoor installation within ceiling space into structure above (e.g., deck or slab) for the support of cable supports such as cable hangers.
- B. Listings: UL 2043, for use in air handling spaces
- C. Drop wire shall be equipped with pre-mounted ceiling clip, fastening pin, and pre-tied wire. Pin shall be 7/8". Wire shall be 12 gauge.
- D. Manufacturer, or equal:
 - 1. Hilti #CC27 X-AL-H22P8T x ft. PT (100); drop wire assembly, "x" for length
 - 2. Armstrong #7891
 - 3. Dottie #CWC
 - 4. Garvin Industries
 - 5. Oregon Wire Products

2.3 DROP ROD

- A. Application: Suitable for indoor installation within ceiling space into building structure above (e.g., deck or slab) for the support of cable supports such as cable hangers.
- B. Listings: UL 2043, for use in air handling spaces
- C. Zinc plated for corrosion resistance

- D. Manufacturer, or equal:
 - 1. CEAS #01014801; "Stiffy" straight rod, 1-1/4" power-actuated pin, 48 inches (or configured as required per instance)

2.4 FIRE RATED SLEEVE

- A. Application: Suitable as a sleeve for cables to pass through a full-height partition (e.g., gypsum or masonry) or floor (e.g., cast-in-place slab or concrete metal deck), and as a through-penetration fire stop system maintaining the fire rating of the penetrated partition.
- B. Sleeves shall be re-enterable.
- C. Sleeve system shall be tested in accordance with ASTM E 814 (ANSI/UL1479).
- D. Sleeve system shall be UL Listed and shall bear a UL Classification marking.
- E. Sleeve system shall match (or exceed) the partition's/floor's F and T rating.
- F. Manufacturer:
 - 1. Specified Technologies Inc (STI)
 - a. #EZDP44; "EZ Path Series 44" 4-inch square sleeve kit
 - b. #EZDP144FK; "EZ Path Series 44" 4-inch square sleeve kit with kick plate
 - c. #EZDG444; "EZ Path Series 44" 4-inch square kit with 4 sleeves and 1 grid
 - d. #EZD44; "EZ Path Series 44" 4-inch square sleeve
 - e. #EZP144W; "EZ Path Series 44" wall plates (1 pair) for EZD44 sleeve
 - f. #EZP544W; "EZ Path Series 44" wall plates (1 pair) for up to 5 EZD44 sleeves
 - g. #EZP144K; "EZ Path Series 44" kick plate for EZD44 sleeve
 - h. #EZG844; "EZ Path Series 44" grid for 8 sleeves
 - i. #TRK444; T-rating kit, for 4 Series 44 sleeves

2.5 SPIRAL WRAP

- A. Application: Suitable for an indoor installation for the support of telecommunications cables from a feed pathway to furniture systems, or similar.
- B. Material shall be flame retardant polyethylene (UL94V-0), or equivalent.
- C. Color: Black.
- D. Size: As required to support the given cable bundle size (e.g., 3/4" minimum).
- E. Manufacturer, or equal:
 - 1. HellermannTyton
 - 2. Panduit

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of section 270000.

3.2 EXAMINATION AND PREPARATION

- A. Prior to starting the work of this section, examine areas to receive pathways systems to verify conditions are ready for work and to verify conformance with manufacturer and specification tolerances. Notify the Owner's Representative in writing of conditions that would adversely affect the installation, or subsequent utilization, of the system. Do not proceed with installation until unsatisfactory conditions are corrected.
- B. Prior to installation, plan routes and locations of pathway systems and coordinate with other trades (ductwork, plumbing, electrical raceways, wall construction, ceilings, etc.). Pathway systems shall not unnecessarily cross other trade's work, shall not prevent removal of ceiling tiles or panels, and shall not block access to mechanical or electrical equipment. Provide offsets as required to avoid obstruction of pathway systems with other trades.

3.3 INSTALLATION

- A. Hangers and Straps
 1. Install hangers so they are accessible through the ceiling grid and are not blocked by other building infrastructure.
 2. Install hangers above ceiling grid to result in cables sag 6 to 12 inches (150 to 300 mm), minimum, above ceiling grid. Cables shall not rest on the ceiling grid and/or ceiling tiles.
 3. Where hangers have loops/retainers, close loop/retainer (latch after cable installation).
- B. Fire Rated Sleeve
 1. Install the sleeves in strict accordance with the UL System drawing, with the approved shop drawings, and with the equipment manufacturer's instructions.
 2. Framed Walls – Pre-Framed and Cut-In
 - a. Coordinate location of penetration with other trades such as framing (wall studs), electrical (lighting), mechanical (ducts), and other trades.
 - b. For cut-in instances, cut wallboard to fit rated sleeve system – no more wallboard than is necessary to fit the system.
 - c. Apply the factory-supplied gasket prior to the installation of the wall plates.
 - d. Secure wall plates to sleeves per the equipment manufacturer's recommendations.
 3. Affix a label at each fire sleeve location onto the wall or floor – within 2 to 3 feet. Place label in a location that will not be obscured after cables get installed through the sleeve. Label shall describe the system's applicable ratings, such as F, T, and L ratings.

3.4 FINAL INSPECTION AND CERTIFICATION

- A. Punch the Work of this Section compliant to the requirements of section 270000.
- B. Comply with system acceptance and certification requirements of section 270000.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 270536

COMMUNICATIONS BUILDING PATHWAYS – CABLE TRAYS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Cable tray systems as pathways within buildings to support low voltage/signal systems
- B. Base Bid Work
1. Provide materials and labor, whether explicitly mentioned herein or not, needed for a complete cable tray system to satisfy the requirements of this section and the related drawings. "Complete" shall include supports, seismic bracing, straight sections, fittings, connectors/splices, bonding straps (as required), etc., necessary for a complete installation. This specification lists major equipment but not every accessory, support, fastener, etc., needed to complete the work.
 2. Install cable tray systems in accordance with CEC (e.g., Articles 392 and 250), UL listing information, manufacturer's instructions, and NEMA VE 2, and compliant to local inspections and seismic restraint requirements, NECA's "Standards of Installation" pertaining to general electrical installation practices, and recognized industry practices. Cable tray systems shall conform to ANSI/TIA-569-B standard and BICSI TDMM guidelines.
 3. Supports: Provide supports at each connection point, at fittings, direction transitions, at the end of each run, and at other locations necessary to attain a fully supported and seismically braced cable tray system using a structurally-approved anchoring system and in accordance with NEMA VE 2.
 - a. Allowable Support Methods:
 - 1) Trapeze, consisting of threaded rod, channel/strut or angle iron, and appropriate hardware (anchors, nuts, washers, hold-down clips, etc.)
 - 2) Single hanger clip ("Flip-Clip", "trapeze support clip", other side wire clip)
 - b. Disallowable Support Methods:
 - 1) Center hung, consisting of a single threaded rod and strut or angle iron
 - 2) Cantilever (wall), consisting of wall-mount strut assembly, gusset or triangle assembly, and appropriate hardware (lag bolts, nuts, washers, hold-down clips, etc.)
 4. Seismic Bracing: Provide seismic bracing and restraints to supports and tray system. Seismic bracing shall be approved by a structural engineer licensed in the state of California.
 5. Splices: Provide UL classified splice systems by the same manufacturer as the straight sections and fittings.
 - a. Wire Mesh Cable Tray Systems Straight Section Splices:
 - 1) Allowable Splice Methods: washer splice, splice plate, splice bar, wing splice
 6. Expansion Connections: Provide expansion connectors where required per NEMA VE 1 and/or NEMA VE 2 and per manufacturer's instructions.
 7. Provide pre-manufactured radius kits at each bend/corner of "T" type intersections and cross intersections.
 8. Vertical Transitions: At vertical transitions of 36 inches (~1 m) or less, provide either a vertical section of tray between both tray levels or a cable dropout on the higher tray

section. At vertical transitions of greater than 36 inches (~1 m), provide a section of tray to span between both tray levels.

9. Dropouts:
 - a. Provide dropouts as shown on the drawings.
 - b. In locations that require 12" wide or 18" wide dropouts, the Engineer will accept combined dropouts, such as two 6" wide dropouts to create one 12" wide dropout, or one 12" wide dropout with one 6" wide dropout to create an 18" wide dropout.
10. Provide blind ends where tray truncations are exposed (i.e., not at a wall).
11. Bonding and Grounding
 - a. Provide a bonding strap at connections, expansion joints, sleeves, crossovers, and at other locations where the tray system's electrical continuity is interrupted and where splices and other accessories are not UL Listed.
 - b. Where straight sections or field fittings have been modified during installation such that wires have been removed, provide bonding straps or other accessories to ensure minimum continuous area to satisfy CEC requirements.
 - c. Bond cable tray system to approved ground, as per CEC 250.96, using approved connection means. Provide 2 AWG bare copper grounding conductor through entire length of tray. Bond grounding conductor to each component (straight section, fitting, etc.). Connect grounding conductor to approved ground, as per CEC 250.96, using approved connection means.
12. Provide acoustic treatments and/or acoustically rated systems where cable trays or their routs penetrate acoustically rated assemblies/walls. Such treatments and/or systems shall be approved by the project's acoustician.
13. First-In-Place: Install a single unit of work as described below.
 - a. As requested by the Owner, Owner's Representative, Engineer, or the General Contractor, install a section or sections of cable tray as a first-in-place using the products and installation means and quality intended to be used throughout the building. The installation shall demonstrate cable tray, support means, connections, bonding (as applicable) and seismic bracing (as applicable). Coordinate a meeting for the Owner and Engineer to review the installation. Proceed after obtaining written approval from either the Engineer or the Owner.

C. Related Sections

1. Comply with the Related Sections paragraph of section 270000.
2. Section 260536, "Cable Trays for Electrical Systems"
3. Section 270526, "Communication Bonding"
4. Section 271100, "Communication Rooms"

1.2 REFERENCES

- A. Comply with the References requirements of section 270000.
- B. In addition to those codes, standards, etc., listed in 270000, products (including fabrication process) and installation shall comply with the latest edition of the following applicable specifications and standards:
 1. ASTM International
 - a. ASTM A 123, "Specification for Zinc (Hot Galvanized) Coatings on Iron and Steel"
 - b. ASTM A 510, "Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel"
 - c. ASTM A 580, "Standard Specification for Stainless Steel Wire"
 - d. ASTM A525, "General Requirements for Steel Sheet, Zinc-Coated Galvanized by the Hot-Dip Process"
 - e. ASTM A 580, "Standard Specification for Stainless Steel Wire"

- f. ASTM A591, "Specifications for Electrodepositing Coatings of Zinc on steel wire or sheets"
- g. ASTM A 641, "Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire"
- h. ASTM A 653, "Specification for Steel Sheet, Zinc-Coated (Galvanized) by the Hot Dip Process"
- i. ASTM B 633, "Specification for Electrodeposited Coatings of Zinc on Iron and Steel"
- j. ASTM D 769, "Standard Specification for Black Oxide Coatings"
- k. ASTM D3451, "Standard Guide for Testing Coating Powders and Powder Coatings"
- 2. National Electrical Manufacturer Association (NEMA)
 - a. NEMA VE 1, "Metal Cable Tray Systems"
 - b. NEMA VE 2, "Metal Cable Tray Installation Guidelines"
- 3. National Electrical Contractors Association (NECA)
 - a. NECA/NEMA 105, "Recommended Practice for Installing Cable Trays"
- 4. National Fire Protection Agency (NFPA)
 - a. NFPA 70B, "Recommended Practice for Electrical Equipment Maintenance"
 - b. NFPA 70E, "Standard for Electrical Safety In The Workplace"
- 5. Underwriters Laboratories (UL)
 - a. UL 467, "Grounding and Bonding Equipment"
- 6. Manufacturer's guidelines and installation instructions

1.3 DEFINITIONS

- A. Definitions of section 270000 apply to this Section.
- B. In addition to those Definitions of 270000, the following list of terms as used in this Section defined as follows:
 - 1. "AHJ": Authority Having Jurisdiction; "the organization, office, or individual responsible for approving equipment, materials, an installation, or a procedure" (per NFPA)
 - 2. "Cable Tray" and "Cable Tray System": a unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways
 - 3. "CEC": California Electrical Code (CCR Title 24 Part 3)
 - 4. "LEED": Leadership in Energy and Environmental Design
 - 5. "CEC": California Electrical Code (NFPA 70)
 - 6. "NEMA": National Electrical Manufacturers Association
 - 7. "NFPA": National Fire Protection Agency
 - 8. "Wire Mesh Cable Tray": a cable support and management system fabricated of continuous, rigid, welded steel wire mesh; available in many sizes with attachment hardware suiting multiple installation methods; falls under NFPA 70's definition as cable tray.

1.4 SYSTEM DESCRIPTION

- A. Cable tray systems shall be electrically continuous maintaining minimum metal area requirements per CEC Table 392.7 (for use as an equipment grounding conductor).
- B. Bend Radius: Completed cable tray systems shall have a 12", minimum, radius, e.g., at fittings (factory and field-fabricated) and changes of direction.

- C. Cable tray supports (e.g., trapeze) shall carry a concentrated load of at least 200 pounds per anchorage point.
- D. Seismic Bracing: Cable tray systems shall include both lateral and longitudinal seismic bracing.
- E. Clearances (minimum):
 - 1. Top access clearance: Refer to the drawings; if not explicitly stated or shown, then the default shall be 12 inches (300 mm), minimum.
 - 2. Side access clearance: Refer to the drawings; if not explicitly stated or shown, then the default shall be 12 inches (300 mm), minimum.
 - 3. Between cable tray and fluorescent light fixtures, or other EMI sources: Refer to the drawings; if not explicitly stated or shown, then the default shall be 6 inches (150 mm), minimum.
 - 4. Between cable tray and any motor or transformer: Refer to the drawings; if not explicitly stated or shown, then the default shall be 48 inches (1,220mm), minimum.
 - 5. Between cable tray and any flue, hot water, steam line or other non-insulated heat sources: Refer to the drawings; if not explicitly stated or shown, then the default shall be 12 inches (300 mm), minimum.

1.5 SUBMITTALS

- A. General: Conform to Submittal requirements as described in section 270000.
- B. Submittal Requirements Prior to the Start of Construction:
 - 1. Product Data: Submit product data showing manufacturers, part numbers, dimensions, fabrication materials, fabrication details, finishes, capacities, and accessories.
 - 2. Shop Drawings: Submit shop drawings consisting of the following:
 - a. Cable tray layout/routes, supports locations, support details
 - b. Highlight proposed changes to pathways (routes, types, sizes, etc.) compared to the contract documents
 - c. Clearance variations and/or requests for exceptions
 - d. Load calculations for supports
 - e. Seismic bracing details (also see "Seismic Calculations" below)
 - f. Instances of penetrations through fire and smoke rated barriers, including calling out firestopping type/UL System, size, quantity, and other relevant information
 - g. Instances of seismic joints, including method and configuration to allowing independent movement, and other relevant information.
 - 3. Seismic Calculations: Refer to structural drawings for seismic bracing and supports type, quantities and locations.
- C. Submittal Requirements at Close Out:
 - 1. As-Built Drawings, showing the routes, dimensions, types, sizes, quantities, etc. (minimum)
 - 2. O&M Manual, including as-builts, parts list, repair information, and maintenance requirements
- D. Substitutions
 - 1. Requests for substitutions shall conform to the general requirements and procedure outlined in section 270000.

1.6 QUALITY ASSURANCE

- A. Comply with Quality Assurance requirements of section 270000.
- B. Cable tray materials and parts shall be UL Listed and Labeled, and shall comply with CEC Article 392 and with NEMA VE 1/CSA C22.2 No. 126.1 "Metal Cable Tray Systems" for materials, sizes, and configurations.
 - 1. The terms "Listed" and "Labeled" shall mean as defined in CEC, Article 100.
 - 2. Listing and Labeling Agency Qualifications: a "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.
- C. Cable tray installation shall comply with CEC Articles 392 (for materials and installation) and 250.96 (for bonding) and with NEMA VE2.
- D. Assembled cable tray systems shall be UL Classified as an equipment ground conductor.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage and Handling requirements of section 270000.

1.8 WARRANTY

- A. Comply with Warranty requirements of section 270000.

PART 2 - PRODUCTS

2.1 CABLE TRAY – WIRE MESH TYPE

- A. Application: Suitable for the support and management of communications cables, either overhead or mounted vertically on a wall.
- B. Listing: Cable tray system (straight sections, fittings, splice kits, etc.) shall be UL-Classified as a grounding conductor. Cable tray shall be listed by a nationally recognized testing laboratory and shall bear the UL label. Markings shall be permanent.
- C. Material: Straight sections shall be fabricated from high strength steel wires meeting the minimum mechanical properties of ASTM A510 and formed into a standard 2-inch by 4-inch wire mesh pattern with intersecting wires welded together. Wire ends along sides (flanges) shall be rounded during manufacturing for safety of cables and installers. Longitudinal wires shall be straight (with no bends).
- D. Finish – straight sections: Straight sections shall be electro-plated zinc, in accordance with ASTM B633, Type II SC1 (or SC2).
- E. Splicing assemblies shall be the bolted-type using serrated flange locknuts. Hardware shall have SC2 yellow zinc chromate finish, in accordance with ASTM B633, or can be AISI Type 304 Stainless Steel.
- F. Size: Refer to Drawings for sizes.

- G. Manufacturers, or equal:
 - 1. B-Line (Eaton) "Flextray" series cable tray
 - 2. Chatsworth Products Inc "OnTrac" "Round" series cable tray
 - 3. WBT cable tray

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of section 270000.
- B. Install cable tray systems in accordance with manufacturers' instructions, with NEMA VE 2 and with recognized industry practices. Install cable tray systems compliant to requirements of NEC, applicable portions of NFPA 70B, and to NECA's "Standards of Installation" pertaining to general electrical installation practices.

3.2 PREPARATION

- A. Routes shown on the drawings are diagrammatic in nature. Plan routes and locations of pathway systems, and coordinate the installation (concrete drilling, anchors, supports, heights, clearances, access to the trays, interface with sleeves, etc.) with other trades/systems (ductwork, plumbing, electrical raceways, wall construction, ceilings, etc.). Field verify the planned route prior to installation.
- B. Pathway systems shall not unnecessarily cross other trade's work, shall not prevent removal of ceiling tiles or panels, and shall not block access to mechanical or electrical equipment. Offset trays as required to avoid obstruction of pathway systems with other trades.
- C. Prior to installation, examine areas to receive pathways systems to verify conditions are ready for work and to verify conformance with manufacturer and specification tolerances. Notify the Owner's Representative in writing of conditions that would adversely affect the installation, or subsequent utilization, of the system. Proceed with installation when unsatisfactory conditions are corrected.

3.3 INSTALLATION

- A. In general, install cable trays parallel or at right angles to the centerlines of columns and beams.
- B. Access and Clearances:
 - 1. Ensure clearance and access requirements to cable tray – above, below, and side, as shown on the drawings – are met. Coordinate with other trades to avoid other building infrastructure encroaching on access/clearance.
 - 2. Ensure no other trades/building systems conflict with cable tray systems and clearances. Other building infrastructure, such as columns, pipes, valves, etc., shall not route inside or through cable tray. Either relocate/alter other building infrastructure (preferred) or, if other building infrastructure cannot be altered, adjust the cable tray route to avoid conflicts other building infrastructure.
 - 3. Under no circumstance shall cable tray block or inhibit access to fire smoke dampers or other code-required access. All such conditions will require corrective actions be taken. Adherence to this requirement will be strictly enforced.

- C. Provide supports according to applicable codes, NEMA VE2, and approved shop drawings. Do not share supports with ductwork, piping, or other equipment hangers. Attach supports to the exterior of the cable tray. Do not install brackets, rods, etc., through the inside of the cable tray.
- D. Do not install more than one splice or junction between supports.
- E. Fabricate fittings (tee, cross, reducers, and 90-degree turns) in the field according to the manufacturer's instructions and to ensure the pathway system remains UL listed. Bends shall have a minimum of a 12-inch bend radius.
- F. At transitions to and/or interface with conduits and/or sleeves, align ends of cable trays directly underneath the conduits/sleeves or within the allowable offset ranges as shown in the drawings. Refer to the drawings for additional information.
- G. At rated partitions, either transition to an approved acoustically rated sleeve or penetrate the partition using an approved acoustically rated system.
- H. Remove burrs and sharp edges.
- I. Bonding
 - 1. Bond the cable tray system per "[Summary] Base Bid Work" requirements.
 - 2. If splice kits are not UL Listed, then provide bonding jumpers at each splice/junction.
 - 3. Bond completed cable tray systems to approved ground according to applicable codes.
 - 4. At connection points:
 - a. Thoroughly clean connection surfaces prior to attaching connection/termination components.
 - b. At painted surfaces, remove paint to completely expose metal – enough for the connector to make 100% contact by area with the surface.
 - c. Apply antioxidant joint compound to the surface prior to receiving connection/termination components.
 - d. Attach connection/termination components using hardware sets appropriate for the connector and receiving surface. Tighten hardware sets.
 - 1) For lugs at holes, use appropriately sized bolt, flat washer, Belleville or split washer, and nut.
 - 2) For lugs at studs, use appropriately sized flat washer, Belleville or split washer, and nut.
 - e. Connections shall be visible, accessible and verifiable.
- J. Protection: Protect installed system until completion of project. Touch-up, repair or replace damaged products before punch walk.

3.4 TESTING

- A. Test cable tray systems for electrical continuity throughout and its bonding connection to approved ground point(s).

3.5 FINAL INSPECTION AND CERTIFICATION

- A. Punch the work of this section compliant to the requirements of section 270000.
- B. Comply with system acceptance and certification requirements of section 270000.

END OF SECTION

SECTION 270811

COMMUNICATIONS TWISTED PAIR TESTING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Testing of communications Backbone and Horizontal twisted pair cabling subsystem.
- B. Base Bid Work
 - 1. Testing of a completed communication infrastructure cabling system, which includes:
 - a. Submittals
 - b. Testing of the twisted pair cabling as follows:

Table 270811-1.1: Tests For UTP Cabling

Subsystem	Type	Test	Configuration	Notes
Backbone	ISP/Riser	*see "Notes"	-	Wire map, length
Horizontal	CAT6A	Category 6A	Permanent Link Channel	per TIA-568

- c. Record Documents, including test results.
- C. Work Provided Under Other Sections
 - 1. Backbone twisted pair cabling
 - 2. Horizontal twisted pair cabling
- D. Related Sections
 - 1. Comply with the Related Sections paragraph of section 270000.
 - 2. Section 271313, "Communication Backbone ISP Twisted Pair Cabling"
 - 3. Section 271513, "Communication Horizontal Twisted Pair Cabling"

1.2 REFERENCES

- A. Comply with the References requirements of section 270000.
- B. In addition to the References of section 270000, the following references apply to this specification:
 - 1. ANSI/TIA-1152, "Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling"

1.3 DEFINITIONS

- A. Refer to Definitions of section 270000, section 271313, and section 271513.
- B. In addition to those Definitions of section 270000, the following list of terms as used in this specification defined as follows:
 - 1. "CAT3": Shall mean Category 3 cabling (per TIA-568)
 - 2. "CAT6A": Shall mean Augmented Category 6 cabling (per TIA-568)

3. "Channel": Shall mean a testing configuration which includes the Permanent Link and the line cord (at the workstation), the equipment cord, and, if a full crossconnection is implemented, a patch cord and the crossconnect termination/connecting apparatus.
4. "Connect": Shall mean install all required patch cords, equipment cords, cross-connect wire, etc. to complete an electrical or optical circuit.
5. "Cord": Shall mean a length of cordage having connectors at each end. The term "Cord" is synonymous with the term "Jumper" and "Lead".
6. "Permanent Link": Shall mean the 'permanent' portion of the Horizontal cabling to each outlet with the test cords de-embedded from the measurements; this includes cable, consolidation point (if used), termination/connecting apparatus in the IDF and the connector at the outlet.
7. "System Cord": Shall mean the cord used in the operating transmission circuit.
8. "Test Cord": Shall mean the cord certified for use in testing, as described in this section.

1.4 SYSTEM DESCRIPTION

- A. Refer to section 270000, section 271313, and section 271513 for addition system description information.

1.5 SUBMITTALS

- A. Comply with the Submittal requirements of section 270000.
- B. Submittal Requirements prior to the Start of Testing
 1. Testing Procedures Submittal: Submit as a PDF file the step-by-step procedures that the field technicians will follow during testing.
 2. Product/Equipment Submittal: Submit as a PDF file cutsheets of testing equipment and applicable accessories to be used. As applicable, note software/firmware versions and last factory calibrations.
 3. Schedule Submittal: Submit as a PDF file a proposed schedule of work. This schedule may be combined with the schedule developed for the work of Related Sections (listed above).
- C. Submittal Requirements at Closeout
 1. Test Reports and Measurement Data: After completing testing of cabling and before final closeout, submit test reports and measurement data. This report may be combined with the test reports of section 270821.
 - a. Test Reports Content and Organization
 - 1) Cover Page, with the following information:
 - a) Client/Owner Name
 - b) Project Name and Address
 - c) Report Name (e.g., "Test Reports for Horizontal Cabling System")
 - d) Date of Submittal – date format: **Month Day, Year** (e.g., "January 1, 2018")
 - e) Testing Company Name
 - 2) Table of Contents
 - 3) Warranty Certificate: include a certificate stating that the testing company warrants the validity of the test reports; this may be a letter on company letterhead or a traditional certificate format.
 - 4) Test Reports: report per link showing tested parameters and results from prescribed performance levels (e.g., CAT6A PASS); organize test reports by

backbone cabling/horizontal cabling, by building, by floor, and by telecom room.

- b. Test Reports Format
 - 1) Submit test reports as a PDF file. The Table of Contents shall have links to organized sections.
- c. Measurement Data
 - 1) Submit native measurement data format (for example, an *.FLW file from a Fluke tester); if native data format is not possible to submit, then submit measurement data as an exported Microsoft Excel compatible format. Include 'Viewer' software necessary to view, sort, filter, and print individual and summary test results from the native data format.
- d. Transmittal
 - 1) The preferred method of transmitting closeout submittals is via a cloud-based file transfer platform (such as Dropbox or similar).
 - 2) If by data storage disc (not preferred), 'burn' the test reports and measurement data onto one storage disc (e.g., CD-ROM or DVD). Clearly label the disc with the "Cover Page" information described above.

1.6 QUALITY ASSURANCE

- A. Comply with the Quality Assurance requirements of section 270000.
- B. Under no circumstances shall any cable's and/or conductor's test results be substituted for another's. If an instance of falsification is confirmed, the Contractor is liable for a complete retest of the cabling system at no additional cost to the Owner. This includes the retaining the services of a neutral party to observe all retesting.

1.7 WARRANTY

- A. Warrant the validity of the test results.

PART 2 - PRODUCTS

2.1 CATEGORY 6A HORIZONTAL CABLE TESTER

- A. Certification: Test equipment and accessories (adapters, cords, etc.) shall be independently verified to and compliant with ANSI/TIA-1152-A Level 2G field tester accuracy requirements to 2000 MHz.
- B. Test Standards (minimum): TIA-568 Category 6A under a permanent link, MPTL, and channel configuration; IEEE 802.3 100Base-TX, 1000Base-T, and 10Base-T; screen continuity along path of cabling;
- C. Equipment, or equal:
 - 1. Fluke Networks
 - a. #DSX-5000 or DSX-8000 (or DSX2-8000); "CableAnalyzer" test kit (main unit, remote unit, CAT6A permanent link adapters, CAT6A channel adapters, CAT6A patch cord adapters, accessories), loaded with the latest firmware version.
 - b. "LinkWare" PC management software, latest version of and documentation software

PART 3 - EXECUTION

3.1 SCHEDULING

- A. Prepare a testing schedule based on the construction schedule developed in sections 271313 and 271513 for the testing activities. Update testing schedule when changes in the cabling schedules occur.

3.2 FIELD QUALITY CONTROL

- A. Calibrate test sets and associated equipment per the manufacturers printed instructions at the beginning of each day's testing and after each battery charge. Fully charge the test sets prior to each day's testing to ensure proper operation.
- B. Ensure test equipment and test cords are clean and undamaged during testing activities. At the Engineer's discretion, halt testing activity and clean testing equipment, test cords, and related apparatus.

3.3 BACKBONE TWISTED PAIR CABLING TESTING REQUIREMENTS AND PROCEDURES

- A. Precautions
 - 1. Adhere to the equipment manufacturer's instructions during all testing.
 - 2. Prior to any testing activity or any measurements taken, ensure the test equipment is at room temperature – approximately 70 degrees F (e.g., if necessary, bring the test equipment in from outdoors and let it set for about 15 minutes or for however long it takes to bring the test equipment to reach room temp).
 - 3. Fully charge power sources before each day's testing activity
- B. Testing Requirements
 - 1. Test backbone multipair cabling per "Base Bid Requirements" in Part 1 of this Section.
 - 2. The installation will be accepted when testing has indicated availability of 100% terminated pairs.
- C. Testing Procedures
 - 1. Test continuity and wire map for all pairs.
 - 2. Test length for 2% of pairs of each cable. Pairs shall be from different 25-pair binder groups.
- D. Acceptable Test Result Measurements
 - 1. Overall:
 - a. Links which report a Fail, Fail* or Pass* for any of the individual tests shall result in an overall link Fail. All individual test results must result in a Pass to achieve an overall Pass.
 - b. Any reconfiguration of a link components required as a result of a test Fail, must be re-tested for conformance.
 - c. Remove and replace any cabling links failing to meet the criteria described in this specification, at no cost to the Owner, with cables that prove, in testing, to meet the minimum requirements.
 - 2. Length
 - 3. Wire Map: Provide continuous cable link and terminate all pairs correctly at both ends. No exceptions accepted.

4. Attenuation: The acceptable attenuation measurements for any CAT3 cabling link is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3 and as adjusted to length measurement.
5. Worst Pair-to-Pair Near End CrossTalk (NEXT) Loss: The acceptable worst pair-to-pair NEXT loss no greater than that listed in ANSI/EIA-568-C.2, 6.3 for CAT3 cabling.

3.4 HORIZONTAL CATEGORY 6A TESTING PROCEDURES

A. Precautions

1. Adhere to the equipment manufacturer's instructions during all testing.
2. Prior to any testing activity or any measurements taken, ensure the test equipment is at room temperature – approximately 70 degrees F (e.g., if necessary, bring the test equipment in from outdoors and let it set for about 15 minutes or for however long it takes to bring the test equipment to reach room temp).
3. Fully charge power sources before each day's testing activity

B. Test Equipment Set Up

1. Set up the tester to perform a full CAT6A test, as a Permanent Link Channel configuration.
2. If the tester has cable-specific test parameters pre-loaded, set up the tester as product-specific setting. If not, set as generic CAT6A.
3. Set the tester to save the full test results (all test points, graphs, etc.).
4. Save the test results with the associated cable link identifier.
5. Calibrate the test set per the manufacturer's instructions.

C. Acceptable Test Result Measurements

1. Overall Test Results:
 - a. The Owner shall accept only individual test results that result in a Pass.
 - b. Links which report a Fail, Fail* or Pass* for any of the individual tests shall result in an overall link Fail.
 - c. Any reconfiguration of link components required as a result of a test Fail, must be re-tested for conformance.
 - d. Remove and replace any cabling links failing to meet the criteria described in this specification, at no cost to the Owner, with cables that prove, in testing, to meet the minimum requirements.
2. Wire Map: Correctly terminate all pairs of the cabling link at both ends. Provide only continuous pairs. No exceptions.
3. Length: Ninety-four meters is the maximum acceptable electrical length measurements for any cabling link measured under a Permanent Link configuration, including test cords.
4. Insertion Loss: The acceptable insertion loss measurements for any CAT6A cabling link is that which is no greater than that listed in TIA-568.1-D.
5. Worst Pair-to-Pair Near End CrossTalk (NEXT) Loss: The acceptable worst pair-to-pair NEXT loss for any CAT6A cable is that which is no greater than that listed in TIA-568.1-D.
6. Power Sum NEXT Loss: The acceptable power sum PS-NEXT loss for any CAT6A cable is that which is no greater than that as listed in TIA-568.1-D.
7. Worst Pair-to-Pair ELFEXT and FEXT Loss: The acceptable worst pair-to-pair ELFEXT and loss for any CAT6A cable is that which is no greater than that listed in TIA-568.1-D.
8. Power Sum ELFEXT and FEXT Loss: The acceptable PS-ELFEXT and loss for any CAT6A cable is that which is no greater than that listed in TIA-568.1-D.
9. Alien Near End CrossTalk (ANEXT) Loss: The acceptable ANEXT loss for any CAT6A cable is that which is no greater than that listed in TIA-568.1-D.

10. Alien Far End CrossTalk (AFEXT) Loss: The acceptable AFEXT loss for any CAT6A cable is that which is no greater than that listed in TIA-568.1-D.
11. Return Loss: The acceptable return loss measurements for any CAT6A cable is that which is no greater than that listed in TIA-568.1-D.
12. Propagation Delay and Delay Skew: The acceptable propagation delay and delay skew measurements for any CAT6A cable is that which is no greater than that listed in TIA-568.1-D.

3.5 TEST REPORTS

- A. Permanently record measurements and test results.
- B. Submit test results to the Engineer after testing for approval. The Engineer will check these test reports for a format acceptable to the Owner, or Owner's Representative. Each cabling link test record shall contain the following information:
 1. Project name and address
 2. Testing Company's name and Operator's name
 3. Date of measurement/test
 4. Test equipment, including the following:
 - a. Manufacturer, model, and serial number
 - b. Date and time of last calibration
 5. Cable identification and (as applicable) pair identification
 6. Overall test result
- C. Cable and pair identifiers of the test reports shall match the identifiers as labeled in the field – i.e., use the ID on the cable label/termination label in the test reports.

END OF SECTION

SECTION 270821

COMMUNICATIONS FIBER OPTIC TESTING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Testing of telecommunications fiber optic cabling.

B. Scope Of Work of this Section

1. Pre-Testing Submittals (also see "Submittals" for more details)
2. Inspection of completed fiber optic passive link segment(s) per IEC 61300-3-35.
3. Testing of completed fiber optic passive link segment(s) per the following table (also see "Part 3" for elaboration of testing requirements), according to ANSI/TIA-568-C.0 Annex E:

Subsystem	Type	Test	Direction	Wavelength
Backbone	Multimode	Tier 1, Method B (per TIA-526-14-B)	Both^	850nm and 1300nm
Backbone	Singlemode	Tier 1, Method A.1 (per TIA-526-7)	Both^	1310nm and 1550nm

4. Pre-Acceptance Submittals

C. Work Provided Under Other Sections

1. Fiber optic cabling and patching

D. Related Sections

1. Comply with the Related Sections paragraph of Section 270000.
2. Section 271323, "Communication Backbone ISP Fiber Optic Cabling"

1.2 REFERENCES

A. Comply with the References requirements of Section 270000.

B. In addition, the following standards are referenced to this Section:

1. American National Standards Institute (ANSI) Z136.2, "American National Standard for the safe use of optical fiber communication systems utilizing laser diode and LED sources"
2. ANSI/TIA-455-50B, "Light Launch Conditions For Long-Length Graded-Index Optical Fiber Spectral Attenuation Measurements"
3. TIA-455-77, "Procedures To Qualify A Higher-Order Mode Filter For Measurements On Singlemode Fibers"
4. TIA-455-78A, "Spectral-Attenuation Cutback Measurement for Singlemode Optical Fibers"
5. EIA-455-95, "Absolute Optical Power Test for Optical Fibers and Cables"
6. EIA-455-171A, "Attenuation By Substitution Measurement – For Short-Length Multimode Graded-Index And Single-Mode Optical Fiber Cable Assemblies"
7. TIA-526-7, "Measurement of Optical Power Loss of Installed Singlemode Fiber Cable Plant"
8. TIA-526-14-B (TIA-455-526-14B), "Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant"

9. TIA-TSB-4979, "Practical Considerations for Implementation of Multimode Launch Conditions in the Field"
10. ISO/IEC 14763-3, "Testing of Optical Fibre Cabling"
11. IEC 6100-3-35 (end faces)
12. IEC 61300-3-35, "Fibre optic interconnecting devices and passive components – Basic test and measurement procedures – Part 3-35: Examinations and measurements – Fibre optic connector endface visual and automated inspection"
13. IEC 61280-4-1
14. IEC 61280-4-2, "Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant"
15. BICSI Telecommunication Distribution Methods Manual (TDMM)

1.3 DEFINITIONS

- A. Refer to Definitions of sections 270000, 271323. The definitions of these sections apply to this section.
- B. In addition to those definitions in referenced sections, the following list of terms as used in this specification defined as follows:
 1. "Adapter" (associated with fiber connectivity): a connecting device that joins 2 fiber connectors, either like or unlike
 2. "Approved cleaning equipment": includes dry "one-click" probe type cleaners and/or other approved cleaning apparatus; also see "Cleaning Apparatus under Pat 2
 3. "Connect": install all required test cords, patch cords, system cords, etc. to complete an optical circuit
 4. "Cord": a length of cordage (simplex, duplex, or ribbon) having connectors at each end; the term "Cord" is synonymous with the term "Jumper"
 5. "Defect": detectable (via microscope) non-linear features on the end face of a fiber including particulates, debris, pits, chips, edge chipping, etc. as defined in 3.1 of IEC 61300-3-35 Edition 1
 6. "High Resolution" (microscope): as defined in 4.4.3 of IEC 61300-3-35 Edition 1
 7. "Jumper": see "Cord"
 8. "Low Resolution" (microscope): as defined in 4.4.2 of IEC 61300-3-35 Edition 1
 9. "OLTS": Optical Loss Test Set
 10. "Scratch": detectable (via microscope) permanent linear surface features on the end face of a fiber as defined in 3.1 of IEC 61300-3-35 Edition 1
 11. "Segment": cabling (cable, splices, couplings, splitters, connectors, etc.) between termination points / 2 endpoints or between points of access to the conductors within the cabling sheath, including the termination apparatus/components
 12. "System Cord": the cord used in the operating electrical or optical circuit
 13. "Test Record": a record (electronic and/or printed) of a the measured performance of a conductor against a standardized set of metrics
 14. "Test Report": a report containing a set of test records meeting a defined scope
 15. "Tier 1": testing of installed fiber optic cabling for loss (optical link power loss) with an OLTS, and verifying the cabling length and polarity – also refer to ANSI/TIA-568-C.0 Annex E
 16. "Test Cord": the cord certified for use in testing, and meeting the requirements of this section

1.4 SYSTEM DESCRIPTION

- A. Refer to section 271323for description of cabling systems.

1.5 SUBMITTALS

- A. Comply with the Submittal requirements of section 270000.
- B. Pre-Testing Submittal Requirements: Prior to the start of testing, submit the following:
 - 1. Product Data, submitted at least 8 weeks in advance the start of field measurements
 - 2. Testing Procedures, submitted at least 8 weeks in advance the start of field measurements
 - 3. Pre-Testing Loss Calculations, submitted at least 4 weeks in advance the start of field measurements
 - 4. Testing Schedule, submitted at least 4 weeks in advance the start of field measurements
- C. Pre-Acceptance Submittal Requirements: Prior to owner's acceptance, submit the following:
 - 1. Test Reports: Submit test reports in a format acceptable to the Owner or Engineer. Submit one electronic copy and one printed copy of test reports. This may be combined with the reports of Section 270811.
 - 2. Warranty Certificate: Submit warranty certificate in a format acceptable to the Owner.
- D. Submittal: Product Data
 - 1. Testing equipment ('mainframes', modules, remotes, etc.) including the following information (minimum):
 - a. Manufacturer and model number
 - b. Serial number
 - c. Date of last factory calibration
 - d. Software/firmware versions (as applicable)
- E. Submittal: Testing Procedures
 - 1. Describe step-by-step procedures the technicians will use in the field during actual testing – standards-based test methods, test equipment including the test cords and conditioners used, equipment configuration, how the reference gets established, etc. – something to which the engineer could compare the testing witnessing (observe testing technicians actually following these written step-by-step procedures).
- F. Submittal: Pre-Testing Loss Calculations
 - 1. Calculate the loss of each segment (not necessarily each fiber strand). The cable length may be based on the footage markings printed on the cable jacket. Include a brief description of each segment (such as endpoints).
- G. Submittal: Schedule
 - 1. Consists of proposed schedule of work (this schedule may be combined with the schedule developed for Division 27)

H. Submittal: Test Reports

1. Each test record shall include information per test as noted following:

CONTENT	LOSS – MMF	LOSS – SMF	CHARACTERIZATON
Owner/Project Name and Address	X	X	X
Contractor (Company) Name and Technician (test equipment operator) name	X	X	X
Date of Test	X	X	X
Test Equipment, including Serial Numbers (must match pre-testing submittal)	X	X	X
Test Procedure	X (e.g., OFSTP-14A, Method B)	X (e.g., OFSTP-7, Method A.2)	X
Test Cords – Type and Length	X	X	–
Test Cords – Measured Loss	X	X	–
Launch Fiber – Type and Length	–	–	X
Fiber/Strand Identifier and Fiber Type (e.g., “OM3”)	X	X	X
Test Equipment Set Up Parameters: wavelength, pulse width, refractive index, event threshold	–	–	X
End Locations and Measurement Direction	X	X	X
Wavelength	X	X	X
Reference Power Level	X	X	–
Optical Loss Measurement / Overall Loss	X	X	X
Characterization Trace	–	–	X
Fiber Length	X	X	X

2. Cable and fiber identifiers of the test reports shall match the identifiers as labeled in the field – i.e., the ID stored with the test result shall be the same ID as on the cable label/fiber port label.
3. Test Report Format – Electronic Submittal of Tier 1 Testing:
- Submit test report files as native data format (for example, an *.FLW file from a Fluke tester) and printed to PDF format assembled into a single file. Organize reports by backbone cabling, by floor, and by IDF.
 - For the native data format files, include the ‘Viewer’ or ‘Reader’ software necessary to view, sort, filter, and print individual and summary test results.
 - Organize the test records by (in this hierarchy): backbone cabling , by floor, by IDF, by sheath and by strand.
4. Test Report Format – Printed Submittal of Tier 1 Optical Loss Testing:
- Submit printed test reports, on 8.5”x 11” paper, color, one cabling link per page
 - Assemble prints into a 3-ring binder
 - Include a Table Of Contents at the beginning that lists the contents
 - Organize the test records by (in this hierarchy): backbone cabling, by floor, by IDF, by sheath and by strand. Include tabbed separators for improved navigation through the manual. Per tabbed section, sort records in ascending cable ID order.

- I. Submittal: Warranty Certificate
 - 1. Submit one printed copy of warranty certificate warranting the accuracy and validity of the test reports.

1.6 QUALITY ASSURANCE

- A. Comply with the Quality Assurance requirements of section 270000.
- B. Test equipment shall be fully functional and in proper working order (not broken adapters, connectors, buttons, battery cover, etc.). Test equipment shall have loaded the latest firmware/operating software.
- C. Calibration: Test equipment shall be factory calibrated within the manufacturer's published calibration period. The manufacturer, where applicable, shall calibrate test equipment against National Institute of Standards and Technology (NIST) standards.
- D. Technician Training: Technicians that operate test equipment shall have successfully attended an appropriate training program, which includes testing with an OLTS and an OTDR, and shall have obtained a certificate as proof thereof. Training may have been conducted by any of the following:
 - 1. Manufacturer of the test equipment used for the field certification
 - 2. Manufacturer of the fiber optic cable system
 - 3. Training organizations (such as BICSI)
- E. Cleaning: Throughout testing, clean connector end faces and adapter alignment sleeves using an approved cleaner and cleaning method – also refer to "Field Quality Control" in Part 3.

1.7 WARRANTY

- A. Warrant the validity of the test results and that no test measurements have been falsified. Issue such warranty in writing. Under no circumstances shall any cable's and/or optical conductor's test results be substituted for another's. If an instance of falsification is confirmed, the Contractor will be liable for a complete retest of the cabling system at no additional cost to the Owner. This includes the retaining the services of a neutral party to observe all retesting.

PART 2 - PRODUCTS

2.1 DIGITAL INSPECTION MICROSCOPE

- A. Digital inspection microscope shall be suitable for inspecting and certifying connector end faces. The microscope shall be a digital video camera type with probe tips (to permit inspection through adapters) and shall be capable of storing the end face images for inclusion in the test reports.
- B. Microscope shall be compatible with IEC 61300-3-35, particularly 4.2 "Method B: video microscopy".
- C. Microscope shall have adapters that match/are compatible with the connector(s) being inspected.

- D. Magnification: low resolution or high resolution
- E. Manufacturer, or equal:
 - 1. AFL
 - a. "FOCIS PRO"; fiber optic connector inspection system, including a #DFS1 digital inspection microscope and a #DFD1 touchscreen tablet preloaded with 'SimpleView PRO' fiber inspection software
 - b. #DFS1; 'FiberScope' digital inspection microscope with USB connection used in conjunction with 'SimpleView PRO' fiber inspection software on a laptop or with Link WiFi unit and FOCUS MOBILE app loaded on an iPhone, iPad, or Android mobile device
 - 2. Corning
 - a. #VIPROBE-DUAL; video inspection probe (for use with OV-1000 V2 OTDR mainframe)
 - 3. Fluke Networks
 - a. #FI-7000; 'FiberInspector Pro' series digital inspection microscope

2.2 OPTICAL LOSS TEST SET (OLTS) – SINGLE STRAND TESTING

- A. OLTS can be an integrated set or separate light source and power meter. The test equipment shall, either as an integrated set or as separates, meet the following specifications/requirements.
- B. Multimode Light Source: The light source used for testing multimode fibers shall meet the requirements of ANSI/TIA-526-14-B, 3.1. Additional requirements:
 - 1. Type: LED
 - 2. Central wavelengths: 850nm \pm 30 nm, 1300nm \pm 20 nm
 - 3. Output stability: +/- 0.40 dB from 0 to 50 degrees C
 - 4. Long term output stability: +/- 0.10 dB at 25 degrees C
 - 5. Output power: -20 dBm, minimum
 - 6. Encircled Flux: light source shall meet the encircled flux launch requirements of TIA-455-526-14B, ISO/IEC 14763-3, and IEC 611280-4-1 for 50/125 um at the source's optical connector.
- C. Singlemode Light Source: The light source used for testing singlemode fibers shall meet the requirements of TIA-526-7, 3.1.1. Additional requirements:
 - 1. Type: laser
 - 2. Central wavelengths: selectable to 1310 nm \pm 20 nm, 1550 nm \pm 20 nm
 - 3. Output stability +/- 0.40 dB from 0 to 50 degrees C
 - 4. Long term output stability +/- 0.10 dB at 25 degrees C
 - 5. Output power: -10 dBm, minimum
- D. Power Meter
 - 1. Type: multi-wavelength photodetector
 - 2. Measurement wavelengths: selectable to 850 nm, 1300 nm, 1310 nm, and 1550 nm
 - 3. Measurement range: -60 dBm to +10 dBm
 - 4. Measurement resolution 0.01 dB
 - 5. Measurement accuracy: +/-10% at +10 to 0 dBm, +/- 5% at 0 to -50 dBm, and +/-10% at -50 to -60 dBm
 - 6. Measurement uncertainty: +/- 0.25 dB
 - 7. Storage: internal data storage for reference power measurement and test measurements
 - 8. Connections (for data transfer to computer): serial and/or USB

- E. Length Measurement: The OLTS should be capable of measuring the optical length of the fiber.
- F. Manufacturer, or equal:
 - 1. AFL
 - 2. Corning
 - a. OTS-600 series optical loss test set
 - 3. Fluke Networks
 - a. DSX-5000 CableAnalyzer series test set equipped with fiber modules
 - b. CertiFiber Pro series test set
 - 4. Fluke Networks MultiFiber Pro series test set
 - a. #MFPOWERMETER; MultiFiber Pro optical power meter
 - b. #MFMULTIMODESOURCE; MultiFiber Pro 850 nm multimode source
 - c. #MF1310SOURCE; MultiFiber Pro 1310 nm singlemode source
 - d. #MF1550SOURCE; MultiFiber Pro 1550 nm singlemode source
 - 5. Fluke Networks CertiFiber Pro series test set
 - 6. JDS Uniphase
 - 7. Softing
 - a. WX4500; WireXpert test set with below test kit
 - 1) WX_AD_EF_MM2 kit for testing on single strand multimode links
 - 2) WX_AD_SM2 kit for testing on single strand singlemode links

2.3 FIBER OPTIC TEST CORDS AND LAUNCH CORDS

- A. The fiber of the test cords and launch cords shall match as closely to the fiber of the segment-under-test as possible. At a minimum, the fiber type and performance (e.g., OS2) shall match and, ideally, the fiber should be by the same manufacturer.
- B. Connectors of the test cords shall be compatible with (the same type as) the equipment (light source, power meter) and with the segment-under-test.
- C. Test cords shall meet the following:

REQUIREMENT	MULTIMODE	SINGLEMODE
TIA Compliance	TIA-526-14-B, 3.3	TIA-526-7, 3.1.3
ISO/IEC Compliance	ISO/IEC 14763-3	ISO/IEC 14763-3
Reference Grade	Yes (per ISO/IEC 14763-3)	Yes (per ISO/IEC 14763-3)
End Face Compliance	IEC 6100-3-35	IEC 6100-3-35
Loss Performance, per Connector	≤ 0.1dB at 850nm and 1300nm	≤ 0.2dB at 1310nm and 1550nm
Loss Measurement Technique	Per FOTP-171 D2	Per FOTP-171 D3
PC Finish	Not required	Connectors shall inhibit Fresnel reflections (i.e., have a "PC" finish)
Length for Tier 1 Loss	1 m to 5 m	1 m to 5 m

2.4 CLEANING APPARATUS

- A. Cleaning apparatus shall remove skin oil, isopropyl alcohol, graphite, dust, and other contaminants from connector end faces, and shall be able to clean both unattached connectors and connectors inserted into adapters.

- B. Manufacturer, or equal:
 - 1. AFL
 - a. #8500-05-0002MZ; one-click cleaner for 1.25mm ferrules (LC/MU)
 - 2. Corning
 - a. CLEANER-PORT-LC
 - 3. Fluke
 - a. #NFC-IBC-1.25mm; IBC OneClick cleaner, for 1.25 mm ferrules (LC, MU connectors)

PART 3 - EXECUTION

3.1 SAFETY

- A. Safety: Operate test equipment that contains a laser or LED in accordance with ANSI Z136.2.
- B. Adhere to the precautions described in TIA-526-14-B, 5.1.
- C. Adhere to the equipment manufacturer's instructions during testing.

3.2 FIELD QUALITY CONTROL

- A. Charge test equipment's batteries to full capacity prior to each day's testing to ensure proper operation.
- B. Cleaning:
 - 1. Only use approved cleaning apparatus and methods.
 - 2. Keep test equipment, connectors and adapters/coupling alignment sleeves clean at the test points prior to and during testing activities and measurements. During testing, clean connector end faces with each reconnection. The Engineer may, at their discretion, request the contractor halt testing activity and have the technician clean testing equipment, test cords, launch cords, connectors of the cables under test, and related apparatus.

3.3 TEST CORD VERIFICATION

- A. Visual Verification: Prior to accepting test cords for use in testing, inspect cords and connectors.
 - 1. Visually inspect each cord to ensure the cordage has no damage and the connectors are firmly attached to the cordage. If the cordage is undamaged and the connectors are firmly and properly attached, then the connector end faces may be inspected (go to next step). Otherwise, the cord may not be used for testing.
 - 2. Visually inspect each connector end face using a digital inspection microscope to ensure each end face is clean (no contamination) and free of defects (scratches, pits, chips, etc.) that would adversely affect measurement and repeatability. If the connector end face is clean with no defects and meets IEC 6100-3-35, then the cord may be used for testing. Otherwise, go to next step.
 - 3. If contamination is seen during end face visual inspection (step described above), then clean the end face using equipment and methods of TIA-526-14-B 5.6 [for multimode] or TIA-526-7 5.7 [for singlemode]. After cleaning, visually inspect the connector end faces using a digital microscope. If the connector end face is clean with no defects and meets

- IEC 6100-3-35, then the cord may be used for testing. If, after cleaning, the end faces still exhibit scratches, pits, and/or other defects/imperfections, do not use this cord for testing.
4. Once the cord is acceptable and if the microscope has storage capability, record an image of the connector end face (for inclusion in the test report).

B. Test Cord Performance Verification

1. Validate performance of cords for testing only if no defects are observed during visual inspection.
2. Connect Test Cord #1 to the light source and to the power meter.
3. Store the measured light value into the power meter as the reference power (P_{ref}).
4. Disconnect Test Cord #1 from the power meter. Do not disconnect Test Cord #1 from the light source.
5. Connect the 'open' end of Test Cord #1 to an adapter (of matching connector type). Connect one end of Test Cord #2 to that adapter and the other end of Test Cord #2 to the power meter.
6. The value displayed on the power meter represents the test cord #2 connector loss at the adapter.
7. Flip the ends of Test Cord #2 so that the end connected to the power meter is now connected to the adapter (attached to test cord #1), and the end connected to the adapter is now connected to the power meter.
8. The value displayed on the power meter represents the test cord #2 connector loss at the adapter (opposite end as previous measurement).
9. Only accept and use test cords meeting the loss values noted in Part 2.
10. Repeat this test procedure from the beginning reversing the test cords in order to verify the performance of test cord #1.
11. Documentation of test cord verification is not required.

3.4 TIER 1 | OPTICAL POWER LOSS TESTING REQUIREMENTS AND PROCEDURES

A. Test Equipment Preparation

1. Bring test equipment to room temperature – approximately 72 degrees F.
2. Power on the OLTS (or light source and power meter) for at least 5 minutes prior to setting a reference or obtaining measurements.
3. Do not power off test equipment during testing activity. Should the test equipment power off, fully complete setting a reference.
4. Set the test routine parameters to meet the testing requirements of this section.

B. Connection Preparation

1. Prior to connecting test cords to the test equipment and to the cable-under-test, prepare connector end faces of the test cords and cable-under-test in accordance with IEC 6100-3-35 using approved cleaning equipment.

C. Visual Inspection:

1. Prior to connecting test cords, visually inspect each connector end face of the cable-under-test using a digital inspection microscope to ensure each end face is clean (no contamination) and free of defects (scratches, pits, chips, etc.) that would adversely affect performance. Once the connector end face is clean with no defects and meets IEC 6100-3-35, record the image for inclusion in the test report submittal.
2. If contamination is seen during end face visual inspection, then clean the end face using equipment and methods of TIA-526-14-B 5.6 [for multimode] or TIA-526-7 5.7 [for singlemode]. After cleaning, inspect the end faces using a digital inspection microscope. If the connector end face is clean with no defects and meets IEC 6100-3-35, then record the image for inclusion in the test report submittal. If, after cleaning, the end faces still

exhibit scratches, pits, and/or other defects/imperfections, remove the connector and reterminate the fiber with a new connector.

D. Setting a Reference

1. Follow the test equipment manufacturer's initial adjustment and set up instructions.
2. Set the light source and power meter to the same wavelength.
3. Set the power meter to relative power measurement mode
4. Set the meter to display power levels in dBm.
5. Upon a stable power reading, set this as the reference power level following the manufacturer's instructions.
6. Do not remove Test Cord #1 from the light source at any time (unless the test cord must be replaced, testing is complete, or the equipment is being put away for the evening).
7. Do not bend the test cords smaller than 20 times the cord diameter (this may induce loss into the cord, which will reduce the accuracy of the measurement).

E. Measuring Multimode Passive Link Insertion Loss

1. Only use cords that satisfy the test cord verification (see previous article) requirements. Do not use any cord with observed defects during testing.
2. Connect test equipment, test cords, and cable-under-test per the Method noted in the Table under article 1.01 of this section.
3. Do not disconnect the test cord from the light source. Should the test cord be disconnected from the light source, fully complete setting a reference.
4. Do not bend the test cord smaller than 20 times the cord diameter during testing activities (this may induce loss into the cord reducing the accuracy of the measurement).
5. Test each segment of installed cable plant according to the table under article 1.01 of this section.
6. Store the measured insertion loss per segment into the test equipment.

F. Measuring Singlemode Passive Link Insertion Loss

1. Connect test equipment, test cords, and cable-under-test per the Method noted in the Table under article 1.01 of this section.
2. Use launch conditions described in FOTP-78 and employ a method to remove high-order propagating modes. A method to select a mode filter is described in FOPT-77.
3. Do not disconnect the test cord from the light source. Should the test cord be disconnected from the light source, fully complete setting a reference.
4. Do not bend the test cord smaller than 20 times the cord diameter during testing activities (this may induce loss into the cord, which will reduce the accuracy of the measurement).
5. Test each segment of installed cable plant according to the table under article 1.01 of this section.
6. Store the measured insertion loss per segment into the test equipment.

G. Recorded Test Measurements.

1. Measurements shall carry a precision through at least one significant decimal place.

END OF SECTION

SECTION 271100
COMMUNICATIONS EQUIPMENT ROOMS

PART 1 - GENERAL

1.1 SUMMARY

- A. Base Bid Work
 - 1. Backboards:
 - a. Provide sheet hardwood/plywood and fasteners as a backboard within telecom rooms as shown on the drawings. If not explicitly shown, provide backboard on portions of walls greater than 18 inches.
 - b. Provide painting of the plywood as a finish and to improve space illumination.

1.2 REFERENCES

- A. Comply with the References requirements of section 270000.
- B. In addition to those codes, standards, etc., listed in section 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. National Fire Protection Association (NFPA):
 - a. NFPA 255, "Standard Method of Test of Surface Burning Characteristics of Building Materials"
 - b. NFPA 703, "Standard for Fire Retardant—Treated Wood and Fire-Retardant Coatings for Building Materials"
 - 2. ASTM E 84, "Standard Test Method for Surface Burning Characteristics of Building Materials"

PART 2 - PRODUCTS

2.1 SHEET HARDWOOD / PLYWOOD (AS BACKBOARD)

- A. Application: Sheet hardwood/plywood used as backboard in telecommunications rooms, "Use Category" UCFA per AWPA U1-17.
- B. Plywood shall be new and free from defects, and shall be interior "Type A" with a veneer grade of A-C.
- C. Size: 8' x 4' plywood sheets, 11/16" to 13/16" thick.
- D. Plywood shall be fire retardant treated with a flame spread rating of 25 or less / Class A, when tested in accordance with ASTM E84. Plywood shall be:
 - 1. Chemically treated and pressure impregnated
 - 2. Kiln dried after treatment to maximum moisture content of 15%.
 - 3. Stamped with the fire rating and the certifying lab.

- E. Plywood shall not contain VOCs, urea formaldehyde or formaldehyde, halogens, sulfates, chlorides, or ammonium phosphate.
- F. Manufacturers, or equal:
 - 1. Hoover Treated Wood Products, Inc. "Pyro-Guard" plywood

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the "Execution" requirements of section 270000.

3.2 EXAMINATION AND PREPARATION

- A. Prior to installation, verify rooms are suitable for the construction scope of this section. Schedule work to prevent damage caused by other trades during their construction.
- B. Prepare surfaces, such as walls, for permanent installation of products, such as plywood.

3.3 INSTALLATION

- A. Plywood Backboards
 - 1. General
 - a. Complete work in a neat, high quality manner. The final conditions shall conform to applicable codes, BICSI's TDMM, TIA's 569 standard, and telecom utility standards.
 - b. Coordinate the plywood installation with the outlets to result in a clean finish.
 - 2. Preparation
 - a. Prior to installing wood materials, condition wood to the prevailing humidity conditions in installation areas.
 - 3. Plywood Installation
 - a. Install plywood in accordance with WIC Custom or Premium Quality Standard, as scheduled. Ensure work complies with applicable codes and recognized standards.
 - b. Install plywood as indicated on Drawings to the dimensions shown. In lieu of no dimensions, install plywood from +0'-6" to +8'-6" above the finished floor.
 - c. Install plywood plumb, level, true, and straight with no distortions. Shim as needed using concealed shims.
 - d. Trim plywood around electrical and telecommunications outlets to result in a clean finish.
 - e. Install plywood such that the fire rating stamp is visible.
 - f. Install plywood to a tolerance of 1/8" in 8' for plumb and level; and with 1/16" maximum offset in flush adjoining, 1/8" maximum offsets in revealed adjoining surfaces.
 - g. Do not install plywood that has defects or is not new.
 - h. Do not install pieces of plywood that are too small for the area (thus resulting in an excessive number of joints).
 - 4. Fasteners
 - a. Install plywood using screws, concrete anchors, or other fasteners suitable for the purpose/ required for application/mounting substrate.

- b. Do not use aluminum fasteners.
 - c. Install fastener such that fastener heads are flush with and not protruding from the plywood finished surface. Countersink fastener heads as needed.
5. Painting
- a. Paint plywood with a low-gloss, white (or similar bright color) paint.
 - b. Mask the plywood's fire rated stamp from the paint such that the stamp is still visible after painting.
6. Cleaning, Finishing, and Protection
- a. Clean exposed surfaces. Touch-up finishes to restore damaged or impaired areas.
 - b. Protect and maintain protection to ensure finished work will be without damage. Repair or replace finished work and materials defaced or destroyed prior to acceptance.

END OF SECTION 27 11 00

SECTION 271313

COMMUNICATIONS BACKBONE ISP TWISTED PAIR CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Backbone ISP (inside plant/indoor) twisted pair cabling.
- A. Base Bid Work
 - 1. Provide pre-construction services (e.g., submittals, coordination with other trades, etc.), materials, apparatus, labor, tools, equipment, and transportation required for complete communications backbone twisted pair cabling described in this section and shown on related drawings.
 - 2. The related drawings are diagrammatic in nature.
 - 3. In general, the base bid work includes:
 - a. Submittals
 - b. Backbone inside plant (riser) twisted pair (copper) cables and termination apparatus
 - c. Cable management
 - d. Cable identification tags and system labeling
 - e. Closeout documents
 - f. Warranty
- B. Related Sections
 - 1. Comply with the Related Sections requirements of section 270000.
 - 2. 270526, "Communications Grounding and Bonding"
 - 3. 270811, "Communications Twisted Pair Testing"
 - 4. 270528, "Communication Building Pathways"
 - 5. 270536, "Communication Building Pathways – Cable Trays"
- C. Work Covered Under Other Sections
 - 1. Pathways: The communications pathways (backbone conduits, riser sleeves, cable tray, etc.) work will be covered under another section. Refer to the drawings for size/capacity and route information.
 - 2. Rooms: Build out (e.g., backboards, overhead and vertical cable runway, etc.) of the rooms (BDFs, IDFs) will be covered under another section. Refer to the drawings for build out information.
 - 3. Testing: The backbone twisted pair cabling testing requirements are covered under another section. Refer to section 270811 for testing requirements.

1.2 REFERENCES

- A. Comply with References requirements of section 270000.

- B. In addition to the codes and standards listed in section 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
 - a. UL 444, "Communications Cables"
 - b. UL 497B, "Protectors for Data Communications and Fire-Alarm Circuits"
 - c. UL 1581, "Reference Standard for Electrical Wires, Cables, and Flexible Cords"
 - d. UL 1666, "Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts"
 - e. UL 1863, "Communications-Circuit Accessories"
 - 2. Insulated Cable Engineers Association (ICEA)
 - a. ANSI/ICEA S-90-661, "Category 3, 5, and 5e Individually Unshielded Twisted Pair Indoor Cable for Use In General Purpose and LAN Communication Wiring Systems"
 - 3. Telcordia
 - a. GR-111, "Generic Requirements for Thermoplastic Insulated Riser Cable"

1.3 DEFINITIONS

- A. Refer to section 270000 for Definitions.
- B. In addition to those Definitions of section 270000, the following list of terms as used in this specification defined as follows:
 - 1. "ALVYN": sheath type consisting of corrugated polymer-coated aluminum shield with and adhered flame retardant jacket
 - 2. "ARMM": Bell system cable type (shielded riser)
 - 3. "CMR": Communications Media Riser [NEC riser/non-plenum rating]
 - 4. "ISP": Inside Plant [cabling]
 - 5. "PE": Polyethylene
 - 6. "PIC": Plastic Insulated Conductor
 - 7. "PVC": Polyvinyl Chloride
 - 8. "PVDF": Polyvinylidene fluoride

1.4 SYSTEM DESCRIPTION

- A. Backbone twisted pair cabling shall consist of the cabling from the main telecommunications room to the telecommunications rooms or other locations that require analog, digital, or other non-network telecommunications services. Refer to the associated drawings for graphic representation of the system requirements, cabling routes, and quantities.
 - 1. Refer to other sections for pathways and cable support.
 - 2. Refer to other section for testing.

1.5 SUBMITTALS

- A. Comply with Submittal procedural, quantity, and format requirements of section 270000.
- B. Quantity: Furnish quantities of each submittal as noted in section 270000.
- C. Substitutions: Conform to substitutions requirements and procedures in section 270000.

- D. Submittal Requirements Prior To Start Of Construction:
 - 1. Product Data submittal, indicating specifications and conformance with CEC, UL, TIA listings, and other applicable certifications.
 - 2. Schedule Submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for Division 27.
 - 3. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations.
- E. Submittal Requirements at Closeout:
 - 1. As-built drawings
 - 2. O&M Manuals
- F. Substitutions
 - 1. Requests for substitutions shall conform to the general requirements and procedure outlined in section 270000.

1.6 QUALITY ASSURANCE

- A. Comply with Quality Assurance requirements of section 270000.
- B. Contractor Qualifications
 - 1. In addition to the Contractor Qualifications requirements of section 270000, the Contractor shall be manufacturer certified to install the proposed and submitted cabling system and to provide an extended warranty. Provide satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid submission.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage and Handling requirements of section 270000.

1.8 WARRANTY

- A. The telecommunications cabling system, as specified in this section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover electrical performance of cabling system to the specific category per TIA-568 performance criteria for backbone cabling.

PART 2 - PRODUCTS

2.1 UNSHIELDED TWISTED PAIR CABLES CAT5E – PLENUM

- A. Application:
 - 1. Cable suitable for indoor installation, within conduit system and between floors in vertical riser system
 - 2. Each cable run shall be a continuous single cable, homogenous in nature; splices are not permitted.

3. Twisted pair PIC type, air core cable.
- B. Conductors:
1. Annealed solid copper, 24 AWG
 2. Fully insulated, consisting of FEP or other thermoplastic.
 3. Conductors twisted into pairs are stranded into 25-pair bundles.
 4. Color Coding: Twisted pairs and units individually color-coded to industry standards (ANSI/ICEA Publication S-80-576, and EIA-230).
- C. Core and Sheath:
1. Cable sheath shall consist of an overall flame-retardant PVDF, or equivalent, jacket.
 2. NEC rated as CMP and UL listed as such.
- D. Performance:
1. Electrical performance of the twisted pairs and overall cable shall comply with the performance requirements of TIA-568 for Category 5e "Backbone Cable Transmission Performance".
- E. Certifications
1. UL 444, UL 1666
 2. C22.2 No. 214-02
 3. ETL Listed, or equal
- F. Manufacturers, or equal:
1. Berk-Tek
 - a. #10089521; Category 5e (Power Sum), 25 pair, 24 AWG, white, CMP rated

2.2 TERMINATION APPARATUS – CAT5E PATCH PANEL, PUNCH DOWN TYPE

- A. Application: Patch panels shall be suitable for installation within a TR for the termination of the horizontal cables specified herein. Panels shall be horizontally oriented for a rack-mounted configuration. Panels shall be capable of supporting, organizing, labeling and patching/crossconnecting between the horizontal termination field and the equipment termination field.
- B. Patch panel shall have punch down type termination (general 110-type), and shall be compatible with the specified horizontal cables both electrically and physically.
- C. Mechanical Performance: Each port shall be an 8-position modular jack, compliant to ANSI/TIA-568.
- D. Electrical Performance: Each port shall meet or exceed TIA-568 standard series and ISO/IEC 11801 requirements for CAT5E U/UTP cabling through the cable termination and patch cord connection.
- E. Manufacturer, or equal:
1. Leviton
 - a. #5G596-U24; flat patch panel, 1U, top labeling, 24 CAT5E ports

2.3 LABELS

- A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.
- B. Labels for Cables
 - 1. Labels shall be adhesive-backed and have a self-laminating feature.
 - 2. Labels shall fit the backbone cables listed above (i.e., shall fully wrap around the cable's jacket).
 - 3. Printable area should be 1 inch wide x 0.5 inch high, or larger.
 - 4. Printable area color shall be white.
 - 5. Manufacturer, or equal:
 - a. Panduit
 - 1) #S200X400YAJ; labels for 25 to 100 pair cables [0.32" (8.09mm) - 0.95" (24.26mm) dia.]
 - 2) #S200X650YAJ; labels for 100 to 400 pair cables [0.48" (12.13mm) – 1.59" (40.43mm) dia.]

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of section 270000.

3.2 EXAMINATION AND PREPARATION

- A. Rooms: Prior to installation, verify equipment rooms are suitable to accept the backbone twisted pair cables and terminations.
- B. Pathways: Prior to installation verify that pathways and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, "True Tape" the conduits).
- C. Cable Integrity: Prior to installation, verify the twisted pair cable is fully operational – both cable sheath and twisted pair conductors. Documentation of pre-installation testing is not a close out requirement and is the responsibility of the Contractor.

3.3 INSTALLATION

- A. Backbone Cable Installation and Routing
 - 1. Cable runs shall have continuous sheath continuity, homogenous in nature; splices are not permitted.
 - 2. Maximum cable length of 500 meters from the termination within the Entrance Facility to the termination in Telecommunications Room.
 - 3. Placement
 - a. Place cables within designated pathways.

- b. Maintain a minimum bend radius of 6 times the cable diameter during and after installation.
 - c. Maintain pulling tension within manufacturer's limits.
 - d. Place and suspend cables in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables if damaged during installation
 - e. Place a pull rope along with cables where run in conduit and spare capacity still exists in the conduit. Tie off ends of the pull rope.
4. Routing
- a. When routing horizontally within telecommunications rooms, utilize the overhead cable support. When routing vertically within telecommunications rooms, utilize the vertical cable support and provide cable ties every 24 inches on center using.
 - b. Route cables a minimum of 6" away from power sources to reduce interference from EMI.
5. Termination
- a. Provide 15 feet cable slack loop at each end of the run. Store slack in wall mounted storage ring cable support or as noted on drawings.
 - b. Properly relieve strain from cables at termination points per manufacturer's instructions.
 - c. Terminate twisted pairs onto the termination apparatus in accordance with manufacturer's latest instructions and TIA-568 standard installation practices.
 - d. Perform post-installation testing as described in section 270811.
- B. Termination Apparatus
- 1. Provide accessories required for a complete installation.
 - 2. Install the termination apparatus to the dimensions shown on the drawings. If the dimensions are not shown, install the termination apparatus such that the bottom row of terminations is no lower than 24 inches (+/- 3") AFF and the top row of terminations is no higher than 60 inches (+/- 3") AFF.
 - 3. Mount termination apparatus plumb and square.
- C. General Requirements
- 1. Labeling and identifier assignment and the label colors shall conform to the TIA-606 Administration Standard and as approved by Owner or Owner's Representative before installation.
 - 2. Provide permanent and machine-generated labels; hand written labels will not be accepted.
- D. Cable Labels
- 1. Label Format:
 - a. Label type shall be wrap-around self-laminating.
 - b. Label color shall be white background with clear laminating window.
 - c. Text color shall be black; text height shall be 1/8" high, minimum, or #12 font size.
 - 2. Provide labels on both ends of cables. Fully wrap label around the cable jacket. Install labels no more than 4 inches from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.
- E. Termination Apparatus Labels
- 1. Use labels included in the product packaging. For substitutions, request approval by the Engineer.
 - 2. Label color shall be white for respective field type, per TIA-606.
 - 3. Text color shall be black, 3/32" high, minimum, or #10 font size.

F. Identifier Assignment

1. General: Separate label fields of the identifier with a hyphen.
2. Backbone ISP Twisted Pair Cables
 - a. The first field: the originating MDF/BDF room identity; for example: "AD1.1".
 - b. The second field: the destination BDF/IDF room identify; for example: "AD3.1".
 - c. The third field: the cable type; for example: "C25" (copper 25 pair).
 - d. The fourth field: beginning pair count served from originating room; for example: "01".
 - e. The fifth field: ending pair count served from originating room; for example: "25"
 - f. Identifier Example: "AD1.1-AD3.1-C25-01-25"

3.4 FINAL INSPECTION AND CERTIFICATION

- A. Punch the work of this section compliant to the requirements of section 270000.
- B. Remove and replace with new, at no cost to the Owner, cables or conductors failing to meet the indicated standards and not passing the testing requirements of section 270811. The Owner, or Owner's Representative, will not accept the installation until testing has indicated a 100% availability of all cables and conductors or the Owner or Owner's Representative has approved any deviation from this requirement.
- C. Comply with system acceptance and certification requirements of section 270000.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 271314

COMMUNICATIONS BACKBONE OSP TWISTED PAIR CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Backbone OSP (outside plant) twisted pair cabling.
- B. Related Sections
 - 1. Comply with the Related Sections requirements of Section 270000.
 - 2. Section 270811, "Communications Twisted Pair Testing"

1.2 REFERENCES

- A. Comply with References requirements of Section 270000.
- B. In addition to the codes and standards listed in Section 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
 - a. UL 497, "Protectors for Paired-Conductor Communication Circuits"
 - b. UL 497A, "Secondary Protectors for Communications Circuits"
 - c. UL 497B, "Protectors for Data Communications and Fire-Alarm Circuits"
 - d. UL 497C, "Protectors for Coaxial Communications Circuits"
 - e. UL 1863, "Communications-Circuit Accessories"
 - 2. Insulated Cable Engineers Association (ICEA)
 - a. ANSI/ICEA S-107-704-2012, "Broadband Buried Service Wire, Filled, Polyolefin Insulated, Copper Conductor Technical Requirements"

1.3 DEFINITIONS

- A. Refer to Section 270000 for Definitions.
- B. In addition, define the following list of terms as used in this specification as follows:
 - 1. "BEP": Building Entrance Protection [systems]
 - 2. "CMP": Communications Media Plenum [NEC plenum rating]
 - 3. "CMR": Communications Media Riser [NEC riser/non-plenum rating]
 - 4. "HDPE": High Density Polyethylene
 - 5. "ISP": Inside Plant [cabling]
 - 6. "LDPE": Light Density Polyethylene
 - 7. "OSP": Outside Plant [cabling]
 - 8. "PE": Polyethylene
 - 9. "PIC": Plastic Insulated Conductor
 - 10. "PVC": Polyvinyl Chloride

1.4 SYSTEM DESCRIPTION

- A. Work Provided Under Other Sections
 - 1. Telecommunications Pathways
 - a. Pathways (underground conduits, maintenance holes, pull boxes, pull ropes, etc.) will be provided under other Sections.
 - b. Refer to the Drawings for size/capacity and route information.
 - 2. Telecommunications Rooms
 - a. Buildout (e.g., backboards, overhead and vertical cable runway, etc.) of the telecommunications rooms (MDF, BDFs, IDF) work will be covered under another Section.
 - b. Refer to the Drawings for buildout information.
- B. Base Bid Work
 - 1. Provide engineering, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working telecommunications backbone twisted pair cabling system installation described in these specifications and shown on related Drawings.
 - 2. The Drawings are diagrammatic in nature.
 - 3. Consider Backbone cabling as shown on Drawings as base bid work, unless otherwise noted. This includes terminations at both ends.
 - 4. In general, the base bid work includes:
 - a. Submittals
 - b. Backbone outside plant (interbuilding) twisted pair (copper) cables and terminations
 - c. Cable management
 - d. Crossconnects
 - e. Cable identification tags and system labeling
 - f. Record Documents
 - g. Warranty

1.5 SUBMITTALS

- A. Comply with Submittal procedural, quantity, and format requirements of Section 270000.
- B. Submittal Requirements Prior To Start Of Construction:
 - 1. Product Data Submittal, indicating conformance with NEC, UL, TIA/EIA listings, certifications and specifications.
 - 2. Schedule Submittal, consisting of proposed schedule of Work. This schedule may be combined with the schedule developed for other Sections within Division 27.
 - 3. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations.
- C. Submittal Requirements at Closeout:
 - 1. As-Built Drawings.
 - 2. Crossconnection records/cut sheets.
 - 3. O & M Manuals.

1.6 QUALITY ASSURANCE

- A. Comply with Quality Assurance requirements of Section 270000.

- B. Contractor Qualifications
 - 1. In addition to the Contractor Qualifications requirements of Section 270000, the Contractor shall be manufacturer certified to install the proposed and submitted cabling system and to provide an extended warranty. Provide satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid submission.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage and Handling requirements of Section 270000.

1.8 WARRANTY

- A. The communications cabling system, as specified in this Section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover electrical performance of cabling system to the specific category per ANSI/TIA-568-C performance criteria for backbone cabling.

PART 2 - PRODUCTS

2.1 UNDERGROUND CABLES – DUCT/CONDUIT

- A. Application:
 - 1. Cable shall be suitable for underground conduit installations.
 - 2. Each and every cable run shall be a continuous single cable, homogenous in nature. Splices are not permitted anywhere.
 - 3. Cable type shall be PIC twisted pair, filled core, with an “ALPETH” sheath and compatible with Bell System type “ANMA” or RDUP type “PE89-AL”.
- B. Conductors:
 - 1. Solid, annealed copper, 24 AWG
 - 2. Fully insulated conductors consisting of an inner layer of expanded polyolefin, covered with an outer layer (skin) of solid polyolefin
 - 3. Conductors twisted into pairs. Twisted pairs are stranded into 25-pair bundles and into units (and super units, if required by pair count)
 - 4. Color Coding: Twisted pairs and units (supper units, if necessary) individually color-coded to industry standards (ANSI/ICEA Publication S-80-576, and EIA-230)
- C. Core & Sheath:
 - 1. Cable core shall have a tape applied longitudinally (wrapped around its entirety)
 - a. Tape Material: non-hydrosopic dielectric (polypropylene) film, or equivalent
 - 2. Cable core and sheath flooded (interstices between the pairs and under the core tape) with filling compound to protect against moisture penetration
 - a. Filling compound: 80°C ETPR compound, or equivalent
 - 3. Sheath Type: “ALPETH”. Sheath consists of a shield and an outer jacket
 - a. Shield: Corrugated bare 8 mil aluminum tape applied longitudinally over the core wrap
 - b. Outer Jacket: PE, black, with UV inhibitors, bonded to shield

- D. Standards Compliance:
 - 1. UL 444
 - 2. RoHS-compliant

- E. Manufacturers:
 - 1. Superior Essex
 - a. #09-100-77; 50 pair, 24 AWG, filled core, ALPETH/ANMA

2.2 LABELS

- A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.

- B. Labels for Cables
 - 1. Labels shall be adhesive-backed and have a self-laminating feature
 - 2. Labels shall fit the backbone cables listed above (i.e., shall fully wrap around the cable's jacket).
 - 3. Printable area should be 1 inch wide x 0.5 inch high, or larger
 - 4. Printable area color shall be white
 - 5. Manufacturer:
 - a. Panduit
 - 1) #S200X400YAJ; labels for 25 to 100 pair cables [0.32" (8.09mm) - 0.95" (24.26mm) dia.]
 - 2) #S200X650YAJ; labels for 100 to 400 pair cables [0.48" (12.13mm) – 1.59" (40.43mm) dia.]
 - b. Or equal

2.3 DUCT PLUGS

- A. Plug shall create a watertight seal.

- B. Manufacturer:
 - 1. Tyco
 - a. #40S136S; simplex plug for 4-inch conduit, cable OD 1.19-1.36
 - b. #40S196SB; simplex plug for 4-inch conduit, cable OD 1.38-1.96
 - c. #40S256SB; simplex plug for 4-inch conduit, cable OD 1.92-2.56
 - d. #40S291SB; simplex plug for 4-inch conduit, cable OD 2.56-2.91
 - e. #40S327SB; simplex plug for 4-inch conduit, cable OD 2.91-3.27
 - f. #40B167S; "triplex" plug for 4-inch conduit, with 3 ports
 - g. #40Q136S; "quadplex" plug for 4-inch conduit with 4 ports
 - 2. Carlon
 - a. #MATPG3; "triplex" duct plug for 4-inch conduit, with 3 ports (1.53"-1.67")
 - 3. Or equal

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of Section 270000.

3.2 EXAMINATION AND PREPARATION

- A. Rooms: Prior to installation, verify equipment rooms are suitable to accept the backbone twisted pair cables and terminations.
- B. Pathways: Prior to installation verify that pathways and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, "True Tape" the conduits).
- C. Cable Integrity: Prior to installation, verify the twisted pair cable is fully operational – both cable sheath and twisted pair conductors. Documentation of pre-installation testing is not a close out requirement, and is the responsibility of the Contractor.

3.3 INSTALLATION

- A. OSP Interbuilding Backbone Cable
 - 1. Cable runs shall have continuous sheath continuity, homogenous in nature, between either termination points or designated splices points. Only splices as noted on the Construction Documents are permitted.
 - 2. Maximum cable length of 1,500 meters between termination points.
 - 3. Placement
 - a. Place cables within designated pathways.
 - b. Maintain a minimum bend radius of 6 times the cable diameter during installation.
 - c. Maintain pulling tension within manufacturer's limits. Only use UL approved cable-pulling compounds when necessary to reduce pulling tensions.
 - d. Protect cable during installation. Place and suspend cables in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cable if damaged during installation.
 - e. Neatly dress and organize cables in the cable routing facilities, and fastened to support devices via tie wraps.
 - f. Place a pull rope along with cables where run in conduit and spare capacity still exists in the conduit. Tie off ends of the pull rope.
 - 4. Routing:
 - a. When routing horizontally within telecommunications rooms, utilize the overhead cable support; route backbone cables to avoid crossing over horizontal cabling or horizontal cabling crossing backbone cabling. When routing vertically within telecommunications rooms, utilize the vertical cable support and provide cable ties every 24 inches on center using.
 - b. Route cables a minimum of 6" away from power sources to reduce interference from EMI.
 - 5. Duct Plugs
 - a. Provide duct plugs into each duct port in maintenance holes/pullboxes and building entrances.
 - 6. Termination
 - a. Provide 15 feet cable slack loop at each end of the run. Store slack in overhead cable support or as noted on Drawings.
 - b. Properly strain relieve cables at designated points per manufacturer's instructions.
 - c. Terminate copper pairs at both ends on the specified termination apparatus. Perform terminations in accordance with manufacturer's instructions and ANSI/TIA-568-C standard installation practices.
 - 7. Labeling

- a. Provide labels on each end of the cable, no more than 4" from where the cable enters the specified termination apparatus.
- b. Place labels such that they are visible by a technician from a normal stance.

B. Termination Apparatus

1. Install the termination apparatus such that the bottom row of terminations is at a height as shown on the Drawings. If no height is shown, install bottom at 24" AFF (+/- 3").
2. Provide accessories required for a complete installation.
3. Mount blocks plumb and square.

C. Crossconnects

1. In the MDF, provide one 1-pair crossconnect to length from the equipment field to the backbone field based on the records from the IDF crossconnections.
2. Utilize the horizontal and vertical management components to properly route the crossconnect wire.
 - a. Splices in crossconnect wire are prohibited.

3.4 LABELING

A. General Requirements

1. Labeling and identifier assignment and the label colors shall conform to the TIA/EIA-606-A Administration Standard and as approved by Owner or Owner's Representative before installation.
2. Provide permanent and machine-generated labels; hand written labels will not be accepted.

B. Cable Labels

1. Label Format:
 - a. Label type shall be wrap-around self-laminating.
 - b. Label color shall be white background with clear laminating window.
 - c. Text color shall be black; text height shall be 1/8" high, minimum, or #12 font size.
2. Provide labels on both ends of cables. Fully wrap label around the cable jacket. Install labels no more than 4 inches from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.

C. Protection and Termination Apparatus Labels

- a. Use labels included in the product packaging. Request approval by the Engineer for substitutions.
- b. Label color shall be for respective field type, per TIA/EIA-606-A.
- c. Text color shall be black, 3/32" high, minimum, or #10 font size.

D. Identifier Assignment

1. General: Separate label fields of the identifier with a hyphen.
2. Cables
 - a. The first field shall identify the cable type: "CBT" (for Cable, Backbone, Twisted pair).
 - b. The second field shall identify the originating termination room identifier as shown on the plans; e.g., "MDF1.1".
 - c. The third field shall identify the ending termination room identifier as shown on the plans; e.g., "BDF2.1".
 - d. The fourth field shall identify the beginning and ending pair counts.
 - e. Identifier Example: "CBT-MDF1.1-BDF2.1-0401-0600"

3. Termination Positions on the BEP Terminal Cover
 - a. The first field shall identify the opposite end's room; for example "TO BDF2.1".
 - b. The second field shall identify the pair count range; for example, "0401-0500"
 - c. Identifier Example: "TO BDF2.1 0401 - 0500"

3.5 FINAL INSPECTION AND CERTIFICATION

- A. Punch the Work of this Section compliant to the requirements of Section 270000.
- B. Remove and replace with new, at no cost to the Owner, cables or conductors failing to meet the indicated standards and not passing the testing requirements of Section 270811. The Owner, or Owner's Representative, will not accept the installation until testing has indicated a 100% availability of all cables and conductors or the Owner or Owner's Representative has approved any deviation from this requirement.
- C. Comply with system acceptance and certification requirements of Section 270000.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 271323

COMMUNICATIONS BACKBONE ISP FIBER OPTIC CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Backbone ISP (indoor) fiber optic cabling.
- B. Related Sections
 - 1. Comply with the Related Sections paragraph of Section 270000.
 - 2. 270821 Communication Fiber Optic Testing

1.2 REFERENCES

- A. Comply with References requirements of Section 270000.
- B. In addition to the codes and standards listed in Section 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
 - a. UL 1569, "Metal-Clad Cables"
 - b. UL 1651, "Optical Fiber Cable"
 - 2. Insulated Cable Engineers Association (ICEA)
 - a. ANSI/ICEA S-83-596-1994, "Fiber Optic Premises Distribution Cable"
 - 3. Telcordia
 - a. GR-20-CORE, Issue 3, "Generic Requirements for Optical Fiber and Optical Fiber Cable"
 - b. GR-409-CORE, Issue 2, "Generic Requirements for Indoor Fiber Optic Cable"

1.3 DEFINITIONS

- A. Refer to Section 270000 for Definitions.
- B. In addition to those Definitions of Section 270000, the following list of terms as used in this specification defined as follows:
 - 1. "MM": Multimode [fiber type]
 - 2. "OFCP": Optical Fiber Conductive Plenum, plenum rating
 - 3. "OFCR": Optical Fiber Conductive Riser, non-plenum riser rating
 - 4. "OFNP": Optical Fiber Non-conductive Plenum, plenum rating
 - 5. "OFNR": Optical Fiber Non-conductive Riser, non-plenum riser rating
 - 6. "OFN": Optical Fiber Non-conductive, general purpose indoor rating
 - 7. "PVC": PolyVinyl Chloride
 - 8. "SM": Singlemode [fiber type]

1.4 SYSTEM DESCRIPTION

- A. Work Covered Under Other Sections
 - 1. Pathways: The communications pathways (backbone conduits, riser sleeves, basketway, cable tray, etc.) work will be covered under another Section. Refer to the drawings for size/capacity and route information.
 - 2. Rooms: Build out (e.g., backboards, overhead and vertical cable support, etc.) of the telecommunications rooms will be covered under another Section. Refer to the drawings for build out information.
- B. Base Bid Work
 - 1. Provide engineering, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working telecommunications backbone fiber optic cabling system installation described in these specifications and shown on related drawings.
 - 2. The drawings are diagrammatic in nature.
 - 3. Consider Backbone cabling, as shown on drawings, as base bid work, unless otherwise noted, including terminations at both ends.
 - 4. In general, the base bid work includes:
 - a. Submittals
 - b. Backbone inside plant (riser) fiber optic cables and terminations
 - c. Bonding (cable armor, termination apparatus, etc)
 - d. Cable management
 - e. Crossconnections / patching.
 - f. Cable identification tags and system labeling
 - g. Record Documents
 - h. Warranty

1.5 SUBMITTALS

- A. Comply with Submittal procedural, quantity, and format requirements of Section 270000.
- B. Submittal Requirements Prior To Start Of Construction:
 - 1. Product Data Submittal, indicating conformance with NEC, UL, TIA/EIA listings, certifications and specifications.
 - 2. Schedule Submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for Division 27.
 - 3. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations
- C. Submittal Requirements at Closeout:
 - 1. Copy of the manufacturer's printed reel documentation, including the following.
 - a. Manufacturer's reel number
 - b. Manufacturer's traceable batch number
 - c. Length of the fiber cable on the reel
 - d. Maximum attenuation
 - e. Minimum bandwidth
 - 2. As-Built Drawings
 - 3. Crossconnection records/cut sheets
 - 4. O&M Manuals
- D. Substitutions
 - 1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 270000.

1.6 QUALITY ASSURANCE

- A. Comply with Quality Assurance requirements of Section 270000.
- B. Contractor Qualifications
 - 1. In addition to the Contractor Qualifications requirements of Section 270000, the Contractor shall be manufacturer certified to install the proposed and submitted cabling system and to provide an extended warranty. Provide satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid submission.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage and Handling requirements of Section 270000.

1.8 WARRANTY

- A. The backbone fiber optic cabling system, as specified in this section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover optical performance of cabling system.

PART 2 - PRODUCTS

2.1 FIBER OPTIC CABLE – INTERLOCKED ARMOR PLENUM RATED

- A. Application:
 - 1. Cable shall be suitable for indoor installation, between floors in vertical riser system, under access flooring, and through overhead ceiling space (in basketway, cable tray, conduit, and/or hangers).
 - 2. Optical transmission performance shall not be significantly affected by environmental fluctuations, installation, or aging.
 - 3. Materials shall not evolve hydrogen in quantities that will increase light attenuation.
- B. Multimode 50/125 μm fiber strands shall meet or exceed the following geometry criteria:
 - 1. Core diameter = 50 μm , $\pm 3.0 \mu\text{m}$
 - 2. Cladding diameter = 125 μm , $\pm 1.0 \mu\text{m}$
 - 3. Core/Cladding Concentricity = $\leq 3 \mu\text{m}$
 - 4. Minimum Tensile Strength = 100,000 psi
- C. Multimode 50/125 μm fiber strands shall meet or exceed the following performance criteria:
 - 1. Attenuation = 3.0 dB/km at 850 nm and 1.0 dB/km at 1300 nm wavelengths, maximum
 - 2. Overfilled Bandwidth = 1,500 MHz•km at 850 nm and 500 MHz•km at 1300 nm wavelengths, minimum
 - 3. Effective Modal Bandwidth = 2,000 MHz•km at 850 nm and 500 MHz•km at 1300 nm wavelengths, minimum
- D. Singlemode fiber strands shall meet or exceed the following geometry criteria:
 - 1. Core diameter = 8.3 μm

2. Mode field diameter = 8.8 μm , $\pm 0.5 \mu\text{m}$
3. Cladding diameter = 125 μm , $\pm 1.0 \mu\text{m}$
4. Core/Cladding Concentricity = $\leq 0.8 \mu\text{m}$
5. Minimum Tensile Strength = 100,000 psi

- E. Singlemode fiber strands shall meet or exceed the following performance criteria:
1. Attenuation = 0.7 dB/km at 1310 nm and 0.7 dB/km at 1550 nm wavelengths, maximum
 2. Cutoff wavelength = 1260 nm
 3. Dispersion = 3.5 ps/nm•km at 1285-1330 nm and 18 ps/nm•km at 1550 nm
 4. Singlemode fiber shall meet the specifications of the following:
 - a. International Telecommunication Union (ITU) ITU-T G.652.D classification for low water peak (LWP) singlemode fiber
 - b. International Electrotechnical Commission (IEC) 60793-2-50 "Sectional Specification for Class B single-mode fibres", Class B1.3
- F. Primary Coating:
1. Each fiber shall be completely covered with a "primary coating" (acrylate material).
 2. Coating diameter = 250 μm , $\pm 5 \mu\text{m}$
- G. Buffering:
1. Each coated fiber shall be fully covered with a material extruded over and directly onto the coating. This shall be the tight buffer. Tight buffer diameter = 900 μm , $\pm 5 \mu\text{m}$. Material = PVC, or equivalent flame retardant thermoplastic.
 2. Buffered strands shall be individually color-coded to meet the requirements of ANSI/TIA/EIA-598-A-1995. (Also, ref. ANSI/ICEA S-83-596-1994, and EIA-230)
- H. Cable Sheath:
1. Strength Element: The cable shall have an internal strength element such as aramid yarn (e.g., Kevlar).
 2. Inner Jacket: The cable shall have a seamless inner jacket (material = PVC, or equivalent) applied to and completely covering the internal components (fiber strands, strength element, other).
 3. Armor: The cable shall have an interlocking metallic armor applied spirally and longitudinally to and completely covering the cable.
 4. Outer Jacket: The cable shall have a seamless outer jacket (material = PVC, or equivalent) applied to and completely covering the armor.
 5. Tensile Strength: The cable shall have a 150-lb, minimum, rated load.
 6. Flame Rating: NEC (Article 770) rated as OFCP, and UL listed as such.
- I. Manufacturer, or equal:
1. Berk-Tek
 - a. #PDPK012FB3010/F5-I/O-C4(AQU); 12 strand, 50/125 μm , interlock armor, aqua, OFCR rated
 2. Berk-Tek
 - a. #PDPK012AB0707-I/O-C4C5(YEL); 12 strand, singlemode, interlock armor, yellow, OFCR rated

2.2 TERMINATION APPARATUS – FIBER OPTIC PATCH PANELS

- A. Application:
1. Fiber optic patch panels shall be an enclosed housing for protecting, storing and organizing the termination of fiber cable(s) and fiber strands, shall provide means to

- strain relieve and support of the specified cables, shall contain facilities to store fiber slack, and shall provide patch cord management.
 - 2. Fiber optic patch panels shall be passive physical equipment and apparatus used in terminating, interconnecting, and cross-connecting fiber optic cabling, shall possess a minimum fire resistant rating of UL94V-1, and shall conform to existing OSHA Health and Safety Laws.
 - 3. Fiber optic patch panels shall be rack-mountable.
- B. Fiber optic patch panels shall come equipped with safety labels such as laser identification or warning labels as required by system considerations.
- C. Manufacturer, or equal:
- 1. Leviton
 - a. #5R1UH-S03; Opt-X 2000i SDX – 1RU Fiber Enclosure, sliding tray, accepts 3 adapter plates, (72 LC’s)
 - b. #5F100-2QL; Fiber Adapter plate – 12 Fiber LC 50um, OM3/4
 - c. #5F100-2LL; Fiber Adapter plate – 12 Fiber LC Single-Mode, OS2
 - d. #5F100-PLT; Fiber Adapter Plate - Blank

2.3 FIBER OPTIC CONNECTORS

- A. Multimode Fiber Optic Connectors – LC Type
- 1. Materials:
 - a. Ferrule: ceramic with pre-radiused finish/face
 - b. Connector Housing: Plastic
 - 2. Connector shall have an integral strain relief feature, including a bend limiting rear boot.
 - 3. Manufacturer, or equal:
 - a. Leviton
 - 1) #54PLC-M03; 1 – Fiber 50/125 um, OM4 LC, 3 meter
- B. Singlemode Fiber Optic Connectors – LC Type
- 1. Materials:
 - a. Ferrule: ceramic (zirconia or alumina) with pre-radiused finish/face
 - b. Connector housing: plastic
 - 2. Connector shall meet or exceed Ultra PC performance (LC-UPC).
 - 3. Connector shall have an integral strain relief feature, including a bend limiting rear boot.
 - 4. Manufacturer, or equal:
 - a. Leviton
 - 1) #UPPLC-S03; 1 – Fiber Single-Mode, OS2 LC, 3 meter

2.4 LABELS

- A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.
- B. Labels for Cables
- 1. Labels shall be adhesive-backed and have a self-laminating feature
 - 2. Labels shall fit the backbone cables listed above (i.e., shall fully wrap around the cable’s jacket).
 - 3. Printable area should be 1-inch wide x 0.5 inch high, or larger
 - 4. Printable area color shall be white
 - 5. Manufacturer:

- a. Brother P-Touch Labels
 - 1) #TZe231; .50" / 12mm Black on White, 110 Blocks, fiber enclosures
 - 2) #TZeFX241; .75" / 18mm Black on White, Flex Tape – Cable Rapping

2.5 MISCELLANEOUS

- A. Fiber Slack Storage Reel: Leviton #48900-OFR
- B. Velcro Cable Ties
 - 1. Width: .75".
 - 2. Color: Velcro cable ties the same color as the cable to which it is being applied.
 - 3. Manufacturers:
 - a. Panduit
 - 1) #HLS-15R-0 Black, 15' roll, cut to length.
 - b. Or equal

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with Execution requirements of Section 270000.

3.2 EXAMINATION AND PREPARATION

- A. Pathways: Prior to installation verify pathways (conduits, etc.) and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, "True Tape" the conduits).
- B. Rooms: Prior to installation, verify equipment rooms are ready for cables and terminations.
- C. Prior to installation, verify cables and conductors are fully operational – both cable sheath and fiber strands. Pre-installation testing is the responsibility of the Contractor, though documentation of pre-installation testing is not a close out requirement.

3.3 INSTALLATION

- A. Backbone Cable Installation, Routing, and Termination
 - 1. Cable runs shall have continuous sheath continuity, homogenous in nature. Splices are not permitted anywhere.
 - 2. Do not exceed 500 meters optical conductor length from the termination within the Entrance Facility/BDF IDF.
 - 3. Placement
 - a. Place cables within designated pathways.
 - b. Maintain a minimum bend radius of 20 times the cable diameter during installation, and a minimum bend radius of 10 times the cable diameter after installation.
 - c. Maintain pulling tension within manufacturer's limits.

- d. Place and suspend cables in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables damaged during installation.
 - e. Do not use cable-pulling compounds for indoor installations.
 - f. Provide 20 to 30 feet of cable slack at each end within the Telecommunications Rooms; store slack in fiber slack storage reel mounted on the wall.
 - g. Place a pull rope along with cables where run in pathways and spare capacity in the pathway remains. Tie off ends of the pull rope.
4. Routing
- a. Within Telecommunications Rooms, neatly dress and organize cables on designated cable support apparatus (for example, overhead and vertical cable support), and fasten cables to cable support apparatus via tie wraps or Velcro-type straps.
5. Termination
- a. Properly relieve strain from cables at termination points (at/within the fiber optic termination panels) per manufacturer's instructions.
 - b. Bond cable armor to grounding point (busbar) – refer to section 270526 for additional information.
 - c. Terminate fiber strands via pigtail splicing at both ends using the specified fiber optic pigtail appropriate for the mode type of the fiber. Splicing type shall be fusion; mechanical splicing will not be accepted. Perform terminations in accordance with manufacturer's instructions.
 - d. Provide required accessories and consumables for the complete termination of fiber strands.
 - e. Provide 3 feet of unsheathed fiber (tight buffer) slack within the patch panel/termination enclosure at each end of the link. Properly store fiber slack in rear of patch panel into the 'routing rings', per manufacturer's instructions. Include 'extension' slack loop/fold in the rear of the shelf to allow for the drawer to be pulled out without putting tension on the fibers.

B. Fiber Optic Cable Termination Panel

- 1. Provide fully assembled termination panel in designated equipment rack; locate per drawings (if not shown, locate at the top). "Fully assembled" includes installation and mounting components and accessories such as adapter panels, coupling adapters, etc. required for operation.
- 2. Provide accessories required for proper installation of each termination panel, including connector panels and adapters.
- 3. Bond termination apparatus to grounding point (busbar) – refer to section 270526 for additional information.

3.4 LABELING

A. General Requirements

- 1. Labeling, identifier assignment, and the label colors shall conform to the TIA/EIA-606-A Administration Standard and as approved by Owner or Owner's Representative before installation.
- 2. Provide permanent and machine generated labels; hand written labels will not be accepted.

B. Cable Labels

- 1. Label Format:
 - a. Label type shall be wrap-around self-laminating.
 - b. Label color shall be white background with clear laminating window.

- c. Text color shall be black; text height shall be 1/8" high, minimum, or #12 font size.
2. Provide labels on both ends of cables. Fully wrap label around the cable jacket. Install labels no more than 4 inches from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.

C. Termination Apparatus Labels

1. Use labels included in the product packaging. For substitutions, request approval by the Engineer.
2. Label color shall be white for respective field type, per TIA/EIA-606-A.
3. Text color shall be black, 3/32" high, minimum, or #10 font size.

D. Identifier Assignment

1. General: Separate all label fields of the identifier with a hyphen.
2. Backbone ISP Fiber Optic Cables
 - a. The first field: the originating MDF/BDF room identity; for example: "AD1.1".
 - b. The second field: the destination BDF/IDF room identify; for example: "AD3.1".
 - c. The third field: the cable type; for example: "F6" (fiber optic, 50/125 multimode).
 - d. The fourth field: beginning strand count served from originating room; for example: "01".
 - e. The fifth field: ending strand count served from originating room; for example: "12"
 - f. Identifier Example: "AD1.1-AD3.1-F6-01-12"

3.5 FINAL INSPECTION AND CERTIFICATION

- A. Punch the Work of this Section compliant to the requirements of Section 270000.
- B. Remove and replace with new, at no additional cost, cables with conductors failing to meet the indicated standards and not passing the testing requirements of Section 270821. The Owner, or Owner's Representative, will not accept the installation until testing has indicated a 100% availability of cables and conductors or the Owner or Owner's Representative has approved in writing any deviation from this requirement.
- C. Comply with system acceptance and certification requirements of Section 270000.

END OF SECTION

SECTION 271324

COMMUNICATIONS BACKBONE OSP FIBER OPTIC CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Backbone outside plant (OSP) fiber optic cabling
 - 2. Outside plant innerduct
 - 3. Conduit and innerduct plugs
- B. Related Sections
 - 1. Comply with the Related Sections paragraph of Section 270000
 - 2. 270821 Communication Fiber Optic Testing
 - 3. 271323 Communication Backbone ISP Fiber Optic Cabling

1.2 REFERENCES

- A. Comply with References requirements of Section 270000.
- B. In addition to the codes and standards listed in Section 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
 - a. UL 1651, "Optical Fiber Cable"
 - b. UL 1666, "Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts"
 - 2. Insulated Cable Engineers Association (ICEA)
 - a. ANSI/ICEA S-87-640-1999, "Fiber Optic Outside Plant Communications Cable"
 - b. ANSI/ICEA S-104-696-2001, "Indoor-Outdoor Optical Cable"
 - 3. Telcordia
 - a. GR-20-CORE, Issue 3, "Generic Requirements for Optical Fiber and Optical Fiber Cable"

1.3 DEFINITIONS

- A. Refer to Section 270000 for Definitions.
- B. In addition to those Definitions of Section 270000, the following list of terms as used in this specification defined as follows:
 - 1. "HDPE": High Density Polyethylene
 - 2. "LDPE": Light Density Polyethylene
 - 3. "MDPE": Medium Density Polyethylene
 - 4. "MM": Multimode [fiber type]
 - 5. "OSP": Outside Plant [cabling]
 - 6. "PE": Polyethylene
 - 7. "SM": Singlemode [fiber type]

1.4 SYSTEM DESCRIPTION

- A. Work Covered Under Other Sections
 - 1. Pathways: The communications pathways (underground conduits, maintenance holes, pull boxes, innerducts, pull ropes, etc.) work will be covered under another Section. Refer to the Drawings for size/capacity and route information.
 - 2. Rooms: Build out (e.g., backboards, overhead and vertical cable support, etc.) of the rooms (MDF, BDFs, IDF) will be covered under another Section. Refer to the Drawings for build out information.
- B. Base Bid Work
 - 1. Provide engineering, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working telecommunications backbone fiber optic cabling system installation described in this Section and shown on related Drawings.
 - 2. The Drawings are diagrammatic in nature, and require shop drawings to complete the detailed design of the telecommunications infrastructure.
 - 3. Consider Backbone cabling, as shown on Drawings, as base bid work, unless otherwise noted, including terminations at both ends.
 - 4. In general, the base bid work includes:
 - a. Submittals
 - b. Backbone outside plant (OSP) fiber optic cables and terminations
 - c. Innerduct
 - d. Cable management
 - e. Crossconnections / patching.
 - f. Cable identification tags and system labeling
 - g. Record Documents
 - h. Warranty

1.5 SUBMITTALS

- A. Comply with Submittal procedural, quantity, and format requirements of Section 270000.
- B. Submittal Requirements Prior To Start Of Construction:
 - 1. Product Data Submittal, indicating conformance with NEC, UL, TIA/EIA listings, certifications and specifications.
 - 2. Schedule Submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for Division 27.
 - 3. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations.
- C. Submittal Requirements at Closeout:
 - 1. Copy of the manufacturer's printed reel documentation, including the following.
 - a. Manufacturer's reel number
 - b. Manufacturer's traceable batch number
 - c. Length of the fiber cable on the reel
 - d. Maximum attenuation
 - e. Minimum bandwidth
 - 2. As-Built Drawings
 - 3. Crossconnection records/cut sheets
 - 4. O & M Manuals

1.6 QUALITY ASSURANCE

- A. Comply with Quality Assurance requirements of Section 270000.
- B. Contractor Qualifications
 - 1. In addition to the Contractor Qualifications requirements of Section 270000, the Contractor shall be manufacturer certified to install the proposed and submitted cabling system and to provide an extended warranty. Provide satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid submission.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage and Handling requirements of Section 270000.

1.8 WARRANTY

- A. The communications cabling system, as specified in this Section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover optical performance of cabling system.

PART 2 - PRODUCTS

2.1 SUBSTITUTIONS

- A. Comply with the Substitutions requirements of Section 270000.

2.2 FIBER OPTIC CABLE – INDOOR/OUTDOOR, NON-PLENUM/RISER RATED

- A. Application:
 - 1. Cable shall be suitable for outdoor installations within underground pathways system and/or within innerduct/sub-ducting, and for indoor installation, between floors in vertical riser system, under access flooring, and through overhead ceiling space (in basketway, cable tray, conduit, and/or hangers).
 - 2. Optical transmission performance shall not be significantly affected by environmental fluctuations, installation, or aging.
 - 3. Materials shall not evolve hydrogen in quantities that will increase light attenuation.
- B. Multimode 50/125 μm fiber strands shall meet or exceed the following geometry criteria:
 - 1. Core diameter = 50 μm , $\pm 3.0 \mu\text{m}$.
 - 2. Cladding diameter = 125 μm , $\pm 1.0 \mu\text{m}$.
 - 3. Core/Cladding Concentricity = $\leq 3 \mu\text{m}$.
 - 4. Minimum Tensile Strength = 100,000 psi.
- C. Multimode 50/125 μm fiber strands shall meet or exceed the following performance criteria:
 - 1. Attenuation = 3.0 dB/km at 850 nm and 1.0 dB/km at 1300 nm wavelengths, maximum.

- D. Singlemode fiber strands shall meet or exceed the following geometry criteria:
1. Core diameter = 8.3 μm .
 2. Mode field diameter = 8.8 μm , $\pm 0.5 \mu\text{m}$.
 3. Cladding diameter = 125 μm , $\pm 1.0 \mu\text{m}$.
 4. Core/Cladding Concentricity = $\leq 0.8 \mu\text{m}$.
 5. Minimum Tensile Strength = 100,000 psi.
- E. Singlemode fiber strands shall meet or exceed the following performance criteria:
1. Attenuation = 0.5 dB/km at 1300 nm and 0.5 dB/km at 1550 nm wavelengths, maximum.
 2. Cutoff wavelength = 1260 nm.
 3. Dispersion = 3.5 ps/nm•km at 1285-1330 nm.
 4. Singlemode fiber shall meet the specifications of the following:
 - a. International Telecommunication Union (ITU) ITU-T G.652.D classification for low water peak (LWP) singlemode fiber
 - b. International Electrotechnical Commission (IEC) 60793-2-50 "Sectional Specification for Class B single-mode fibres", Class B1.3
- F. Sheath:
1. Sheath shall consist of a strength member and an outer jacket, with non-metallic component dielectric sheath.
 2. Strength Member: Aramid yarn (e.g., Kevlar®), or reinforced fiberglass rods.
 3. Jacket: Fluoropolymer Thermoplastic.
 4. Flame Rating: NEC (Article 770) rated as OFNR, and UL listed as such.
 5. Rated tensile load: 600 lb. maximum rated load.
 6. Operating Temperature Range: -40 to 158°F (-40 to 70°C)
 7. Installation Temperature Range: -22 to 140°F (-30 to 60°C)
- G. Manufacturer:
1. Leviton
 - a. #PDR12B036-I/O(BLA)FB3010/F5; Multimode - Bend Insensitive, gel-free outdoor/indoor OFNR cable, 36-strand 50/125 μm
 2. Leviton
 - a. # PDR12B048-I/O(BLA)AB0707; Singlemode - Bend Insensitive, gel-free outdoor/indoor OFNR cable, 48-strand
 3. Or equal

2.3 LABELS

- A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.
- B. Labels for Cables
1. Labels shall be adhesive-backed and have a self-laminating feature
 2. Labels shall fit the backbone cables listed above (i.e., shall fully wrap around the cable's jacket).
 3. Printable area should be 1 inch wide x 0.5 inch high, or larger
 4. Printable area color shall be white
 5. Manufacturer:
 - a. Panduit
 - 1) #S200X225YAJ; labels cables 0.24" (6.06mm) - 0.48" (12.13mm) dia.
 - 2) #S200X400YAJ; labels for cables 0.32" (8.09mm) - 0.95" (24.26mm) dia.
 - 3) #S200X650YAJ; labels for cables 0.48" (12.13mm) - 1.59" (40.43mm) dia.

- b. Or equal
- C. Fiber Slack Storage Reel: Leviton #48900-OFR, or equal
- D. Velcro Cable Ties
 - 1. Width: .75".
 - 2. Color: Velcro cable ties, same color as the cable to which it is being applied.
 - 3. Manufacturers:
 - a. Panduit
 - 1) #HLS-15R-0 Black, 15' roll, cut to length
 - b. Or equal

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of Section 270000.

3.2 EXAMINATION AND PREPARATION

- A. Pathways: Prior to installation verify that duct banks, ducts, maintenance holes, pullboxes, and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, "True Tape" the conduits).
- B. Rooms: Prior to installation, verify equipment rooms are ready for cables and terminations.
- C. Prior to installation, verify cables and conductors are fully operational – both cable sheath and fiber strands. Pre-installation testing is the responsibility of the Contractor, though documentation of pre-installation testing is not a close out requirement.

3.3 INSTALLATION

- A. Backbone Cable Installation and Routing
 - 1. Cable runs shall have continuous sheath continuity, homogenous in nature. Splices are not permitted anywhere, unless expressly shown on the Drawings or approved in writing by the Engineer prior to installation.
 - 2. Do not exceed 1,500 meters optical conductor length.
 - 3. Placement
 - a. Install cables within designated pathways. Place OSP cables in innerduct between points of termination throughout entire length (except at the fiber take up reel).
 - b. Maintain a minimum bend radius of 20 times the cable diameter during installation, and a minimum bend radius of 10 times the cable diameter after installation.
 - c. Maintain pulling tension within manufacturer's limits. Use a pulling tension meter when using mechanical assistance during installation. Record maximum pulling tension for each cable run, and submit to the Engineer for review if requested. Replace runs when manufacturer's maximum pulling tension is exceeded.

- d. Place and suspend cables in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables damaged during installation.
 - e. Only use UL approved cable-pulling compounds when necessary to reduce pulling tensions.
 - f. Provide 20 to 30 feet (minimum) cable slack at each end within the Telecommunications Rooms; store slack in fiber slack storage reel mounted on the wall.
 - g. Place a pull rope along with cables where run in pathways (e.g., conduit) and spare capacity in the pathway remains. Tie off ends of the pull rope.
4. Routing
- a. Within Telecommunications Rooms, neatly dress and organize cables on designated cable support apparatus (for example, overhead cable tray or vertical cable runway), and fasten cables to cable support apparatus via tie wraps or Velcro-type straps.
5. Termination
- a. Properly relieve strain from cables at termination points (at/within the fiber optic termination panels) per manufacturer's instructions.
 - b. Bond cable armor to grounding point (busbar) – refer to section 270526 for additional information.
 - c. Provide breakout kits to furcate fibers from buffer tubes.
 - d. Terminate/connectorize fiber strands at both ends using the specified fiber optic connectors appropriate for the mode type of the fiber. Perform terminations in accordance with manufacturer's instructions.
 - e. Provide required accessories and consumables for complete termination of fiber strands.
 - f. Provide 3 feet of unsheathed fiber (including buffer tube and broken out from the buffer tube) slack within the patch panel/termination enclosure at each end of the link. Properly store fiber slack in rear of patch panel into the 'routing rings', per manufacturer's instructions. Include 'extension' slack loop/fold in the rear of the shelf to allow for the drawer to be pulled out without putting tension on the fibers.

B. Fiber Optic Cable Termination Panel

- 1. Provide fully assembled termination panel in designated equipment rack; locate per Drawings (if not shown, locate at the top). "Fully assembled" includes installation and mounting components and accessories such as adapter panels, coupling adapters, etc. required for operation.
- 2. Provide accessories required for proper installation of each termination panel, including connector panels and adapters.
- 3. Bond termination apparatus to grounding point (busbar) – refer to section 270526 for additional information.

3.4 LABELING

A. General Requirements

- 1. Labeling, identifier assignment, and the label colors shall conform to the TIA/EIA-606-A Administration Standard and as approved by Owner or Owner's Representative before installation.
- 2. Provide permanent and machine generated labels; hand written labels will not be accepted.

- B. Cable Labels
 - 1. Label Format:
 - a. Label type shall be wrap-around self-laminating.
 - b. Label color shall be white background with clear laminating window.
 - c. Text color shall be black; text height shall be 1/8" high, minimum, or #12 font size.
 - 2. Provide labels on both ends of cables. Fully wrap label around the cable jacket. Install labels no more than 4 inches from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.

- C. Termination Apparatus Labels
 - 1. Use labels included in the product packaging. For substitutions, request approval by the Engineer.
 - 2. Label color shall be for respective field type, per TIA/EIA-606-A.
 - 3. Text color shall be black, 3/32" high, minimum, or #10 font size.

- D. Identifier Assignment
 - 1. General: Separate all label fields of the identifier with a hyphen.
 - 2. Backbone OSP Fiber Optic Cables
 - a. The first field shall identify the cable type: "CBF" (for Cable, Backbone, Fiber optic).
 - b. The second field shall identify the originating termination room identifier as shown on the plans; e.g., "MDFA.1".
 - c. The third field shall identify the ending termination room identifier as shown on the plans; e.g., "BDF1.1".
 - d. The fourth field shall identify the type and number of strands; for example, "Mxxx" where "M" stands for multimode and xxx stands for the ending fiber strand sequential count
 - e. Identifier Example: "CBF-MDFA.1-BDF1.1-M145-M192"
 - 3. Termination Positions at the Termination Panels
 - a. Make the first field of the identifier the destination room; for example "TO IDF2.2".
 - b. Make the second field of the identifier the strand count range; for example, "M025-M048"
 - c. Identifier Example: "TO BDF1.1 M145-M192".

3.5 FINAL INSPECTION AND CERTIFICATION

- A. Punch the Work of this Section compliant to the requirements of Section 270000.
- B. Remove and replace with new, at no cost to the Owner, cables or conductors failing to meet the indicated standards and not passing the testing requirements of Section 270821. The Owner, or Owner's Representative, will not accept the installation until testing has indicated a 100% availability of all cables and conductors or the Owner or Owner's Representative has approved any deviation from this requirement.
- C. Comply with system acceptance and certification requirements of Section 270000.

END OF SECTION

APPENDIX A – Laney College Conduit Survey (Following Page 8)

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 271513

COMMUNICATIONS HORIZONTAL TWISTED PAIR CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes: Horizontal twisted pair cabling
- B. Base Bid Work
 - 1. Provide pre-construction services (e.g., submittals, coordination with other trades, etc.), materials, apparatus, labor, tools, equipment, and transportation required for complete communications horizontal twisted pair cabling described in this section and shown on related drawings.
 - 2. In general, the base bid work includes:
 - a. Submittals
 - b. Horizontal cables, terminations, and outlets
 - c. Cable support and management
 - d. Patch cords, and cord management
 - e. Cable identification tags and system labeling
 - f. Closeout documents
 - g. Warranty
 - 3. Identifiers and Labeling: The scope of work herein includes the responsibility for assigning identifiers to each horizontal cabling link and related cabling media in addition to providing physical labeling to each component.
- C. Related Divisions and Sections
 - 1. Comply with the Related Divisions and Sections requirements of section 270000
 - 2. 270811, "Communications Twisted Pair Testing"
 - 3. 271313, "Communications Backbone Twisted Pair Cabling"
 - 4. 270528, "Communications Building Pathways"
 - 5. 270536, "Communications Building Pathways – Cable Trays"
- D. Work Provided Under Other Sections
 - 1. Pathways: Communications pathways (cable tray, conduits, stubs, etc.) are covered under another section. Refer to the drawings for type, size/capacity and route information. Refer to sections 270528 and 270536 and to the drawings for requirements, buildout information and layouts.
 - 2. Rooms: Telecommunications room buildout (e.g., backboards, rack bays, overhead and vertical cable support, etc.) is covered under another section. Refer to section 271100 and to the drawings for requirements, buildout information and layouts.
 - 3. Testing: The horizontal cabling system testing requirements are covered under another section. Refer to section 270811 for testing requirements.

1.2 REFERENCES

- A. Comply with the References requirements of section 270000.

- B. In addition to the codes and standards listed in section 270000, comply with the latest edition (or as noted) of the following applicable specifications and standards except as otherwise shown or specified:
1. National Fire Protection Agency (NFPA)
 - a. NFPA 255, "Standard Method of Test of Surface Burning Characteristics of Building Materials"
 - b. NFPA 259, "Standard Test Method for Potential Heat of Building Materials"
 - c. NFPA 262, "Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces"
 2. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
 - a. UL 444, "Communications Cables"
 - b. UL 1863, "Communications-Circuit Accessories"
 3. Insulated Cable Engineers Association (ICEA):
 - a. ICEA S-116-732, "Standard for Category 6 and 6A, 100 Ohm, Individually Unshielded Twisted Pairs, Indoor Cables (With Or Without An Overall Shield) for Use in LAN Communications Wiring Systems"
 - b. ANSI/ICEA S-107-704, "Standard for Broadband Buried Service Wire, Filled, Polyolefin Insulated, Copper Conductor Technical Requirements"

1.3 DEFINITIONS

- A. The Definitions in section 270000 apply to this section.
- B. In addition, define the following list of terms as used in this specification as follows:
1. "Cabling": cabling consists of cables, connectors (jacks, plugs), termination apparatus (panels, blocks, outlets, etc.), consolidation points, connecting media (patch cords, line cords, etc.), and labeling/identification.
 2. "CAT6A": Category 6 Augmented performance grade
 3. "Channel": End to end transmission path; e.g., the Permanent Link and connecting media such as line cord (at the workstation), patch cord, and (if a full crossconnection is implemented) the crossconnect termination/connecting apparatus and equipment cord.
 4. "CMP": Communications Media Plenum [plenum rating]
 5. "FEP": Fluorinated Ethylene Propylene
 6. "F/UTP": twisted pair cabling with an overall foil shield
 7. "FTP": synonymous with "F/UTP", unless otherwise noted
 8. "ID": identifier
 9. "BDF": Building Distribution Facility
 10. "PE": Polyethylene
 11. "Permanent Link": Test configuration for a horizontal cabling link excluding patch cords, equipment cords, and line cords; e.g., the permanent portion of the horizontal cabling to each outlet consisting of cable, consolidation point (if used), termination/connecting apparatus in the telecommunications and the connector at the outlet.
 12. "PVC": Polyvinyl chloride
 13. "IDF": Intermediate Distribution Facility
 14. "U/UTP": twisted pair cabling with no shield
 15. "UTP": synonymous with "U/UTP", unless otherwise noted

1.4 SYSTEM DESCRIPTION

- A. Horizontal twisted pair cabling shall consist of the cabling from telecommunications rooms to outlets/connectors at work areas, to equipment, to devices, or other items that require network connections or other telecommunications services.
 - 1. Refer to other sections for pathways and cable support.
 - 2. Refer to other section for testing.

- B. Cabling Length Requirements: Note that cable length means the electrical length (pair length), not the sheath length. Also, length requirements must account for test equipment accuracy tolerances (for example, TIA568-C.2 allows for 10% uncertainty).
 - 1. The maximum electrical length of any permanent link shall not exceed 90 meters. If consolidation points or multi-user outlets are used, then the lengths shall not exceed those listed in the TIA-568 standard and the cabling system manufacturer's guidelines (whichever is shorter).
 - 2. The maximum electrical length of any channel shall not exceed 100 meters. If consolidation points or multi-user outlets are used, or if the total length of cords needs to exceed 10 meters, then the permanent link lengths shall not exceed those listed in the TIA-568 standard and the cabling system manufacturer's guidelines (whichever is shorter).
 - 3. The minimum electrical length of any permanent link shall be no shorter than as required by the manufacturer (as described in written guidelines).

- C. Jack Wiring: Jacks shall be wired to T568B configuration.

1.5 SUBMITTALS

- A. Comply with the Submittals requirements of section 270000.
- B. Quantity: Furnish quantities of each submittal as noted in section 270000.
- C. Substitutions: Conform to substitutions requirements and procedures in section 270000.
- D. Submittal requirements prior to the start of construction:
 - 1. Product Data submittal, indicating specifications and conformance with CEC, UL, TIA listings, and other applicable certifications.
 - 2. Schedule submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for 27xxxx series sections
 - 3. Shop Drawings submittal, consisting of proposed changes to cable routing, or termination locations/configurations

- E. Submittal requirements at closeout:
 - 1. As-Built Drawings: Submit a set of floor plans and (as appropriate) RCPs showing the location of every complement of cabling with its respective ID – these as-built drawings may be combined with those showing the pathways (cable trays, conduits, etc.). The IDs on the shop drawings shall exactly match the physical labeling applied to cabling components.
 - 2. Link ID –to– Office Number Key: Submit a “link ID-to-office number key” as an electronic format (such as an MS-Excel spreadsheet file or cloud-based medium) that lists every permanent link associated with the final location / office number.
 - 3. Crossconnection records/cut sheets

4. Operations and Maintenance (O&M) Manuals

F. Posted Documentation

1. Post one full size plot of as-built drawings, specifically the floor plans and (as applicable) reflected ceiling plans, within TRs showing each TR's serving area. Coordinate location with Owner.

1.6 QUALITY ASSURANCE

- A. Comply with the Quality Assurance requirements of section 270000.

B. Contractor Qualifications

1. In addition to the Contractor Qualifications requirements of section 270000, the Contractor shall be an approved member in good standing of the Leviton Certified Installer network. The Contractor shall maintain a certified RCDD on staff and utilize manufacturer trained, Union certified, or BICSI certified installers.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with the Delivery, Storage and Handling requirements of section 270000.

1.8 WARRANTY

- A. Provide to the Owner a Limited Lifetime Product and Performance Warranty covering all components of the horizontal cabling system (cables, jacks, panels, patch cords, equipment, workmanship, etc.). The warranty shall guarantee the cabling system performance to the Category specified herein. Submit a written warranty statement with system documentation. The warranty period shall begin on the system's first use by the Owner.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Berk-Tek Leviton Technologies cabling system (no other substitutions allowed)

2.2 SUBSTITUTIONS

- A. Comply with the Substitutions requirements of section 270000.

2.3 HORIZONTAL CABLE – CAT6A U/UTP PLENUM RATED (CMP)

- A. Application: Suitable for indoor installation, within ceiling space in primary and secondary pathways, within access/raised floor space.

- B. Conductors:
 1. Insulated Conductors: 23 AWG solid copper, fully insulated with a flame retardant thermoplastic material (material = FEP, or similar).
 2. Twisted Pairs: Two insulated conductors “twisted” into a “pair” (twisted pair) color-coded to industry standards (EIA-230).
- C. Cable Sheath:
 1. Shielding: none
 2. Outer Jacket: seamless outer jacket (material = LS-PVC, or similar) applied to and completely cover the internal components (twisted pairs).
- D. Flame Rating: CMP, UL listed as such, and the rating shall be printed on the jacket.
- E. Electrical and Mechanical Performance: Meet or exceed requirements of TIA-568 standard series, ANSI/ICEA S-116-732, ISO 11801 Class E_A Edition 2.2, and IEEE Std. 802.3an channel for CAT6A cabling.
- F. Limited Power: UL certified as “Limited Power (LP)”, and the rating shall be printed on the jacket.
 1. Listed to 0.5 A per conductor.
- G. Jacket marking: “CMP–LP (0.5A)”
- H. Manufacturer:
 1. Berk-Tek LANmark-SST CAT6A U/UTP Plenum Rated (CMP) Cable
 - a. #11101842; CAT6A 4 pair U/UTP cable, CMP, blue

2.1 HORIZONTAL CABLE – CAT6A U/UTP INDOOR/OUTDOOR PLENUM RATED (CMP)

- A. Application: Suitable for indoor installation, within ceiling space in primary and secondary pathways, within access/raised floor space.
- B. Conductors:
 1. Insulated Conductors: 23 AWG solid copper, fully insulated with a flame retardant thermoplastic material (material = FEP, or similar).
 2. Twisted Pairs: Two insulated conductors “twisted” into a “pair” (twisted pair) color-coded to industry standards (EIA-230).
- C. Cable Sheath:
 1. Shielding: none
 2. Filled: No, Dry core
 3. Outer Jacket: seamless outer jacket (material = LS-PVC, or similar) applied to and completely cover the internal components (twisted pairs).
- D. Flame Rating: CMP, UL listed as such, and the rating shall be printed on the jacket.
- E. Electrical and Mechanical Performance: Meet or exceed requirements of TIA-568 standard series, ANSI/ICEA S-116-732, ISO 11801 Class E_A Edition 2.2, and IEEE Std. 802.3an channel for CAT6A cabling.

- F. Limited Power: UL certified as “Limited Power (LP)”, and the rating shall be printed on the jacket.
 - 1. Listed to 0.8 A per conductor.
- G. Jacket marking: “CMP–LP (0.8A)”
- H. Color: White
- I. Manufacturer, or equal:
 - 1. General Cable:
 - a. #7141001

2.2 TERMINATION APPARATUS – CAT6A PATCH PANEL, PUNCH DOWN TYPE

- A. Application: Panels shall be suitable for installation within a TR for the termination of the horizontal cables specified herein. Panels shall be horizontally oriented for a rack-mounted configuration. Panels shall be capable of supporting, organizing, labeling and patching/crossconnecting between the horizontal termination field and the equipment termination field.
- B. Modular patch panel shall have 110-type termination, and shall be compatible with the specified horizontal cables both electrically and physically.
- C. Mechanical Performance: Each port shall be an 8-position modular jack, compliant to ANSI/TIA-568.
- D. Electrical Performance: Each port shall meet or exceed TIA-568 standard series and ISO/IEC 11801 requirements for CAT6A U/UTP cabling through the cable termination and patch cord connection.
- E. Manufacturer:
 - 1. Leviton 110-Style CAT6A Patch Panels
 - a. #6A586-U24; flat modular patch panel, 1U, 24 CAT6A ports
 - b. #6A586-U48; flat modular patch panel, 2U, 48 CAT6A ports

2.3 TERMINATION APPARATUS – CAT6A MODULAR 8-POSITION CONNECTORS, UNSHIELDED

- A. Application: Modular connectors, i.e., jacks and plugs, shall be used for the termination of 4-pair U/UTP cables, and shall be compatible – both electrically and physically – with the cables specified herein.
- B. Mechanical Performance: Modular connectors shall be 8-position, compliant to TIA-568 standard series.
- C. Electrical Performance: Modular connectors shall meet or exceed TIA-568 standard series and ISO/IEC 11801 requirements for CAT6A U/UTP cabling.

- D. Manufacturer:
 - 1. Leviton "Atlas-X1" Series CAT6A Jacks
 - a. #6AUJK-RL6; modular 8-position jack, CAT6A, blue

2.4 WORK AREA OUTLETS – FLUSH-MOUNT FACEPLATES

- A. Application: Faceplates shall be suitable for indoor installation for standard 1-gang and 2-gang flush-mount devices.
- B. Faceplates shall have 2, 4, or 6 ports, and shall include required accessories, such as icons, blank inserts, label windows and labels.
- C. Color: White
- D. Manufacturer:
 - 1. Leviton "QuickPort" Type, with label windows
 - a. #42080-2WS; "QuickPort" faceplate, 1-gang, 2 ports, white
 - b. #42080-4WS; "QuickPort" faceplate, 1-gang, 4 ports, white
 - c. #42080-6WS; "QuickPort" faceplate, 1-gang, 6 ports, white

2.5 WORK AREA OUTLETS – FACEPLATES FOR WALL PHONE OUTLETS

- A. Application: Faceplates shall be suitable for indoor installation for standard 1-gang flush-mount device equipped with 1 modular jack and two mounting studs for standard wall-mount telephones.
- B. Faceplates shall include required accessories, such as icons, blank inserts, label windows and labels.
- C. Color: Finish shall be stainless steel.
- D. Manufacturer:
 - 1. Leviton
 - a. #4108W-1SP; wall phone faceplate, stainless steel, recessed port
 - b. #4108W-0SP; wall phone faceplate, stainless steel

2.6 SURFACE MOUNT BACK BOXES – INDOOR

- A. Application: Surface mount back boxes shall be suitable for indoor installation for surface mounting to support an outlet or device.
- B. Color: White
- C. Manufacturer, or equal:
 - 1. Leviton
 - a. #42777-1WA; surface mount back box, 1 gang, 1.89"D, white
 - b. #42777-2WA; surface mount back box, 2 gang, 1.89"D, white

2.7 CONNECTOR ADAPTERS AND BRACKETS

A. Drop Wire Jack/Box Bracket

1. Application: Brackets shall retain and hold in place connectors and attach to a drop wire, such as within a ceiling space; brackets shall be fully compatible with the connectors/connector accessories specified herein.
2. Manufacturer, or equal:
 - a. Leviton
 - 1) #49223-CBC; QuickPort bracket with clip for drop wire, galvanized
 - 2) #49223-W10; Plenum Rated In-Ceiling Bracket

B. In-Box Jack Bracket

1. Application: Brackets shall retain and hold in place connectors within a back box; brackets shall be fully compatible with the connectors/connector accessories specified herein and with a standard gang ring.
2. Manufacturer, or equal:
 - a. Leviton
 - 1) #49223-BA5; QuickPort in-wall / in-box bracket, galvanized

C. Adapters for Poke-Thru Devices

1. Application: Adapters shall retain and hold in place connectors within a poke-thru floor device; adapters shall be fully compatible with both the poke-thru floor device and the connectors/connector accessories specified herein. An example use is a termination configuration serving a wireless access point (Wi-Fi WAP).
2. Manufacturer, or equal:
 - a. Wiremold
 - 1) #CM2-U2KEYA-WH; bezel adapter, accepts 2 keystone mount connectors, white

2.8 FACEPLATES FOR FURNITURE FEEDS

- A. Application: Suitable for indoor installation for standard 1-gang flush-mount device box with round opening allowing cables to freely exit (towards furniture system entry).
- B. Color: White
- C. Manufacturer, or equal:
 1. Leviton
 - a. #80704-W; faceplate with 1.4" round opening, white

2.9 LABELS

- A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.
- B. Labels shall be permanent, unless otherwise noted.

C. Cable and Wire Labels

1. Labels for cables and wires shall be either of the following types:
 - a. Tape – adhesive-backed, wrap-around, self-laminating
 - b. Strip – adhesive backed, under shrink-wrap
2. Face stock (print area) shall be white.
3. Size: as needed per cable size/diameter and to fit the full identifier (at least 1" wide).
4. Manufacturer, or equal:
 - a. Brady
 - b. Brother
 - c. DYMO XTL or Rhino
 - d. Panduit
 - 1) #S100X125YAJ; self-laminating cable label, white face stock (1"W x 0.38"W), for cable diameters 0.12"-0.28"
 - 2) #S100X150YAJ; self-laminating cable label, white face stock (1"W x 0.5"W), for cable diameters 0.16"-0.32"
 - 3) #S100X225YAJ; self-laminating cable label, white face stock (1"W x 0.75"W), for cable diameters 0.24"-0.48"

D. Patch Panel Labels

1. Application: For patch panels that do not have an integrated labeling feature and do not come packaged with labeling parts.
2. Patch panel labels shall be adhesive backed, and shall fit within the area suitable for labeling the ports on the panel.
3. Face stock (print area) shall be white.
4. Size: as needed.
5. Manufacturer, or equal:
 - a. Brady
 - b. Brother
 - c. DYMO XTL or Rhino
 - d. Panduit
 - 1) #C061X030FJJ; component label, laser/inkjet print, white face stock, 0.61"W x 0.3"H
 - 2) #C125X030FJJ; component label, laser/inkjet print, white face stock, 1.25"W x 0.3"H
 - 3) #C150X030Y1J; component label, laser/inkjet print, white face stock, 1.50"W x 0.3"H
 - 4) #C188X030FJJ; component label, laser/inkjet print, white face stock, 1.88"W x 0.3"H
 - 5) #C252X030FJJ; component label, laser/inkjet print, white face stock, 2.52"W x 0.3"H

E. Faceplate Labels

1. Application: For faceplates that do not have an integrated labeling feature and do not come packaged with labeling parts.

2. Labels for faceplates shall be adhesive backed, and shall fit within the area for labeling the faceplate.
3. Face stock (print area) shall be white.
4. Size: as needed.
5. Manufacturer, or equal:
 - a. Brady
 - b. Brother
 - c. DYMO XTL or Rhino
 - d. Panduit
 - 1) #C061X030FJJ; component label, laser/inkjet print, white face stock, 0.61"W x 0.3"H
 - 2) #C125X030FJJ; component label, laser/inkjet print, white face stock, 1.25"W x 0.3"H
 - 3) #C150X030Y1J; component label, laser/inkjet print, white face stock, 1.50"W x 0.3"H
 - 4) #C188X030FJJ; component label, laser/inkjet print, white face stock, 1.88"W x 0.3"H
 - 5) #C252X030FJJ; component label, laser/inkjet print, white face stock, 2.52"W x 0.3"H

F. Faceplate Port Labels

1. Application: For faceplates that do not have an integrated port identifying feature.
2. Labels for ports of faceplates shall be adhesive backed, and shall fit within the area suitable for applying a label per port on the faceplate.
3. Face stock (print area) shall be white.
4. Size: as needed.

G. Surface Outlet Labels

1. Application: For surface outlets that do not have an integrated labeling feature and do not come packaged with labeling parts.
2. Labels for surface mount outlets shall be adhesive backed, and shall fit within the area for labeling the outlet box and for labeling ports of the outlet box.
3. Face stock (print area) shall be white.
4. Size: as needed.
5. Manufacturer, or equal:
 - a. Brady
 - b. Brother
 - c. DYMO XTL or Rhino
 - d. Panduit
 - 1) #C061X030FJJ; component label, laser/inkjet print, white face stock, 0.61"W x 0.3"H
 - 2) #C125X030FJJ; component label, laser/inkjet print, white face stock, 1.25"W x 0.3"H

- 3) #C150X030Y1J; component label, laser/inkjet print, white face stock, 1.50"W x 0.3"H
- 4) #C188X030FJJ; component label, laser/inkjet print, white face stock, 1.88"W x 0.3"H
- 5) #C252X030FJJ; component label, laser/inkjet print, white face stock, 2.52"W x 0.3"H

2.10 MISCELLANEOUS COMPONENTS

A. Loom Tubing

1. Application: manage and protect cables from feed point to furniture system, or similar
2. Manufacturer, or equal:
 - a. Panduit
 - 1) #CLT100F-C20; split corrugated loom tubing (polyethylene), 0.91" ID, black
 - 2) #CLT125F-L20; split corrugated loom tubing (polyethylene), 1.28" ID, black
 - 3) #CLT150F-T20; split corrugated loom tubing (polyethylene), 1.58" ID, black
 - 4) #CLT188F-C20; split corrugated loom tubing (polyethylene), 1.85" ID, black

B. Velcro Cable Ties

1. Width: .75".
2. Manufacturer, or equal:
 - a. Panduit "Tak-Ty" series cable ties
 - b. Panduit
 - 1) #HLS-15R0; black, 15' roll, cut to length

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of section 270000.

3.2 EXAMINATION AND PREPARATION

- A. Rooms: Prior to installation, verify equipment rooms are suitable to accept the horizontal cables and terminations.
- B. Pathways: Prior to installation verify that pathways and supporting devices, provided under other sections, are properly and completely installed (at least the portions into which cables will be placed), and that temporary supports, devices, etc., have been removed. Cable tray shall be complete prior to placing cables within them, per CEC (at least the portions into which cables will be placed). Verify dimensions of pathways, including length (for example, "True Tape" the conduits) to ensure that the resulting cable lengths will not exceed the maximum allowable length specified herein.

- C. Cable Integrity: Prior to installation, verify the cable's integrity – both sheath and conductors. Documentation of pre-installation testing is not a close out requirement, and is the responsibility of the Contractor.

3.3 INSTALLATION

A. Cable Installation and Routing

1. No cable length shall violate the requirements stated in "System Description".
2. Cables shall have continuous sheath continuity. Splices are not permitted anywhere.
3. Install cables within the cable manufacturer's published installation temperature range.
4. Place cables within designated pathways, such as cable tray, cable hangers, etc. Do not fasten (such as with cable ties) or attach cables to other building infrastructure (such as ducts, pipes, conduits, etc.), other systems (such as ceiling support wires, wall studs, etc.), or to the outside of conduits, cable trays, or other non-approved pathway systems.
5. Place and suspend cables during installation and termination in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables damaged during installation or termination.
6. In general, route cables at 90-degree angles, along corridors (for improved maintenance and access).
7. Do not bend cables tighter than 2 inches during and after installation.
8. Do not exceed manufacturer's limits for pulling tension.
9. Do not use cable-pulling compounds / pulling lubricants for indoor installations.
10. Route cables under building infrastructure (such as ducts, pipes, conduits, etc.) – to result in easy accessibility to the cables for future maintenance.
11. Place cables at least 6 inches away from power sources – to reduce interference from EMI.
12. Neatly dress and organize cables using designated cable routing facilities, and fasten to support devices via Velcro-type straps.
13. When exiting primary pathways (such as cable tray) to the work area, exit via the top of the pathway.
14. Cable Ties: Install cables ties, where allowed, tight enough to keep cables organized/managed but loose enough to be moved about the cables/cable bundles. Cable ties shall not deform or cinch cables too tightly. Tie installed too tightly per the Engineer's opinion shall be subject to removal upon direction from the Engineer.

B. Cable Routing and Dressing within the TR

1. Place cables within the overhead cable support. When routing vertically, fasten the cables onto vertical cable support approximately every 24 inches using approved cable fastening means.
2. At the rack bay, route cables within the back of the vertical management sections (do not route cables into the front as this space is reserved for patch cords only). Divide the cables equally between both sides of an equipment rack such that a cable does not travel past the midpoint of the rack prior to termination. Dress and cut cables to length required to reach the designated termination point (maintaining bend restrictions) with no excess cable slack left in the horizontal cable manager (if used) and vertical management section.
3. Do not provide slack within the TR.

C. Termination in the TR

1. Install and assemble termination apparatus, accessories and associated management apparatus according to the manufacturer's instructions.
2. Properly strain relieve cables at termination points per manufacturer's instructions.

3. For OSP cables, apply sealant (such as B-sealant) where the pairs exit the cable jacket to seal the end of the cable and prevent water-blocking gel from leaking from the cable's sheath.
 4. Terminate cables and twisted pairs in accordance with manufacturer's latest installation requirements and TIA-568 series standard installation practices. Terminate cable pairs onto the termination apparatus. Terminate twisted pairs compliant to TIA-568 series standards and wired per 1.04 System Description.
 5. Patch Panels and Horizontal Management Panels
 - a. Quantity: Provide patch panels to support termination of cables. Provide horizontal management panels based on the quantity of patch panels.
 - b. Install and assemble discrete port patch panels and horizontal management panels according to the manufacturer's instructions.
 - c. Install the patch panels and the horizontal management panels as shown on the contract drawings. If configuration is not shown, install the patch panels in association with the horizontal management panels such that a management panel is mounted above and below given patch panel.
 6. Termination Sequence
 - a. Terminate the cables in sequential order using the link's identifier starting at the top left and completing a panel before moving to the next panel below.
- D. Cable Routing and Dressing at the Work Areas
1. Leave 2-4 feet sheathed cable slack (20 feet for WAPs and SEC WAPs) – length not to exceed permanent link maximum length requirement. Store slack within ceiling space neatly on a cable hanger.
 2. Routing to Type "B" Furniture-Mount Faceplates
 - a. While placing cables into furniture, exercise caution to prevent scraping, cutting, or other damage to cable's jacket.
 - b. Provide spiral wrap around cables from furniture-feed pathway (such as a wall feed to the point where cables enter furniture).
- E. Termination at the Work Areas
1. Mount faceplates plumb, square, and at the same level as adjacent device faceplates.
 2. Patch gaps around faceplates so that faceplate covers the entire opening.
 3. Terminate cables and twisted pairs in accordance with manufacturer's latest installation requirements and TIA-568 series standard installation practices and wired per 1.04 System Description.
- F. Perform post-installation testing as described in the Telecommunication Testing specification (refer to section 270811). Replace permanent links (cables, terminations and connectors) not passing the required tests.
- 3.4 LABELING
- A. General Requirements
1. Labeling, identifier assignment, and label colors shall conform to the TIA-606 standard and as approved by the Owner before installation.
 2. Label text shall be machine-generated; hand written labels will not be accepted.
- B. Label Formats and Text Attributes
1. Horizontal Cable Labels
 - a. Labels for cables shall be wrap-around self-laminating type.
 - b. Labels shall be permanent.

- c. Text Attributes: color: black; size: approx. 1/8" high (#12 font size).
- 2. Termination Field \ Patch Panel Labels
 - a. Labels for cables shall be adhesive-backed polyester (or similar) type.
 - b. Label color shall be white.
 - c. Text Attributes: color: black; size: approx. .35" high
- 3. Termination Field \ Termination Block Labels
 - a. Use labels included in the block kit packaging. Any deviation from this requirement must be approved in writing by the Owner
 - b. Label color shall be white.
 - c. Text Attributes: color: black; size: approx. .50" high.
- 4. Outlet Labels
 - a. Labels for cables shall be adhesive-backed polyester (or similar) type.
 - b. Label color shall be white.
 - c. Text Attributes: color: black; size: approx. .35" high.
- 5. Outlet Port Labels
 - a. (These labels are in the case that the faceplate/surface outlet does not have port numbers stenciled or molded into the product.)
 - b. Labels for cables shall be adhesive-backed polyester (or similar) type.
 - c. Label color shall be white.
 - d. Text Attributes: color: black; size: approx. .35" high.

C. Identifier System

- 1. General: Separate fields of the identifier with a hyphen.
- 2. Individual Ports at Patch Panels
 - a. First field: the end user room number; for example: "D107".
 - b. Second field: outlet port number, for example "D1".
 - c. Example: "D107-D1"
- 3. Outlets (Faceplates, Surface Outlets, etc.)
 - a. First field: the originating BDF/IDF room number; for example: "AD1.1".
 - b. Second field: the destination room number; for example: "D107".
 - c. Third field: a unique sequential number; for example: "01".
 - d. Example: "AD1.1-D107-01"
- 4. Individual Ports at the Outlets
 - a. The specified faceplate has individual port numbers molded into the product. However, if a substitution is accepted that does not have port numbers, provide port labels as follows.
 - b. First field: the cables intended service type followed by a unique sequential number, for example "D1".
- 5. Horizontal Cables
 - a. First field: the originating BDF/IDF room identity; for example: "AD1.1".
 - b. Second field: the destination room number; for example: "D107".
 - c. Third field: a unique sequential outlet number, for example "01".
 - d. Fourth field: a unique port number, for example "D1".
 - e. Fifth field: the cable type; for example: "CAT6A"
 - f. Example: "AD1.1-D107-01-D1-CAT6A"

D. Label Installation

- 1. Horizontal Cable Labels
 - a. Install labels on both ends of cables no more than 4" from the edge of the cable jacket.
 - b. Install labels such that they are visible during normal maintenance.
- 2. Termination Group\Patch panel ports
 - a. Install labels on the front and on left side.

- b. Install labels such that they are visible during normal maintenance.
- 3. Termination Port\Patch panel ports
 - a. If the patch panel does not have individual port numbers stenciled on the product, then install port labels at each port – above the top row and below the bottom row.
- 4. Outlet Labels
 - a. Install label in the top label window. Leave the bottom label window blank.
- 5. Outlet Port Labels
 - a. If the outlet does not have individual port numbers stenciled or molded into the product, then install port labels at each port – either to the sides (preferred) or above the top row and below the bottom row.

3.5 FINAL INSPECTION AND CERTIFICATION

- A. Punch the work of this section compliant to the requirements of section 270000.
- B. Remove cables and replace with new without impact to cost and schedule those failing to meet the indicated standards and not passing the testing requirements of section 270811. The Owner will not accept the installation until testing has indicated a 100% availability of cables and conductors. Any deviation from this requirement must be approved in writing by the Owner.
- C. Comply with system acceptance and certification requirements of section 270000.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 272133

WIRELESS ACCESS POINTS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Wireless network access system supporting multiple wireless services and consisting of access points/radios, switches, controllers, etc. – herein “System”.
- B. Base Bid Work
 - 1. Provide, whether specifically mentioned herein or not, equipment, materials, labor, on-site and remote project management, tools, transportation, storage, temporary protection, insurance, bonds, permits, taxes, software, licenses, integration, inspections, testing, training, warranties required for a complete, balanced and fully operational System. This specification and the associated drawings list major equipment but not every wire, connector, bracket, support, etc., needed to complete the work in a functional and professional manner. Coordinate the work of this section through the General Contractor with other trades.
 - 2. In general, the base bid work includes the following:
 - a. Project management
 - b. Wireless access points, including installation accessories (clips, brackets, hangers, etc.)
 - c. External antennas
 - d. External antenna cable extensions
 - e. In-line lightning arrestors (for exterior antenna connections)
 - f. Installation of patch cords for WAPs
 - g. Coordinate deployment with the construction team
 - h. Coordinate deployment and integration with the network integrator
 - i. Coordinate deployment and integration with the Owner
 - j. Coordinate integration with voice system integrator
 - k. Installation and system balancing
 - l. System acceptance testing and turn over to the Owner
 - 3. As requested by the Inspector of Record (IOR), produce and submit supporting, anchoring, and fastening details that demonstrate compliance with project requirements.
 - 4. Coordination requirements
 - a. Coordinate with the construction team at large to ensure equipment is installed properly, and that there will be no compromises due to, among other aspects, spatial conflicts or mounting incompatibilities.
 - b. Coordinate with the telecom contractor and other trades/contractors (as needed) the cabling to support WAPs and the patch cords.
 - c. Coordinate with the telecom contractor (or Owner) for locations within racks for installing equipment”
 - d. Coordinate with the Owner (or Owner’s network provider) for network configurations and/or settings required for the System’s proper or correct operation.
- C. Products furnished but not installed under this section
 - 1. None
- D. Products installed but not furnished under this section
 - 1. Network patch cords

- E. Work Provided Under Other Sections
 - 1. Communications cabling (cabling from telecommunications rooms to WAPs)
 - 2. Communications rooms, including equipment support/racks, power, cooling, and grounding
 - 3. Patch cords

- F. Related Sections: Review other sections and divisions; determine the extent and character of related work. Coordinate the work of this section with, but not limited to, the following:
 - 1. Comply with the Related Sections requirements of section 270000
 - 2. Section 271513, "Communications Horizontal Twisted Pair Cabling"

1.2 REFERENCES

- A. Comply with the References requirements of section 270000.

- B. In addition to the codes and standards listed in section 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. Federal Communications Commission (FCC) Title 47 of the Code of Federal Regulations (CFR):
 - a. Part 15, "Radio Frequency Devices"
 - b. Part 24, "Personal Communications Services"
 - c. Part 27, "Miscellaneous Wireless Communications Services"

1.3 DEFINITIONS

- A. Definitions as described in section 270000 shall apply to this section.

- B. In addition to those definitions of section 270000, the following list of terms as used in this specification are defined as follows:
 - 1. "802.11a": Wireless networking using 5 GHz frequency spectrum
 - 2. "802.11b/g": Wireless networking using 2.4 GHz frequency spectrum
 - 3. "802.11a/b/g/n": Wireless networking using both 2.4 GHz and 5 GHz spectrums
 - 4. "802.11ac": Wireless networking Wave-1 and Wave-2 using 5 GHz frequency spectrum
 - 5. "AP": access point
 - 6. "AWS": Advanced wireless services
 - 7. "BIM": Building Information Model
 - 8. "IOR": Inspector of Record
 - 9. "LAN": Local area network
 - 10. "LBS": Location based services
 - 11. "PCS": Personal communications service
 - 12. "RF": Radio frequency
 - 13. "RFID": Radio frequency identification
 - 14. "RSSI": Received signal strength indication
 - 15. "RTLS": Real time location services
 - 16. "WAP": Wireless Access Point (also, "AP")
 - 17. "Wi-Fi": Wireless Fidelity (synonymous with "System")
 - 18. "WVoIP": Wireless VoIP

1.4 SYSTEM DESCRIPTION

- A. The System shall reliably provide Wi-Fi wireless services and those wireless services listed under "Wireless Services" throughout designated spaces listed under "Wireless Coverage"

Areas” at minimum signal levels listed under “Signal Strength”. The System shall be implemented with proven and the most current technology that can seamlessly integrate with the rapid evolution of wireless technologies and business applications.

- B. The System shall comply with FCC requirements.
- C. Frequency Ranges: The System’s radios shall operate at the 2.4 GHz and 5 GHz frequency spectra compatible with IEEE 802.11a/b/g/n/ac standards.
- D. Wireless Services: The System shall be able to simultaneously support the wireless services the Engineer’s Predictive Wireless Report and the following wireless services, applications, and/or technologies:
 - 1. 802.11a/b/g/n (2.4 and 5.8 Ghz) / Wi-Fi – data
 - 2. 802.11ac (Wave-2)
 - 3. WVoIP phone handsets that use 802.11a/b/g/n
- E. Wireless Coverage Areas: The System shall provide RF coverage at levels meeting or exceeding performance criteria the Engineer’s Predictive Wireless Report and throughout the areas of the building(s) as outlined as follows:
 - 1. Floor areas – accessible and usable
 - 2. Stairwells (signal bleed from adjacent areas)
 - 3. Elevators (signal bleed from adjacent areas)
 - 4. General use spaces (lobbies, corridors, restrooms, etc.)
 - 5. Staff use spaces (offices, work rooms, etc.)
 - 6. Restrooms
 - 7. MEP and other building facility rooms
 - 8. Exterior public spaces such as Terrace on Level 2
- F. Signal Strength: The System shall deliver signal at the following levels (measure signal strength using an industry-standard tool such as AirMagnet or Ekahau calibrated test equipment or equal):
 - 1. Wi-Fi -85 dBm or stronger within 100% of the specified coverage areas for all systems, services, applications, and/or technologies.
 - 2. Wi-Fi -65 dBm or stronger within 90% of the wireless coverage areas for Wi-Fi signals with an RSSI without creating undesirable side-effects such as co-channel interference.
- G. The System shall have the capability for separate control over each frequency (aka channels) to allow the ability to adjust and control power levels without disturbing other services.
- H. The System shall support multiple services in a modular architecture so services can be added or removed without requiring new infrastructure, without readjustment of signal power levels, or disturbing existing services.
- I. The System shall enable services to be added without requiring additional cable plant or antenna systems.
- J. The System shall not impede any management features or functionality of any attached network and/or device management system. The System shall allow for proactive management and end-to-end alarming of active electronics. The System shall be able to engage with 3rd party SNMP-based element management systems and provide fault management information.
- K. The System shall have the ability to locate wireless 802.11 rogue WAPs, clients, and other 802.11a/b/g/n devices within the defined coverage areas.

- L. The System shall not have co-channel interference stronger than -85dBm within 90% of the specified wireless coverage areas.
- M. The System shall support the following IEEE 802.11n-2008 standards: Multiple Input Multiple Output (MIMO), 40 MHz channel bonding, and Modulation, Coding Scheme (MCS) values 0 through 15.
- N. The System shall provide sufficient capacity to support a minimum of 12 wireless clients per WAP radio throughout the specified coverage areas for Wi-Fi.
- O. The System shall provide sufficient multiple WAP signal strength within coverage areas for VoIP.
- P. The System shall support Wi-Fi management applications and advanced WAP features provided by the selected WAP manufacturer.
- Q. To maintain performance as usage increases, the System shall have dynamic mechanisms for adding WAP capacity and segmenting the Wi-Fi coverage into smaller areas.
- R. The System shall maintain a balanced link budget with the downlink (WAP-to-client device) limited to match an assumed uplink (client device-to-WAP) signal strength of 35mW.
- S. The System shall leverage Auto Cell / ARM / RRM features for channel and power level control.

1.5 SUBMITTALS

- A. Comply with Submittal procedural, quantity, and format requirements of section 270000.
- B. Submittal Requirements Prior to Start of Construction:
 - 1. Product Data Submittal
- C. Submittal Requirements Prior to Acceptance Testing:
 - 1. Submit a spreadsheet listing the installed System equipment, including location, serial number, MAC address, IP address, and switch port.
 - 2. Acceptance Testing Procedures Submittal: Submit procedures (describing in detail) for testing system performance and balancing signal strength, including a description of the test data (or an example of the test report).
- D. Submittal Requirements at Close Out:
 - 1. Operations and Maintenance (O&M) manual
 - 2. Inventory in spreadsheet format that includes serial numbers, MACs, locations and labels
- E. Substitutions
 - 1. Conform requests for substitutions to the general requirements and procedure outlined in section 270000.

1.6 QUALITY ASSURANCE

- A. Comply with Quality Assurance requirements of section 270000.
- B. Manufacturer Qualifications: The manufacturer(s) shall demonstrate that a quality assurance program is in place to assure that the specifications are met.

- C. Contractor Qualifications:
 - 1. The Contractor shall be certified by the manufacturer to install the proposed and submitted system.
 - 2. The Contractor shall be certified by the manufacturer to warrant the System.
 - 3. Submit satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the proposal.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage and Handling requirements of section 270000.

1.8 WARRANTY

- A. Warrant the System for the period as noted in Division 1>.
- B. Warrant the System to perform as described within this section under normal use and service, including installed hardware, programming, signal balancing, etc., to be free of defects and faulty workmanship during the warranty period. Keep the System in operating condition at no additional material or labor costs to the County during the warranty period.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Cisco – matching district preferred Catalyst 91xx models

2.2 WAP ENCLOSURES

- A. Manufacturers, or equal:
 - 1. Oberon
 - 2. Terra-Wave

2.3 IN-LINE LIGHTNING ARRESTORS

- A. Application: for use with cabling links to outdoor locations
- B. Manufacturers, or equal:
 - 1. Cisco AIR-ACC245LA-R Aironet lightning arrester for RP-TNC connectors
 - 2. Cisco AIR-ACC245LA-N lightning arrester for N-type connectors

2.4 SUBSTITUTIONS

- A. Comply with the Substitution requirements of section 270000.

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of section 270000.
- B. Project Management Services: Assign a single-point-of-contact (“PM”) to this project with overall responsibility for communications and, ultimately, delivery of the work (equipment, installation, performance criteria, and services). This PM shall be responsible for interfacing with the owner, engineer, general contractor, trade contractors, and their own subcontractors. The PM shall present the design iterations to the owner, coordinate cable routes with the engineer, coordinate on-site construction activities with the general contractor, oversee installation of materials and equipment, coordinate integration of the wireless network into the overall network, integrate wireless services onto the wireless network, and close out the project with the owner.

3.2 INSTALLATION

- A. Examination and Preparation: Prior to the start of installation, examine communications rooms, pathways, and cabling (specifically serving WAPs) for completeness, compatibility with the work/equipment of this section, and readiness for connections with the work/equipment of this section.
- B. Coordinate the installation and schedule with other disciplines (such as telecom cabling, ceiling activities, network, etc.).
- C. Mount WAPs at each location shown in drawings. Adapt the exact location and installation method to best suit each instance.
- D. Mount external antenna at each location shown on the approved shop drawings or narrative. Install antenna cable extensions where needed that meet manufactures specifications and recommendations. Install in-line lightening arrestors for exterior antenna at the earliest opportunity upon entering the building.
- E. Cabling Patching
 - 1. Connect WAPs to designated telecom outlets. Use appropriate length patch cord as per Section 271513 and Telecom Outlet Schedule.
 - 2. Within the telecom rom, connect links/patch panel ports (to WAPs) to designated LAN ports. Use appropriate length patch cord as per Section 271513 and Telecom Outlet Schedule.
- F. Coordinate with the network integrator the integration of 802.11 wireless services, such as wireless LAN access points. Coordinate with the network integrator and owner to ensure access control and authentication is enabled and functional.
- G. Change default passwords in accordance with manufacturer’s recommendations and owner’s direction.
- H. Install latest security patches in accordance with manufacturer and owner recommendations.
- I. Disable unused communication ports, protocols and access accounts in accordance with manufacturer and owner recommendations.

- J. Provide equipment and components required to support the wireless services and to make adjustments to the System necessary for full operation.
- K. System Balancing: Balance system component (e.g., antenna) signal strength to the device signal levels.
- L. Assist with other technology systems needing Wi-Fi integration. This may include but not limited to support help with Wi-Fi base security, AV, BMS, digital signage devices, etc.

3.3 LABELING

- A. Permanently label equipment, components, and patch cords.
- B. Labeling, identifier assignment, and label colors shall conform to the ANSI/TIA-606-C standard, and shall meet the Engineer's and/or Owner's approval.
- C. Submit a labeling plan to the Engineer for approval prior to labeling work.
- D. Label Format
 - 1. Labels shall be permanent.
 - 2. Label text shall be machine-generated; hand written labels will not be accepted.
 - 3. Labels on cables and cords shall fully wrap around cable jacket with a self-laminating feature.
- E. Label Placement:
 - 1. Equipment and WAPs: Affix label onto equipment and WAPs so that it is visible in whole by a technician in a normal stance and does not cover any accessible component (such as attachment screw, etc.).
 - 2. Cables and Cords: Affix label as close as practical to each end of cables and cords.

3.4 FINAL INSPECTION, SYSTEM ACCEPTANCE TESTING AND TURN OVER

- A. Complete the acceptance testing as described in the accepted Testing Procedures submittal. Comply with system acceptance and certification requirements of section 270000.
- B. Punch the work of this Section compliant to the requirements of section 270000.
- C. Present the completed system and wireless services to the owner and Engineer, and demonstrate operation, functionality, features, and signal strength (at select locations) – essentially, demonstrate the System and desired services have been successfully deployed and tested.
- D. Turn over 1 set of electronic records and 1 set of printed records.

3.5 OWNER TRAINING

- A. Provide a minimum of 4 hours of training at the project site (or other location designated by the Owner) by a qualified instructor (equipment manufacturer as needed) covering operation and maintenance of the System. Training shall include (at a minimum): design, equipment, configuration, wireless settings and configurations, ongoing maintenance, and warranty procedures.

- B. Comply with training requirements of section 270000.

3.6 EXTENDED SUPPORT SERVICES

- A. Provide cost for additional service levels beyond the warranty period as follows:
 - 1. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and same-day issue response
 - 2. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and 24-hour issue response
 - 3. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and 48-hour issue response

END OF SECTION

SECTION 274116

INTEGRATED AUDIOVISUAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Audiovisual systems – presentation systems, conference systems, distributed audio systems distributed video systems, control systems, and interface with other systems. Refer to article 1.4 “System Description” for more information.
- B. Base Bid Work
1. Provide equipment and materials, whether specifically mentioned herein or not, needed for a complete and operating audiovisual systems to satisfy the requirements of this section and related drawings. This specification lists major equipment but not every wire, connector, extender, converter, fastener, etc., needed to complete the work.
 2. Equipment racks or enclosures:
 - a. Plenum enclosures: Provide plenum-rated equipment enclosures, including frame, side panels, top panels, access doors, anchorage and seismic bracing, integrated power outlets and cooling provisions as required.
 - b. Provide standard or custom accessories and mount adapters for equipment installed in equipment racks or enclosures as needed to properly mount equipment, power supplies, accessories, components, and the like. Provide cable management to properly route and mind wires, cables, and cords.
 - c. Provide power receptacle strips in quantities needed to supply power to the equipment within the rack.
 - d. Provide spare rack mounting screws. Determine based on rack mount units (RUs) – 1 spare screw per 2 RU installed, minimum.
 - e. Provide bonding for racks, cabinets, equipment, equipment support and cable/wire management to an approved grounding point.
 3. Cooling provisions
 - a. Provide cooling provisions (means to move heat out of enclosed spaces to prevent temperatures from exceeding equipment manufacturer’s specified maximums). Ensure equipment operates within manufacturer’s cooling guidelines. Provide only code-compliant cooling provisions (e.g., exhausting from one space to another).
 - b. In racks, enclosures, millwork, cabinets, and other spaces where equipment will be installed and prone to heat buildup, provide thermostatically-controlled active cooling devices to create adequate airflow through the enclosed space. Examples of active cooling devices include vent fans. At a minimum, ensure airflow by installing active cooling devices or systems such as fans.
 4. Provide power controllers (such as an IP power strip connected to the network or controllable through the room control system) to devices that cannot inherently be remotely controlled for power cycling. Verify functional operation for specified control operations.
 5. Provide audio transformers, whether or not explicitly shown on the drawings, with appropriate impedance ratios and power handling capacities as required for the intended function of the System.
 6. Provide networks and pads, whether or not explicitly shown on the drawings, as required to achieve proper impedance matching and levels. Provide networks and pads that are balanced and constructed from 0.5 watt, 5% resistors, soldered to fixed connection points at each end.

7. Labeling: Provide labeling for audiovisual system components. The components include, but are not limited to, the following:
 - a. Equipment racks and equipment enclosures
 - b. Rack-mounted equipment and devices: Provide a label on the back of each piece of equipment. If a serial number (of a given piece of equipment) is not visible in a final installed condition, provide a label on the equipment on a visible location duplicating the serial number.
 - c. Wall-mounted equipment and devices: Provide an equipment label on the back of each piece of equipment. If a serial number (of a given piece of equipment) is not visible in a final installed condition, provide a label on the equipment on a visible location duplicating the serial number.
 - d. Provide an equipment plate for each piece of equipment.
 - e. Provide a label for each control that is not inherently labeled, such as those in racks and user spaces.
 - f. Wires and cables: Provide a cable label at each end of each piece of wire, cable and cord.
 - g. Terminal blocks, patch panels, and other termination apparatus: Provide a label on each termination block, piece of termination apparatus and termination position on patch panels.
 - h. Handheld, lavalier, wireless, and other microphones and associated equipment (such as receivers)
 - i. User interface devices/plates
 8. Coordination Requirements
 - a. Coordinate with the construction team at large to ensure that equipment and other system components will be installed properly, and that there will be no compromises due to, among other aspects, spatial conflicts or power service incompatibilities.
 - b. Coordinate with the electrical contractor for power requirements and service connection to the System's equipment.
 - c. Coordinate with the telecom contractor and other trades/contractors (as needed) placement of cables and wires when sharing pathways (such as cable tray) with other low voltage systems. Do not place cables and wires into pathways provided by others without permission.
 - d. Coordinate with the telecom contractor (or Owner) for locations within racks for installing equipment"
 - e. Coordinate with the Owner (or Owner's network provider) for network configurations and/or settings required for the System's proper or correct operation.
- C. Related Divisions and Sections: Consult other divisions, determine the extent and character of related work. Coordinate the work of this section with, at least but not limited to, the following divisions and sections:
1. Division 0 (for Bidding Requirements, Contract Forms, and Conditions of Contract) and Division 1 (for General Requirements) – provisions listed or specified therein apply to work under this section.
 2. Section 270000, "Communications Basic Requirements"
 3. Division 26, "Electrical Systems"
 4. Division 23, "Heating, Ventilating, and Air Conditioning Systems"
 5. Section 271513, "Communications Horizontal Cabling"
 6. Section 270811, "Communications Twisted Pair Testing"
 7. Section 270821, "Communications Fiber Optic Testing"
- D. Products Installed but not Furnished Under this Section
1. Owner-furnished equipment
 2. Network patch cords

- E. Products Furnished and Installed Under Another Section
 - 1. Rough-in (device boxes, conduits, and related accessories)
 - 2. Electrical service (e.g., 120 VAC); refer to division 26
 - 3. Telecommunication cabling; refer to section 271513
 - 4. Telecommunication pathways; refer to section 270528.
 - 5. Network switches, with Power over Ethernet (PoE)

1.2 REFERENCES

- A. Comply with the References requirements of section 270000.
- B. In addition to the references listed in section 270000, perform work in accordance with applicable requirements of governing codes, rules and regulations including the following minimum standards, whether statutory or not:
 - 1. National Fire Protection Agency (NFPA)
 - a. NFPA 262, "Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces"
 - 2. Underwriters Laboratories (UL)
 - a. UL 969, "Marking and Labeling Systems"
 - b. UL 1419, "Professional Video and Audio Equipment"
 - c. UL 60065, "Audio, Video and Similar Electronic Apparatus – Safety Requirements"
 - 3. AVIXA
 - a. A102.01, "Audio Coverage Uniformity in Listener Areas"
 - b. ANSI/AVIXA D401.01:201X "Standard Guide for AV Systems Design and Coordination Processes"
 - c. V201.01:2018, "Projected Image System Contrast Ratio"
 - d. F501 01, "Cable Labeling for Audiovisual Systems"
 - 4. "Sound Systems Engineering", 3rd Ed., Davis and Davis
 - 5. Electronic Components Industry Association (ECIA)
 - a. EIA/ECA-310, "Cabinets, Racks, Panels, and Associated Equipment"

1.3 DEFINITIONS

- A. Refer to section 270000 for definitions. The definitions of section 270000 apply to this section.
- B. In addition to those definitions of section 270000 and Division 01, the following terms used in this specification are defined as follows:
 - 1. "ACEG": alternating current equipment ground (an example of this is a ground bus within an electrical panel)
 - 2. "Approved Grounding Point": an approved grounding point is one that satisfies the applicable electrical code and provides a low impedance path to earth. Examples include the following though may manifest in different means: a telecommunications grounding busbar (such as for bonding an equipment rack within a telecom room), the ACEG of the electrical panel serving the equipment requiring bonding to ground (such as for bonding a credenza rack within a conference room), or the ground conductor of a branch circuit (such as for bonding a single piece of equipment).
 - 3. "A/R": Indicates that the quantity of an item is as required to meet the design criteria indicated in the audiovisual drawings and specifications.
 - 4. "A/S": Indicates that the quantity of an item is as shown on the drawings.
 - 5. "Audience Area": the portion of a presentation space intended to be occupied by an audience. An audience area includes the primary seating and standing spaces and may include the adjacent circulation spaces. An audience area generally excludes spaces reserved for presenters.

6. "Custom" indicates systems or components the Contractor fabricates based on these specifications and drawings
7. "EDID": Extended display identification data
8. "HDCP": High-bandwidth digital content protection
9. "HDMI": High-definition multimedia interface
10. "OFE": Owner Furnished Equipment
11. "Or equal" indicates an item that is equal in function and performance to the specified device or system
12. "RU": rack unit, as defined in EIA/ECA-310
13. "Shall" denotes a mandatory requirement
14. "Should" denotes an advisory statement
15. "SPL": sound pressure level
16. "THD": total harmonic distortion
17. "Will" denotes an informative statement
18. "Project": The scope of work defined by this specification and its related drawings
19. "Software": Any executable programs, parameter files, user interfaces, or other coded content that are required to operate, control, or maintain the audiovisual systems in this Project
20. "Custom Created Software": Any software, parameter files, user interfaces, or other coded content created for the control or operation of the audiovisual systems in this Project
21. "Third-party software:" Any programming developed by a party other than the AV Contractor and the Owner to be used to operate, control, or maintain the audiovisual systems in this Project
22. "System": The audiovisual components, cabling, and programming incorporated in the descriptions and equipment lists herein

1.4 SYSTEM DESCRIPTION AND PERFORMANCE REQUIREMENTS

- A. General
 1. In circumstances where the specifications and drawings conflict, the drawings govern quantity and the specifications govern quality.
 2. The contract drawings and specifications convey design intent. They are not intended to be used in lieu of shop drawings.
- B. ADA Compliance: Provide the following:
 1. Display of closed captioning content
 2. Accessible control systems
 3. Assistive listening systems
- C. Audio System Performance Criteria
 1. Provide echo cancellation for microphones in audio and video conferencing systems.
 2. Frequency Response:
 - a. Program audio system: 100 Hz to 12,000 Hz. 3 dB per octave roll off below 100Hz and above 12 kHz.
 - b. Distributed audio system: 125 Hz to 10,000 Hz. 3 dB per octave roll-off below 125 Hz and above 10 kHz.
 3. Total Acoustical Harmonic Distortion:
 - a. Program audio system: less than 2% at 90 dBC (1 kHz reference) at four feet (1,220 mm) above finished floor in the middle of the room.
 - b. Distributed audio system: less than 2% at 85 dBC (1 kHz reference) at four feet (1,220 mm) above finished floor in the middle of the room.
 4. Signal to noise ratio (mixer input to amplifier output): 75 dB from 50 Hz to 15 kHz minimum.

5. Frequency response with equalizers bypassed: less than ± 1 dB from 50 Hz to 12 kHz.
 6. Distortion: less than 0.5% at 1 kHz at the equipment's rated input signal level.
 7. Output levels (in audience areas without objectionable distortion, rattles, or buzzes, employing as test signals several different samples of recorded music and microphones applied at each system input):
 - a. Program audio: not less than 95 dB
 - b. Speech reinforcement: not less than 85 dB
 8. Hum and Noise: inaudible (below the background noise level of the space) under normal operation observed in audience areas.
- D. Video System Resolutions
1. System component minimum resolution: capability of 1920 X 1080.
 2. Supported resolutions: 1,280 x 720, 1,920 x 1,080, 1,920 x 1,200, 3840 X 2160, and 4096 x 2160.
- E. Wireless Systems
1. Ensure that wireless AV systems do not create radio frequency interference to other systems.
 2. Demonstrate at AV acceptance testing that wireless AV systems are not adversely affected by AV-related nor other radio frequency sources.
- F. Control Systems
1. Provide user interfaces, such as control panels, that respect ergonomics and varying levels of technical ability among users. Follow these guidelines:
 - a. Avoid abbreviations
 - b. Size lettering at 1/8" minimum
 - c. Maintain background to lettering contrast
 2. Positive logic: Avoid conditions which may cause command synchronization conflicts (i.e., alternate action (toggling) on/off without power reset or feedback. Provide power sensors or other devices where necessary to ensure that positive logic conditions are maintained.
 3. Timing: Prevent two or more commands being sent simultaneously to the same piece of equipment.
 4. Linking: Provide linking of functions to require the fewest number of user actions to effectively control the equipment.
 5. Clearing: Ensure that each media selection clears the previous audio and visual selection (e.g., selecting COMPUTER clears the audio and video section of the previous Blu-ray disk selection).
 6. Defaults: Establish default power-up conditions for the system including device audio levels, warm-up routine, power conditions, switcher status and other default conditions as required by the Owner or the Owner's representative.
 7. Volume Memory: Provide easy-to-use memory for volume settings associated with each source device. Unless directed otherwise in this document, provide programming that maintains these settings between alternate selections during each use – through power-on and power-off.
 8. Status indication: Program buttons for both touch panels and pushbutton panels to provide clear status indication using illumination when back-lighting is available or by changing color.
 9. Failsafe: Provide program that ensures that no operation or sequence of operations causes the control system to become inoperable or interferes with further processing, correct operations or execution of commands.
- G. Centralized Management Procedure
1. Provide server-based software for the management of the AV systems deployed in the facility and the District. Include the following:

- a. Help-desk functionality
- b. Enterprise-wide scheduling and monitoring
- c. Time-stamped AV systems data collection for reporting

1.5 ROOM TYPES

A. General

- 1. The audiovisual systems design and documentation in this set of contract documents are based on standard room types.
- 2. Each room to receive audiovisual systems is shown on the drawings with a type designation.
- 3. For each room, adapt the audiovisual system to best suit the architectural layout such that each room of a certain type is similar to others of its type, with minor layout differences to accommodate architecture.
- 4. Refer to the drawings for the quantities of each type of room and for specific audiovisual interface information per room.

B. Group Study Rooms

- 1. Group Study rooms include three sizes: small, medium, and large. These spaces will be used by student and faculty members for meetings and working sessions.
- 2. Provide a wall-mounted display for users to share content from personal devices. Refer to the overall floor plan drawings for the required display size for each room.
- 3. Provide hardwired, HDMI laptop connection to the display via 2.5" diameter brushed stainless grommet in the table.
- 4. Provide a soundbar in the small and medium rooms for program audio. Provide ceiling-mounted loudspeakers in the large room for program audio.
- 5. Provide an Assistive Listening System to meet Code requirements.
- 6. Provide a wall-mounted button panel for system control including on/off, volume up/down, and source selection.

C. Meeting Rooms

- 1. Meeting rooms are available for faculty member meetings and include software-based video conferencing system. These spaces will support audiovisual presentations and collaboration. Provide a scaled input to the display.
- 2. Provide a wall-mounted display for users to share content from personal devices.
- 3. Provide hardwired, HDMI laptop connection to the display via 2.5" diameter brushed stainless grommet in the table.
- 4. Provide wall-mounted camera/microphone for software-based video conferencing hosted on laptop.
- 5. Provide ceiling-mounted loudspeakers for program audio.
- 6. Provide a shared- portable RF Assistive Listening System to meet Code requirements.
- 7. Provide a wall-mounted control panel for system control including on/off, volume up/down, and source selection.

D. Office of IT Director

- 1. The Office of the IT Director is a private office with a basic AV system.
- 2. Provide a wall-mounted, annotative display for users to share content from personal devices.
- 3. Provide hardwired, HDMI laptop and USB connections to the display.

E. Classroom Type 1

- 1. This classroom will be used for lecture style sessions.
- 2. Provide projection system with short-throw projector and wall-mounted projection screen.
- 3. Provide a wall mounted equipment enclosure near wall-mounted projector

4. Provide technology connection points at the instructor lectern containing:
 - a. Connection for laptop, including HDMI with multiple adaptors for DisplayPort, and Mini DisplayPort for legacy support including audio via 2.5" diameter brushed stainless grommet in the furniture.
 - b. Document camera
 - c. Owner-furnished, all-in-one computer
5. Provide wireless sharing device
6. Provide supporting AV presentation system, including switching and amplification functions
7. Provide ceiling-mounted, pendant loudspeakers
8. Provide wireless instructor microphone
9. Provide a control system, self-contained, with push-button style panel, to control all functions of the AV systems
10. Provide a shared portable Assistive Listening System as required by Code

F. Classroom Type 2

1. This classroom type is flexible in configuration.
2. Provide two flat panel displays. Both displays will show content from the instructor input location.
3. Provide a plenum-rated ceiling equipment enclosure the display in the accessible ceiling
4. Provide two technology connection points at the wall for an instructor:
 - a. Connection for laptop, including HDMI with multiple adaptors for DisplayPort, and Mini DisplayPort for legacy support including audio
 - b. Document camera
 - c. Owner-furnished, all-in-one computer
5. Provide wireless sharing device
6. Provide supporting AV presentation system, including switching and amplification functions
7. Provide ceiling-mounted loudspeakers
8. Provide wireless instructor microphone
9. Provide a control system, self-contained, with push-button style panel, to control all functions of the AV systems
10. Provide a shared portable Assistive Listening System as required by Code

G. Classroom -Type 3

1. This classroom will be used for lecture style sessions
2. Provide short throw projection system with projector and projection screen.
3. Provide a wall mounted equipment enclosure near wall-mounted projector
4. Provide two technology connection points at the front of the room for an instructor lectern containing:
 - a. Connection for laptop, including HDMI with multiple adaptors for DisplayPort, and Mini DisplayPort for legacy support including audio via 2.5" diameter brushed stainless grommet in the furniture
 - b. Document camera
 - c. Owner-furnished, all-in-one computer
5. Provide wireless sharing device
6. Provide supporting AV presentation system, including switching and amplification functions
7. Provide ceiling-mounted loudspeakers
8. Provide wireless instructor microphone
9. Provide a control system, self-contained, with push-button style panel, to control all functions of the AV systems
10. Provide a shared portable Assistive Listening System as required by Code

H. Classroom -Type 4

1. This classroom will be used for lecture style sessions
 2. Provide projection system with projector and projection screen.
 3. Provide a ceiling mounted equipment enclosure at projector
 4. Provide two technology connection points at the front of the room for an instructor lectern containing:
 - a. Connection for laptop, including HDMI with multiple adaptors for DisplayPort, and Mini DisplayPort for legacy support including audio via 2.5" diameter brushed stainless grommet in the furniture
 - b. Document camera
 - c. Owner-furnished, all-in-one computer
 5. Provide wireless sharing device
 6. Provide supporting AV presentation system, including switching and amplification functions
 7. Provide ceiling-mounted loudspeakers
 8. Provide wireless instructor microphone
 9. Provide a control system, self-contained, with push-button style panel, to control all functions of the AV systems
 10. Provide a shared portable Assistive Listening System as required by Code
- I. Tutoring Lab
1. This classroom type is flexible in configuration
 2. Provide two flat panel displays and connection points for OFE mobile display carts at four floor locations. All displays will show the instructor's content.
 3. Provide terminated HDMI extension RJ45 connectors at four floor locations for mobile cart connections.
 4. Locate AV equipment in lectern
 5. Provide two technology connection points at the front of the room for an instructor lectern containing:
 - a. Connection for laptop, including HDMI with multiple adaptors for DisplayPort, and Mini DisplayPort for legacy support including audio via 2.5" diameter brushed stainless grommet in the furniture
 - b. Document camera
 - c. Owner-furnished, all-in-one computer
 6. Provide wireless sharing device
 7. Provide supporting AV presentation system, including switching and amplification functions
 8. Provide ceiling-mounted loudspeakers
 9. Provide wireless instructor microphone
 10. Provide a control system, self-contained, with push-button style panel, to control all functions of the AV systems
 11. Provide a shared portable Assistive Listening System as required by Code
- J. Instructional Lab
1. This classroom type is flexible in configuration
 2. Provide dual flat panels systems
 3. Provide a ceiling, plenum-rated equipment enclosure near displays in accessible ceiling
 4. Provide two technology connection points at the wall for:
 - a. Connection for laptop, including HDMI with multiple adaptors for DisplayPort, and Mini DisplayPort for legacy support including audio
 - b. Document camera
 - c. Owner-furnished, all-in-one computer
 5. Provide wireless sharing device
 6. Provide supporting AV presentation system, including switching and amplification functions
 7. Provide ceiling-mounted loudspeakers

8. Provide wireless instructor microphone
 9. Provide a control system, self-contained, with push-button style panel, to control all functions of the AV systems
 10. Provide a shared portable Assistive Listening System as required by Code
- K. Writing Center lab
1. None
- L. Library Reading Open Area
1. Library Reading area is flexible space with a single projection system (projector and projection screen).
 2. Provide projector and projection screen
 3. Provide a ceiling mounted equipment enclosure near ceiling-mounted projector
 4. Provide a technology connection point at the wall for:
 - a. Connection for laptop, including HDMI with multiple adaptors for DisplayPort, and Mini DisplayPort for legacy support including audio
 - b. Document camera
 - c. Owner-furnished, all-in-one computer
 5. Provide wireless sharing device
 6. Provide supporting AV presentation system, including switching and amplification functions
 7. Provide ceiling-mounted loudspeakers
 8. Provide wireless instructor microphone
 9. Provide a control system, self-contained, with push-button style panel, to control all functions of the AV systems
 10. Provide a shared portable Assistive Listening System as required by Code
- M. Design Suite
1. Provide infrastructure to support owner-furnished systems
- N. Room scheduling
1. Provide room scheduling device outside all AV-enabled rooms to display room reservation information and the room's occupancy status.
 2. Each room scheduler will require a single network/data drop.
 3. Integrate with Laney's calendaring system.
- O. Digital Signage
1. The digital signage software system and hardware are owner-furnished.
- P. Overhead networked audio paging system
1. Furnish an overhead audio paging system consisting of headend, network enabled equipment, ceiling loudspeakers and supporting equipment.
 2. Paging will be performed via Laney's IP phone system and 3rd floor reception paging microphone.
 - a. Physically secure paging microphones from tampering
 3. Provide ceiling mounted loudspeakers to provide uniform audio distribution coverage throughout the building.
 4. Zone the system to include the following:
 - a. Entire building
 - b. Library only
 - c. LRC only
 - d. Each floor individually
 - e. Confirm zoning requirements with Laney during wiring and programming
 5. Provide end of line modules at the end of each loudspeaker chain.
 6. Connect the audio paging system to the fire/life safety system and security system.

1.6 SUBMITTALS

- A. Comply with the Submittal requirements of section 270000.
- B. Bid Submittal: Submit bids in accordance with the project's overall bidding requirements, and include the following requirements of this section.
 1. Site visit: As possible, visit the site before submitting your bid. Coordinate site visit arrangements with the General Contractor. Include date of site visit in the bid submittal.
 2. Firm information and qualifications: Include detailed information about the firm, including but not limited to the following, in the bid:
 - a. Firm's history – how long the firm has been in business, how long the firm has offered audiovisual systems integration services, etc.
 - b. Annual revenue for the three most current years
 - c. Bonding capacity and bonding insurance agent contact information
 - d. Three successfully completed projects of similar scope within the past 24 months. For each project, include the owner/client name, contact information (person's name, position, and telephone number or email address), project location, type of systems installed, total contract amount, date completed, and services included (e.g., engineering, installation, integration, maintenance, etc.).
 - e. Industry affiliations
 - f. Advanced certifications (CTS-I/D, DMC-D/E, ACE-D//P/RMS, XTP, etc.)
 - g. Manufacturer certifications
 - h. Contractor license number for the state where the work will take place
 - i. Union affiliation(s)
 3. Personnel and Certifications: Include information on key personnel in the bid.
 - a. Include résumés and certifications for personnel who will be assigned to the project including but not limited to the Project Manager, Systems Engineer, Field Installation Supervisor, Lead Control System Programmer, and other key personnel.
 - b. Include résumé(s) of CTS-I (Certified Technology Specialist – Installation) certified personnel
 - c. Include résumé(s) of Extron Certified Professionals.
 - d. Include other relevant company-held industry, manufacturer, and educational certifications and designations for involved personnel
 4. Subcontract Information: Indicate in the bid, all subcontractors and their responsibilities and qualifications.
 5. Schedule of Values: Include a schedule of values in the bid. Break out the schedule of values into three areas – equipment costs, non-equipment costs, and service contract.
 - a. Equipment Costs: List equipment costs (each piece of equipment), including required modifications and accessories.
 - b. Non-equipment Costs: List non-equipment costs, such as the following:
 - 1) General and Administrative: shipping, insurance, and guarantees, etc.
 - 2) Fees: e-Waste/disposal, permits, etc.
 - 3) Engineering: design, drawings, run sheets, instruction manuals, etc.
 - 4) Pre-installation: fabrication, modification, assembly, rack wiring, etc.
 - 5) Installation: installation, coordination, supervision, testing, etc.
 - 6) Owner training: training session(s), manuals, etc.
 6. Alternates/Substitutions: Refer to section 270000 for alternate and substitution requirements. Submit bids based on the specified equipment. If the bid includes proposed alternates and/or substitutes, separate these from the costs of the equipment as specified and include for alternate equipment full technical information and cut sheets. Proposed alternate equipment will receive consideration if the differences between the specified and alternate/substituted equipment do not depart from the design intent and function of the system and are in the best interests of the Owner. If the inclusion of substituted equipment will result in a different connection configuration than that in the bid

documents, include drawings that illustrate how the proposed system would be connected.

7. System Enhancements: Include in the bid recommendations, if any, that will enhance the performance and/or functionality of the system or will reduce costs without loss of performance/functionality. Recommendations that are of value to the Owner will be taken into consideration in the evaluation of the bids. Make such proposed recommendations as "alternates", with the appropriate cost modifications shown separate and apart from the costs of the system "as specified".
8. Exceptions: In the bid, explain exceptions, if any, to these specifications and related drawings. In the absence of exceptions, these specifications and related drawings are binding in letter and intent.
9. Guarantee compliance with requirements and regulations in effect on the job site. Explicitly state any such non-compliances or conflicts in the bid submittal. The bidder has the responsibility to investigate potential contract, union, and scheduling issues, and to notify the general contractor of such.

C. Pre-construction Submittals

1. Product Data: Prior to purchase and installation, submit as a PDF file information (such as cut sheets, etc.) for equipment, components, products, etc., that will be installed as part of the work of this section.
 - a. Include in the submittal, a Table of Contents, listing equipment, components, products, etc., by room, by system, and/or by other logical designation. A continuous list of all products with no reference to where the products will be installed will be rejected. Incomplete lists will be rejected.
 - b. Indicate (arrow, highlight or other designator) on each product's cut sheet the manufacturer, model/part number, accessories (as applicable), options (as applicable), color (as applicable), and other information to indicate the exact item to be installed. Where this information is not already provided on the cut sheet, manually input this information and a brief description (as applicable).
2. Substitutions [refer to section 270000 for substitution requirements]: Submit substitution requests based on the specified equipment and including associated equipment costs separate from the costs of the equipment as specified.
 - a. Proposals for alternate equipment will receive consideration if the differences between the specified and alternate/substituted equipment do not depart from the overall intent of the design and operation of the system and are in the best interests of the Owner.
 - b. Include full technical information and cut sheets for the proposed substitutions.
 - c. If the inclusion of substituted equipment will result in a different connection configuration than that in the bid documents, produce drawings that illustrate how the proposed system would be connected.
3. Shop Drawings [refer to section 270000 for additional shop drawing requirements]: Submit shop drawings prior to installation and in accordance with the Conditions of Contract and Division 1, including the following.
 - a. Functional line diagrams for all systems – clearly tag each item with name, manufacturer, and manufacturer's model number (e.g., "Program Amplifier LabGruppen LUCIA 60/2M") and show the terminal number or input/output designation (e.g., "Mic 1-In", or "Record Out-Left").
 - b. Provide schematic diagrams of custom circuitry such as receptacle pin numbers and component callouts; show details of custom resistive attenuation and/or combining networks, filters, or pads which may be required in the assembly; show point to point wiring drawings for control system modules and interfaces, and for switches and relays in audio, video, or control systems
 - c. Equipment rack elevations and patch panel assignments – clearly and consistently label rack elevations, patch panels, and on equipment controls.

- d. Provide pushbutton and handheld remote control panel layouts –tag each button with function and ID matching installed labels
 - e. Factory and custom panels, plates, and designation strips, showing material, finish, color and engraving (exact lettering)
 - f. Custom designed consoles, tables, carts, support bases, and shelves
 - g. Equipment modifications (if any), including details of modifications that change or void manufacturers' warranties.
 - h. Cable run lists – clearly show at each terminal point the type of connector to be used; include typical wiring details of each connector; note where shields are connected and where they will float to ensure the integrity of the shielding system; indicate cable types and, where appropriate, color codes; assign wire numbers and patch bay locations to every wire and patch point in the drawing
 - i. Wattage tap setting per loudspeaker.
4. User Interface Menu Submittal:
 - a. Provide a PDF per system containing a page for each menu, submenu, and popup in that system's user interfaces. Include menus that are manually triggered and those that automatically appear as the result of events such as the connection of a source device. Ensure that the PDF is unlocked so that the Engineer may annotate it.
 - b. If the development environment allows, provide an executable menu simulation file or web link for control systems in addition to a PDF-based submittal.
 5. Network Coordination: Submit as an Excel file or cloud-based collaborative spreadsheet (such as Google Sheets) a list of equipment that will be connected to the network, including but not limited to the following (e.g., spreadsheet column headers):
 - a. Item number
 - b. Description
 - c. Manufacturer
 - d. Model/part number
 - e. MAC address
 - f. IP address type (DHCP or static)
 - g. Power-over-Ethernet (PoE) requirements (yes or no)
 - h. Specific network and/or subnet configuration requirements
 - i. Specific QOS requirements
 - j. Anticipated network traffic
 6. Samples: Submit sample panels, plates, and designation strips, including details relating to terminology, engraving, finish and color.
 7. Testing Equipment and Procedures:
 - a. Submit a list of test equipment, including manufacturer, model number, and description that will be used for testing and adjustment of the installed systems.
 - b. Submit testing procedures to be performed during pre-functional testing and acceptance testing, including the minimum acceptable outcome for each test.
- D. At the Completion of the Installation
1. Initial Testing and Tuning Report: After completing initial testing and tuning, checkout, settings, as-built drawings, and operational documentation, submit written notification to the Owner and Architect that initial checkout is complete. Include in this notification a completed Initial Testing and Tuning Report that satisfies the requirements of Part 3. In the Report, document the results for tests performed during initial testing and tuning. Organize the report per room, per system, and per test. Include the testing tools/equipment, manual and automated tests, testing procedures, and expected result per test. If the test equipment stores test results and has the capability to produce reports, also include these reports.
 2. Wireless Microphone Frequencies: Submit a list of wireless microphone frequencies and associated channels used for each microphone and system.

E. Closeout Submittals

1. Acceptance Testing Report: After completing final acceptance testing, final tuning and settings, submit an Acceptance Testing Report that documents the results for tests performed during final testing and tuning. Organize the report per room, per system, and per test. Include the testing tools/equipment, manual and automated tests, testing procedures, and expected result per test. If the test equipment stores test results and has the capability to produce reports, also include these reports. Include the system's normal settings.
2. As-built Drawings [refer to section 270000 for additional as-built drawing requirements]: Submit as-built drawings in accordance with the Conditions of Contract and Division 1, including the following.
 - a. System functional line drawings for all systems; clearly tag each item with name, manufacturer, and manufacturer's model number (e.g., "Program Amplifier LabGruppen LUCIA 60/2M") and show the terminal number or input/output designation (e.g., "Mic 1-In", or "Record Out-Left").
 - b. Point-to-point wiring diagrams for switches and relays in audio, video, and control systems; point-to-point wiring diagram for control system modules and interfaces
 - c. Schematic diagrams of custom circuitry such as receptacle pin numbers and component callouts; show details of custom resistive attenuation and/or combining networks, filters, or pads which may be required in the assembly
 - d. Equipment rack elevations and patch panel assignment drawings. Clearly label the rack elevations, patch panels, and equipment controls.
 - e. Cable run lists – clearly show at each terminal point the type of connector to be used; include typical wiring details of each connector; note where shields are connected and where they will float to ensure the integrity of the shielding system; indicate cable types and, where appropriate, color codes; assign wire numbers and patch bay locations to every wire and patch point in the drawing
 - f. Pushbutton and handheld remote-control panel layouts, including tagging each button with function and ID that matches installed labels
 - g. Factory and custom panels, plates, and designation strips, showing material, finish, color and engraving (exact lettering)
 - h. Wattage tap setting per loudspeaker.
3. System Operation and Maintenance (O&M) Manual:
 - a. Describe typical procedures necessary to activate each system for full functionality as required under the System Description.
 - b. Describe normal settings for equalizer, amplifier, signal processing, and user operated controls (as established during system check out) in tabular or pictorial form.
 - c. Outline a recommended maintenance schedule with reference to the applicable pages in the manufacturer's maintenance manuals. Where inadequate maintenance information is provided by the manufacturer, provide the information necessary for proper maintenance.
 - d. Outline a recommended plan for a normal maintenance period of at least one year, including a list of necessary and recommended replacement parts.
 - e. Assume the reader of this manual to be technically competent, but unfamiliar with this particular facility.
 - f. Submit equipment manufacturer's operation and maintenance manuals for each piece of equipment.
4. Programming/Software:
 - a. Submit the project's control system programming and audio processor configuration files – refer to "Software License" below.

1.7 QUALITY ASSURANCE

- A. Audiovisual Contractor Requirements: Demonstrate that your firm meets or exceeds the following requirements:
1. Five years' experience, minimum, with the design, engineering, assembly, installation, start-up and maintenance of audiovisual systems of similar or greater complexity to those identified in this specification
 2. Provide the necessary professional design, engineering, fabrication, installation, and project management personnel to execute the work of this section, and to guarantee a complete, functional system in compliance with the design intent
 3. Successfully completed in the past 24 months a minimum of three projects of similar scope
 4. Current state contracting license, as required to perform the work under this section
 5. Bondable to 100% of contract value
 6. Be an authorized supplier and installer for equipment listed in this section
 7. Maintain permanent fabrication, service and support facilities within 100 miles of the Project site.
- B. Audiovisual Contractor Certifications: Demonstrate that your firm has the following certifications:
1. An InfoComm CTS-I (Certified Technology Specialist-Installation) certified employee to actively manage this project – the Engineer will verify CTS credentials at the InfoComm website.
 2. An Extron Control Specialist-certified employee to be actively involved in the design, implementation and commissioning of systems in this project – the Engineer will verify Control Specialist with Extron.
 3. A QSC Q-Sys Level 2-certified employee to be actively involved in the design, implementation and commissioning of systems in this project – the Engineer will verify Q-Sys credentials with QSC.
- C. Manufacturer/equipment Supplier Requirements: Demonstrate that your firm meets or exceeds the following:
1. Operate their business for not less than five years
- D. Subcontractor Quality:
1. Specifically identify in the bid submission, for Owner, Architect, or Engineer's approval, all subcontractors that will be used.
 2. Regardless of any subcontract arrangement, your firm will have sole responsibility for the successful implementation of the work in this section.

1.8 PROJECT MANAGEMENT AND COORDINATION

- A. Comply with the Project Management requirements of section 270000.
- B. Assign a project manager to this project for the entire duration. They shall oversee the design, submittals, implementation, testing, and close out – the entire process from start to finish. The project manager shall also coordinate this work of this section with other trades.
- C. Report to the Engineer any conditions that would prevent the correct installation of the system as designed.

- D. This project requires an programming contractor. Definitions of the equipment programming responsibilities of each are defined below.
 - 1. Programming Contractor
 - a. Touch panel layout and user experience, coordinated with the Owner's representative and TEECOM.
 - b. Standard control and user interface development specific to the functionality of the audiovisual control systems and communication with controlled devices in the systems.
 - c. Installation and validation of the systems and UI code on-site.
 - d. Optimize and integrate Building Management System License with corresponding systems – room scheduling displays, HVAC, occupancy sensors, etc.
 - 2. Audiovisual Systems Contractor
 - a. Audio processor programming including signal routing, system optimization, and integration of control triggers.
 - b. Wireless microphone frequency coordination.
 - c. Video matrix configuration including routing, scaling, and EDID optimization.
 - 3. Coordination Requirements
 - a. Audiovisual contractor: provide a device table to the independent programming contractor including an IP address table, source input connections in matrices and output connections in matrices and corresponding end points.
 - b. Audiovisual contractor and independent programming contractor: conduct coordination meetings every two weeks and supply meeting notes to TEECOM and the Owner.
 - c. Audiovisual contractor and independent programming contractor: conduct collaborative on-site troubleshooting and system tuning sessions for the Project.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Comply with Delivery, Storage, and Handling requirements of section 270000.

1.10 WARRANTY

- A. Warrant the System for a minimum of one year from the date of system acceptance by the Owner. Honor component warranties per manufacturers' terms if greater than one year.
 - 1. Include service as described in 3.13 "Maintenance and Extended Service" in the warranty.
- B. Activate manufacturers' equipment warranties in the Owner's name. The warranty period shall commence on the date of System Acceptance by the Owner.
 - 1. In the case of contractor-modified equipment (where the manufacturer's warranty could be voided), warrant such equipment equivalent to that of the original manufacturer.
- C. Warrant the Software and version updates – see "Software" below.

1.11 SOFTWARE LICENSE

- A. Nondisclosure
 - 1. During or after the termination of this Agreement, the Owner agrees not to disclose any proprietary information provided by the AV Contractor, to maintain such information as confidential and not use such information provided in Project documents for any purpose other than maintenance and support of in-house systems. This does not apply to any of

the information that becomes generally known to the public due to publication or other legal means and through no fault of the Owner.

B. Obligations Governing the Software

1. The AV Contractor shall own the copyright of any custom created software/parameter files ("Software") and hereby grants the Owner a royalty-free, non-exclusive license to use the Software for use with the audiovisual and other connected systems in this project. This license cannot be transferred.
2. The Owner shall not rent, loan or re-license rights to use the Software to any third party.
3. Any Third-party software provided or made available to the Owner by the AV Contractor, but not created by the AV Contractor, is sublicensed to the Owner through the AV Contractor. The AV Contractor agrees that such sublicense is granted with consent of the third-party at no cost to the Owner, and the Owner shall be entitled to use such software under the same terms as the AV Contractor.
4. The AV Contractor and third-party suppliers are not restricted from licensing the Software or any portion thereof to other customers.
5. At acceptance testing, provide the source code for custom created software, applications required to use the source code, descriptions of the required equipment, and instructions detailing the modification and installation of the Software to the Owner.

C. For project and custom Software, the following apply.

1. Provide the source code to the Owner either directly via file transfer or make it available through other means, such as cloud storage, an FTP site, etc. Maintain older versions within a folder structure and make them available to the Owner at the Owner's request. At the end of the warranty period, release the current and older versions of the source code to the Owner. If the AV contractor ceases to exist during the warranty period, release the source code to the Owner upon termination of the business.
2. Provide the Software in a form suitable for immediate access by the System.
3. The AV contractor grants the Owner the right to modify and to enhance the Software as furnished and licensed under the terms of this Agreement at its own risk and expense, and further agrees such modifications and enhancements developed by the Owner to be the property of the Owner. Any changes to the custom created software parameter files do not affect copyright ownership.
4. During the warranty period, if the Owner discovers that the Software is no longer functioning in the same manner as had been approved at the beginning of the warranty period, they shall document the fault in sufficient detail to allow errors to be reproduced, and they will notify the AV contractor. Within two business days of this notification, update the software, provide or post updated Software files as detailed above, demonstrate that the error has been resolved, and maintain updated Software files as detailed above.
5. Defend any suit brought against the Owner and pay any damages due to the resulting judgment from any suit brought against the Owner as it pertains to a violation of copyrights or patents of the Software or licenses. The Owner shall notify the AV contractor in writing promptly and give authority, information and assistance at the AV Contractor's expense.
6. The AV contractor at its own expense and option shall, if able, procure for the Owner the right to continue to use the Software as licensed or to replace it with a non-infringing release. This shall not include any agreement by the AV Contractor to accept liability for patent or copyright infringement for beyond the Software as licensed and furnished for the Project. This also excludes any agreement by the AV contractor to accept liability for patent or copyright infringements for methods and processes to be carried out by using said Software except those inherent in the furnished System.
7. All contracts with Third-party software suppliers will transfer from the AV Contractor to the Owner at Project acceptance by the Owner.
8. The Owner shall apprise the AV Contractor of activities it takes with Third-party software providers during the warranty period. Included activities would include discontinuing the

use of any Software component, installing updated or alternate versions of the Software, revising the configuration of affected systems.

9. The Owner can contact the AV Contractor for questions at no additional cost during the warranty period, providing:
 - a. The queries are related to the audiovisual systems defined in this document.
 - b. The query is asked by the Owner's staff or an authorized representative.
 - c. The inquirer has attended the AV Contractor's or the manufacturer's training in the use of the systems defined in this document.
 - d. The question is not intended as design consultation.
10. The Owner can only make copies as backup files of the Software and they are required to include the AV Contractor's copyright notice. The Owner shall make a reasonable effort to secure this Software to prevent theft or unlicensed usage.

D. Software License Terms

1. The Software license is granted by the AV Contractor for the devices provided for the Systems. If any devices in the system fails, the license can be transferred to a replacement device on a temporary or permanent basis if the original device is to be phased out. The transference may only occur with written notification to the AV Contractor.
2. Additional licenses or changes to the Software are subject to a supplemental agreement between the AV Contractor and the Owner.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Comply with the Products requirements in section 270000.
- B. Provide products, equipment and software that are the latest version of the specified model or type available at the time of procurement, providing the updated devices provide the same or better capabilities and performance required by the system design.
- C. Only where denoted "or equal", equal products will be considered. The manufacturers, product numbers, and types listed at those instances establish minimum performance.
- D. Substitutions: The Engineer may consider substitutions for certain equipment if the Contractor demonstrates that the substitution meets or exceeds the functional requirements described in the System Description and Performance Standards. Follow the requirements of section 012500 "Substitutions" for substitution requests.

2.2 EQUIPMENT SCHEDULE

- A. Quantities: Quantities are either listed herein with a number, as "A/S" (as shown), or as "A/R" (as required). If listed as A/R or the quantity is marked with an asterisk, determine quantities as required for a fully operational system. Confirm the quantity listed here against the drawings. If the quantity is different than shown on the drawings, the drawings govern quantity and the specifications govern quality.
- B. Centralized Software-Based Management
 1. Provide a web-based AV resource management and remote control application to manage, monitor, and control AV equipment and other devices using a standard TCP/IP network.

- a. Extron Global Viewer/Global Configurator
 - b. Or Equal
- C. Provide AV signal extension as required.
- D. Provide plenum-rated equipment, enclosures, and cables where required.
- E. Provide secure mounting/tamper-proof attachments for all accessible AV devices to prevent theft.

F. **Group Study Rooms – Typical Small**

Description	Make	Model	Qty.	Notes
Category: Audio				
Soundbar	Extron Or Equal	60-1737-11	1	No camera, provide wall bracket
Audio extractor	Extron Or Equal	60-1681-01	1	Mount behind display
Volume control module	Extron Or Equal	60-1090-01	1	Mount behind display
Category: Video				
Video display	NEC Or Equal	C432	1	
Display mount	Chief Or Equal	MTM1U	1	
Category: Control				
Control panel	Extron Or Equal	MLC62 RS D	1	
Category: Accessories				
Interface plate	Custom		1	
Misc. cables				

G. **Group Study Rooms – Typical Medium**

Description	Make	Model	Qty.	Notes
Category: Audio				
Soundbar	Extron Or Equal	60-1737-11	1	provide wall bracket.
Video conference camera	Logitech Or Equal	C920	1	Provide in two video conference enabled rooms (typical of 200 and 289A)
Audio extractor	Extron Or Equal	60-1681-01		Mount behind display
Volume control module	Extron Or Equal	60-1090-01	1	Mount behind display
Category: Video				
Video display	NEC Or Equal	C551	1	
Display mount	Chief Or Equal	LTM1U	1	
Category: Control				
Control panel	Extron Or Equal	MLC62 RS D	1	

Description	Make	Model	Qty.	Notes
Category: Accessories				
HDMI Interface plate	Custom		1	Provide HDMI and USB for video conference enabled rooms (typical of 200 and 289A)
Misc. cables				

A. **Group Study Rooms – Typical Large**

Description	Make	Model	Qty.	Notes
Category: Audio				
Ceiling loudspeakers	Extron Or Equal	60-1310-03	A/S	
Power amplifier	Extron Or Equal	60-1449-01	1	Mount behind display
Category: Video				
Video display	NEC Or Equal	C651	1	
Display mount	Chief Or Equal	LTM1U	1	
HDMI extension TX	Extron Or Equal	60-1586-52	1	Install in floor box
HDMI extension RX	Extron Or Equal	60-1631-53	1	
Category: Control				
Control panel	Extron Or Equal	MLC62 RS D	1	
Category: Accessories				
Misc. cables				

B. **Typical Meeting Rooms**

Description	Make	Model	Qty.	Notes
Category: Audio				
Ceiling loudspeakers	Extron Or Equal	60-1310-03	A/S	
Power amplifier	Extron Or Equal	60-1449-01	1	
Volume controller	Extron Or Equal	60-1090-01	1	Mount behind display
Audio plate for portable ALS	C2G Or Equal	Stereo RCA wall plate	1	
Tabletop microphone	Biamp Or Equal	Parlé TTM-XEX	A/R	Confirm color with Architect. Secure mount to table
Category: Video				
Video Display	NEC Or Equal	C751Q	1	
Wall Mount	Chief Or Equal	LWRIWUB	1	
Wide angle Camera	Logitech Or Equal	C930E	1	Provide wall mount
VC Hub	Biamp Or Equal	Devio SCR-20	1	Mount under table

Description	Make	Model	Qty.	Notes
Category: Control				
Wall mounted control panel	Extron Or Equal	MLC62 RS D	1	

C. Office of IT Director

Description	Make	Model	Qty.	Notes
Category: Video				
Annotative video Display	Sharp Or Equal	PN-L401C	1	
Wall Mount	Chief Or Equal	MTM1U	1	
Category: Accessories				
Input plate	Custom		1	

D. Classroom Type 1

Description	Make	Model	Qty.	Notes
Category: Audio				
Ceiling mounted loudspeakers	Extron Or Equal	60-1736-02	A/R	Coordinate color with Architect
Instructor microphone	Extron Or Equal	VLM 3001	1

Network switch				Coordinate model selection with owner IT

2.3 CABLES AND WIRES

- A. Provide cables and wires that are continuous - without splices.
- B. For CATEGORY-type UTP cabling (cables, termination apparatus and installation requirements), refer to section 271513.
- C. Cable Selection:
 1. Refer to functional diagrams for signal type between equipment.
 2. Select a cable with the appropriate rating and configuration required by the applicable building code, electrical code, AHJ, and applicable codes and regulations governing the installation.
 3. For cables that will be installed in conduit within on-grade concrete, select a cable rated for underground construction.
 4. For cables that will be installed outdoors in underground conduit, aerial, and/or corrosive environments, select a cable rated for outdoor construction.
 5. For signal extenders, use extender the manufacturer's recommended cable type and within the maximum cable run length to be used.
- D. Unless otherwise called for in these specifications and drawings, the following cables are approved for the associated application or signal type. Ensure the chosen cable is appropriate for the signal type, available pathway capacity, and run length.

Application	Non-Plenum Product, or equal	Plenum Product, or equal

2.4 CUSTOM REMOTE-CONTROL PANELS AND INTERFACE PLATES

- A. For custom remote-control panels and interface plates, use 1/8 inch (3mm) thick #6061 T6 aluminum, with a brushed, anodized, black finish (or as approved by the Architect via submittals).

2.5 EQUIPMENT PLATES

- A. For equipment plates, utilize 1/32" to 1/16" thick by 1/4" high aluminum with a brushed anodized black finish.
- B. Provide engraved lettering 1/8" to 3/16" high.

2.6 LABELS

- A. General: Labels shall meet UL 969 product requirements.
- B. Equipment Labels:
 1. Equipment labels shall be machine printable, shall be polyester (or similar) adhesive-back type, and shall be permanent.
 2. Face stock (print area) shall be white.
 3. Size: as needed.
 4. Manufacturer, or equal:
 - a. Brady
 - b. Brother
 - c. DYMO XTL or Rhino

- d. Panduit
 - 1) #C150X075YJJ; component label, laser/inkjet print, white face stock 1.5"W x 0.75"H
- e. Thomas and Betts

C. Cable and Wire Labels:

1. Cable and wire labels shall be machine printable, shall be permanent, and shall be either of the following types:
 - a. Tape – machine-printable, wrap-around, self-laminating, permanent adhesive-backed tape
 - b. Machine-printable, shrink-wrapped labels
2. Face stock (print area) shall be white.
3. Size: as needed per wire/cable size (approximately 1" wide).
4. Manufacturer, or equal:
 - a. Brady
 - b. Brother
 - c. DYMO XTL or Rhino
 - d. Panduit
 - 1) #S100X075YAJ; self-laminating cable label, white face stock 1"W, for cable diameters 0.08"-0.16"
 - 2) #S100X125YAJ; self-laminating cable label, white face stock 1"W, for cable diameters 0.12"-0.28"
 - 3) #S100X150YAJ; self-laminating cable label, white face stock 1"W, for cable diameters 0.16"-0.32"
 - 4) #S100X225YAJ; self-laminating cable label, white face stock 1"W, for cable diameters 0.24"-0.48"

D. Loudspeaker Labels:

1. Loudspeaker labels shall be polyester (or similar) adhesive-back type, shall be permanent, and shall be machine printable with a printer.
2. Face stock (print area) shall be white.
3. Size: as needed.
4. Manufacturer, or equal:
 - a. Brady
 - b. Brother
 - c. DYMO XTL or Rhino
 - d. Panduit
 - 1) # C075X050YJJ; component label, laser/inkjet print, white face stock 0.75"W x 0.5"H

2.7 RACK BONDING

- A. Refer to section 270526 for approved bonding products.

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of section 270000.
- B. Perform work in accordance with the standards and best practices defined by the AVIXA coursework for Installation 1: System Fabrication and Installation 2: Setup and Verification.

- C. Install products per manufacturers' instructions.
- D. Install panels, equipment, boxes, etc., plumb and square.
- E. Seismic Safety:
 1. Mount, anchor and/or brace permanently-installed equipment to the building structure using anchors, fastenings, supports, and methods approved by structural engineer with a safety load factor of at least 1.5. Provide installations that meet the most stringent of applicable codes and regulations to minimize potential damage to personnel and equipment from foreseeable seismic events.
 2. Brace hanging audiovisual and associated equipment both to minimize sway and to prevent detachment from the overhead structure in accordance with applicable codes.
 3. Firmly secure equipment in place unless requirements of portability dictate otherwise.

3.2 EXAMINATION

- A. Prior to starting the work of this section, examine areas to receive system components and pathways to receive cabling to verify conditions are ready for work of this section and to verify conformance with manufacturer and specification tolerances.
 1. Verify that pathways, including conduit, junction boxes, cable trays, ceiling enclosures, etc., are in place prior to placing cables into pathways and as required by applicable codes.
 2. Verify that rough-in (including conduit, device boxes, floor boxes, and the like) is ready to receive wiring, cabling, devices, equipment, and the like prior to installing into the rough-in.
 3. Verify that electrical power service is ready and stable prior to connecting equipment.
 4. Verify that support infrastructure, including equipment racks, are in place prior to installation.
 5. Check ceiling types, ceiling heights, and clearances above ceilings to ensure conditions are appropriate per manufacturer's installation requirements.
- B. Verify that the network is operational and ready to receive connection from and configuration for the System. "Ready" includes settings on the network required for the System to function properly. Coordinate with the network contractor as needed to ensure the network settings have been adjusted to support full functionality of the System.
- C. Proceed with installation work only after unsatisfactory conditions are corrected.

3.3 INSTALLATION

- 1. Furniture connections
 - a. Provide 2.5" diameter brushed stainless grommets at Av furniture locations. Coordinate AV requirements with furniture vendor.
- B. Displays and Mounts
 1. Wall-Mounted Displays: Install mounts using fasteners approved for the mounting substrate. For framed walls, firmly engage fasteners into backing or, if no backing is present, into framing studs.
 2. Ceiling-Mounted Displays: Install mounts to structure using fasteners and mounting accessories approved for the mount and mounting substrate. Install seismic restraints as appropriate for the installation location. Conceal cabling within mounting columns where feasible.
 3. Securely install displays onto mounts. Complete final connections (power, signal, control, etc.).

4. Install accessories onto mounts or displays using approved attachment methods that guarantee the longevity of the installation. Accessories may be attached mechanically, if allowed by the display/mount manufacturer, or by using 3M TB3571/3572 hook and loop fastener tape or an approved equal.
 5. Dress cables; ensure they are maximally concealed yet serviceable.
 6. Adjust each display and mount to attain a true, square, and level installed result.
- C. Video Walls (arrays of individual displays assembled to create a larger composite image)
1. Position all displays physically to align in a common plane.
 2. Position all displays to have equal gaps between them. Provide gaps per the display manufacturers' specifications.
 3. Verify consistent gapping by displaying full-screen images with horizontal, vertical, and diagonal lines. The evidence of proper alignment will be zero line offsets between adjacent displays.
 4. Adjust displays or video wall processors for proper bezel compensation.
 5. Verify correct bezel compensation by displaying full-screen images with diagonal lines. The evidence of proper adjustment will be an absence of line offsets between adjacent displays.
- D. Projection Systems
1. Projector Supports
 - a. Anchor poles to structure using means approved by a structural engineer.
 - b. Install lateral and/or transverse bracing to poles for seismic bracing as required.
 - c. Securely install mounts onto poles using compatible adapting components.
 2. Projectors
 - a. Securely install projectors to mounts.
 - b. Fully assemble and install projectors, lenses, and mirrors such that the final condition will be no observable movement in the image induced by motor vibration or other mechanical operations.
 - c. Install accessories onto mounts or projectors using approved attachment methods that guarantee the longevity of the installation. Accessories may be attached mechanically, if allowed by the projector/mount manufacturer, or by using 3M TB3571/3572 hook and loop fastener tape or an approved equal.
 3. Align projection systems so projected images fill the viewing areas of the associated projection screens and exhibit no geometric distortion.
 4. Only use physical and/or optical adjustments to correct geometric distortion.
 5. Only use electronic or digital correction when called for in this document package.
 6. Confirm that the total averaged light output from all projectors, in lumens, is at least 85% of that specified by the projector manufacturer.
 7. Confirm that the light falloff from the center of the projected image to four corners, as measured at the projected image plane, does not exceed 50%.
- E. Ceiling Microphones
1. Review field conditions, and coordinate with the Architect or Engineer to resolve conflicts with other trades' devices conflicting with microphone locations.
 2. Route analog microphone cabling away from other cabling types. Where this cabling must cross other cabling types, install it at a 90° angle.
 3. Install microphone preamplifiers, conversion devices, and other back boxes using safety wires attached to the building structure.
 4. Prior to acceptance testing, confirm microphones do not produce audible buzz and/or noise.

- F. Table Microphones
1. Review table drawings, and coordinate with the Architect and Engineer to resolve conflicts with other tabletop or through-table devices conflicting with microphone locations.
 2. Coordinate microphone locations and installation activities with the Architect and Engineer prior to installing through-tabletop microphones and microphone receptacles.
 3. Route analog microphone cabling separated from other cabling types to prevent signal interference. Where this cabling must cross other cabling types, cross it at a 90° angle.
 4. Install microphone preamplifiers and other microphone-related conversion devices neatly, square to the table, and as hidden from view as possible. Coordinate the locations of these devices with the Architect and Engineer.
 5. Label and dress all cables neatly and with approved cable management products.
 6. Prior to acceptance testing, confirm microphones produce no audible buzz and/or noise.
- G. Wireless Microphone Systems
1. Mount antennas external to equipment racks.
 2. For wireless microphone systems using multiple antennas, space them per manufacturers' recommendations.
 3. For VHF and UHF wireless systems, use RF coordination software (such as Shure Wireless Workbench) to scan and coordinate frequencies of all wireless microphone systems to be installed into the project.
 - a. Avoid local public safety channels when assigning frequencies.
 - b. Verify frequency assignments do not interfere with each other and are free from dropouts
- H. Antennas
1. Use antennas designed specifically for the frequency bands they will carry.
 2. For antennas extended from the attached equipment, use cabling appropriate for the frequency and distance.
 3. Use extender devices (preamplifiers) and distribution amplifiers per cabling lengths and manufacturers' recommendations.
 4. Install cabling per manufacturers' bend radius guidelines.
 5. Locate and orient antennas to ensure coverage throughout the room(s). Verify this by walk-testing systems.
- I. Loudspeaker Tap Settings
1. Where loudspeaker tap wattages are specified in the design documents, set transformers per these. Otherwise, set taps per best practices.
 2. Set taps such that the total wattage of a series of loudspeakers will not exceed 75 percent of the associated amplifier's rated wattage.
 3. Record tap settings per loudspeaker for inclusion on the as-built drawings.
- J. Loudspeakers, Wall, Surface-Mounted
1. Install loudspeakers per manufacturers' recommendations and the design documents.
 2. Install loudspeakers plumb and square.
 3. Use security mounting hardware where loudspeakers will be mounted below 10' AFF.
 4. Provide security cables per codes and best practices.
 5. Where manufacturer labels are visible on loudspeaker grills and are rotatable, align these to read correctly.
 6. Where loudspeakers will be exposed to humidity or water spray, ensure water will not be able to penetrate cable connections.
- K. Loudspeakers, Acoustical Tile, Ceiling-Mounted
1. Coordinate ceiling tile work (such as cutting holes) with the ceiling contractor.

2. Unless directed otherwise, center ceiling loudspeakers to ceiling tiles and evenly space loudspeakers.
 3. Cut ceiling tiles to fit loudspeaker such that no gaps are visible after the loudspeaker cover/grille is installed.
 4. Install ceiling loudspeakers with safety wires attached to the building structure per applicable codes and best practices.
 5. Use tile rails and other support components to ensure loudspeakers do not sag.
 6. Where manufacturer labels are visible on loudspeaker grills and are rotatable, align these consistently.
 7. Replace ceiling tiles damaged during loudspeaker installation work.
- L. Loudspeakers, Gypsum (hard lid) Ceiling-Mounted
1. Coordinate ceiling work (such as cutting holes) with the framing contractor.
 2. Unless directed otherwise, align and evenly space loudspeakers.
 3. Cut wallboard to fit loudspeaker such that no gaps are visible after the loudspeaker cover/grille is installed.
 4. Install ceiling loudspeakers with safety wires attached to the building structure per applicable codes and best practices.
 5. Where manufacturer labels are visible on loudspeaker grills and are rotatable, align these consistently.
- M. Room Scheduling Displays
1. Coordinate with the general contractor and specialty contractors to conceal cabling in glazing system frame members.
 2. Room Scheduling displays will be provided in the future. Provide cabling to support future system.
 3. Provide service loops to allow displays to be removed prior to disconnection.
- N. Digital Signage
1. Digital signage software and hardware are owner furnished
 2. Make digital signage players accessible and controllable via the network and via web access.
 3. Coordinate with the Owner to determine configuration and/or initialization files are required by players/receivers to be managed by the Owner's local or cloud-hosted management platform.
 4. Coordinate with the Owner's Representative to ensure a successful implementation of this requirement.
- O. Cabling and Wiring at Racks
1. Do not use electrical tape for bonding, splicing, joining, or any other purpose.
 2. As a general practice, run power cables, control cables, and other cables with higher voltage levels on the left side of an equipment rack as viewed from the back; run other cables with lower voltage levels on the opposite side. Where wiring issues or wire routing facilities preclude this configuration, it is acceptable to deviate from the directions above, if separation is maintained between signal and electrical power cables.
 3. To reduce signal contamination, group cables per the signals being carried. Maintain appropriate distances between cable groups, especially between high-current (power; loudspeaker) and low-current (microphone) groups. Form separate groups for the following cables/signal types:
 - a. Power
 - b. Control
 - c. Analog video
 - d. Digital audio and video
 - e. Analog microphone audio
 - f. Analog line audio

- g. Loudspeaker audio
- h. Radio frequency
- 4. Within racks, install wires and cables with service loops. Provide sufficient cable to allow each piece of equipment to be removed from the front of the rack for servicing.
- 5. At boxes or points of termination, install wires and cables with service loops. Provide sufficient cable to allow each piece of equipment to be removed and laid flat on a surface for servicing.
- 6. At slide-out equipment racks, dress cables to allow racks to be extended to the maximum length of the rack slides. For slide-out rotating racks, provide sufficient cable to allow full extension and rotation.
- 7. For cables that interface with racks, cabinets, consoles, or equipment modules, use screw-type terminal blocks, terminal strips, or connectors. Telephone-style punch-down blocks (e.g., 110 blocks) are not acceptable.
- 8. Do not bend any cable or wire tighter than the manufacturer's minimum bend radius.
- 9. Install wires and cables such that the cable exerts no strain on its termination.
- 10. Label wires and cables, regardless of length, using a cable label with a unique number or letter per the instructions below under "Labeling".
- 11. Cable Shield Bonding: For cables with shields, connect them using approved connectors per an approved grounding topology.
- 12. Encase umbilicals (groups of bundled cables) connecting moveable racks and cabinets to walls and other fixed locations in braided sleeving. Where racks and cabinets are installed in view of non-technical people, coordinate sleeving colors with the Architect.

P. Cabling and Wiring – Overhead Distribution

- 1. Use cabling appropriate to loudspeaker impedance, cabling distance, and installation conditions (such as plenum versus non-plenum).
- 2. The use of electrical tape for bonding, splicing, joining, or any other purpose is prohibited.
- 3. Provide cable runs between termination points that are continuous, with sheath continuity. Splices are not permitted anywhere.
- 4. Place cables within designated pathways, such as cable tray, cable hangers, etc. Do not fasten cables to other building infrastructure (such as ducts, pipes, etc.), other systems (such as ceiling support wires, wall studs, etc.), or to the outside of conduits, cable trays, or other non-approved pathway systems.
- 5. Protect cables from physical interference and damage during installation and termination. Install cables with no kinks or twists.
- 6. Install HDBaseT cables within manufacturers' length recommendations.
- 7. Comply with manufacturers' limits for pulling tension.
- 8. Do not use cable-pulling compounds for indoor installations.
- 9. Install cables within manufacturers' bend radius limits. If no minimum bend radius is given, then maintain a minimum bend radius of six times the cable diameter during and after installation.
- 10. Route cables under building infrastructure (such as ducts, pipes, conduits, etc.); do not route cables over building infrastructure. Install cables to provide accessibility for future service.
- 11. Place cables 6", minimum, away from power sources to reduce interference from EMI.
- 12. Connectors: Use the following connectors:

Q. Terminations and Cords at Floor Boxes

1. Provide strain relief for cables. Use appropriate cable management products (such as hook and loop straps for UTP and STP cabling, and nylon cable ties for other cables) to group similar cable types.
2. Provide permanent labels on cables within 6" of terminations.
3. Provide permanent labels on receptacles within floor boxes to clearly identify terminations and services.
4. Encase umbilicals connecting moveable racks, cabinets, etc., to floor boxes in braided sleeving. Where racks and cabinets are installed in view of non-technical people, coordinate sleeving colors with the Architect.

R. Blank Panels: Provide blank trim plates in floor, wall and furniture-mounted boxes at unused termination positions. Fill each module opening filled, either with a receptacle, a receptacle plate, or a module of the type the opening is intended to house.

S. Patch Panels

1. Assignments: Wire patch panels so that signal sources appear on the upper row of a row pair; and destinations appear on the lower row of a row pair. Submit variations from this approach per the requirements in Submittals.
2. Designation strips: Utilize alphanumeric identifications and descriptive information on audio and video patch panel designation strips. Number the jack positions in each row

sequentially from left to right. Letter the jack rows sequentially from top to bottom. Include the alphanumeric identification of each jack on the functional block drawings. Mount reproductions of these drawings in an appropriate location near the patch bays.

3.4 EDID MANAGEMENT

- A. For each system, determine the maximum pixel resolution, frame rate, and color depth supported by all content displays, and designate this as the target resolution for the system. Omit digital signage displays from this process.
 - 1. Scalers: Configure video scalars as follows:
 - a. Input: Emulate the EDID configuration of the native resolution of the connected display or projector for both analog and digital inputs.
 - b. Output: Configure to match the native resolution of the display system and at the highest supported scan rate.
- B. Determine the system's maximum audio parameters – output channel count, LFE capabilities, etc.
- C. Configure the system's EDID management to ensure that these audio and video parameters are sent to source devices.

3.5 HDCP MANAGEMENT

- A. Include HDCP support in all equipment that incorporates copy protection for the transport of copyrighted media.
 - 1. Installation Requirements
 - a. Equipment capable of passing HDCP included in this project must support the same HDCP version (i.e. HDCP 1.4 or HDCP 2.2).
 - 2. Exceptions
 - a. HDCP may be defeated for educational institution projects per 'fair use' copyright terms.

3.6 NETWORK SECURITY

- A. Leave no network-connected device operating with its factory-default password.
- B. Obtain Owner-defined password changes for all network-connected devices. Program these passwords into the devices.
- C. Where available, enable two-factor authentication.

3.7 PROGRAMMING AND EQUIPMENT CONFIGURATION

- A. General Programming
 - 1. Install the most current version of manufacturers' firmware on devices.
- B. Audio Processor Programming
 - 1. The following instructions apply to all systems including programmable audio processors and microphones.

2. Set input devices (wireless microphones, ceiling microphones, video device audio, etc.) to unity gain.
3. Set output devices to unity gain.
4. Set amplifiers to maximum gain.
5. Set gains from microphones on analog and Dante/AES67 input blocks in audio processors to achieve input gains on meters around -15 to -20dBFS.
6. Set gains on analog and Dante/AES67 output components in audio processors to achieve required output gain from the loudspeakers.
7. Adjust gating auto-mixer settings so that room participants can be heard clearly with minimal room noise and echo, with no noticeable delay nor cutoff words when talkers begin to speak, and with minimal breathing and other artifacts after talkers stop speaking.
8. Adjust AEC settings so that no echo can be heard by far-end callers.
9. Balance program levels between HDMI program audio and USB bridge program audio to within 3 dB.
10. Coordinate AEC among all processing devices and software in the system so that only one processor in the audio chain, whether physical, such as a hardware DSP, or virtual, such as a software processor in collaboration software, has AEC enabled.
11. Make equalization and other room tuning adjustments to obtain the flattest and least colored result the system is capable of.
12. Make additional equalization and other room tuning adjustments to eliminate feedback when the microphones are at maximum system gain. Do not use feedback suppression components.

C. Control System and Touch Panels

1. Owner's Requirements
 - a. Meet with the Owner and document their functional and user interface requirements (backgrounds, color scheme, screens, menus, functions, etc.).
 - b. Develop programming and user interfaces based on the user requirements.
 - c. Submit touch panel layouts and menu flow documentation to the Owner and Engineer per submittal schedule.
 - d. Meet with the Owner and Engineer and present the control system programming and user interfaces. Obtain the Owner's approval on these items.
2. Programming Guidelines
 - a. Create initial screens (splash screens) that use a version of the Owner's logo, generated without visible scaling artifacts.
 - b. Only use red for alarm indicators and other screen elements of special significance.
 - c. Avoid use of technical terms, rather, use clear, everyday language. For example, instead of "System On", use "Turn System On"; instead of "Power Down", use "Turn Power Off", etc.
 - d. Ensure soft buttons are sized consistently and spaced evenly.
 - e. Ensure spelling, punctuation, and grammar are 100% correct.
 - f. Provide menus on both touch panels and control system web pages that appear and function consistently throughout the project.
 - g. Ensure items with similar functions appear consistently in all menus.
 - h. Provide soft button presses that display visual feedback, and if required by the Owner, audible feedback.
3. Tech Menus: Provide a "tech" (Technician-level) menu for each touch panel. Include in tech menus:
 - a. Volume control for button audible feedback
 - b. Screen brightness
 - c. A means to change the tech screen password; obtain from the Owner's Representative a default password for all touch panel tech menus or an alternative method for password management, such as the use of Active Directory.
 - d. Other technician-specific functions required for each system

4. Make IP control system devices (touch panels, controllers, processors, etc.) accessible and controllable via the network and via web access. For example, users and/or technicians shall be able to operate touch and pushbutton panel functions remotely. Coordinate with the Owner's Representative to ensure a successful implementation of this requirement.
5. In AV-equipped rooms with an operable partition, program the AV system to use signals from the rooms' partition sensors to automate audiovisual system combine/divide functions.

D. Power Control and Sequencing

1. Whether explicitly listed in this specification or not, provide power control interfaces, e.g., remotely controllable PDUs, for equipment and devices that are not equipped with integrated power control. Provide power control interfaces that are fully compatible with the specified control system. Follow this directive for devices, such as audio power amplifiers, which would not be adversely affected by external power controls. Omit such power controls for devices, such as transmitters and receivers, that should not be externally power controlled.
2. Configure non-controlling items to power off or go into a standby/low power-consumption mode when systems are powered off. At minimum, program the AV system to power off the following types of devices when not in use.
 - a. Audio processors
 - b. Audio amplifiers
 - c. Displays
 - d. Projectors
3. Configure devices that detect connection to user devices to stay in standby/low power-consumption mode when audiovisual systems are turned off.
 - a. Video switchers and processors
4. When turning systems on, use the following sequence for audio components.
 - a. Turn on source devices.
 - b. Turn on processing and routing devices.
 - c. Turn on amplifiers.
5. When turning systems off, use the following sequence for audio components.
 - a. Turn off amplifiers.
 - b. Turn off processing and routing devices.
 - c. Turn off source devices.

E. BMS Interfacing

1. Coordinate with the Owner's Representative regarding interfacing between AV power control and the building management system. Comply with the Owner's requirements for reporting power control and/or power usage.

F. Network Connection

1. Connect all network-connectable equipment and devices to the network. Program them to electronically issue notifications for preventative maintenance (e.g., replace a projector lamp).
2. Coordinate with the Owner's Representative which devices are to provide notification (e.g., email notification) immediately at the time of a fault and which devices will provide notifications on a daily or weekly report.
3. Coordinate with the Owner's Representative to obtain the default notification means (e.g., the email address for maintenance messages).
4. Ensure the Owner's Representative can revise the maintenance email address via a simple method – using a single address for all networked AV devices. Document this procedure in the Operations Manual.

- G. Equipment Configuration:
 - 1. Computer Interfaces, Signal Extenders and Transmitters with Integral Input Switching: Program devices and related system components so analog audio inputs are active regardless of which video input is selected.

3.8 LABELING

- A. Provide labeling identifiers that match closeout documentation (e.g., as-built drawings, O&M Manual, etc.).
- B. Clean and degrease surfaces receiving nameplates and labels prior to affixing labels.
- C. When creating labels for user-facing equipment and cables, use colored labels where possible. Example uses are floor boxes, table boxes, cameras, displays, and user-facing cables. Use color coding to relate labels to related components, i.e., match the text and color on each user-facing cable, its corresponding button on the button panel, and its corresponding input on the display. Example: HDMI 2 cable has a yellow label printed with "HDMI 2", the button panel at the table box has a yellow "HDMI 2" label and the input on the display has a yellow label printed with "HDMI 2".
- D. Interface Plate Designation:
 - 1. Provide wall-mounted interface plates with clearly engraved alphanumeric identification of input type (e.g., "MIC-1", "LINE IN", "SPEAKER", "VIDEO", etc.) and corresponding patch field designation.
- E. Equipment Racks and Cabinets:
 - 1. Install the label on the top of the rack or cabinet, centered horizontally.
 - 2. Example: line 1: "AV-01", line 2: "Audiovisual Devices".
- F. Equipment
 - 1. Rack-mounted equipment: Install labels in visible locations on equipment and devices on the front and back of the equipment.
 - 2. Field equipment: Install labels in visible locations on miscellaneous field equipment and devices.
- G. Wireless Transmitters and Receivers: Label wireless transmitters and receivers so users can clearly identify a given transmitter associated with its receiver.
 - 1. Use an identifier, such as a room number, that associates each transmitter with a given room or system.
 - 2. Example: RM.230–MIC.3–RCVR.1
- H. Wire and Cable:
 - 1. Comply with the Owner's labeling requirements. If the Owner does not have labeling requirements, conform with AVIXA F501.01.
 - 2. Provide labels with machine-generated text; hand-written labels will not be accepted.
 - 3. Use a numbering system with a consistent number of characters for each cable's unique identifier.
 - 4. Generate a unique identifier for each cable and wire using either the Owner's system or AVIXA F501.01. Include primary level data elements per F501.01; secondary level data elements are optional.
 - 5. Label Installation:
 - a. Install labels on both ends of cables at least 1" (25mm) and no more than 12" (300mm) from the connector strain relief or the heat shrink tube from which individual wires exit the cable jacket.

- b. Labels must be visible; they may not be concealed by strain relief elements or within bundles.
 - c. Install labels such that they are visible by a technician from a normal stance.
 - d. Install labels according to label manufacturers' guidelines.
6. Label Legibility:
- a. Text margins shall be a minimum of 1mm in the printable area.
 - b. Text shall not be obscured by any part of the label.
 - c. Primary text shall be all capitals, no less than 2.5mm tall. Bold is permitted; italics are not.
 - d. Secondary text shall be all capitals, no less than 2.1mm tall. Neither bold nor italics are permitted.
7. Label Consistency:
- a. All primary labels shall have the same width. All secondary labels shall also be the same width, but that width may differ from that of the primary labels.
 - b. All label shall be of sufficient height for the outer dimensions to meet the manufacturer's installation.
 - c. In environments and applications where additional physical protection is required to preserve label integrity and legibility for the specified design life, apply additional protective materials. In such cases, apply the additional materials to all labels in the system. If a specific design life is not otherwise specified, assume 10 years will be required.
 - d. Primary labels shall utilize the same font type, font size, font spacing, and margin spacing except in the case of user-accessible cable labeling. Secondary labels shall utilize the same font type, font size, font spacing, and margin spacing. The properties of the primary labels may differ from the secondary labels, but they shall be consistent within each label type.
 - e. Unless defined otherwise within the labeling schema, text shall be the same color. Text color shall present high contrast to the background color of the label. Black text on a white background is preferable, but where any other color scheme is used, a contrast of no less than 3:1 shall be achieved.

3.9 FIELD QUALITY CONTROL

- A. Initial Tests and Measurements: Prior to final adjustment and scheduling acceptance testing, perform initial tests and measurements. At minimum, include the following initial tests and measurements:
- 1. Adjust, balance, and align equipment for optimum quality and to meet manufacturers' published specifications.
 - 2. Perform the test procedure provided at the end of this specification and return the completed form no less than one week prior to the initial punch walk.
 - 3. For rack-mounted equipment with user-accessible controls, install 1/8" diameter vinyl "map dots" as indicators for nominal operating positions of rotary, slider, and other accessible controls. Provide multiple dots, adequately distinguished, for controls having more than one nominal operating position.
- B. Twisted-pair Cable Testing: Follow the following procedures to test CATEGORY-type twisted pair cabling.
- 1. Equipment, or equal:
 - a. Fluke DSX CableAnalyzer
 - 2. Test Procedure:
 - a. Configure the cabling and test set up as a permanent link.
 - b. Test each cable under a TIA-568 Permanent Link test script to match the category of the installed cabling.

- C. Fiber Optic Cable Testing: Follow the following procedures to test fiber optic cabling.
1. Equipment, or equal:
 - a. MicroCare Fiber Wipes, or equal
 - b. SPC FiberXP DI-200 Fiber Optic Inspection Scope, or equal
 - c. Fluke DSX-5000, AFL Noyes SMLP4-4 Fiber Optic Loss Test Kit, or equal
 2. Test Procedure:
 - a. Using approved materials, clean each connector end face before testing.
 - b. Using the inspection scope, inspect each connector end face.
 - c. Multi-mode Fibers:
 - 1) Set up the optical loss test set under either IEC 61280-4-1 Single Reference Cable Method or the TIA 526-14 OFSTP-14 Method B.
 - 2) Measure the insertion of each fiber. Record the measurements.
 - 3) Re-terminate or replace cables with fibers that exceed 3 dB at 850 nm and 1 dB at 1,300 nm end-to-end insertion loss.
 - d. Single-mode Fibers:
 - 1) Set up the optical loss test set per TIA-526-7 test method A.1 "One Jumper-Cable Measurement".
 - 2) Measure the insertion of each fiber. Record the measurements.
 - 3) Re-terminate or replace cables with fibers that exceed 1.5 dB at 1,310 nm and 1.5 dB at 1,550 nm end-to-end insertion loss.
- D. Digital Video Cabling: Follow the following procedure to test each provided digital video cable.
1. HDMI: Quantum Data 780, or equal
 2. DVI/SDI/HD-SDI: Quantum Data 882D, or equal
 3. DisplayPort: Quantum Data 882E-DP, or equal
 4. Test Procedure:
 - a. Test each cable.
 - b. Replace all cables that fail.
- E. Audio System Testing:
1. Loudspeaker Line Impedance: Measure the impedance at 63 Hz, 250 Hz, and 1 kHz and the resistance of each loudspeaker line leaving the sound equipment rack with the line disconnected from its normal driving source. For lines to full range distributed loudspeaker systems, measure impedance at 1 kHz.
 2. Hum and Noise Level:
 - a. Measure the hum and noise levels of the overall system for each microphone input channel and line level input channel.
 - b. Adjust gain controls for optimum signal to noise ratio so that full amplifier output is achieved with 0 dBm at a line level input.
 - c. Terminate line level inputs with resistors of 150 and 600 ohms, respectively, for these measurements.
 - d. Disconnect the loudspeaker lines and terminate the power amplifier outputs with power resistors for these measurements. Use load resistors within 5% of the nominal load impedance of the amplifier under test. Use resistors with power ratings equal to or greater than the power rating of the amplifiers.
 3. System Frequency Response: Measure audio system frequency response for the AV systems described in Part 1. Adjust systems to provide specified performance.
 4. Uniformity of Coverage: Using a calibrated testing device, measure octave bands using a pink noise test signal played through the loudspeaker system(s).
 5. System Power Output and Signal Level Adjustment:
 - a. Measure the electrical distortion of the overall system for each line level input channel.
 - b. Adjust gain control as for the tests specified herein.
 - c. Apply a 1 kHz sine wave signal from a test signal generator having less than 0.5% total harmonic distortion at the input tested, at a level required to produce full

- amplifier output. Note that a pad with 150-ohm output impedance is required for driving the microphone level input in accordance with the EIA standard.
- d. Use a distortion analyzer to measure the output level and total harmonic distortion of the audio equipment. In the absence of a distortion analyzer, a high input-impedance measuring device such as a DMM may be used to measure the output level.
6. Loudspeaker Polarity:
 - a. Perform loudspeaker line polarity checks using a polarity tester or use DC source at one end of each line and a voltmeter at the other end. Confirm that loudspeaker lines are correctly polarized with respect to color coding.
 - b. Confirm loudspeaker polarity using a polarity tester.
 7. Freedom from Parasitic Oscillation and Radio Frequency Interference:
 - a. With systems set up for each mode of operation specified in the Part 1, confirm that systems are free from spurious oscillation and radio frequency pickup, in the absence of audio input signal and when the system is driven to full output at 100 Hz.
 - b. Confirm these tests audibly and by using an oscilloscope having at least 5 MHz bandwidth.
 - c. Apply a slow sine wave sweep from 50 Hz to 5 kHz at a level of 6 dB below rated power amplifier output to each system. Listen carefully for buzzes, rattles and objectionable distortion.
 - d. Correct causes of these defects unless the cause is clearly from other than the sound amplification system's equipment and installation, in which case bring the cause to the attention of the Owner and Architect.
 8. Audio Test Signal Paths: Verify operation from source inputs through system components to signal destinations.
- F. Projection Systems:
1. For each projection system, measure light intensity at the screen's center and four corners. Take corner measurements 5% of the image area width and height in from image edges.
 2. Use a properly calibrated foot-candle (or lux) meter with cosine correction for the above measurements.
- G. Control Systems:
1. Verify all operational functions at each fixed control interface position.
 2. Verify all operational functions of provided wireless control devices.
 3. Verify all operational functions of the control system and interfaced devices.
- 3.10 CLEANING, PROTECTION AND REPAIR
- A. Comply with the cleaning requirements of section 270000.
 - B. During the installation and up to the date of final acceptance, protect finished and unfinished work against damage and loss. In the event of such damage or loss, replace or repair such damaged work.
- 3.11 SUBCONTRACTOR MANAGEMENT
- A. Continuously supervise subcontractors during the installation; intermittent supervision is not acceptable.

3.12 SYSTEM ACCEPTANCE TESTS

- A. Perform system acceptance tests after completion of initial system checkout and after submitting the Initial Testing and Tuning Report.
- B. Prior to setting up a demonstration and/or punch walk with the Engineer, ensure that the System/Systems are complete, operational, and fully functioning, and that pre-functional and functional testing have been completed. Fees for any additional punch walks resulting from incomplete and/or non-functioning Systems may be assessed.
- C. System acceptance tests consist of the following:
 - 1. Take a physical inventory of equipment on site and compare it to equipment lists in the contract documents.
 - 2. Demonstrate the operation of system equipment.
 - 3. Perform both subjective and objective tests to determine compliance with the specifications. Provide test equipment specified for these tests.
 - 4. Provide final, "as built" drawings, run sheets, manuals, and other required documents, as detailed in Part 1.
 - 5. Provide complete testing reports generated by subsystems that provide self-testing.
 - 6. Perform power on/off cycles to ensure these take place with no audible and only minimally visible artifacts, pops, etc.
- D. Initial Testing and Tuning Report
 - 1. Perform the following tests for each system unless otherwise noted in Part 1.
 - 2. Use additional pages as necessary to allow complete comments.
 - 3. Where blanks are provided in the checklist below, observe the associated value in parenthesis.

Test	Description	Result	Comment
1	Record equipment that was specified but is not present. Provide a reason why this equipment is not present.		
2	Confirm no sharp or jagged surfaces are accessible to users and technicians.		
3	Confirm that each active device's external temperature, measured using a non-contact thermometer, is within manufacturer's guidelines.		
4	Perform and log cable inspection. Confirm each cable is labeled, dressed, included in a bundle with cables with like signals, not under stress, is serviceable, is correctly strain-relieved, is not bent beyond manufacturer's recommended bend radius, does not have tie wraps tensioned excessively or used inappropriately. Confirm labels are positioned and oriented consistently and are legible and unambiguous.		
5	Demonstrate that the full inventory is new equipment, in full compliance with the specification, or as modified by approved submission. Record test results as pass/fail, and list exceptions.		

Test	Description	Result	Comment
6	Confirm rack elevation and single-line drawings, cable and other labels and engravings are an accurate model of the furnished system, and comply with latest revised specifications. Record test results as pass/fail.		
7	Confirm switcher inputs and outputs are labeled (wherever possible), so that users can easily make manual routes quickly without having to refer to the system drawings.		
8	Confirm amplifier channels are properly labeled, so technicians can make quick adjustments without having to refer to the system drawings.		
9	Confirm rack mounted equipment is labeled and that the labels match those on the drawings (equipment symbols and/or description), control system, field plates, patch panels, and any labels associated with the system.		
10	Confirm modular terminations are solid in their connectors.		
11	Confirm each coax cable respects the manufacturer's minimum bend radius or at least 5x the cable's diameter.		
12	Record ambient noise, A-weighted, slow.		
13	Confirm power amplifiers are working within rated load. <i>Record the impedance (and at what frequency) of each loudspeaker line on each power amplifier at 63, 250, and 1,000 Hz.</i>		
14	Using appropriate test signals, have the sound system produce a nominal operating level of __ (65) dB SPL for conference speech, __ (60) dB SPL for program material, "A" weighted at all listeners' ears \pm __ (2) dB ("Uniformity of Coverage") (or at least __ (15) dB above the ambient noise, A-weighted, whichever is greater), with the control system volume control indicating "normal" or default setting. <i>Record results for each channel and source.</i>		
15	Confirm the system is capable of producing an additional __ (15) dB above this level (__ (80) dB SPL) for each audio source, with less than 0.5% THD (Total Harmonic Distortion) plus noise. <i>Measure THD plus noise when source is at __ (15) dB above nominal operating level at each "destination", for all sources selected.</i>		

Test	Description	Result	Comment
16	Confirm the system develops a noise level that is electrically __ (55) dB below the normal operating level for all audio sources. "Noise" refers to the aggregate of hum, electrostatic noise, RF interference, etc. <i>Measure and record Signal to Noise ("signal" measured electrically at nominal operating level at each destination, for all sources selected).</i>		
17	Confirm program loudspeakers are connected in the same polarity, and speech reinforcement systems are polarized such that a positive acoustic pressure on a microphone results in a positive acoustic pressure at the loudspeaker ("Polarity Test").		
18	Confirm the system produces no more than a __ (1) dB variance in program source levels when each program source is playing audio from a calibrated medium (CD, test signal generator, etc.)		
19	Confirm there is no audible vibration caused by improper mechanical installation. <i>Use a continuous sweep signal at headroom level (from an audio test signal generator or test CD.) Provide a pass/ fail result and document which device fails and the frequency of these artifacts.</i> ("Buzzes and Rattles Test").		
20	Confirm speech reinforcement systems are stable, with no ringing nor feedback.		
21	For audio conference systems, adjust microphone input gain to demonstrate that a "standard talker" (60 dB SPL at 1 m), positioned at each talker position in the room, produces a 0 dB level at the input of the mixer bus of the audio conference DSP device. If there is local voice reinforcement ("mix-minus"), AGC and ALC may need to be restricted when performing this test. <i>Record test results as pass/fail. Record level across analog telephone line, if one is used. Inspect DSP mixer telephone line levels, both transmit and receive, when normal speech is encountered in the room.</i>		
22	For conferencing mode, at the __ (65) dB SPL listening level, confirm full duplex operation, with no reports of echo or "speech trails" as detected from the far end.		

Test	Description	Result	Comment
23	Confirm equalizers, whether hardware or virtual, are adjusted for best intelligibility, and in accordance with any preferred acoustic level response curves. <i>Record the “house curve” before equalization, as well as after the equalizers have been tuned, with and without microphone input filters. If requested by the Consultant, produce this documentation for systems without equalizers, as this test may apply to the preamp filter settings in cases where intelligibility can be improved.</i>		
24	If required, confirm system intelligibility, with a RSTI (Rapid Speech Transmission Index) greater than 0.85.		
25	For wireless microphone systems, with all wireless microphones turned on, confirm that throughout the specified operating area for the transmitter, there are no dropouts, intermodulation interactions between wireless systems, nor RF-caused artifacts.		
26	If required, for composite video sources, connect a test generator at each input and confirm 1 volt peak-to-peak to each destination $\pm 10\%$ (or 1dB). <i>Record results at each destination using NTSC/PAL bars, peak white, and five-step multiburst (0.5, 1.0, 2.0, 3.0, 3.58, and 4.2 MHz).</i>		
27	For NTSC sources, confirm optimum brightness, contrast, and color in displays using a SMPTE source with PLUGE display.		
28	Where several displays are visible in the same space, confirm picture tonal consistency across all of them. For composite video signals, use NTSC color bars with PLUGE signal to all. For digital video signals use a colorimeter and test color signal software to confirm consistent images		
29	Confirm projectors are focused, centered, and evenly illuminated. <i>If requested, confirm using a calibrated light meter that the brightest measurement locations are no more than +10% above average, and the dimmest locations no less than –5% below average measurement. If requested, document that geometric distortion is within 2% tolerance. Take actual measurements if necessary (top, bottom, left, right dimensions of white portion of screen) and photograph if necessary.</i>		
30	Confirm that the system displays with stability, and with no scaling-related visual artifacts when switching between, at a minimum, the resolutions specified in 1.04 D. Record test results.		

Test	Description	Result	Comment
31	<p>Where HDMI, DVI, or DisplayPort signals are included in the system, confirm that an acceptable signal is being displayed on the monitor from each source position. Use the Alt Pixel test image (pixel-on, pixel-off) for each resolution included in the design intent: 1,920x1,200@60, 1,920x1,080@60, 1,280x720@60, as required. Inspect each, leaving the signal on for three minutes. Confirm that no artifacts are visible.</p> <p>For systems including 4k displays, test also at 3,840 x 2,160 and 4,096 x 2,160.</p> <p>Note: If the signal is going to a codec, disable HDCP. If the signal is going to a display, enable HDCP unless specified otherwise in Part 1.</p>		
32	Using a signal generator, confirm scaler and display/projector configurations by successfully passing video at the resolutions defined in 1.04 D.		
33	Confirm HDCP is maintained from sources to destinations except as excluded above. Confirm EDID is managed correctly and that devices output at resolutions supported by the system.		
34	Confirm the control system controls all of the required equipment as specified. Confirm system performs with stability and in sync with the equipment being controlled without the need to reset any item of equipment. Confirm that user interface requirements dictated in Part 3 of the audiovisual specifications have been met.		
35	Confirm system is serviceable: all devices must be easily removable for repair by one person; all cables must be dressed neatly and be provided with adequate services looks, must be bundled in forms (refer to "Sound System Engineering", Davis and Davis, 1987 and "Audio Systems Design and Installation", Giddings, 1990) having no excessive pressure on cables at termination points and connectors, and each cable number must agree with the shop drawings and cabling run list.		
36	Confirm switches and receptacles are logically and permanently labeled.		
37	Confirm nomenclature for consistency: drawings, touch screen, wall plates, floor boxes, patch panels, equipment, etc.		
38	Confirm patch cables have cable numbers.		

Test	Description	Result	Comment
39	Where cameras are included in system, confirm each operates correctly and provides correct image quality.		
40	Confirm camera presets are programmed as specified by the user. In the absence of Owner direction, create and document presets that are logical for the room's layout.		
41	Confirm TV reception from all sources (OTA, CATV, etc.) and that all channel presets are accurate.		
43	Confirm and document the IP configuration information provided by the Owner is loaded into the equipment, including IP and MAC addresses, Dante device names, subnet masks, gateways, time server, gatekeeper, etc. Confirm that all network functions specified by the customer function properly on the customer's LAN.		
44	Confirm all web-based system control and monitoring features, and other IP system functionality (time servers, system-generated e-mail, etc.) are completely functional.		
45	Confirm that display devices have On-Screen Displays/Menus disabled. If the customer has directed otherwise, document from which person this direction came.		
46	Confirm that video projectors have blue screens or other images or colors displayed in the absence of an input signal disabled. If the customer has directed otherwise, document from which person this direction came.		
47	Log test conference calls (audio and video). Include in the log start time, line used, number called, status of connection (completed/failed, etc.) who was spoken with at the far end, success of full duplex, success of auto-disconnect, dB SPL in the room. Note static, jitter/packet loss, or any other artifacts, distortion, etc. Note if auto-disconnect functions as specified.		
48	Using a full-screen white test signal, confirm no direct view display nor projector has more defective pixels than specified in Part 1. Note number and location of lost pixels, if any. Provide photos of defects. Include room numbers and any other distinguishing information in photo file names.		
49	Check for excessive vibration on VC camera(s) at full telephoto position.		
50	Provide video recordings of all non-conformances and anomalies.		
51	Confirm all visible devices are installed square and plumb.		

Test	Description	Result	Comment
52	Confirm no dust, grease, scratches, or any other signs of handling are visible on any devices		
53	Confirm assistive listening systems work throughout intended listening areas		
54	Confirm closed captioning is functional on all displays		
55	Confirm control system user interfaces provide a means to enable and disable display of closed captions		

- E. If further adjustment is required, or defective equipment must be repaired or replaced, tests may be suspended or continued at the option of the Owner or Owner's representative.
1. If the need for further adjustments becomes evident during the demonstration and testing, continue work until the installation operates properly. Included in the continued work, changes to or installation of resistive pads, adjustment of loudspeaker aiming, adjustment of system processing, programming changes to the control system, convergence and/or alignment of the video projector, if these adjustments are required.
 2. If acceptance of the system is delayed because of defective equipment or because the equipment does not fulfill this specification, reimburse the Owner for time and expenses for these tests during extensions of the acceptance testing period.

3.13 OWNER TRAINING

- A. Provide a minimum of 16 hours of training on the audiovisual systems specified herein at the project site (or other location designated by the Owner) by a qualified instructor (equipment manufacturer as needed) covering operation and maintenance of the systems.

3.14 MAINTENANCE AND EXTENDED SERVICE

A. Warranty Maintenance

1. On a quarterly basis during the warranty period, execute a service visit to check and adjust equipment and systems such that they maintain the original performance. Coordinate visits directly with the Owner.
2. Pre-emptive Maintenance Minimum Requirements:
 - a. Clean filters, vents, and lenses, and dust the equipment.
 - b. Verify projector images fill screens appropriately and images are focused.
 - c. Test and verify that all system controls operate as labelled and that the controlled devices respond accordingly.
 - d. Document and photograph any conditions that may affect the continued function and long-term operation of the audiovisual system and report to owner.
 - e. Document and report projector lamp life to the Owner and replace lamps as directed.

B. Provide cost for additional service levels beyond the warranty period (as defined in this section) as follows:

1. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and same-day issue response
2. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and 24-hour issue response

3. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and 48-hour issue response
- C. Touch Panel Programming Updates
1. At a date determined by the Owner within six months following Substantial Completion, attend a single meeting with them regarding alterations or updates to the touch panel layouts or function. At a time approved by the Owner, implement those alterations or updates.
 2. Provide any training necessitated by these revisions.
 3. Provide documentation of these revisions to the Engineer.
 4. Provide the source code documentation according to “Software License” in this section.

END OF SECTION

SECTION 275133

TWO-WAY COMMUNICATIONS SYSTEM FOR ACCESSIBLE MEANS OF EGRESS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Two-way emergency communication system for accessible means of egress, including related infrastructure and functional requirements (addressing CBC Section 1007.8, 1009.8, 1009.9 {and subparagraphs}, NFPA 72 section 24.5.3 {and subparagraphs}, and NFPA 101 items 7.2.12.2.5 and 7.2.12.2.6).
- B. Related Sections
 - 1. Comply with the requirements of Section 270000

1.2 REFERENCES

- A. Comply with the References requirements of Section 270000.
- B. Section 10 14 00 SIGNAGE
- C. Section 28 31 11 DIGITAL, ADDRESSABLE FIRE-ALARM SYSTEM
- D. In addition or particular to the codes and standards listed in Section 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. California Code of Regulations (CCR), Title 24
 - a. Volume 2, "California Building Code" (CBC), Section 1007 and referenced sections

1.3 DEFINITIONS

- A. Definitions of Section 270000 apply to this section.
- B. In addition to the Definitions article of Section 270000, the following list of terms as used in this specification defined as follows:
 - 1. "AOR": Area of Refuge (as defined in CBC Section 1007.6)
 - 2. "Cabling": refer to 270000 for definition
 - 3. "Calling Station": System functional unit that provides two-way voice communications between the occupancy space's egress path (such as an elevator landing or area of refuge on an accessible floor) and the central control point
 - 4. "Central Control Point": shall mean either the a location approved by the fire department to monitor the System or fire command center
 - 5. "Command Station": System functional unit that that receives and controls communicates with the calling stations
 - 6. "IEEE": Institute of Electrical and Electronics Engineers
 - 7. "IP": Internet protocol
 - 8. "LED": light emitting diode
 - 9. "PoE": "Power over Ethernet

10. "SIP": Session Initiation Protocol
11. "Telco": shall mean the telecom utility company
12. "UPS": Uninterruptable Power Supply
13. "VoIP": Voice over IP

1.4 SYSTEM DESCRIPTION

- A. Provide planning, coordination, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working two-way communications system (herein "System") described in this section and shown on related T-series drawings. The System shall consist of headend equipment, command station(s), calling stations, directions (instructional signage), rough-in, cabling, programming, labeling, and connection to the designated outside phone line(s). Refer to the drawings for locations of the command station(s) and call stations.
- B. System Requirements
 1. The System shall fulfill the requirements and intent of CBC section 1007, 1009.8, 1009.9 (primarily 1007.8), and all subparts and references relative to two-way communications.
 2. The System, including installation, shall meet applicable ADA requirements.
 3. The System headend or control station shall provide power to the calling stations; the calling stations shall not require power local to station.
- C. System Operation: The System shall operate as follows and/or feature the following:
 1. When a call is initiated from any calling station, the System shall establish a dedicated and uninterrupted hands-free, full duplex, two-way communications session between the calling station and a command station (effectively acting as an intercom).
 2. The call station shall produce a visual annunciation to indicate that a call has been placed. Annunciation may be fulfilled as an LED integrated into call station. The LED should illuminate as blinking when a call is placed and in queue, and should illuminate as solid when a call session has been established with the command station.
 3. The command station shall produce visual and audible annunciations to indicate an incoming call from a call station. Visual annunciation may be fulfilled as an LED integrated into the command station or a separate strobe. Audible annunciation may be fulfilled as a loud ring integrated into the command station or as a separate siren.
 4. The command station (or associated annunciation panel) shall display requisite information – identify the call station showing the station identifier, story/floor/level, and location on the given level.
 5. When the command station has an active conversation with one calling station, the System shall automatically queue additional calls from other calling stations and shall automatically put through the calls in order received when the previous call is completed.
 6. When the central control point is not staffed, the System shall automatically route calls from call stations to an emergency outside line. This will allow a call placed from a call station to ultimately reach a monitored rescue team.
 7. The System shall be able to initiate a call at the command station to any calling station.
- D. Coordinate the System with the VoIP system integrator. Support the VoIP integrator's programming of the System calling requirements for calling stations and command stations.
- E. Provide a UPS to power the System for at least 4 hours in the event of a loss of utility or normal power.
- F. Provide labeling and identification tags.

1.5 SUBMITTALS

- A. Comply with Submittal procedural, quantity, and format requirements of Section 270000.
- B. Substitutions: Comply with the Requests for Substitutions requirements and procedures of Section 270000.
- C. Submittal Requirements Prior to the Start of Construction:
 - 1. Product Data Submittal, consisting of production details (specifications, dimensions, connectivity requirements, etc.) and regulatory listings and certifications
 - 2. Shop Drawings Submittal, consisting of system configuration diagrams (for example, block diagram, riser diagram, and/or other diagrams), floor plans (showing station locations), installation details, and system labeling
 - a. The shop drawings shall show the dimensioned location where the control station and System equipment will be installed.
 - 3. Schedule Submittal, consisting of proposed schedule of work – this schedule may be combined with the schedule developed for division 27
- D. Submittal Requirements at Closeout:
 - 1. As-Built Drawings, consisting of floors plans (can be combined with telecommunications as-built drawings), block diagrams, and other drawings to accurately and fully describe the System – refer to section 270000 “Submittals” for more information
 - 2. Warranty statement and instructions (contact information, etc)
 - 3. O&M Manuals, consisting of product cut sheets, as-built drawings, and warranty information– also refer to section 270000 “Submittals” for more information

1.6 QUALITY ASSURANCE

- A. Comply with quality assurance requirements of Section 270000.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Comply with the delivery, storage and handling requirements of Section 270000.

1.8 WARRANTY

- A. Warrant the System as required in the general warranty.
- B. In addition, warrant the System for the manufacturer’s full period – 5 years minimum.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Equipment shall meet requirements of CBC section 1138A.4.
- B. System electrified components (such as headend equipment, control stations, and calling stations) shall be UL listed.

C. Communications shall be full duplex.

2.2 COMMAND CENTER AND DISTRIBUTION MODULE

- A. Manufacturer, or equal: Rath Communications Series 2500
1. #2500-12 RCF; annunciation panel, up to 12 zones

2.3 POWER SUPPLY

- A. Manufacturer, or equal: Rath Communications
1. #2500-PWRUPS; power supply with battery backup

2.4 CALLING STATION

- A. Manufacturer, or equal: Rath Communications Series 2400
1. #2400-808NSP; call station, push button, stainless steel, flush mount

2.5 CABLING

- A. Cabling for two-way communication system shall meet the applicable requirements for pathway survivability.
- B. Manufacturer, or equal: Rath Communications
1. # RPP66010002; 18 AWG-2 Conductor Shielded 2 Hour Fire-Rated UL Listed FPLR-CI-LS, CMR-CI-LS, PLTC-CI-LS, C(UL), CMR-LS & CSA FAS 90, cable ANSI/UL 2196 Certified.

2.6 IP INTERFACE

- A. Meets NFPA 72 supervision requirements
- B. Protocols and Connections
1. VoIP Protocols: SIP v2, SDP, RTP, and RFC 2833
 2. Network Protocols: IPv4, TCP, UDP, DHCP, SNTP, STUN, HTTP, and PPPoE
 3. Connections: FXS RJ11 and WAN RJ45 (10/100 BaseT)
- C. Manufacturer, or equal: Rath Communications
1. #2100-VOIP2CS

2.7 COMMAND SYSTEM SUPERVISOR

- A. Manufacturer, or equal: Rath Communications
1. #2500-12SPRVS

2.8 CALL STATION SIGNAGE

- A. Call station signage shall comply with CBC 1009.8.2.
- B. Call station signage provided by signage consultant, per specification Section 10 14 00 SIGNAGE.

2.9 CABLE, TERMINATION APPARATUS, AND CABLE LABELS

- A. Refer to section 271513 for cable, termination apparatus, and cable labeling requirements.

PART 3 - EXECUTION

3.1 GENERAL

- A. Comply with the Execution requirements of Section 270000.

3.2 EXAMINATION AND PREPARATION

- A. Call Stations: Prior to installation:
 - 1. Confirm the installation dimensions of call stations and associated signage within each space (as the station may impact surrounding finishes).
 - 2. Verify that the rough-in is installed properly using the proper products.
 - 3. Verify locations are ready for the installation and that surfaces are suitable to accept the calling stations.
- B. Central Control Point: Prior to installation, verify the room is ready for the installation and that surfaces are suitable to accept the control stations and equipment.

3.3 INSTALLATION

- A. Call Stations
 - 1. Height: Install calling unit such that the call button is at 48" AFF.
 - 2. Fasteners: Install calling stations using tamper-proof screws; quantity and type as required by the manufacturer's installation instructions.
- B. Command Stations
 - 1. Install the command station onto the wall at the designated location at 60" AFF to the center of the cabinet.
 - 2. Install headend equipment at the designated location within the BDF, and make final connections. Dress wiring and cords within cable management apparatus.
- C. System Programming
 - 1. Program each calling station per the manufacturer's instructions to call directly to the command station.
 - 2. Program each command station/headend equipment with each call station's requisite information. Program each command station/headend equipment with the automatic roll-over number (number provided by the Owner).

- D. Fire Alarm Panel Connections and Coordination
 - 1. Provide all connections required to the fire alarm panel and coordinate with the fire alarm panel installer.
- E. Cabling: Refer to section 271513 for cabling installation and labeling requirements – placement, termination, patching/crossconnecting, identifier, and labeling.
- F. Cabling Testing: Refer to section 270811 for cabling testing requirements.
- G. Manufacturer's Installation Requirements
 - 1. Provide all hardware, cabling, and apparatus required for installation per the manufacturer's installation requirements.

3.4 PROTECTION

- A. After installation, protect in place call stations, signage, headend equipment, command stations, and related equipment/accessories to mitigate damage from other construction activities.
- B. Repair damaged call stations, signage, and related System equipment/accessories to a like-new condition. Replace products damaged beyond repair, at no cost to the Owner.

3.5 PRE-FUNCTIONAL TESTING

- A. Test cabling per the requirements of 270811.
- B. Test the emergency outside line. Ensure the line is active and successfully reaches a monitoring rescue team.

3.6 FUNCTIONAL TESTING

- A. Prior to acceptance testing, perform the functional testing and submit a functional testing report.
- B. Test 1: Calling Station Operation
 - 1. At each calling station, press the call button.
 - 2. While the call station is in the process of establishing a connection with the command station (e.g., dialing), confirm the call station illuminates the dialing-in-process light. Record the light operation.
 - 3. Confirm each station establishes a two-way communications link with the command station. Record each station's operation (establishing a two-way connection with the command station).
 - 4. While the call is established between the call station and the command station, confirm the call station illuminates the call-established light. Record the light operation.
- C. Test 2: Command Station Operation
 - 1. At the command station, call each calling station to confirm the command station has the ability to dial each calling stations. Record the command station operation.
- D. Test 3: Cueing Multiple Calls
 - 1. At 2 calling stations, press the call button at one station and then the call button at the other call station.

2. Confirm the first call station establishes a connection with the command station and the other call station gets put in cue. Record the System operation.
3. At the command station, disconnect the first call station. Confirm the second call station (the one that was in cue) establishes a connection with the command station. Record the System operation.

E. Test 4: Automatic Dial Out to Emergency Line

1. At a calling station, press the call button. At the command station, do not pick up the call – let the System roll the call over to the emergency outside line (to the monitoring rescue team). Record the System operation.

3.7 FINAL INSPECTION AND ACCEPTANCE TESTING

- A. Comply with system acceptance and certification requirements of section 270000.
- B. Punch the Work of this Section compliant to the requirements of section 270000.
- C. Demonstrate System's operation witnessed by the Owner, IOR, architect, engineer, general contractor, and System installer. The Owner will accept the System only after testing demonstrates 100% functionality of calling stations, command station(s), calling scenarios, and as accepted by the IOR. Demonstrate the following System operation:
 1. Calling station operation (operation, 2-way communications with command station, visual indicators)
 2. Command station operation (operation, receiving calls from calling station, station identification per call, cueing multiple concurrent calls)
 3. Automatic roll over to outside line / monitored rescue team
- D. Remove and replace with new, at no cost to the Owner, stations and/or other components failing to meet the requirements of this section until the System proves fully functional.

3.8 TRAINING

- A. Provide up to 3 half-hour sessions with the Owner to train the owner. Training should cover (at least): system configuration (general arrangement of system and components), cabling (cable type, routes, crossconnections), stations (detailed descriptions, features), system programming, emergency outside line (connection location, number, description of the monitoring rescue team), and other pertinent aspects.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 28000
BASIC SECURITY REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

- A. This section includes general administrative and procedural requirements for division 28 sections and supplements the requirements specified in Division 1.
- B. The requirements described herein include the following:
 - 1. References
 - 2. Definitions
 - 3. System Description and Existing Conditions
 - 4. Submittals
 - 5. Quality Assurance
 - 6. Permits and Inspections
 - 7. Coordination
 - 8. Project Management and Coordination Services
 - 9. Product Delivery, Storage, and Handling
 - 10. Warranty
 - 11. Maintenance
- C. Products Supplied But Not Installed Under This Section:
 - 1. None
- D. Products Installed But Not Supplied Under This Section:
 - 1. None
- E. Products Specified But Not Installed Under This Section:
 - 1. None
- F. Products Furnished and Installed Under another Section:
 - 1. 120V power
 - 2. Conduit, junction boxes, device boxes (essentially rough-in)
 - 3. Door hardware
 - 4. Network cabling and equipment
- G. Related Sections:
 - 1. Consult other sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable installation.
 - 2. Section 270528, "Pathways for Communications Systems"
 - 3. Section 280553, "Security System Labeling"
 - 4. Section 280800, "Security System Acceptance Testing"
 - 5. Section 281300, "Access Control and Alarm Monitoring System"
 - 6. Section 282300, "Video Surveillance System"
 - 7. Earthwork: Include trenching, backfilling, boring and soil compaction as required for the installation of underground conduit, in-grade pull boxes, vaults, and bollard foundations.

8. Selective Demolition: Nondestructive removal of materials and equipment for reuse or salvage as indicated. Also dismantling electrical materials and equipment made obsolete by these installations.
9. Concrete Work: Include forming, steel bar reinforcing, cast-in-place concrete, finishing and grouting as required for underground conduit encasement, pedestal foundations, and curbs. [Also includes saw-cutting of existing slabs and grouting of conduits in saw-cut.]
10. Miscellaneous Metal Work: Include fittings, brackets, backing, supports, rods, welding and pipe as required for support and bracing of raceways, equipment enclosures, cameras, and similar devices.
11. Miscellaneous Lumber and Framing Work: Include wood grounds, nailers, blocking, fasteners, and anchorage for support of security materials and equipment. Refer to Division 6, Rough Carpentry.
12. Moisture Protection and Smoke Barrier Penetrations: Include membrane clamps, sheet metal flashing, counter flashing, caulking and sealant as required for waterproofing of conduit penetrations and sealing penetrations in or through fire walls, floors, ceiling slabs and foundation walls. Tape and make vapor tight penetrations through vapor barriers at slabs on grade.
13. Division 8 Locking Hardware: Include interface to electronic hardware and door controllers on security related doors.
14. Access Panels and Doors: Required in walls, ceilings, and floors to provide access to security devices and equipment.
15. Painting: Include surface preparation, priming and finish coating as required for security cabinets, exposed conduit, pull and junction boxes, and devices where indicated as field painted in this Division.

1.2 REFERENCES

- A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.
- B. Codes: Perform work executed under this section in accordance with applicable requirements of the latest edition of governing codes, rules and regulations including but not limited to the following minimum standards, whether statutory or not:
 1. California Code of Regulations (CCR):
 - a. Title 8, "Industrial Relations"
 - 1) Chapter 3.22, "California Occupational Safety and Health Regulations (CAL/OSHA)"
 - b. Title 24, "California Building Standards Code"
 - 1) Part 1, "California Building Standards Administrative Code"
 - 2) Part 2, Volumes 1 and 2, "California Building Code" (CBC)
 - 3) Part 3, "California Electrical Code" (CEC)
 - 4) Part 11, "California Green Building Standards Code" (CALGreen)
 2. National Fire Protection Agency (NFPA)
 - a. NFPA 70, "National Electrical Code" (NEC)
 - b. NFPA 75, "Protection Of Information Technology Equipment"
 - c. NFPA 262, "Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces", 2007
 3. Code of Federal Regulations (CFR) Title 47 "Telecommunication", Chapter I "Federal Communications Commission (FCC)":
 - a. Part 27, "Miscellaneous Wireless Communications Services"
 4. Other applicable national, state, and local binding building and fire codes

- C. Standards: Perform work and furnish materials and equipment in accordance with the latest editions of the following standards as applicable:
 - 1. Underwriter's Laboratories (UL): Applicable listing and ratings.
 - a. UL 294, "Access Control System Units"
 - b. UL 1076, "Proprietary Burglar Alarm Units and Systems"
 - c. UL 2044, "Commercial Closed-Circuit Television Equipment"

1.3 DEFINITIONS

- A. The Definitions of Division 1 apply to the sections of Division 28.
- B. In addition to those Definitions of Division 1, the following list of terms as used in this specification defined as follows:
 - 1. "ACAMS": Access Control & Alarm Monitoring System
 - 2. "As directed": As directed or instructed by Owner, or their authorized representative
 - 3. "Cabling": A combination of cables, wire, cords, and connecting hardware [e.g., cables, conductor terminations, connectors, outlets, patch panels, blocks, and labeling]
 - 4. "Connect": To install required patch cords, equipment cords, crossconnect wire, etc. to complete an electrical or optical circuit
 - 5. "Engineer": TEECOM
 - 6. "Furnish": To purchase, procure, acquire, and deliver complete with related accessories
 - 7. "Install": To set in place, join, unite, fasten, link, attach, set up or otherwise connect together and test before turning over to Owner, parts, items, or equipment supplied by Contractor or others. Complete installation and make ready for regular operation
 - 8. "Owner": Laney College
 - 9. "Provide": furnish and install
 - 10. "Security System": the ACAMS, IDS, VSS, and Intercom systems collectively and integrated
 - 11. "SEC": Security Equipment Enclosure
 - 12. "VAC": volts alternating current
 - 13. "VDC": volts direct current
 - 14. "VSS": video surveillance system
 - 15. "VMS": visitor management system

1.4 SYSTEM DESCRIPTION

- A. Overview
 - 1. Laney College is constructing a 3-story multi-level library building.
 - 2. Security at the new facility consists of access control and alarm monitoring (ACAMS), and video surveillance (VSS). The ACAMS will automate opening and closing the buildings, control access through designated doors, and will restrict after-hours access to authorized cardholders.
 - 3. The new system will connect to Owner's existing head end located in the data center over the Owner's LAN/WAN.
 - 4. The System includes integration to the Fire/Life Safety system to disconnect power to magnetic door holders and automatically close doors after hours.
 - 5. The System includes elevator security and integration between the electronic security system and elevator controller.
 - 6. Refer to individual sections for detailed description of systems.

- B. Custom Device Requirements
 - 1. General: Provide a high level of coordination services to ensure the proper installation and functioning of the security system. Coordinate the installation of the security system with other trades. This may include: review of other trade's shop drawings, attendance at meetings, providing samples for mockup, and preparation & distribution of written documentation.

1.5 SUBMITTALS

- A. Submit required submittals in accordance with the requirements of section 013300 "Submittal Procedures".
- B. Required submittals include the following:
 - 1. Written detailed project description
 - 2. Project schedule as referenced in this section
 - 3. Product data sheets – clearly indicate by arrows or brackets precisely what is being submitted on and those optional accessories which are included and those which are excluded
 - 4. Estimated delivery lead times for products
 - 5. Voltage drop calculations demonstrating less than ten percent voltage loss to individual security devices
 - 6. Battery calculations showing backup support of security equipment and locks (except egress hardware with local power supplies) for 25 lock activations or 4 hours, whichever is greater
- C. Complete submittals are comprised of shop drawings and product data sheets as detailed below and related sections (covering specific security systems). Incomplete or partial submittals will be rejected.
- D. Shop Drawings
 - 1. Shop drawings shall document Contractor's intent to execute the work and shall include the following:
 - a. Title sheet and index
 - b. Floor plans showing device locations, cable routing, and pathways
 - c. System block diagrams
 - d. Point-to-point wiring diagrams
 - e. Specific wiring details and device mounting/installation details
 - f. Schedules:
 - 1) Building/floor
 - 2) Unique device name/number
 - 3) Security controller/location
 - 4) Interfaces, interlocks
 - 5) IP address
 - 6) Master/substation intercom calling locations
 - 2. Upon award of contract, request CAD release forms from TEECOM so that electronic files may be released for Contractor's use. TEECOM will release floor plans with devices; TEECOM will not installation details and block diagrams (Contractor shall develop their own diagrams and details for the shop drawings submittal package).
- E. Format: Furnish submittal data in electronic copy including table of contents with each section bookmarked by specification section listing materials.

- F. Label each submittal with the specification section number and provide a cover letter or stamp stating that the submittal has been thoroughly reviewed by Contractor and complies with the requirements of the contract documents. Failure to comply with this requirement will constitute grounds for rejection of the submittal.
- G. Resubmittals: Provide a cover letter with the resubmittal that lists the action taken and revisions made to each product submittal in response to submittal review comments. Failure to include this cover letter will constitute rejection of the resubmittal package and no review will occur.
- H. Drawings
 - 1. Prepare shop and as-built drawings using software compatible with AutoCAD and/or Revit per project standard.
 - 2. Drawing requirements:
 - a. Sheet size: match the project's contract drawings size and use the project's title block
 - b. Text size: minimum 3/32 inches high when plotted at full size
 - c. Symbology: match the project's contract drawings symbols
 - d. Backgrounds: screen background information to allow pertinent drawing information to stand out.
 - e. Line Weights: Use appropriate line weights for devices, raceways, and text to stand out against background information.
 - f. Floor Plans: 1/8 inch scale floor and site plans showing the locations of devices and cable routing paths with cable types and quantity called out.
- I. Contractor Qualifications: Submit the following for review and comment at the beginning of the project.
 - 1. Resumes of the project manager, general foreman, and lead technician(s) indicating role, years of experience, product certifications and training, listing of similar projects the individual performed the role proposed for this project along with client contact information for each.
 - 2. Certification letters from manufacturers of major system components stating Contractor is an authorized reseller, installer, and extended warranty provider for the specified security systems.
- J. Samples
 - 1. Submit samples as required for proper coordination and installation of custom mounted equipment. Examples of samples that may be required include:
 - a. Screen shots showing graphical floor plan maps indicating:
 - 1) Active functional icons
 - 2) Secure areas/zones
 - b. Camera field of views

1.6 QUALITY ASSURANCE

- A. General
 - 1. Provide new and unused materials, equipment, and parts comprising the units specified herein of current manufacturer and of highest grade.
 - 2. Only use products and applications listed in this Division on the project.
- B. Bid Discrepancies
 - 1. In the event of discrepancies within the contract documents, notify Engineer within 5 days prior to the bid opening to allow the issuance of an addendum.

2. If, in the event that time does not permit notification or clarification of discrepancies prior to the bid opening, the following applies: The drawings govern in matters of quantity, and the specifications govern in matters of quality. In the event of conflict within the drawings involving quantities, or within the specifications involving quantities, or within the specifications involving quality, the greater quantity and higher quality apply. Note such discrepancies and clarify in the bid. We will make no additional allowances because of errors, ambiguities, or omissions, which reasonably should have been discovered during the preparation of the bid.

C. Substitutions

1. Conform to the general requirements and procedure outlined in section 012500 "Substitution Procedures".
2. Where products are noted as "or equal", a product of equivalent design, construction, and performance is considered. Include in the product data submittal: catalog cuts, product information, and pertinent test data required to substantiate that the product is in fact equivalent to that specified.
3. Only one substitution allowed for each product specified. Do not provide substituted material, processes, or equipment without written authorization from Engineer. Assumptions on the acceptability of a proposed substitution, prior to acceptance by Engineer, are at the sole risk of Contractor.
4. The burden of proof rest with Contractor that the substituted product is equivalent or better than the specified product. When Engineer accepts a substitution in writing, it is with the understanding that Contractor guarantees the substituted product, component, article, or material to be equivalent to the one specified and dimensioned to fit within the construction according to contract documents. Approved substitutions do not relieve Contractor of responsibilities for the proper execution of the work, or from provisions of the Specifications.
5. Manufacturers' names and model numbers used in conjunction with materials, processes or equipment included in the contract documents are used to establish standards of quality, utility and appearance. Materials, processes or equipment that, in the opinion of Engineer, are equivalent in quality, utility and appearance will be approved as substitutions to that specified when "or equal" follows the manufacturers' names or model number(s).
6. Whenever material, process or equipment is specified in accordance with a Federal specification, an ASTM standard, an ANSI specification, UL rating or other association standard, present an affidavit from the manufacturer certifying that the product complies with the particular standard specification. When requested by Engineer, submit support test data to substantiate compliance at no additional cost.
7. Pay expenses, without additional charge to Owner, in connection with substitution materials, processes and equipment, including the effect of substitution on self, Subcontractor's or other Contractor's work.

D. Electronic Control Systems Contractor Qualifications

1. A current, active, and valid and C7 or C10 license registered with the Contractors State License Board (CSLB)
2. Minimum five years of experience in installation and service of access control, video surveillance, and intrusion detection systems
3. Minimum five completed projects similar to scope and cost
4. Evidence of technicians qualified for the work in the form of current manufacturer's training certification

E. Materials

1. Provide new materials and equipment without defects.

2. Provide only specified products and equipment, or products and equipment that have been approved in writing.

F. Regulatory Requirements

1. Work and materials to conform to the latest rules of National Board of Fire Underwriters wherever such standards have been established and to the regulations of the State Fire Marshal, OSHA and the codes of the governing local municipalities. Perform work under these specifications conforming to the most stringent of the applicable codes.
2. Provide the quality identified within these specifications and drawings when codes, standards, regulations, etc. allow Work of lesser quality or extent. The contract documents address the minimum requirements for construction.

G. Drawings

1. Layout: Follow the general layout shown on the contract drawings except where other work may conflict with the contract drawings.
2. Accuracy: The contract drawings show a diagrammatic representation of the system within the constraints of the symbology applied.
3. Detail: The contract drawings represent the design intent and do not represent the entire installation for the System. Contract drawings indicate the layout and location of control panels, devices (i.e. card readers, door locks and contacts, and duress stations) and other components. The contract drawings do not show conduits, wire and cabling between every system component, equipment, or device.
4. Complete the details necessary for point-to-point design. This allows the Contractor to attain the design intent while applying their own means and methods.

H. Role of Engineer

1. During the construction phase of the project, Engineer will work with Contractor to provide interpretation and clarification of project contract documents, process and reply to relevant Requests for Information (RFI), and act as an interface between Contractor and Owner.
2. Owner has retained Engineer's services to observe the work for general compliance with the contract documents.
3. In summary, Engineer will perform the following specific services during the design phase:
 - a. Review product submittals and shop drawings for general compliance with the contract drawings and specifications.
 - b. Review changes as they arise and confirm that the proposed solutions maintain the intended functionality of the system.
 - c. Interpret field problems for Owner and translate into understandable language.
 - d. Review the testing procedures to confirm compliance with industry-accepted practices.

1.7 PERMITS AND INSPECTIONS

- A. Obtain and pay for permits and inspections required for the work.
- B. Furnish materials and workmanship for this work in conformance with applicable legal and code requirements.
- C. Perform tests required herein, or as may be reasonably required to demonstrate conformance with the Specifications or with the requirements of legal authority having jurisdiction.

- D. Obtain review from compliance officials responsible for enforcement of applicable codes and regulations to establish that the work is in compliance with requirements of reference codes indicated herein.

1.8 PROJECT MANAGEMENT AND COORDINATION SERVICES

- A. Provide a project manager for the duration of the project to coordinate the security system work with other trades. Coordination services, procedures and documentation responsibility include at a minimum, the items listed in this section.
- B. Review of Shop Drawings prepared by Other Subcontractors:
 - 1. Obtain copies of shop drawings for equipment and systems provided by others that require connections or interface with the security system work. Thoroughly review those shop drawings to confirm compliance with the interface requirements.
 - 2. Document discrepancies or deviations:
 - a. Prepare memo summarizing the discrepancy.
 - b. Submit a copy of the specific shop drawing, indicating via cloud, the discrepancy.
 - 3. Prepare and maintain a shop drawing review log indicating the following information:
 - a. Shop drawing number and brief description of the system/material.
 - b. Date of your review.
 - c. Indication if follow-up coordination is required.
- C. Scheduling: Prepare work schedules for each floor indicating the following information:
 - 1. Submittals
 - 2. Cable Installation
 - 3. SEC Build Out
 - 4. Device Installation
 - 5. Programming
 - 6. Testing
 - 7. Training
 - 8. Other tasks included under the alternate work section of these specifications
- D. Job Conditions
 - 1. Protection: Keep conduits, junction boxes, outlet boxes and other openings closed to prevent entry of foreign matter. Cover equipment, devices, and apparatus to protect them against dirt, paint, water, chemical or mechanical damage, before and during construction period. Prior to final acceptance, restore to original condition fixture, apparatus or equipment damaged including restoration of damaged factory applied painted finishes. Protect bright finished surfaces and similar items until in service. No rust or damage will be permitted.
 - 2. Supervision: Personally, or through an authorized and competent representative, supervise the work from beginning to completion and, within reason, keep the same foreman and workmen on the project throughout the project duration.
- E. Weekly Status Reports: Prepare weekly status reports throughout the entire course of the project containing the following information:
 - 1. Current / up-to-date 2-week look ahead schedule
 - 2. Progress during prior week
 - 3. Work expected to be completed during the upcoming week
 - 4. Delivery dates for equipment
 - 5. Coordination status for each device requiring coordination with other subcontractors
 - 6. Summary of the information owed to Contractor, who is responsible for providing the information, and due date for the information

- F. Weekly Meetings: Conduct or attend weekly coordination meetings with the electrical and other specialty subcontractors to coordinate the installation of the security systems.

1.9 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Delivery
 - 1. Do not deliver security system components to the site until protected storage space is available.
 - 2. Replace equipment damaged during shipping and return to manufacturer at no cost to Owner.
- B. Storage
 - 1. Store materials in a clean, dry, ventilated space free from temperature extremes. Storage outdoors covered by rainproof material (for example, a tarp) is not acceptable.
 - 2. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic.
 - 3. Provide heat where required to prevent condensation or temperature related damage.
- C. Handling
 - 1. Handle in accordance with manufacturer's written instructions.
 - 2. Prevent internal component damage, breakage, denting and scoring. Do not install damaged equipment. Replace damaged equipment and return equipment to manufacturer.

1.10 WARRANTY

- A. Provide the Security System as described in this specification with a one-year parts and service warranty at no additional cost to Owner.
- B. Include in the warranty package, at a minimum, the following:
 - 1. Emergency maintenance service on regular working hour basis
 - 2. Service by factory trained and employed service representatives of system manufacturer
- C. Maintain regular service facilities and provide a qualified technician familiar with this work at the site within four hours of receipt of a notice of malfunction including weekends and holidays. Provide material, devices equipment and personnel necessary for repairs. Install approved temporary, alternate equipment if required by Owner, complete and operational within 24 hours after notification of a malfunction, at no additional cost.
- D. Conduct warranty repairs and service at the job site unless in violation of manufacturer's warranty; in the latter event, provide substitute systems, equipment and/or devices, acceptable to Owner, for the duration of such off-site repairs. Transport warranty substitute and/or test systems, equipment, devices, material, parts and personnel to and from the job site at no additional cost.
- E. Warranty period shall commence upon written final acceptance by Owner or Owner's designated representative.

1.11 MAINTENANCE

- A. Extra Materials
 - 1. Deliver extra materials to a secured location determined by Owner.
 - 2. Provide a complete bill of materials listing quantities, part numbers, and descriptions for each device for Owner to sign indicating receipt of equipment.
 - 3. Provide new and unused spare parts in their original packing materials upon delivery.
- B. Maintenance Service
 - 1. For the first year of service, conduct quarterly system performance review meetings to review system operation problems and/or defects that occurred during the preceding 3 months. During these performance review meetings, perform the following:
 - a. Visual checks and operational tests of the central processor, local processors, monitors, keyboards, system printers, peripheral equipment, security equipment and devices, power supplies, and electrical and mechanical controls.
 - b. Clean system equipment, including interior and exterior surfaces.
 - c. Perform diagnostics on equipment.
 - d. Check and calibrate each device.
 - e. Run system software and correct diagnosed problems.
 - f. Resolve previous outstanding problems.
 - 2. Provide software and firmware updates issued free of charge by the manufacturer.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Material and equipment specified herein have been selected as the basis of acceptable quality and performance and have been coordinated to function as components of the included systems. Where a particular material, device, equipment or system is specified directly, the current manufacturer's specification for same is a part of these specifications, as if completely elaborated herein.
- B. Use standard, regularly manufactured, materials and equipment for this and/or other similar systems, and not custom designed especially for this project. Provide systems and components thoroughly tested and proven in actual use. Provide subsystems of one manufacturer.

2.2 EQUIPMENT ENCLOSURES AND JUNCTION ENCLOSURES

- A. Application: For indoor use to house panels and equipment, and to house terminations, relays, and other components local to controlled doors and other field devices
- B. Type: NEMA type 1 enclosure
- C. Description:
 - 1. Solid steel enclosure with solid, continuous-hinged door
 - 2. Finish: ANSI 61 gray polyester powder paint finish inside and out
 - 3. Lockable / equipped with a lock kit (lock kits shall be keyed alike with other security enclosures throughout the project)
 - 4. Perforated back panel within enclosure (for mounting control boards, relays, terminal strips, etc.)
 - 5. One tamper switch per enclosure

6. One 5" electric fan with a screen at the port per enclosure that houses electrically-powered devices/equipment

D. Size:

1. For use as Security Equipment Enclosure: 36"L x 24"W x 6"D minimum
2. For use as Security Junction Enclosure: 12"L x 12"W x 6"D minimum

E. Manufacturer, or equal:

1. Eaton Cooper B-Line
 - a. #36246-1PP; 36"L x 24"W x 6"D enclosure with back panel and lock kit
 - b. #12126-1PP; 12"L x 12"W x 6"D enclosure with back panel and lock kit
2. Hoffman
 - a. #A36N24M; 36"L x 24"W x 6"D enclosure
 - b. #A36N24MPP back panel for 36" x 24" enclosure
 - c. #A12N126; 12"L x 12"W x 6"D enclosure
 - d. #A12N12PP; back panel for 12" x 12" enclosure
 - e. # AL12AR; lock kit
3. Wiegmann
4. SquareD

2.3 SLOTTED WIRING DUCT

- A. For indoor use inside equipment enclosures to manage/mind wiring.

B. Description:

1. Type: Lead-free PVC with narrow finger design
2. Color: Light gray

C. Manufacturer, or equal:

1. Panduit Type-F narrow slot wiring duct
2. Iboco #T1-1010 wiring duct

2.4 WIREWAYS

- A. For indoor use with equipment enclosures to manage and route wiring and cabling.

- B. Type: NEMA type 1 screw cover 'gutter' wireway and accessories

C. Description:

1. Wireways shall have open top assembly and closure plates/end caps (to secure end of wireway sections).
2. Finish: ANSI 61 gray polyester powder paint finish inside and out
3. Size: 4" x 4", minimum

D. Manufacturer, or equal:

1. Eaton Cooper B-Line #4448-G-NK; lay-in painted wireway without knockouts
2. Hoffman #F44T148GVP lay-in painted wireway without knockouts

2.5 INTERFACE RELAYS

- A. Application: lock power switching and interfacing with other high-voltage powered equipment, i.e. gates, high-voltage locks, etc. (not for use at the output contacts on the access controllers since their rating is not adequate)
- B. Type: Standard industry control, plug-in type with LED indicator lights to indicate when the relay is energized.
- C. Contacts: Rated for 10 amps at 120VAC.
- D. Coil Operating Voltage: as required, with 24VDC as first choice
- E. Features:
 - 1. Color-coded test button
 - 2. Mechanical flag
 - 3. Snap-on label
 - 4. Pilot light
 - 5. 2mm test jacks
 - 6. Dual contact markings
 - 7. Snap-on number and letter markers
 - 8. Solid bus-bar socket construction
- F. Relay bases shall be mountable on standard mounting rails
- G. Manufacturer, or equal:
 - 1. Releco
 - 2. Idec

2.6 TAMPER RESISTANT HARDWARE

- A. Tamperproof hardware shall be used in locations below 10' exposed to the public.
- B. Hardware exposed in public spaces shall be pinned-allen type.
- C. Hardware used in specialty metal surfaces shall have a similar finish color.

2.7 WIRE CONNECTORS

- A. Wire connectors shall be heat activated, gel filled.
- B. Twist and solder/taped or wire nut connections are not acceptable.
- C. Manufacturer, or equal:
 - 1. Dolphin
 - 2. 3M Terminals
 - 3. Fastenal Sealed Crimp and Solder connector

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Conditions: Verify existing conditions, which have been previously provided under other sections, are acceptable for product installation in accordance with manufacturer's instructions.
- B. Pathways: Verify that pathways and supporting devices, which have been previously provided under other sections, are properly installed, and that temporary supports and devices have been removed.
- C. Field Measurements: Verify dimensions of pathways, including length of pathways. For example, "True Tape" the conduits to verify cable distances.

3.2 FIELD QUALITY CONTROL

- A. Staffing: Provide a qualified foreman who is in charge of the work and who is present at the job site at times work is being performed. Perform the work using skilled technicians under the direction of the foreman. Supervise the work force executing the work. Perform the installation within the restraints of the construction schedule. Do not change the supervisor during the project without prior written approval from Owner.
- B. Inspection: Perform inspection after installation. Keep areas of work accessible and notify code authorities, or designated inspectors, of work completion released for inspection. Document completion, and inspection as required.

3.3 INSTALLATION

- A. Perform this work in accordance with acknowledged industry and professional standards and practices and the procedures specified herein.
- B. Provide a complete, operating system. Include devices specified including basic components and accessories, interconnecting wiring and other equipment and installation devices necessary for a complete system as specified.
- C. System Password Management:
 - 1. Change default passwords.
 - 2. Create a base administrator account for Owner's use/login.
 - 3. Install the latest security patches (for the operating system and each individual piece of equipment).
 - 4. Disable unused communication ports or protocols.
 - 5. Perform quarterly software security patch updates for the client during the warranty period.
 - 6. Contractor to turn over all source media including installation discs, manuals, drives, dongles, and licensing keys and codes.
- D. Manufacturer's Instructions:
 - 1. Comply with manufacturer's product data, including product technical bulletins, product catalog installation instructions, and product carton instructions for installation.
 - 2. Maintain jobsite file of Material Safety Data Sheets (MSDS) for each product delivered to jobsite.

- E. Boxes, Panels, and Enclosures
 - 1. Install boxes, panels, and enclosures square and plumb.
 - 2. Set flush-mounted units with the face of the cover, bezel, or escutcheon in the same plane as the surrounding finished surface.
 - 3. Mount boxes, panels, and trim so that there are no gaps, cracks, or obvious lines between the trim and the adjacent finished surface; ready them to receive final finish, as applicable.
 - 4. Install insulating terminations in signal circuit boxes, panels, wireways, or enclosures.
- F. Painting
 - 1. Custom paint devices as indicated on the drawings.

3.4 REPAIR/RESTORATION

- A. Replace or repair work completed by others that you deface or destroy, and at no cost to Owner.
- B. Punch List:
 - 1. Inspect installed work and develop a punch list for items needing correction.
 - 2. Submit punch list to Engineer for review prior to performing punch walk with Engineer.
- C. Re-Installation:
 - 1. Make changes to the system such that defects in workmanship are correct and cables and the associated termination hardware passes the minimum test requirements.
 - 2. Repair defects prior to system acceptance.
- D. Painting: Repaint surfaces altered during installation of the security system to match previous conditions.

3.5 CLEANING

- A. Remove temporary coverings and protection of adjacent work areas. Remove unused products, debris, spills, or other excess materials. Remove installation equipment.
- B. Leave finished work and adjacent surfaces in neat, clean condition with no evidence of damage.
- C. Repair or replace damaged installed products.
- D. Legally dispose of debris in an environmentally friendly manner.
- E. Clean installed products in accordance with manufacturer's instructions prior to Owner's acceptance.

END OF SECTION

SECTION 280513
SECURITY SYSTEM CABLING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Cables and wires for security systems
- B. Related Sections:
 - 1. Consult other sections; determine the extent and character of related work and properly coordinate work executed under this section with that specified elsewhere to produce a complete and operable system.
 - 2. Section 280000, "Basic Security Requirements"
 - 3. Section 280553, "Security System Labeling"
 - 4. Section 260533, "Raceway and Boxes for Electrical Systems"
 - 5. Section 270528, "Pathways for Communications Systems"
 - 6. Section 271513, "Horizontal Cable"

1.2 REFERENCES

- A. Comply with the References requirements of section 280000.
- B. In addition to those codes, standards, etc., listed in section 280000, products and work shall comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. NFPA 262, "Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces"

1.3 SUBMITTALS

- A. Submittal Requirements at Start of Construction:
 - 1. Product Data: Submit product information, including manufacturer, part number, description, use/application, jacket rating, outside diameter, etc.
- B. Submittal Requirements at Closeout:
 - 1. Include wire and cable types in As-Built Drawings
 - 2. Include wire and cable information in O&M Manuals

1.4 SCOPE OF WORK

- A. General: Provide engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction and special or occasional services as required to make a complete working security system installation as described in these specifications.

- B. Cables for Security System
 - 1. Provide wires and cables sized to allow for voltage drop of 12VDC and 24VDC power service from power supplies in equipment rooms to field devices.
 - 2. Provide cables effectively shielded for video signal cable within the same conduit to mitigate interference or signal noise.
 - 3. Provide plenum rated jacket (type CL2P, CL3P, or CMP) on cables installed indoors where required.
 - 4. Provide PVC or PE jacket, flooded cables to prevent water intrusion where installed outdoors, underground, and/or within slab-on-grade. Provide transition of outdoor/underground cables to indoor cables when entering a building.
 - 5. Provide surge protection when cables enter buildings from outdoors where required by NEC.

- C. Cable Supports and Pathways for Security System Cabling
 - 1. Provide dedicated cable support for security cables when not within primary pathways (such as cable tray). Coordinate work with Division 27 – particularly for use of pathways/cable support.

PART 2 - PRODUCTS

2.1 INDOOR PLENUM MULTI-CONDUCTOR CABLES

- A. Application: Indoor use, for ACAMS, and VSS
- B. Type: multi-conductor or paired, unshielded and shielded
- C. CMP (plenum) rated
- D. Manufacturers, or equal:
 - 1. Belden
 - a. #6500UE; 22AWG/2C, unshielded
 - b. #6502UE; 22AWG/4C, unshielded
 - c. #1325A; 22AWG/2PR, individually shielded
 - d. #6502FE; 22AWG/4C, overall shielded
 - e. #6504FE; 22AWG/6C overall shielded
 - f. #3004A; 22AWG/8C overall shielded
 - g. #6300UE; 18AWG/2C, unshielded
 - h. #6302UE; 18AWG/4C, unshielded
 - i. #6302FE; 18AWG/4C, overall shielded
 - j. #6100UE; 14AWG/2C, unshielded
 - 2. West Penn
 - a. #25221B; 22AWG/2C, unshielded
 - b. #25241B; 22AWG/4C, unshielded
 - c. #D25510B; 22AWG/2PR, individually shielded
 - d. #253241B; 22AWG/4C, overall shielded
 - e. #253270B; 22AWG/6C overall shielded
 - f. #253271B; 22AWG/8C overall shielded
 - g. #25224B; 18AWG/2C, unshielded
 - h. #25244B; 18AWG/4C, unshielded
 - i. #253244B; 18AWG/4C, overall shielded
 - j. #25226B; 14AWG/2C, unshielded

3. Windy City Wire
 - a. 444362; 22AWG/2C, unshielded
 - b. 444381; 22AWG/4C, unshielded
 - c. 4150102; 22AWG/2PR, individually shielded
 - d. 4443440; 22AWG/4C, overall shielded
 - e. 444351-03; 22AWG/6C overall shielded
 - f. 444352-08; 22AWG/8C overall shielded
 - g. 442363; 18AWG/2C, unshielded
 - h. 442384; 18AWG/4C, unshielded
 - i. 442344; 18AWG/4C, overall shielded
 - j. 447960; #6100UE; 14AWG/2C, unshielded

2.2 IP CAMERA CABLE AND IP ACAMS CABLE

- A. Application: Suitable for indoor installation within conduit
- B. Refer to Section 271513 for product requirements.

2.3 MISCELLANEOUS COMPONENTS

- A. Cable Ties
 1. Width: 0.75 inches
 2. Color: Black
 3. Manufacturers, or equal:
 - a. Panduit #HLS-15-R-0 Black, 15 feet roll, cut to length

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Cable Installation and Routing
 1. Install cables and wires continuously (splices will not be permitted without written approval from the Engineer) for the entire length of run between connections and/or terminations.
 2. Place and suspend cables within designated pathways, such as cable hangers, cable tray, etc. Do not fasten or attach cables (such as with cable ties) to other building infrastructure (such as ducts, pipes, conduits, etc.), other systems (such as ceiling support wires, wall studs, etc.), or to the outside of conduits, cable trays, or other non-approved pathway systems.
 3. Place and suspend cables during installation and termination in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables damaged during installation or termination at no additional cost.
 4. Route cables at 90-degree angles, allowing for bending radius, along corridors for ease of access.
 5. Route cables under building infrastructure (such as ducts, pipes, conduits, etc.) so the installation results in easy accessibility to the cables in the future.
 6. Do not exceed manufacturer's limits for pulling tension.
 7. Do not use cable-pulling compounds for indoor installations.

8. Dress and secure cables without stress and/or deformation. Dress and bind cabling with cable ties every 24" minimum. Within telecommunications spaces and covered wireways, provide Velco-style cable ties on security cabling.
9. Install shielded wiring or route in separate raceways as recommended by the manufacturer's current requirements.
10. Place cables a minimum of 6" away from power sources to reduce interference from EMI.
11. Do not run signal wire and cable in parallel to power (120VAC).
12. When connecting to screw-type barrier blocks, terminate wires with insulated crimp-type spade lugs. Size lugs properly to assure high electrical integrity, i.e., low resistance connections.
13. Follow manufacturers recommended guidelines for installation.
14. When exiting the primary pathway (such as cable tray) to the device, exit via the top of the pathway. Secure the cables to the pathway using an approved cable tie.
15. When routing cables vertically in conduit for continuous distances greater than 30 feet, secure cables as the cables exit the vertical pathways. Secure cables using screw-flange nylon cable ties or similar approved ties. Provide symmetrical clamping devices with split, circular, or other wire conforming, nonmetallic bushings for coaxial cables.
16. Within telecom rooms, route and dress cables on the overhead cable support and, when routing vertically, fasten the cables onto wall-mounted vertical cable support every 24 inches on-center using cable ties.

B. Cable Support

1. Coordinate cable support work with sections 270528 and 270536 for indoor pathways such as cable hangers.
2. Above ceilings, support cables at intervals no greater than 5 feet.
3. Anchor cable support system/components to structure.
4. Vertical Support on floor space, not in riser system
 - a. Route cable from below suspended ceiling devices to above ceiling when possible.
 - b. When routing cable in fire-rated wall assemblies, provide conduit and firestopping.
 - c. When routing cable on concrete tilt up style walls from below ceiling devices to above ceiling, provide conduit – either surface or recessed (depending on wall construction).
 - d. For cable routed vertically from devices with no suspended ceiling, provide conduit stub from device junction box to 14 feet, minimum, above finish floor.
5. Vertical Support in riser system
 - a. In vertical riser systems, route cable within conduit.
 - b. Terminate conduit at each stacked closet in a lockable junction box. Size junction box as required per conduit size and quantity – 12" x 10" x 8", minimum.
 - c. Support cables within the junction box at every other floor or approximately every 24 feet utilizing cable ties equipped with eyelets designed to accept screws for fastening or approved equivalent method.
6. Label cables in accordance with section 280553, "Security System Labeling".

END OF SECTION

SECTION 280553
SECURITY SYSTEM LABELING

PART 1 - GENERAL

1.1 SUMMARY

- A. General: Furnish labor, materials, tools, etc., as required to complete security system labeling.
- B. Section Includes:
 - 1. Labeling of wire, cable, security devices, enclosures, and raceways.
- C. Related Sections:
 - 1. Consult other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.
 - 2. Section 280000, "Basic Security Requirements"

1.2 SUBMITTALS

- A. Product Data: Submit the following:
 - 1. Product information for components specified herein.
 - 2. List of equipment (wire, cable, devices, enclosures, and raceways) and the corresponding text for the label.

PART 2 - PRODUCTS

2.1 NAMEPLATES

- A. Engraved, plastic laminated nameplates, signs, and instruction plates. Engrave stock melamine plastic laminate 1/16 inch minimum thickness for signs up to 20 square inches, or 8 inches in length; 1/8 inch thick for larger sizes. Use white letters for engraved nameplates and punch for mechanical fasteners.

2.2 WIRE AND CABLE LABELS

- A. General
 - 1. Self-laminating adhesive laser labels.
 - 2. Machine printable with a laser printer.
 - 3. Cable size: 0.16 – 0.32" OD
 - 4. Color: white with black lettering
- B. Manufacturer, or equal:
 - 1. Brady #WML-211-295 and #WML-311-292 wire marking labels

2.3 DEVICE LABELS

- A. Self-laminating, type on tape, adhesive labels. Use Helvetica 12 pt text

PART 3 - EXECUTION

3.1 INSTALLATION

A. General Requirements

1. Label the security system components. The components include, but are not limited to, the following:
 - a. Equipment Enclosures
 - b. Conduits
 - c. Security Devices
 - d. Batteries
 - e. Wires and Cables
 - f. Equipment Racks
 - g. Terminal Blocks
 - h. Relays
 - i. Patch panels, and the termination positions within the patch panels.
2. Labels shall coincide with device IDs used on the record drawings.
3. Degrease and clean surfaces to receive nameplates and labels.
4. Install nameplates parallel to equipment lines. Secure nameplates to equipment fronts using machine screws.

B. Equipment Cabinets

1. Label SEC enclosures associated with the security system with a nameplate.
2. Mount label on exterior of door, centered horizontally, and positioned one-third of the door height vertically from the top.
3. Example:
Line 1 [1/2 inch high letters]: "SEC-01"
Line 2 [1/4 inch high letters]: "Security Equipment Cabinet"

C. Conduits

1. Write the destination for every conduit entering a junction box, SEC, and CEC enclosure, or wireway using a black permanent ink marker next to the conduit inside the box.
2. Example: "To SEC-01"

D. Security Devices

1. Label devices associated with the security system with a permanent machine generated, laminated, label. Use 12 point Helvetica text with a clear background. Use white or black lettering depending upon the color of the device.
2. Label each device in a concealed location with the system point number and address.

E. Batteries

1. Label power supply batteries with the month and year they were installed.
2. Example: "April 2016"

F. Wire and Cable

1. Identify wire and cable clearly with permanent machine-generated labels wrapped about the full circumference within 1 inch of each connection.
2. Indicate the cable ID designated on the associated field or shop drawings or run sheet, as applies.

3. Assign wire or cable designations consistently throughout a given system; i.e., each wire or cable to carry the same labeled designation over its entire run, regardless of intermediate terminations.
4. Provide labels where wire and cable first enter and exit from conduit, junction or distribution boxes; locate labels within 6 inches of the point of exit.
5. Positional labels so they are clearly visible without the need to remove wire management or other obstructions.
6. Label cables at both ends of a run and within pull and junction boxes using machine generated wrap-around labels.

3.2 CABLE LABEL FORMAT

A. Text: Helvetica font, 12 point (minimum size, unless otherwise specifically stated)

B. From Panel to Field Device

1. Line 1: Device Type and Device Number
2. Line 2: Panel ID – Port Number
3. Example: CR 001

PANEL 2 – CR5

4. Standard Device Types
 - a. CR = Card Reader
 - b. K = Camera
 - c. ET = Entry Telephone
 - d. R = Relay Output
 - e. A = Alarm Point
5. Standard Port Numbers
 - a. CR = Reader
 - b. M = Monitored Input
 - c. R = Relay Output

C. From Door Junction Box to Card Reader

1. Line 1: Device Type and Device Number
2. Line 2: Panel ID – Port Number
3. Example: CR 001

PANEL 4 – CR3

D. Miscellaneous Examples:

1. From Door Junction Box to Door Contact
 - a. CR001
 - b. DC
2. From Door Junction Box to Rex Alarm
 - a. CR001
 - b. REX ALM
3. From Panel to Rex
 - a. CR001
 - b. REX PWR
 - c. 12 VDC
4. From Panel to Lock
 - a. CR001
 - b. LCK PWR
 - c. 24 VDC

SECTION 280800

SECURITY SYSTEM ACCEPTANCE TESTING

PART 1 - GENERAL

1.1 SCOPE OF WORK

- A. General: Furnish engineering, labor, materials, apparatus, tools, equipment, and transportation required to test a completed security system installation as described in these and the related Specifications.
- B. Base Bid Work
 - 1. Comprehensive testing for all systems installed as part of the project in two distinct phases which includes:
 - a. Functional Testing
 - b. Acceptance Testing
 - 2. Produce and submit for review and approval the test results documentation for each of the two distinct phases of testing.
- C. Related Sections:
 - 1. Section 280000, "Basic Security Requirements"
 - 2. Section 280513, "Security System Cabling"
 - 3. Section 280553, "Security System Labeling"
 - 4. Section 280800, "Security System Acceptance Testing"
 - 5. Section 281300, "Access Control and Alarm Monitoring System"
 - 6. Section 282300, "Video Surveillance System"

1.2 SUMMARY OF ACCEPTANCE TESTING ACTIVITIES

- A. Overview
 - 1. The purpose of these testing activities is to ensure the security system operates properly and per the Owner's requirements. Security systems are very complex from both an equipment and programming standpoint and thorough testing is necessary to ensure correct operation.
 - 2. Perform testing activities after-hours or on weekends when the system is not being actively utilized and the building is generally unoccupied. This will minimize the amount of irrelevant activity in the system activity reports that will be used as a record of the Functional Testing and Acceptance Testing test results documentation.
- B. Functional Testing
 - 1. Functional Testing represents a complete and documented test of the security systems. At a minimum, Functional Testing shall demonstrate proper operation of security system components, including: devices, sensors, switches, power supplies, controllers, input/output boards, relays, network communications, tamper switches, initiating circuits, and associated accessories and appurtenances required for system functionality.
 - 2. Perform Functional Testing of security systems to verify correct operation prior to scheduling the Acceptance Testing.
 - 3. Document the results of the Functional Testing and submit to the Engineer along with system activity reports for approval.

4. Functional Testing test results documentation shall be reviewed and approved prior to scheduling the Acceptance Testing.

C. Acceptance Testing

1. Acceptance Testing represents a final walk test with the Engineer and Owner to demonstrate proper operation of security system components including system integration, programming, operational capabilities, and functional performance.
2. Perform Acceptance Testing of the security systems in the presence of the Engineer and Owner to demonstrate fully functional and completely operational security systems.
3. Submit Acceptance Testing test results documentation and punch list/deficiencies corrections, prior to Owner approval of Substantial Completion and the start of the Warranty period.

1.3 SUBMITTALS

A. Functional Testing test results documentation submittal

B. Acceptance Testing test results documentation submittal

C. Operation and Maintenance (O&M) Manuals: Submit O&M Manuals for review and approval at the completion of the project consisting of the following:

1. Warranty letter: copy of Warranty letter reflecting start and end dates, and instructions covering warranty procedures.
2. Functional Design Manual: includes a detailed explanation of the operation of the system.
3. Hardware Manual, which includes:
 - a. Pictorial parts list and part numbers
 - b. Pictorial and schematic drawings of wiring systems including devices, control panels, instrumentation, and annunciators
 - c. Telephone numbers for the authorized parts and service distributors
 - d. Service bulletins
4. Software Manual, which includes:
 - a. Use of system and applications software
 - b. Initialization, start-up, and shut down procedures
 - c. Alarm reports
5. Operator's Manual, which fully explains procedures and instructions for the operation of the system and includes:
 - a. Computers and peripherals
 - b. System start up and shut down procedures
 - c. Use of system, command, and applications software
 - d. Recovery and restart procedures
 - e. Graphic alarm presentation
 - f. Use of report generator and generation of reports
 - g. Data entry operator commands
 - h. Alarm messages and reprinting formats
 - i. System access requirements
 - j. Service maintenance call procedures
6. Maintenance Manual, which includes:
 - a. Instructions for routine maintenance listed for each component, and a multi-page summary of component's routine maintenance requirements
 - b. Detailed instructions for repair of the security system
 - c. A summary of the software licenses, including license numbers, quantity of clients, summary of the software options provided, and database capabilities

- d. A list of IP addresses used and with which system component they are associated, including MAC address
- e. A list of gateway addresses, subnet masks, DNS servers, and host name information
- 7. Test Results Manual which includes the document results of tests, required under this Specification, organized by System, Floor, and Door.
- 8. As-Built Drawings, which includes 11"x17" prints of the as-built drawings.

D. As-Built Drawings

- 1. Submit As-Built Drawings for review and approval at the completion of the project.
- 2. As-Built Drawings shall fully and accurately represent installed systems and conditions, including: actual locations of devices and components, actual cable and terminal block numbering, and actual wire routing and wiring (wire type, gauge/size, rating, etc).
- 3. Record changes in the work during the course of construction on blue or black line prints. Transfer construction mark-ups to AutoCAD or Revit format drawings at the completion of the project.
- 4. Include the following additional information:
 - a. Device addresses and IP address information
 - b. Settings for each camera (lens specs, mm setting, auto shutter setting, and other available camera settings, etc.)
- 5. Include approved Shop Drawings.
- 6. Final acceptance requires the Engineer's approval of the As-Built Drawings.

- E. Owner's acceptance, Substantial Completion, and start of the Warranty period requires all submittals above be approved and punch list deficiencies be corrected.

1.4 QUALITY ASSURANCE

- A. Provide a project manager to coordinate the security system acceptance testing work with other trades.

PART 2 - PRODUCTS

2.1 NOT USED

PART 3 - EXECUTION

3.1 SCHEDULING

- A. Coordinate the security system Functional Testing and Acceptance Testing acceptance testing specific activities into the overall project construction schedule.
- B. Provide the Engineer and Owner with a minimum one week notice prior to scheduling Functional Testing and Acceptance Testing activities.

3.2 TESTING REQUIREMENTS

A. Site Tests

1. At a minimum, security system testing requirements shall include the following tests (where applicable to the project):
 - a. Building Perimeter Test: Test doors, cameras, and devices related to securing the perimeter of the building.
 - b. IDF Test: Test devices related to securing the MDF and IDFs . Inspect system panels, power supplies, and other related security equipment located in these areas.
 - c. Access Control System Test: Test the software for correct programming and setup. Verify correct integration with the Intrusion Detection System and Video Surveillance System.
 - d. Video Surveillance System Test: Test the system for correct programming, operation, and alarm camera call-up.
 - e. Video Recording System Test: Test the recording system for correct programming, alarm recording, and event retrieval. Verify correct integration with the ACAMS and IDS system for alarm call-up. Test and verify the system is viewable from client workstations.
 - f. Video Camera Test: Review cameras for proper coverage, quality of video, focus, configuration, etc.
 - g. Other Readers/Door Test: Test remaining card readers and doors not included in the above tests.
 - h. Battery and UPS Load Test: Disconnect AC power to security system equipment to verify battery operation functions and system remains fully operational.
 - i. Door Hardware Test: Coordinate with the Division 08 door hardware contractor to resolve electrified locking door hardware failures and door alignment or door closer problems.

B. Site Tests Preparation

1. Provide device identification numbers that differ from or were not included on the original Construction Drawings.
2. Provide a complete systems point list.
3. Provide paper and toner for the printer so that an event log can be printed out and attached to the test reports as verification of test sequence and systems response.
4. During testing, provide technicians familiar with the installation to assist with the test. Stage the technicians as follows: one at the host, one at the device being tested, and one runner responsible to furnishing tools, step ladders, etc.
5. Provide radios for use by the Engineer and Owner during testing.
6. Provide pre-programmed access cards for use during testing. Provide one authorized card for each access level. Provide one card with no access authorization. Provide keys for lockset mechanical key override.

3.3 TEST PROCEDURES

- A. Follow manufacturer's written test procedures for each type of device and system.

3.4 FIELD DOCUMENTATION

- A. Provide printed system documentation containing detailed wiring diagrams for each security equipment enclosure. Documentation shall include, at a minimum, layout of equipment, elevation detail, complete parts list, and complete wiring diagrams for each security system controller, input / output board, relay, and power supply.
- B. Provide a printed service log for each security equipment enclosure. Service log shall include, at a minimum, columns for the following information: date of service, description of work performed, service technician(s), and service company.
- C. Neatly fold the printed system documentation and service log and place it inside a clear plastic pocket affixed to the inside door of the security equipment enclosure.

3.5 TRAINING

- A. Upon completion of the Acceptance Testing, provide training to the Owner's representatives, at times convenient to them, in the function and operation as well as the service and maintenance of the security systems.
- B. Utilize the production database for the training to give the users project-specific examples from which to learn.
- C. Provide 16 hours, minimum, of on-site training by a factory trained representative. Maintain a sign-in sheet with names and dates of persons trained and forward to Owner upon completion of training.
- D. Provide for designated Owner's representatives to attend off-site factory certification training for all systems installed as part of the project, including:
 - 1. Access Control and Alarm Monitoring System
 - 2. Video Surveillance System
 - 3. Intrusion Detection System
 - 4. Security Communications System

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 281300

ACCESS CONTROL AND ALARM MONITORING SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes
 - 1. ACAMS, including access control units, input/output units, and card readers
 - 2. ACAMS power supplies
 - 3. Alarm initiating devices, including: magnetic switch contacts, request-to-exit sensors,
 - 4. Power supplies
 - 5. Local audible alarms/sounders
 - 6. Security operations center fixtures and furnishings
 - 7. Interface to electric door hardware, ADA door operators, and gate operators
 - 8. Interface to Fire/Life-Safety system

- B. Products Furnished but not Installed under This Section
 - 1. None

- C. Products Installed but not Furnished under This Section
 - 1. New electric feed-through power transfer hinges
 - 2. Electrified locking hardware cable and termination to transfer hinge and security system

- D. Products Specified but not Installed under This Section
 - 1. Access control devices inside elevator cabs, including card readers, interface relays, and reader modules.

- E. Products Furnished and Installed under Another Section
 - 1. 120VAC power
 - 2. Telecommunication pathways; refer to Section 270528 and/or 270532.
 - 3. Network switches, with Power over Ethernet (PoE)

- F. Related Sections
 - 1. Consult other Divisions, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a fully functional and completely operational system.
 - 2. Section 087100, "Door Hardware"
 - 3. Section 280000, "Basic Security Requirements"
 - 4. Section 280513, "Security System Cabling"
 - 5. Section 280553, "Security System Labeling"
 - 6. Section 280800, "Security System Acceptance Testing"
 - 7. Section 282300, "Video Surveillance System"
 - 8. Section 283100, "Fire Detection and Alarm"

1.2 REFERENCES

- A. Comply with the References requirements of Section 280000.

- B. In addition to the codes and standards listed in Section 280000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
 - a. UL 497, "Protectors for Paired-Conductor Communication Circuits"

1.3 DEFINITIONS

- A. Definitions as described in Section 280000 shall apply to this Section.
- B. In addition to those definitions in Section 280000, the following list of terms as used in this specification defined as follows:
 - 1. "A" and "AMP": amperes
 - 2. "ACAMS": access control and alarm monitoring
 - 3. "IDS": intrusion detection system
 - 4. "LAN": Local Area Network
 - 5. "NC": Normally closed
 - 6. "NO": Normally open
 - 7. "REX": request to exit
 - 8. "SCS": security communications system
 - 9. "UPS": uninterruptable power supply
 - 10. "VAC": volts alternating current
 - 11. "VDC": volts direct current
 - 12. "VMS": video management system
 - 13. "VSS": video surveillance system

1.4 SYSTEM DESCRIPTION

- A. General: Provide engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction and special or occasional services as required to make a complete working Access Control and Alarm Monitoring system installation, as described in these specifications.
- B. Access Control and Alarm Monitoring System (ACAMS) Overview
 - 1. The ACAMS is utilized for electronically controlling access within the building for employees, visitors, delivery personnel, and persons.
 - 2. ACAMS consists of an ACAMS server card readers and alarm initiating devices (refer to the drawings for locations of field panels, card readers, and other devices). The server will communicate with the control panels via the Owner's LAN and/or hardwire connections. The control panels control the electronic door hardware allowing or disallowing passage through a controlled door or gate.
- C. ACAMS Server and Software
 - 1. Server (to host ACAMS software): Utilize the existing server to host ACAMS software package.
- D. Card Readers / Door Devices
 - 1. Provide wireless card readers, including rough-in, wiring, reader, and other components for a complete system and connect to the ACAMS.
 - 2. Provide door contacts and request-to-exit motion detectors for card reader controlled doors and connect to the ACAMS. Refer to drawings for configurations and instances.

3. Provide integrated door contacts for non-card reader controlled doors noted on drawings (such as ground floor perimeter doors) and connect to the ACAMS. ACAMS shall monitor these doors. Program the ACAMS to alarm should the monitored doors open when not authorized.
- E. Provide end of line resistors as required (e.g., on supervised lines).
- F. Provide interface to ADA automatic/power assist door operator and corresponding actuator push plates
- G. Fire/Life-Safety System Interface
1. Coordinate with Fire/Life-Safety system contractor to automatically drop power from stairwell, elevator vestibule lobby, and other doors within the path of egress upon alarm activation of the Fire/Life-Safety system.
 2. Coordinate with Fire/Life-Safety system contractor for scheduled release of electromagnetic door holders on designated card reader doors or scheduled unlocked doors as indicated on project drawings. Provide ACAMS output modules as necessary to interface with Fire/Life-Safety system to release electromagnetic door holders on doors that are required to close and lock on scheduled events.

1.5 SUBMITTALS

- A. Quantity: Furnish quantities of each submittal as noted in Section 280000.
- B. Contractor Qualifications: Submit certification letters for the manufacturer of the ACAMS.
- C. Product Data: Submit product information for components specified herein.
- D. Shop Drawings: Include the following, minimum:
1. Device placement on floor plans and RCPs
 2. Point-to-Point Diagrams: Include wiring, points of connection and interconnecting devices between the following:
 - a. ACAMS control panel
 - b. ACAMS card reader
 - c. ACAMS power supplies
 - d. Card Readers
 - e. Door and lock position monitoring contact switches and request-to-exit sensors
 - f. Interface to electrified door hardware
 - g. Interface to Fire/Life-Safety system
 - h. Cable conductors (identify conductors on the point to point diagrams with the same tag as the installed conductor)
 - i. Miscellaneous control relays
 3. Block Diagram/Riser Diagram: Show ACAMS components, conduit, wire types, and sizes between them, including cabling interties between termination hardware.
 4. Schedules: Include schedules for ACAMS control panels that show each point ID with a description of the connected devices
 5. Include user interface graphics with icons and control buttons displayed.
 6. Include custom mounting details.
- E. Submittal Description: Training Submittal
1. Format: PDF

2. Contents:
 - a. Cover sheet, showing:
 - 1) Owner Name
 - 2) Project Name and Address
 - 3) Project Submittal Number
 - 4) Submittal Name
 - 5) System Name
 - 6) Specification Section Number (e.g., "Section 281300")
 - 7) Date of Submittal. Format: Month Day, Year (e.g., "January 1, 2016")
 - 8) Contractor Name
 - b. Table of Contents
 - c. Training Schedule
 - d. Training Course outline/ agenda
 - e. Course materials and training manuals for the following users as applicable:
 - 1) System Administrator
 - 2) Security staff
 - 3) Operator, and nurse/staff.

F. Submittal Requirements at Closeout:

1. As-Built Drawings: submit as-built drawings that includes approved block diagram, riser diagram, wiring diagram, security control room layout and elevations, floor plans, and reflected ceiling plans, and site plans showing device locations.
2. O&M Manual: submit O&M Manual as a binder or soft copy (bookmarked PDF) including the following, at a minimum:
 - a. Product data – approved submittals ('cleaned up') and electronic
 - b. As-built drawings, printed to 11x17 / tabloid landscape and electronic PDF files and native files (DWG or RVT) on storage media
 - c. Warranty statement and service protocol (guidelines, contact numbers, etc.)
 - d. Maintenance requirements
 - e. Station Matrix, printed to 11x17 / tabloid landscape and electronic PDF files and native XLSX file on storage media
 - f. Include information for the network switches and ports.

1.6 WARRANTY

- A. Warrant work and the system to perform as described within this Section for a period of one year from the date of system acceptance. The warranty shall cover system operation/performance, parts, and labor. During the warranty period, respond within 4 hours and correct deficiencies within 24 hours of notification.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Access Control and Alarm Monitoring System
 1. Secureall to match client's standards
- B. Card Readers
 1. Secureall to match client's standards

2.2 CARD READERS

- A. Description / Features:
 - 1. Capable of reading the following frequencies and card formats:
 - a. 125 kHz and 13.56 MHz
 - 2. Utilize a Wiegand protocol for communication for compatibility with standard access control systems.
 - 3. Multi-color LED and an audible sounder to indicate the status of the door
 - 4. For exterior locations, reader shall be fully weatherized with a rugged, polycarbonate enclosure, designed to withstand an operating temperatures of -22 to 150 degrees Fahrenheit (-30 to 65 degrees Celsius) and operating humidity of 5-95% non-condensing.
- B. Functions:
 - 1. Card reader shall continuous emit radio radiation with a continuous sensing of an access card.
 - 2. Upon reading an access cord, the card reader shall initiate a single transmission to the ACAMS controller.
 - 3. Upon receiving status from the ACAMS controller, the card reader shall change the state of the LED to the programmed state.
- C. Manufacturer:
 - a. SecuerAll #SA-CDR
 - b. SecuerAll #SA-CCR
 - c. SecuerAll #SA-GSW
 - d. SecuerAll #SA-MDR
 - e. SecuerAll #SA-PWR
 - f. SecureAll #SA-ROU
 - g. SecuerAll #SA-PHR

2.3 MAGNETIC CONTACT SWITCHES

- A. Magnetic contact switches shall be UL 634 Listed.
- B. Wood, Steel, and Hollow Metal Doors
 - 1. Description / Features
 - a. Mounting: Recessed
 - b. Switch Type: Double Pole, Double Throw
 - c. Gap Distance: 0.5" maximum
 - 2. Manufacturer, or equal:
 - a. Magnasphere #MSS-19CL; 3/4" dia., open loop contact switch, with leads
 - b. Magnasphere #HSS-L2C; UL 264 Level 2 high security recessed contact switch, with leads

2.4 INTERFACE RELAYS

- A. Refer to section 280000 for relay product requirements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

1. Install equipment per manufacturer's instructions.
2. Install devices, stations, etc., square and plumb. Set flush-mounted units so that the face of the cover, bezel, or escutcheon matches the surrounding finished surface.
3. Install so that there are no gaps, cracks, or obvious lines between the trim and the adjacent finished surface.
4. Install to heights shown on drawings. Heights shall comply with applicable ADA requirements.
5. Provide supervisory and end of line resistors as required.

B. Card Readers

1. Install card reader to the rough-in, not directly to dry wall.
2. Connect readers directly to reader boards. Do not daisy chain readers together.
3. Wire the card reader's multi-color LED to indicate the following status of the door.
 - a. Red = the door is secure (locked).
 - b. Green = the door is unsecured (unlocked).
 - c. Yellow = the card reader is not functioning (off-line/trouble), is processing a read request, or has denied access.
4. Wire/program the card reader to produce an audible beep tone to indicate to the user:
 - a. The card was read and/or access was denied.
 - b. Door is being held open and needs to be closed.

C. Door Hardware

1. Setup and conduct a door hardware coordination meeting.
2. Coordinate the installation and termination of the security cable with the installation of the electric door hardware and transfer hinge.
3. Route power to electrically controlled locks on Life-Safety doors through fire alarm output to automatically unlock the door upon activation of Fire/Life-Safety system. Connect fire alarm output to the disconnect relay on the associated 24VDC lock power supply.
4. Provide cable and terminate wires to delayed egress devices for monitoring activation of delayed egress by the ACAMS system.

D. Door Contacts

1. Install 6" from latch side of door.

E. Request-To Exit Motion Detectors

1. Install motion detector on the secured (protected) side of door. Install so that its detection pattern is not obstructed by exit signs, light fixtures or other objects that would interfere with proper operation.
2. Adjust relay hold time and pattern to properly detect valid exit and allow shunting of door contact.
3. Adjust detection sensitivity to pulse.
4. Mask detector lens to provide a confined detection area limited to the door handle or push bar.
5. Run wire inside structural tube steel frame into back of conduit body for cage locations.

3.2 PROGRAMMING

- A. Prior to the completion of construction, schedule a meeting with the Owner to determine the programming criteria. Document the results of the meeting and perform necessary programming to achieve the Owner's requests. During the meeting, discuss the following:
 - 1. Access card levels and door groupings
 - 2. Alarm priority levels
 - 3. Schedules and time codes
 - 4. Holidays and holiday types (priorities)
 - 5. Action/responses from individual input points
 - 6. Standard and custom (expanded) reports
 - 7. Defining alarm messages and standard response messages applicable to site
 - 8. Routing of alarm points to selected pagers
 - 9. Routing of alarm points to operator's workstations, printers, and history files
 - 10. Owner's graphics – develop sample graphic complete with icons and text. Alarms to appear on building floor plans depicting the nature and location of alarms. Review and revise graphic layout as required by Owner.
 - 11. System database backup procedures
- B. Program and setup the system such that no additional programming other than entering new access cards is required. Include setup of available features of the software.
- C. Import Owner's cardholder database.
- D. Using CAD drawing files of floor plans, perform the following relative to system graphics:
 - 1. Delete non-applicable drawing layers and details to arrive at simple floor plans of the building as built.
 - 2. Convert drawings to a graphic file format compatible with the Owner's access control and alarm monitoring system.
 - 3. Load drawing files into the system.
 - 4. Apply new and predefined icons and other points on each graphic to indicate point and control status.
 - 5. Link graphic images/icons to represent reader, monitor, alarm initiating devices, and control points.
 - 6. Program device icons on plans with functionality.
 - 7. Create camera call-up events.
 - 8. The point names shown on the as-built drawings shall match the system point schedule.
- E. Program ACAMS such that alarm events generate email notification to offsite addresses via the Internet. Also, as required by the Owner, program ACAMS such that alarm events generate pages.
- F. Program customized client workstation log-ins (restrict functions by user privileges).
- G. Program routing of monitor and control points. Route activations and restore messages to one or more of the following locations as directed by the Owner's Representative:
 - 1. One or more system workstations
 - 2. One or more system printers
 - 3. One or more alphanumeric pagers
 - 4. History files in addition to the above
 - 5. History files only

- H. Program the system such that reliance on a remote host for routine building operations, such as scheduled door commands and conditional events, are minimized to the greatest extent possible and decisions are made at the local building controller.
- I. System Operation, Alarm and Reporting Function: Program door control panel tamper switches to immediately report as a separate "tamper" point to the system resulting in an alarm condition displayed in both text and graphic form on the applicable workstation(s) and an alarm message transmitted to the appropriate pager(s).
- J. Program the system in a manner that minimizes the amount of time required for the users to make updates and maintain the system on a daily basis especially updates that impact card holder record updates. Nested programs, such as reader groupings used in access codes, shall be used to the greatest extent possible such that single actions are required to update an entire card data population. If there is a question regarding the appropriate approach to programming, given the flexibility of most systems, contact the Engineer prior to any initial programming
- K. Perform 2 full system back-ups at completion of initial programming and deliver one copy to owner with letter of Transmittal explaining information included in back-up and brief description of recovery procedures. Label the second removable storage device and store onsite. Perform back-ups on a regular bases through the remainder of the project.
- L. Customize menus with the assistance of the factory to "gray-out" features not used on project (such as elevator control).
- M. Perform field software changes after the initial programming session to "fine tune" operating parameters and sequence of operations based on revised operating requirements.
- N. Password management – refer to Section 280000.

3.3 EXTRA MATERIALS

- A. Furnish extra materials to Owner. Produce a transmittal with an itemized list including quantities, recipient, and receipt date. Submit copy of Owner-signed transmittal with project closeout documents.
- B. Place fuses inside each equipment/panel and power supply enclosure.
- C. Turn over keys (equipment enclosures, low voltage power supplies, security junction boxes, rack cabinets, etc.) to the Owner. Produce a transmittal with an itemized list of keys, recipient, and receipt date. Submit copy of Owner-signed transmittal with project closeout documents.

3.4 TRAINING

- A. Combine training on the ACAMS with training on the VSS (Section 282300).
- B. Training Requirements
 - 1. Security Staff/System Operators:
 - a. Prior to the first day of business at the new facility, provide 1 day of training, 4 hours per day.
 - b. Two months later, provide 1 day of training, 4 hours per day.

3.5 TESTING

- A. Test ACAMS in accordance with Section 280800.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 282300
VIDEO SURVEILLANCE SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes
 - 1. Video Surveillance System (complete system)
 - 2. Video Management System (software)
 - 3. Network Video Recorder and Storage (hardware)
 - 4. Fixed cameras, lenses, mounts, and housings
 - 5. Panoramic cameras, lenses, mounts, and housings
 - 6. Power Supplies
 - 7. Network switches, with Power over Ethernet (PoE)

- B. Products Furnished But Not Installed Under This Section
 - 1. None

- C. Products Installed But Not Furnished Under This Section
 - 1. None

- D. Products Specified But Not Installed Under This Section
 - 1. None

- E. Products Furnished And Installed Under Another Section
 - 1. 120VAC power
 - 2. Telecommunication cabling between telecom room and cameras; refer to Section 271513.
 - 3. Network switches, with Power over Ethernet (PoE)

- F. Related Sections
 - 1. Consult other Divisions, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.
 - 2. Section 271513, "Communications Horizontal Cabling"
 - 3. Section 280000, "Basic Security Requirements"
 - 4. Section 280800, "Security System Acceptance Testing"
 - 5. Section 280513, "Security System Cabling"
 - 6. Section 280553, "Security System Labeling"
 - 7. Section 281300, "Access Control and Alarm Monitoring System"
 - 8. Section 282600, "Security Communications System"

1.2 REFERENCES

- A. Comply with the References requirements of Section 280000.

- B. In addition to the codes and standards listed in Section 280000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
 - 1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
 - a. UL 497, "Protectors for Paired-Conductor Communication Circuits"

1.3 DEFINITIONS

- A. Definitions as described in Section 280000 shall apply to this Section.
- B. In addition to those definitions in Section 280000, the following list of terms as used in this specification defined as follows:
 - 1. "A" and "AMP": amperes
 - 2. "ACAMS": access control and alarm monitoring
 - 3. "CCD": charge-coupled device
 - 4. "CMOS": complementary metal oxide semiconductor
 - 5. "DSP": digital signal processing
 - 6. "FC": foot candles
 - 7. "FPS": frames per second
 - 8. "IDS": intrusion detection system
 - 9. "KVM": keyboard, video, mouse switch
 - 10. "NAS": network-attached storage
 - 11. "NVR": network video recorder
 - 12. "PoE": Power over Ethernet
 - 13. "PTZ": pan-tilt-zoom
 - 14. "RAID": redundant array of independent disks
 - 15. "SAN": storage area network
 - 16. "VAC": volts alternating current
 - 17. "VDC": volts direct current
 - 18. "VMS": video management system
 - 19. "VSS": video surveillance system

1.4 SYSTEM DESCRIPTION

- A. General: Provide engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction, and special or occasional services as required to make a complete working video surveillance system, as described in this specification.
- B. Video Surveillance System (VSS) Overview
 - 1. The VSS is an enterprise-wide system generally comprised of fixed cameras (with associated mounting apparatus, housings, cabling, etc.), video management system (software), and network video recorder and storage (hardware), that provides live video feeds for real-time surveillance and monitoring, recorded video for forensic analysis.
 - 2. The VSS serves as the video component of the facility's overall security and safety program. Camera deployment and their respective field-of-views are strategically determined to coincide with points of security and access control as well as surveillance of open and high-security spaces.
 - 3. The VSS interconnects and integrates with the ACAMS, IDS, and security/emergency communications system such that alarms/events generated within the other systems (generally carried through the ACAMS) cause VSS and the VMS to behave in a programmed manner.

- a. Program active icons in graphic user interface map in the ACAMS to allow camera call up based on the selection of icon.
- C. Video Surveillance System (VSS) Scope
- 1. Server (to host VMS software): Provide server to host VMS software package.
 - 2. Video Storage hardware / Network Video Recorder (NVR): Provide server to store video.
 - 3. Video Management System Software: Provide VMS software package, including loading the VMS package onto the VMS server and integrating the software onto the network and integrating the video storage hardware into the VMS. Coordinate with the Owner's IT department for network integration and other IP-related requirements. Provide VMS licenses in a quantity sufficient to support the project's cameras plus 20% (minimum, round up to nearest whole number).
 - 4. Program the software system to meet the project requirements including programming recording input points, video call up, and other aspects of the system. Provide software interface to the ACAMS for alarm call up of cameras on predefined alarm events.
 - 5. Provide cameras as shown on the drawings. Provide outdoor housing and mounts for exterior cameras.
 - 6. Provide power supplies to supply power to cameras. Do not combine with ACAMS power supplies.
- D. Surge Protection: Regardless of who provides the cabling to outdoor cameras, ensure that the connection infrastructure for outdoor cameras receive proper protection against transient voltages. Installations shall comply with NEC 800.47, NEC 800.50 and NEC 800.90.
- E. Extra Materials
- 1. Furnish 10% spare parts of total installed the following (round up to the next complete device):
 - a. Fixed cameras

1.5 SUBMITTALS

- A. Contractor Qualifications: Submit certifications for the manufacturers of the video surveillance equipment.
- B. Product Data: Submit product information for components specified herein.
- C. Shop Drawings:
 - 1. Device placement on floor plans.
 - 2. Point-to-Point Diagrams: Include wiring, points of connection and interconnecting devices between the following:
 - a. Video surveillance system, monitors, and recording equipment
 - b. Network Switches
 - c. Devices connected to the system
 - d. Miscellaneous control relays
 - e. Conductors (identify conductors on the point-to-point diagrams with the same tag as the installed conductor)
 - 3. Camera Matrix: Submit as an Excel-compatible spreadsheet a matrix that includes each camera. The matrix, using the same ID as shown on the as-built drawings, shall include the following column headers, at a minimum:
 - a. Device
 - b. Device Identifier
 - c. Location
 - d. MAC Address

- e. IP Address
 - f. IDF Room
 - g. Network Switch
 - h. Switch Port
4. Block Diagram/Riser Diagram: Show the video surveillance system components, conduit, wire types, and sizes between them, including cabling interties between termination hardware.
 5. User interface graphics with icons and control buttons displayed.
 6. Custom mounting details
- D. Submittal Requirements at Closeout:
1. As-Built Drawings (this may be combined with the ACAMS as-built drawings): submit as-built drawings that includes block diagram, riser diagram, wiring diagram, and reflected ceiling plans, and floor plans and site plans showing camera locations (tagged with a unique ID per camera), security console (with video monitors).
 2. Camera Matrix: submit as an Excel-compatible spreadsheet a matrix that includes each camera. The matrix, using the same ID as shown on the as-built drawings, shall include the following column headers, at a minimum:
 - a. Camera Type
 - b. Camera ID (shall match the as-built plans)
 - c. Camera manufacturer and model (shall match the approved product data submittal)
 - d. Camera lens manufacturer and model (shall match the approved product data submittal)
 - e. Location
 - f. MAC Address
 - g. IP Address
 - h. IDF Room
 - i. Network Switch
 - j. Switch Port
 - k. Maintenance requirements
 3. O&M Manuals: submit O&M Manual as a binder or soft copy (bookmarked PDF) including the following, at a minimum:
 - a. Product data – approved submittals ('cleaned up') and electronic
 - b. As-built drawings, printed to 11x17 / tabloid landscape and electronic PDF files and native files (DWG or RVT) on storage media
 - c. Warranty statement and service protocol (guidelines, contact numbers, etc.)
 - d. Maintenance requirements
 - e. Station Matrix, printed to 11x17 / tabloid landscape and electronic PDF files and native XLSX file on storage media
 - f. Network switches and ports configuration information

1.6 WARRANTY

- A. Warrant the system for a period of one year from the date of system acceptance. The warranty shall cover system operation/performance, parts, and labor. Correct deficiencies within 24 hours of notification.

PART 2 - PRODUCTS

2.1 NETWORK VIDEO RECORDER

A. Features

1. Complete network video platform that encompasses video recording, video viewing, reviewing recorded video, and storing video for indefinite periods of time.
2. Full control of camera selections, sequencing, and viewing modes
3. The system simultaneously records, displays live video, and plays back video. None of the video operations interfere with each other. Live view and video playback does not interrupt the recording process.
4. Recorders capture, digitize, and store video. Recorders may record full-time, in response to an alarm, or based on a user-defined schedule. Full-time recording refers to 24 hours per day, 7 days per week, 365 days per year.
5. Network: Internal network interface for connection to a 10/100BaseT LAN using TCP/IP network protocol
6. Web Access: Web-based remote access via browser

B. Recorders

1. Video Information
 - a. Store for each clip video source, capture date, start time, and stop time. Source identified as either a monitor or a camera. Information to be available during playback
 - b. Store alarm information in the database on the main server when the video is in response to an alarm condition.
2. Video Storage
 - a. Video stored in clips on the recorder's internal hard drive. As the hard drive becomes full, groom oldest clips to make room for new video.
 - b. Ability to utilize a variety of network storage devices such as external disk arrays, RAID and NAS/SAN devices, and external disk drives for exporting, backup, or sharing images.
3. Video Authentication
 - a. Fingerprint each video clip through a mathematical algorithm during the video capture process. The fingerprint becomes part of the clip and used by the playback software to verify the video has not been altered.
4. Alarm Recording
 - a. Recording Options
 - 1) Alarm condition via activation of an external alarm contact.
 - 2) Internal video motion detection
 - b. Recording programmable by camera and by time and date schedule.
 - c. Allow a mix and match of continuous recording and alarm recording, based on camera input and capture card connection.
 - d. Pre and post alarm recording
5. Video Motion Detection
 - a. Each video input capable of detecting activity from camera input and to initiate an alarm condition.
 - b. Video motion detection areas operator selectable for each camera input. If the scene changes within the alarm area, an alarm condition is initiated.
6. Viewing of both live and archived images, from multiple remote systems.
7. Remote event notification
8. Password protected via user authorization, with profiles assigned by the system administrator, and database tracking of events.

- C. Manufacturer, or equal:
 - 1. BCD Video
 - 2. DNF Security
 - 3. Dell

- D. Software:
 - 1. Milestone XProtect Corporate and camera licenses

2.2 CAMERAS

- A. Fixed IP Interior Dome Camera
 - 1. Type: Color, vandal-resistant
 - 2. Power: PoE
 - 3. Imager: 1/3 inch format, unless otherwise noted
 - 4. Lens Mount: Accept a "CS" mount auto or manual-iris lens
 - 5. Resolution: 1080p HD
 - 6. Minimum Light Level: 0.1 fc imager illumination at full video, unless otherwise noted
 - 7. Lens: 3 to 9mm, unless otherwise noted
 - 8. Frame Rate: 30fps at H.264
 - 9. Manufacturer, or equal:
 - a. Axis #P3346-V IP dome megapixel camera
 - 10. Accessories, or equal:
 - a. Axis #5502-781 ceiling mount kit
 - b. Axis #5502-401 mounting plate

- B. Fixed IP Exterior Dome Camera
 - 1. Type: Color, vandal-resistant
 - 2. Power: PoE
 - 3. Imager: 1/3 inch format, unless otherwise noted
 - 4. Lens Mount: Accept a "CS" mount auto or manual-iris lens
 - 5. Resolution: 1080p HD
 - 6. Minimum Light Level: 0.1 fc imager illumination at full video, unless otherwise noted
 - 7. Lens: 3 to 9 mm, unless otherwise noted
 - 8. Frame Rate: 30fps at H.264
 - 9. Manufacturer, or equal:
 - a. Axis #P3346-VE vandal resistant fixed dome with remote focus and zoom for outdoor use
 - 10. Accessories, or equal:
 - a. Axis #T91A61 wall bracket

2.3 LINE PROTECTORS

- A. For use on data cables serving exterior cameras.

- B. Manufacturer, or equal:
 - 1. Transtector #1101-994
 - 2. DITEK

PART 3 - EXECUTION

3.1 PRE-CONSTRUCTION PLANNING

- A. Prior to the completion of construction, schedule a meeting with the Owner and the Engineer to determine the system programming requirements, such as the following:
 - 1. Camera naming/numbering
 - 2. Field of view per camera
 - 3. Settings for contrast, wide dynamic range, and auto-iris
 - 4. Camera call-up and recording features, including video motion detection
- B. Camera Locations
 - 1. Prior to installation, coordinate/confirm camera locations. As needed, perform a field walk with the Owner. Obtain Owner signoff of camera locations and field of view per camera prior to installation.
 - 2. Prior to rough-in construction, coordinate rough-in locations and requirements per camera.

3.2 INSTALLATION

- A. Network Video Recorder
 - 1. Rack mount VSS equipment located in the data center.
- B. Network Switch
 - 1. Rack mount network switches located in the data center.
- C. Cameras
 - 1. Field determine exact placement of cameras to ensure complete coverage.
 - 2. Field determine fixed camera lens size to ensure complete coverage.
 - 3. For exterior cameras, provide liquidtight flexible metallic conduit from junction box to camera housing and connect from below.

3.3 PROGRAMMING

- A. Network Video Recorder
 - 1. Connect the servers/storage to the Owner's LAN/WAN to allow remote viewing from authorized workstations utilizing the VMS client viewing software. Configure the cameras and servers at the following initial requirements:
 - a. Codec: H.264
 - b. Resolution: 1080p
 - c. Storage: 30 Days (minimum)
 - d. Recording: Continuous
 - e. Frame Rate: 30fps
- B. Document the results of the meeting and perform necessary programming to achieve the Owner's requests.
- C. Setup and program the system such that no additional programming required.
- D. Use the camera naming convention agreed upon at in the programming meeting when programming point names into the system.

- E. Perform two full system back-ups at completion of initial programming and deliver one copy to the Owner with a letter of transmittal explaining information included in back-up and brief description of recovery procedures. Perform back-ups on a regular bases through the remainder of the project.

3.4 TESTING

- A. Test the video surveillance system in accordance with Section 280800.

3.5 SYSTEM OPERATION CONFIRMATION

- A. At 30 days after substantial completion, perform field review of video surveillance system software with the Owner to "fine tune" configuration settings for resolutions, recording, and frame rate to meet the storage and operational requirements.

END OF SECTION

SECTION 283111

DIGITAL, ADDRESSABLE FIRE-ALARM SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. This Section includes the following systems for the building:
 - 1. Fire Alarm Systems.
- B. Drawings supplied with this specification shall be used as a reference for the requirement and location of system components.
- C. At the time of bid, all exceptions taken to these Specifications, variances from these Specifications and all substitutions of equipment specified shall be listed in writing and forwarded to Peralta Community College District (Owner). Any such exceptions, variances, or substitutions, which were not listed at the time of bid shall not be approved or considered.
- D. The Work includes all labor, materials, services, software, programming, tools, transportation, and temporary construction necessary to fabricate, install, program and test a fully operational and code compliant UL Listed and FM approved analog-addressable fire alarm system.
- E. The Work includes all fees and activities required to secure approvals for necessary State and Local permits.
- F. The Work includes submitting detailed Shop Drawing Plans, Wiring Diagrams, Calculations and Product Data to the Engineer and Owner for review in parallel to submitting to local officials (as required) for approval and permit as outlined in the specification and project documents.
- G. The Work includes performing field quality control activities.
- H. The Work includes documenting and submitting the results of integrity and functional testing.
- I. The Work includes performing overall system “Pre-Acceptance” test(s) for the Engineer’s approval with the Electrician and Programmer.
- J. The Work includes performing overall system “Final Acceptance” test(s) for Authority approval with the Electrician and Programmer.
- K. The Work includes submitting As-built Plans and closeout documentation in DWG and PDF format to the Engineer.

- L. The Work includes training Owner's personnel on the operation of the system, required maintenance tasks and frequencies, and the locations of all equipment necessary to maintain and operate the fire alarm system.

1.3 SYSTEM DESCRIPTION

- A. Noncoded, addressable system, with multiplexed signal transmission, dedicated to fire-alarm service only.
- B. Fire alarm system.

1.4 ORDER OF PRECEDENCE

- A. Should conflicts arise out of discrepancies between documents referenced in this specification, the most stringent requirement shall apply; however, should a level of stringency be indeterminable, the discrepancies shall be resolved as follows:
 - 1. State and local codes shall take precedence over this specification.
 - 2. The National Fire Protection Association Standards shall take precedence over this specification.
 - 3. Drawing specific requirements as documented on the RFP drawing package.

1.5 PERFORMANCE REQUIREMENTS

- A. Comply with local and national codes and RFP package documents, including:
 - 1. California Fire Code
 - 2. NFPA 72 – *National Fire Alarm Code*
 - 3. NFPA 70 – *National Electric Code*
 - 4. Contract Documents
 - 5. Specification Documents
 - 6. DSA Guidelines
- B. 24 VDC closed-circuit, electrically supervised, addressable, analog, automatic fire alarm system. The system shall include, but not be limited to:
 - 1. Fire alarm control unit (FACU) and power supplies.
 - 2. Fire Alarm Annunciator (Simplex) including a point type annunciator with a minimum of 80 zones.
 - 3. Photoelectric, addressable analog automatic smoke detection system (in those environments suitable for proper smoke detector operation), as indicated in this section and where shown on the drawings.
 - a. Immediate Vicinity of Fire Alarm Control Equipment: System type, analog, addressable, photoelectric smoke detectors with standard bases located in the immediate vicinity of all fire alarm control equipment, including remote power supplies.
 - b. Elevator Lobbies, Shafts, and Machine Rooms: System type, analog, addressable, photoelectric smoke detectors with standard base located in common corridors, elevator lobbies.

- c. Where an area is environmentally unstable such that a smoke detector could experience high levels of dust or temperature variations above 100° F or below 32° F and the area in question is protected by an automatic sprinkler system, smoke detectors shall be omitted. If an automatic sprinkler does not protect the area, an addressable heat detector shall be installed.
- 4. Waterflow and Valve Supervisory Switches: Use conventional zone interface modules to monitor fire protection system alarm and supervisory functions as shown. Fire protection devices such as water flow and valve supervisory switches are furnished by the fire protection contractor. Provide necessary raceway, wiring and end of line devices to monitor.
- 5. Speakers and Speaker Strobes: Speakers installed to provide voice notification to all areas of the building. Standalone strobes or speaker strobes installed to provide visual notification to all common areas.

1.6 SUBMITTALS

A. General Submittal Requirements:

- 1. Submittals shall be approved by the Owner in parallel to submitting them to the authorities having jurisdiction.
- 2. Shop Drawings shall be prepared by persons with the following qualifications:
 - a. Trained and certified by manufacturer in fire-alarm system design.
 - b. NICET-certified fire-alarm technician, Level IV minimum.

B. Product Data: For each type of product indicated. Submittal shall indicate listing and approvals, selected options and electrical characteristics.

C. Shop Drawings: For fire-alarm system. Include plans, elevations, sections, details, and attachments to other work.

- 1. Furnish three complete sets of as built shop drawings. The drawings shall be prepared on uniform sized sheets not less than 36 by 48 inches in size. In addition, provide a USB flash drive containing AutoCAD (Version to be coordinated with Owner) DWG and PDF format of all as built drawings and schematics.
- 2. Comply with recommendations in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter in NFPA 72.
- 3. Include voltage drop calculations for notification appliance circuits.
- 4. Include performance parameters and installation details for each detector, verifying that each detector is listed for complete range of air velocity, temperature, and humidity possible when air-handling system is operating.
- 5. Include floor plans to indicate final outlet locations showing address of each addressable device. Show size and route of cable and conduits.
- 6. Equipment List: Identify type, quantity, make and model number of each piece of equipment (including spare components) included in submittal. Types and quantities of equipment indicated shall coincide with the types and quantities of equipment used in the battery calculations and those shown on the shop drawings.
- 7. Shop Drawing Plans: Minimum 1/8"=1'-0" scale floor plans and corresponding riser diagram inclusive of information required by NFPA 72 requirements. Conceptual riser diagrams are not permitted.

8. Wiring Diagrams: Point-to-point fire alarm control equipment installation diagrams inclusive of information required by NFPA 72 requirements; typical wiring diagrams are not acceptable.
 9. Battery Calculations: Prepared in accordance with NFPA 72 requirements and showing total standby power and total alarm power required to meet the specified system requirements. Include a complete list of current requirements during normal, supervisory, trouble, and alarm conditions for each component of the system.
 10. Sequence of Operation: A sequence of operation that describes how the system responds during an alarm, supervisory and trouble condition. The description shall include fire alarm control unit LEDs, audible and visible indications; initiating devices, notification appliances, and auxiliary functions. The description shall provide sufficient information so that the exact function of each installed device and appliance is known.
 11. Statement of Equipment Lifecycle: A written statement, signed by a representative of the equipment manufacturer stating that the equipment to be supplied is not at or near the end of its life cycle and that replacement components for all control equipment shall be available from the manufacturer for a minimum of fifteen (15) years from the date of installation.
- D. Qualification Data: For qualified Installer.
- E. Field quality-control reports.
- F. Final Acceptance Documentation:
1. As-Built Drawings: With final revisions per Engineer's comments.
 2. Final Record of Completion: Prepared in accordance with NFPA 72.
 3. Test Reports: From Pre-Acceptance testing; substantially in the format and inclusive of information required by NFPA 72.
- G. Operation and Maintenance Data: For fire-alarm systems and components to include in emergency, operation, and maintenance manuals, include the following:
1. Comply with the "Records" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72.
 2. Provide "Record of Completion Documents" according to NFPA 72 article "Permanent Records" in the "Records" Section of the "Inspection, Testing and Maintenance" Chapter.
 3. Record copy of site-specific software.
 4. Provide "Maintenance, Inspection and Testing Records" according to NFPA 72 article of the same name and include the following:
 - a. Frequency of testing of installed components.
 - b. Frequency of inspection of installed components.
 - c. Requirements and recommendations related to results of maintenance.
 - d. Manufacturer's user training manuals.
 5. Manufacturer's required maintenance related to system warranty requirements.
 6. Abbreviated operating instructions for mounting at fire-alarm control unit.
- H. Software and Firmware Operational Documentation:

1. Software operating and upgrade manuals.
2. Program Software Backup: On magnetic media or compact disk, complete with data files.
3. Device address list.
4. Printout of software application and graphic screens.

1.7 QUALITY ASSURANCE

- A. Installer Qualifications: Personnel shall be trained and certified by manufacturer for installation of units required for this Project.
- B. Installer Qualifications: Installation shall be by personnel certified by NICET as fire-alarm Level II technician and shall be:
 1. Licensed in the State of California and be experienced in the installation of fire alarm systems in buildings similar to the Work described herein and has obtained design and inspection approvals for similar projects from authorities having jurisdiction.
 2. Foreman: Provide proof of competence of both their company and the individual foreman that will be assigned to this project, in the area of installing fire detection, alarm, and control systems for at least five (5) years and acceptable to the Owner. Once assigned, the Contractor's foreman shall not be changed without the approval of the Owner.
 3. Service Organization shall be capable of providing a minimum NICET Level III certified service technician on-site within 4 hours of a request for on-site service.
- C. Source Limitations for Fire-Alarm System and Components: Obtain fire-alarm system from single source from single manufacturer. Components shall be compatible with, and operate as, an extension of existing system where applicable.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- E. All control equipment shall have transient protection devices that comply with the requirements outlined in UL 864 9th Edition, Standard for Control Units for Fire-Protective Signaling Systems.
- F. All materials and equipment (initiating devices, notification appliances, etc.) shall be new and unused.
- G. All equipment supplied shall be first quality and the manufacturer's best type and latest model capable of complying with all requirements of this specification and shall have been in continuous production and in continuous service in commercial applications for at least one year. Obsolete equipment shall not be used.
- H. The requirements and recommendations of the latest published edition of the equipment manufacturers' product datasheets, technical specifications, installation instructions and wiring guidelines shall be followed.

1.8 SOFTWARE SERVICE AGREEMENT

- A. Comply with UL 864.
- B. Technical Support: Beginning with Substantial Completion, provide software support for two years.

- C. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade shall include new or revised licenses for use of software.
 - 1. Provide 30 days' notice to Owner to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

1.9 SCHEDULING

- A. The Contractor's Foreman shall act as a primary point of contact and responsible-in-charge for coordinating the Pre-Acceptance Test with the other portions of the Work, Owner, and the Engineer.
- B. The Contractor's Foreman shall act as primary point of contact and responsible-in-charge for coordinating the Final Acceptance Test with the other portions of the Work, Owner, Engineer and Authorities.

1.10 EXTRA MATERIALS

- A. The manufacturer shall provide a suggested spare parts list with firm unit prices maintained for the duration of the manufacturer's warranty period as specified herein, for items such as power supplies, central processor units, fault isolator modules, monitor addressable modules, addressable control relay output modules and other modules that may be long lead replacement items. Firm costs for programming changes shall also be included. Firm prices shall be maintained for one year beyond the duration of the manufacturer's warranty period as specified herein.

1.11 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace fire-alarm system equipment and components that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Extent: All equipment and components not covered in the Maintenance Service Agreement.
 - 2. Warranty Period: One year from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Distributors of acceptable manufacturer's equipment shall provide documentation indicating that they are authorized by the manufacturer to distribute and service the equipment and that the manufacturer has stated that they have satisfactorily completed all training courses offered by the manufacturer in relation to the equipment provided.

2.2 SYSTEMS OPERATIONAL DESCRIPTION

- A. The system shall include new control/communications equipment which is UL Listed to operate with the submitted manual fire alarm boxes, heat detectors and smoke detectors, and shall alert building occupants using audible and visible notification appliances, supervise each system for

conditions which would impair proper system operation, annunciate such abnormal conditions, and where applicable, control related equipment as indicated on contract documents.

B. ALARM CONDITION

1. The system operation shall be such that the alarm operation of any alarm initiating device shall not prevent the subsequent alarm operation of any other initiating device due to wiring or power limitations.
2. Fire-alarm signal initiation shall be by one or more of the following devices and systems:
 - a. Manual stations.
 - b. Heat detectors.
 - c. Smoke detectors.
 - d. Beam detectors
 - e. Automatic sprinkler system water flow.
 - f. Fire standpipe system water flow.
 - g. Fire pump running.
3. Fire-alarm signal shall initiate the following actions:
 - a. Continuously operate alarm-notification appliances.
 - 1) Activate Pre-recorded message or Temporal three evacuation signal as required.
 - b. Identify alarm at the fire-alarm control unit and remote annunciators.
 - c. Transmit an alarm signal to the remote alarm receiving station.
 - d. Switch heating, ventilating, and air-conditioning equipment controls to fire-alarm mode.
 - e. Record events in the system memory.

C. SUPERVISORY CONDITION

1. The control unit shall have a "SYSTEM SUPERVISORY" LED and a supervisory signal "ACKNOWLEDGE" switch.
2. Supervisory signal initiation shall be by one or more of the following devices and actions:
 - a. Valve supervisory switch.
 - b. Duct detectors
3. System trouble signal initiation shall be by one or more of the following devices and actions:
 - a. Open circuits, shorts, and grounds in designated circuits.
 - b. Opening, tampering with, or removing alarm-initiating and supervisory signal-initiating devices.
 - c. Loss of primary power at fire-alarm control unit.
 - d. Emergency generator trouble.
 - e. Ground or a single break in fire-alarm control unit internal circuits.
 - f. Abnormal ac voltage at fire-alarm control unit.
 - g. Break in standby battery circuitry.

- h. Failure of battery charging.
- i. Abnormal position of any switch at fire-alarm control unit or annunciator.

D. TROUBLE CONDITION

1. When a trouble condition is detected, the following functions shall immediately occur:
 - a. An amber “SYSTEM TROUBLE” LED light shall light and the system audible signal shall steadily sound when any trouble is detected in the system. Failure of normal power, opens or short circuits on the signaling line circuits or the notification appliance circuits, disarrangements in system wiring, failure of the microprocessor or any identification module, or system ground faults shall activate this trouble circuit.
 - b. A trouble signal may be acknowledged by actuating the “ACKNOWLEDGE” switch. This shall silence the control unit trouble buzzer. If additional trouble conditions occur, the trouble circuitry shall resound.
 - c. During an “alarm” condition, all “trouble” signals shall be suppressed with the exception of lighting the amber “COMMON TROUBLE” LED steadily.
 - d. The display shall indicate all information associated with the trouble condition, including type of trouble point, it’s location within the protected premises, and the time and date of that activation.
 - e. All system output programs assigned via control-by-event equations to be activated by the particular point in trouble shall be executed, and the associated System Outputs (Trouble Notification Appliances and/or relays) shall be activated.

- E. System Alarm, Trouble and Supervisory Signal Actions: Annunciate at fire-alarm control unit, remote annunciators, and transmit the signal to the supervising station.

F. SYSTEM SUPERVISION

1. All wiring extending from the FACU enclosure to fire alarm system components shall be supervised for opens, shorts and grounds. Systems containing unsupervised wiring of any type shall not be acceptable.
2. The occurrence of any fault shall activate the system trouble circuitry but shall not interfere with the proper operation of any circuit that does not have a fault condition.
3. Incoming 120 VAC line power shall be supervised so that any power failure shall be audibly and visually indicated at the control unit.
4. Batteries shall be supervised so that a low battery condition or disconnection of the battery shall be audibly and visually indicated at the control unit.

G. SYSTEM RESET

1. A “SYSTEM RESET” button shall be used to return the system to its normal state after an alarm condition has been remedied. Printed messages shall provide operator assurance of the sequential steps (i.e.: “IN PROGRESS”, “RESET COMPLETED”) as they occur, should all alarm conditions be cleared.
2. Should an alarm condition continue to exist, the system shall remain in an abnormal state. System control relays shall not reset. The control unit “ALARM” LED shall remain on. These points shall not require acknowledgment if they were previously acknowledged.

2.3 FIRE-ALARM CONTROL UNIT

- A. The FACU shall provide power, English display status, supervision, control, and programming capability for the fire detection and alarm system.
- B. The control unit shall be located by the Owner and the Engineer, as shown on the drawings.
- C. The control unit shall store a record of alarm and trouble events in a nonvolatile history file. This file shall contain, at least, the most recent 500 events, with time and date of each event. It shall be possible to select the number of events to be viewed in the history file so that the entire file does not have to be downloaded. The history file shall remain intact in the event of a loss of AC and battery power.
- D. The control unit shall be modular in construction and receive supervised plug-in component boards to provide system functions as hereinafter specified and/or to accommodate future system expansions.
- E. The control unit shall be capable of being expanded in the future to support a minimum of 99 addressable points (inputs or outputs). The control unit shall be capable of being expanded and field reprogrammed at any time up to the predetermined maximum capacity of the system, without the requirement to return the operating system to the factory for program changes. All field programming shall be done by an authorized manufacturer's representative.
- F. The control unit shall contain a minimum of two (2) signaling line circuits. Each signaling line circuit shall support a minimum of 99 addressable input devices or addressable monitor modules and a minimum of 10 output devices. All addressable input and output devices shall be capable of being intermixed on the same signaling line circuit.
- G. The control unit shall accommodate all addressable input devices in alarm simultaneously and shall be capable of operating all output relays while all inputs are in alarm.
- H. A minimum of one (1) signaling line circuit per floor shall be used, with devices equally distributed on each circuit. Each signaling line circuit shall be loaded to no more than 75% of its manufacturer specified capacity. Additional SLCs shall be furnished and installed as necessary to comply with this requirement.
- I. The control unit shall supply power and communication protocol signals to the addressable input devices over a single pair of wires per signaling line circuit from the control unit. Signaling line circuits shall be field programmable for Style 6 operation.
- J. A minimum of three fault isolator modules shall be used on each signaling line circuit. One fault isolator module shall be installed at the point the SLC leaves the FACU. Fault isolator modules shall be placed in order to minimize loss of addressable devices. Fault isolator modules shall be placed at each floor, where the SLC spans multiple floors. No more than 25 devices shall be installed on a circuit between fault isolators.
- K. The control unit shall contain a minimum of one (1) visible (strobe) and one (1) audible notification appliance circuits (NAC) per floor to provide an evenly distributed number of notification appliances per circuit. Visible (strobe) notification appliance circuits shall be independent from the audible notification appliance circuit. Each circuit's power load shall not

exceed 75% of the individual circuit power available from the FACU and new installed circuits shall be Class B circuits. Additional NACs shall be furnished and installed as necessary to comply with this requirement.

- L. Power for all notification appliances shall come from integral power supplies in the control unit. Remote power supplies, if needed, shall be of the same manufacturer as the FACU. All locations containing remote control equipment (such as a power supply extender) shall be protected with a smoke detector, in accordance with NFPA 72.
- M. At a minimum, the FACU shall contain the following:
 - 1. Display. A minimum 80 character, highly readable, display. Upon input activation, the display shall provide the following indication:
 - a. A device address display.
 - b. A field programmed English label indicating the location of the device.
 - c. An English description of the type of device activated, such as smoke detector, manual fire alarm box, water flow switch, etc.
 - d. The status of the input: alarm, supervisory or trouble.
 - e. Multiple alarm conditions shall be sequentially displayed automatically at not more than a five (5) second interval until manually acknowledged by priority.
 - 2. Annunciation. Annunciation shall be an integral part of the control system and shall indicate alarm, supervisory and trouble conditions and the corresponding address. The following initiating devices shall be annunciated individually:
 - a. Smoke detectors;
 - b. Heat detectors; and
 - c. Other approved types of automatic fire detection devices.
 - 3. Battery voltage and ammeter readouts shall be available from the LCD display.
 - 4. Once acknowledged, individual alarms shall be viewed by operating a "next-alarm" switch.
 - 5. Communication Ports. Two supervised RS232C communication ports shall be provided to support a printer or MODEM. Each RS232C port output shall be programmable for printer or display output and shall be programmable to provide access to the control unit's EEPROM operating system to perform the following functions:
 - a. Listing and indicating status of all field devices.
 - b. Capability of performing alarm tests on any or all addressable smoke detectors and contact input devices.
 - c. Monitoring of the system from remote locations via printer, terminal, or computer.
 - 6. The control unit shall be provided with a "silent" walk test feature. This feature shall allow for testing of the fire alarm system without activating the notification appliances.
 - 7. Clock. A 24 hour clock shall be provided to continually provide the time of day and day of the week information. During normal standby conditions, the control unit shall display time and date.
 - 8. Any operation of an alarm silence, supervisory silence, trouble silence, acknowledge, lamp test, relay switches, or system reset switch shall cause a display indication of operation with time and date. These operations shall also be recorded in the system's history file.

- N. The functional operation of the control unit shall be established by programmable software.
1. Provide nonvolatile memory for system database, logic, and operating system and event history. The system shall require no manual input to initialize in the event of a complete power down condition. The FACP shall provide a minimum 500-event history log.
- O. Access and control of the operating program shall be restricted to proper personnel designated by the Owner.
1. The control unit shall have a minimum of three (3) security levels, and they shall be designated: "ELECTRICIAN", "ALARM SYSTEM SERVICE TECHNICIAN", and "MANUFACTURER." Each level shall have individual passwords. Illegal access attempts shall be rejected by the system and shall be displayed and recorded in the history file with time and date.
 2. The "ELECTRICIAN" security level shall be the lowest security level and shall only allow access to the system status levels and lists and shall not impair system operation.
 3. The "MANUFACTURER" and "ALARM SYSTEM SERVICE TECHNICIAN" security levels shall allow access to the operating system.
 4. Accessing a programming function that disables normal system operation shall initiate a trouble sequence.
- P. Failure of the CPU(s) in the control unit module or a channel shall light the CPU Error LED and sound the control unit trouble buzzer. Alarms received while the control unit is in this state shall bypass the software and sound the general alarm signals and light the alarm LED.
- Q. The channel modules shall be field programmable to report wire-to-wire short conditions as either an alarm or trouble condition.
- R. The control unit shall be capable of locating input circuit openings by the associated address and initiate the proper display and trouble sequence.
- S. The system response to alarms shall be 2.5 seconds maximum for the first alarm.
- T. The control unit shall contain an integral standby battery to provide continuous power in the event of AC power failure.
1. The batteries shall be capable of providing 24 hours of backup power for the system (or 4 hours when using a backup generator) and enough remaining power to operate all notification appliances for 15 minutes at the end of the 24 hour period.
 2. The calculations for battery standby shall include a "safety factor" (reserve power estimate) of a minimum 20%.
 3. Transfer from AC to battery power shall be instantaneous when AC voltage drops below 85 percent input. Transfer to battery standby shall be indicated by display and recorded in the history file with time and date. The indication shall be "AC OFF".
 4. Loss of building power for the system shall automatically and immediately cause transfer of the system to battery power and cause all audible trouble signals to sound. Upon return of building power, the system shall automatically retransfer thereto, and the batteries shall automatically recharge.

5. During battery operation, the control unit shall process all inputs. However, the display shall provide five (5) seconds of indication for each new input condition, then turn off to conserve battery power.
 6. The control unit shall have a dual rate battery charger that shall maintain the batteries in a fully charged condition and shall provide recharge of the batteries to full capacity in forty-eight (48) hours.
- U. The control unit shall provide a nonprogrammable DPDT common alarm relay and common trouble relay both with contacts rated 2 AMP at 24 VDC.
- V. Output Function Modules. The control unit shall utilize output function modules to control output functions. The modules shall plug into the control unit motherboard. The functions and presence of each module shall be supervised, and “ELECTRICIAN” password shall enable the user to request a list that locates the module by panel and slot within system. All modules shall be individually programmable by circuit as hereinafter specified.
1. Addressable control relays shall be provided for each of the auxiliary functions; field verify quantities and locations.
- 2.4 Fire Alarm System Power Supplies
- A. System primary power
1. Primary power for the FACP and the secondary power battery chargers shall be obtained from a dedicated emergency power circuits. Circuit breakers shall be fitted with a suitable guard, requiring removal of a screw to open, and used only for fire alarm. Each circuit used for fire alarm purposes shall be permanently labeled for function.
- B. Secondary power supply
1. Emergency Diesel Generator.
 2. Provide sealed gelled electrolyte batteries as a backup for all fire alarm functions. The battery supply shall be calculated to operate loads in a supervisory mode for forty-eight hours with no primary power applied and, after that time, operate in alarm mode for two hours. Fifteen minutes of all call paging will be considered the equivalent of two hours normal paging use. Batteries shall be sized at 125% of the calculated size to compensate for deterioration and aging during the battery life cycle. Battery calculations shall be submitted to justify the battery size.
 3. Provide battery charging circuitry for each standby battery bank in the system. The charger shall be automatic in design, adjusting the charge rate to the condition of the batteries. All system battery charge rates and terminal voltages shall be read using the fire alarm control panel LCD display in the service mode, indicating directly in volts and amps. Meters reading in percentage are not acceptable.
- C. Equipment power supply capacity for each system shall be based on actual calculated load plus 25% excess capacity.

2.5 WIRING

- A. Wiring for the initiating devices, notification appliances and remote 80 character LCD display shall be solid or stranded copper and shall comply with the appropriate sections of NFPA 70, *National Electrical Code*. All system wiring size shall be as determined suitable by the manufacturer and in compliance with the *National Electrical Code*, yet they shall not be any smaller than as specified herein.
- B. Conductors shall be minimum #14-gauge solid copper, type FPLP or FPLR. All wiring shall be run continuously from device to device. Wiring size shall be increased as required to limit voltage drop in accordance with the lump sum method.
- C. Shielded wire shall be used as directed by the FACU manufacturer.
- D. All wiring shall be installed in metal raceway.

2.6 SYSTEM SMOKE DETECTORS

- A. General Requirements for System Smoke Detectors:
 - 1. Comply with UL 268; operating at 24-V dc, nominal.
 - 2. Detectors shall be two-wire type.
 - 3. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.
 - 4. Base Mounting: Detector and associated electronic components shall be mounted in low-profile twist-lock module that connects to a fixed base. Provide terminals in the fixed base for connection to building wiring.
 - 5. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
 - 6. Integral Visual-Indicating Light: LED type indicating detector has operated and power-on status.
- B. Photoelectric Smoke Detectors:
 - 1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
 - 2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).

2.7 HEAT DETECTORS

- A. General Requirements for Heat Detectors: Comply with UL 521.
- B. Heat Detection: Actuated by temperature that exceeds a fixed temperature of 135 deg F or a rate of rise detector. The temperature must be clearly printed on the detector.

- C. The detectors furnished shall have a listed spacing for coverage up to 2,500 square feet for use in environments as covered by Factory Mutual and UL (UQGS) and shall be installed according to the requirements of NFPA 72E for open area coverage.

2.8 DUCT SMOKE DETECTORS

A. General Requirements for Duct Smoke Detectors:

1. Comply with UL 268; operating at 24-V dc, nominal.
2. Detectors shall be two-wire type.
3. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to Fire Alarm Control Panel.
4. Duct smoke detectors shall meet the requirements for photoelectric light scattering type detectors. Duct smoke detectors shall be UL listed for installation in air duct sampling housings for the detection of smoke in HVAC system ducts.
5. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
6. Integral Visual Indicating Light: LED type indicating detector has operated and power-on status.

2.9 NOTIFICATION APPLIANCES

A. General Requirements for Notification Appliances: Connected to notification appliance signal circuits, equipped for mounting as indicated and with screw terminals for system connections.

1. Combination Devices: Factory-integrated audible and visible devices in a single-mounting assembly, equipped for mounting as indicated and with screw terminals for system connections.

B. Speakers: The operation of any automatic fire detector, sprinkler waterflow device or manual fire alarm box shall automatically sound an alert tone followed by voice instructions giving approved information and directions for a general or staged evacuation in accordance with the building's fire safety and evacuation plans.

C. Visible Notification Appliances: Xenon strobe lights comply with UL 1971, with clear or nominal white polycarbonate lens mounted on an aluminum faceplate. The word "FIRE" is engraved in minimum 1-inch- (25-mm-) high letters on the lens.

1. Rated Light Output:
 - a. 15/30/75/110 cd, selectable in the field.
2. Mounting: Wall or ceiling mounted as indicated.
3. For units with guards to prevent physical damage, light output ratings shall be determined with guards in place.
4. Flashing shall be in a temporal pattern, synchronized with other units.
5. Strobe Leads: Factory connected to screw terminals.
6. Mounting Faceplate: Factory finished, red.

2.10 Notification Appliance Remote Power Supplies

- A. Remote power supplies shall power and supervise a minimum of 4 Class B NACs that shall be capable of synchronization on the same circuit, synchronization with notification appliance circuits on other power supplies, and synchronization with notification appliance circuits connected directly to the FACU.
- B. Remote power supplies shall have an auxiliary power output for providing remote power to fire alarm system devices other than notification appliances. Devices to be powered from auxiliary power output shall be approved by the Manufacturer and have been tested by a UL and/or FM.
- C. Remote power supplies shall be connected to FACU, supervised by and activated by a dedicated Class B notification appliance circuit or Class B connections from addressable monitor modules and addressable control relay output modules.
- D. Remote power supplies shall be supervised for loss of power, brownout, and battery trouble conditions. NACs shall be supervised for wiring faults including, opens, wire-to-wire short circuits and earth faults. Remote power supply Trouble signal(s) shall report on the FACU display. Additionally, remote power supply shall have visible indicators (LEDs) for displaying Trouble signal(s) and indicating which NAC is in Trouble at the power supply.
- E. All locations containing remote control equipment (such as a power supply extender) shall be protected with a smoke detector, in accordance with NFPA 72.

2.11 ADDRESSABLE INTERFACE DEVICE

- A. Description: Microelectronic monitor module, NRTL listed for use in providing a system address for alarm-initiating devices for wired applications with normally open contacts.
- B. Integral Relay: Capable of providing a direct signal to circuit-breaker shunt trip for power shutdown.

2.12 DIGITAL ALARM COMMUNICATOR TRANSMITTER

- A. Digital alarm communicator transmitter shall be acceptable to the remote central station and shall comply with UL 632 and be listed and labeled by an NRTL.
- B. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire-alarm control unit and automatically capture two telephone line(s) and dial a preset number for a remote central station. When contact is made with central station(s), signals shall be transmitted. If service on either line is interrupted for longer than 45 seconds, transmitter shall initiate a local trouble signal and transmit the signal indicating loss of telephone line to the remote alarm receiving station over the remaining line. Transmitter shall automatically report telephone service restoration to the central station. If service is lost on both telephone lines, transmitter shall initiate the local trouble signal.
- C. Local functions and display at the digital alarm communicator transmitter shall include the following:
 - 1. Verification that both telephone lines are available.
 - 2. Programming device.

3. LED display.
4. Manual test report function and manual transmission clear indication.
5. Communications failure with the central station or fire-alarm control unit.

D. Digital data transmission shall include the following:

1. Address of the alarm-initiating device.
2. Address of the supervisory signal.
3. Address of the trouble-initiating device.
4. Loss of ac supply or loss of power.
5. Low battery.
6. Abnormal test signal.
7. Communication bus failure.

E. Secondary Power: Integral rechargeable battery and automatic charger.

F. Self-Test: Conducted automatically every 24 hours with report transmitted to central station.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance of the Work.
 1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment and wiring are installed, before installation begins.
- B. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Prepare and submit a minimum of six (6) complete "Pre-Installation Documentation" submittal packages to the Engineer for review prior to submitting same to local officials (as required) for approval and permit. Resubmit portions or entirety of submittal to address Engineer comments prior to submitting package to local officials (as required) for approval and permit. See Part 1 "Submittals" for submittal content.
- B. Obtain Owner approval to deliver materials and begin installation once "Pre-Installation Documentation" review process is complete and necessary local approvals and permits have been secured.

3.3 GENERAL EQUIPMENT INSTALLATION

- A. Installation, workmanship, fabrication, assembly, erection, examination, inspection and testing shall be in accordance with NFPA 72 and the local applicable codes.

3.4 MODULE AND REMOTE POWER SUPPLY INSTALLATION

- A. Install remote power supplies as indicated on drawings. Obtain Engineer approval for locations not previously identified (and approved) in submittal.
- B. Install addressable isolator modules as indicated on drawings. Obtain Engineer approval for locations not previously identified (and approved) in submittal.
- C. Install addressable monitor modules as indicated on drawings to supervise and monitor the status of each non-addressable device, such as conventional spot-type heat detectors. Obtain Engineer approval for locations not previously identified (and approved) in submittal.
- D. Install addressable control relay output modules as indicated on drawings. Obtain Engineer approval for locations not previously identified (and approved) in submittal.

3.5 INITIATING DEVICE INSTALLATION

- A. In general, automatic detectors shall be mounted on the structural ceiling or finished ceiling and not on the bottom or side of any type of construction or structure which extends down from the ceiling. Automatic detectors shall be installed as indicated on the plans and in conformance with all codes and Regulations and these specifications. The detectors shall be installed within five (5) feet of the location shown on the drawings to accommodate construction.
- B. Automatic detectors shall be located near points where air currents normally intersect. Detectors shall not be located in the direct path of the draft from an HVAC air supply grille, a door, window, or hallway. Detectors shall be installed a minimum of three (3) feet from an HVAC air supply diffuser, in accordance with NFPA 72.
- C. Addressable analog photoelectric smoke detectors shall be installed in areas according to the drawings. Unless otherwise shown on the drawings, detectors shall be spaced at thirty (30) foot centers, and in accordance with NFPA 72 and the manufacturer's installation instructions. Smoke detectors shall only be installed in those environments suitable for proper smoke detector operation.
- D. Addressable heat detectors shall be installed in environments appropriate for proper detection in accordance with NFPA 72 and the manufacturer's installation instructions.
- E. In un-sprinklered areas where the environment is not suitable for proper operation of addressable heat detectors, conventional spot-type heat detectors shall be furnished and installed. Conventional heat detectors shall be monitored and supervised by addressable monitor modules. Addressable monitor modules shall be installed in an area where the environmental conditions are suitable and the monitor modules' initiating circuits extended to the conventional heat detectors alarm contacts.

3.6 NOTIFICATION APPLIANCE INSTALLATION

- A. All wall-mounted combination audible/visible notification appliances shall be mounted such that that the entire strobe lens is not less than eighty (80) inches and not greater than ninety-six (96) inches above the finished floor, or six (6) inches below the finished ceiling, whichever is lower.
- B. All strobes shall be synchronized.

- C. All audible notification appliances shall sound the fire alarm emergency evacuation signal.

3.7 CONNECTIONS

- A. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 3 feet (1 m) from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.
 - 1. Supervisory connections at valve supervisory switches.
 - 2. HVAC interface

3.8 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals.
- B. Install framed instructions in a location visible from fire-alarm control unit.

3.9 WIRING

- A. The wiring and raceway system for the fire alarm system shall be in accordance with the California Building Code and the California Electric Code. Device and appliance boxes shall be new and low-profile.
- B. All raceway shall be electrical metallic tubing (EMT) or rigid conduit. MC cable is not permitted.
- C. Furnish metal raceway, wiring, outlet boxes, junction boxes, cabinets, labels and similar devices necessary for the complete installation of the fire alarm system. Wiring shall be of the type as specified herein and recommended by the manufacturer and shall be installed in metal raceway throughout.
- D. Fire alarm system wiring within the building shall be installed in metal raceway with steel couplings and box connectors. Cast "LB" or "T" type connectors shall be permitted. An equipment-bonding conductor shall be provided in all flexible metallic raceways.
- E. All fire alarm system riser conduits shall be minimum 1-inch in diameter.
- F. All wiring shall be installed continuous from device to device.
- G. Terminal cabinets with hinged, lockable red covers, by Space Age Electronics, Marlboro, MA, or equal shall be provided at all junction points. All conductor splices shall be made on screw-type terminal blocks – wire nuts, butt, crimp or screw type connectors shall not be used. All terminals within a terminal cabinet shall be properly and permanently labeled. All junction box covers shall be painted red.
- H. Raceways containing conductors identified as "Fire Alarm System" conductors shall not contain other conductors, and no AC carrying conductors shall be allowed in the same raceway with the DC fire alarm detection and signaling conductors.

- I. The conductors for the notification appliance circuits shall not be installed in the same race-way as the conductors for signaling line circuits unless written certification from the manufacturer is supplied to the Engineer indicating that the inclusion of these circuits in the same raceway is acceptable and that no additional consideration is needed for these circuits.
- J. Notification appliance circuits and control equipment shall be arranged and installed so that loss of any one (1) notification appliance circuit shall not cause the loss of any other notification appliance circuit in the system.
- K. Color coding of conductors shall be approved by the Owner. Unless otherwise indicated, the color code for all fire alarm system conductors shall be as follows:
 - 1. Signaling line circuits and initiating device circuits shall be red and black. Red shall be positive and black shall be negative. (SLC/IDC)
 - 2. Audible notification appliance circuits shall be blue and white. Blue shall be positive and white shall be negative (NAC).
 - 3. Sprinkler circuits shall be red and black. Red shall be positive and black shall be negative.
 - 4. Smoke detector power circuits shall be brown and violet. Violet shall be positive and brown shall be negative.
 - 5. Auxiliary remote power supply circuits shall be brown and violet. Violet shall be positive and brown shall be negative.
 - 6. HVAC shut-down circuits shall be orange and yellow.
 - 7. Remote annunciator circuits shall be violet and numbered at each end.
 - 8. AC supply circuit to the main FACU shall be white, black and red. The black shall be one phase, and the red shall be the opposite phase, if required. The white shall be the neutral. If a separate feed is required for the battery charger, it shall be black and white unless the main FACU requires only one AC feed. In that case, the conductors to the battery charger shall be red and white.
- L. Exposed raceways shall be run parallel and perpendicular to the walls and ceilings. Wherever practical, exposed raceways shall be run on the ceiling as close as possible to a wall or as high as possible on a wall. Where exposed raceways shall cross under a structural beam or rib, they shall be run down on one side of the beam or rib, across its bottom, and up to the ceiling on the other side of the beam or rib. No spanning from beam to beam or rib to rib shall be permitted. The use of a raceway body on one side of a beam or rib shall be permitted provided it shall be readily accessible.
- M. Fault isolator modules shall be furnished as required and shall be mounted as directed by the manufacturer. The field location of the fault circuit isolators shall be labeled so that the devices may be easily located, and that location shall be noted on the point-to-point and as-built drawings.
- N. All wiring within the control unit shall be neatly served in the panel gutters and be secured by means of Thomas & Betts "Ty-Raps" or by other approved means.

3.10 GROUNDING

- A. Ground fire-alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire-alarm control unit.

3.11 FIELD QUALITY CONTROL

- A. Field tests shall be witnessed by authorities having jurisdiction and Engineer.
- B. Tests and Inspections:
 - 1. Visual Inspection: Conduct visual inspection prior to testing.
 - a. Inspection shall be based on completed Record Drawings and system documentation that is required by NFPA 72 in its "Completion Documents, Preparation" Table in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter.
 - b. Comply with "Visual Inspection Frequencies" Table in the "Inspection" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72; retain the "Initial/Reacceptance" column and list only the installed components.
 - 2. System Testing: Comply with "Test Methods" Table in the "Testing" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72.
 - 3. Test audible appliances for the public operating mode according to manufacturer's written instructions. Perform the test using a portable sound-level meter complying with Type 2 requirements in ANSI S1.4.
 - 4. Test visible appliances for the public operating mode according to manufacturer's written instructions.
 - 5. Factory-authorized service representative shall prepare the "Fire Alarm System Record of Completion" in the "Documentation" Section of the "Fundamentals of Fire Alarm Systems" Chapter in NFPA 72 and the "Inspection and Testing Form" in the "Records" Section of the "Inspection, Testing and Maintenance" Chapter in NFPA 72.
- C. Reacceptance Testing: Perform reacceptance testing to verify the proper operation of added or replaced devices and appliances.
- D. Fire-alarm system will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.
- F. Maintenance Test and Inspection: Perform tests and inspections listed for weekly, monthly, quarterly, and semiannual periods. Use forms developed for initial tests and inspections.
- G. Annual Test and Inspection: One year after date of Substantial Completion, test fire-alarm system complying with visual and testing inspection requirements in NFPA 72. Use forms developed for initial tests and inspections.

3.12 AUTHORITY HAVING JURISDICTION FINAL ACCEPTANCE

- A. Prepare and submit a minimum of six (6) complete "Final Acceptance Documentation" submittal packages to the Engineer for review prior to submitting same to local officials for final system approval. Resubmit portions or entirety of submittal to address Engineer comments prior to submitting package to local officials. See Part 1 "Submittals" for submittal content.
- B. Submit reviewed "Final Acceptance Documentation" submittal package to authority and coordinate scheduling (minimum ten (10) business days notice) of common fire sprinkler and fire alarm system acceptance testing. If acceptable to the authority, the reviewed "Approval

Documentation” submittal may be submitted to the authority at the time of the final acceptance tests.

- C. Demonstrate system components to authority having jurisdiction as necessary.
- D. Reschedule testing where unsatisfactory results cannot be resolved such that testing can be completed to the satisfaction of the authorities. See Owner “General Agreement” for possible additional costs and penalties.
- E. Upon satisfactory completion of the tests, leave the fire alarm system in proper working order.

3.13 PROJECT CLOSEOUT PROCEDURES

- A. Prepare and submit a minimum of six (6) closeout documentation packages to the Engineer for review prior to scheduling Owner demonstration and training. Resubmit portions or entirety of submittal to address Engineer comments prior to scheduling demonstration and training. See Part 1 “Submittals” for submittal content.
- B. Schedule Owner demonstration and training with the Owner for each building. Provide at least five (5) working days notice.
- C. Demonstrate equipment, specialties, and accessories with the Owner. Review operating and maintenance information with the Owner.
 - 1. Electrician & Building Manager: Prior to final acceptance of the fire alarm system, provide operation training to each shift of the Owner's designated Building Manager. Each training session shall be a minimum of 1 hour and shall be conducted on shift or at a time acceptable to the Owner. Each session shall include an overview of the system and the devices connected to it, emergency procedures (including alarm, trouble and supervisory condition procedures), control panel operation, and safety requirements. Each session shall include a complete demonstration of the system.
 - 2. The manufacturer's technical representative shall also be required to instruct designated building and management personnel in the general operation of the system and to give the designated personnel an overview of the system functions when the system is in normal, supervisory mode, alarm mode, and trouble mode, as specified in this specification.

END OF SECTION 283111

SECTION 312000
EARTHWORK

PART 1 - GENERAL

1.1 SUMMARY

- A. Specifications for the excavation, filling, recompacting, grading and disposal of excess material as approved by the Geotechnical Engineer.
- B. Excavated soil and land clearing debris to be 100% reused or recycled
- C. Related Sections
 - 1. Section 312324, "Trench Excavation and Backfill"

1.2 REFERENCED STANDARDS

- A. ASTM International
 - 1. ASTM C136-84a: Standard Method for Sieve Analysis of Fine and Coarse Aggregate
 - 2. ASTM D1557: Laboratory Compaction Characteristics of Soil Using Modified Effort
 - 3. ASTM D2922: Density of Soil and Soil-Aggregate in Place by Nuclear Methods
- B. Caltrans – State of California Standard Specifications; latest edition
- C. Geotechnical Investigation and Geologic Hazards Evaluation Laney College Library Learning Resource Center report prepared by Fugro dated February 28,2020
- D. DMM Design and Recommendations report prepared by Fugro dated June 22,2022

1.3 DEFINITIONS

- A. Compaction
 - 1. The degree of compaction is specified as percent compaction. Maximum densities refer to the maximum laboratory dry soil densities obtainable at optimum moisture content as determined by ASTM D1557.
 - 2. Percent compaction (relative compaction) is the ratio of the measured field dry density to the laboratory maximum dry density.
- B. Excavation Slope: Excavation slope shall be defined as an inclined surface formed by removing material from below existing grade.

1.4 SUBMITTALS

- A. Product Data
 - 1. Fill materials
 - 2. Source of recycle facility
- B. Test Reports
 - 1. Gradation (ASTM C136)
 - 2. Density-In-Place (ASTM D2922)

PART 2 - PRODUCTS

2.1 FILL MATERIALS

- A. General:
 - 1. Fill material will be subject to approval of the Geotechnical Engineer.

2. For approval of imported fill material, notify the District's Representative at least 7 days in advance of intention to import material, designated proposed borrow area, and permit the Geotechnical Engineer to sample as necessary from borrow area for purpose of making acceptance tests to prove quality of material.
 3. The Geotechnical Engineer's report on acceptability shall be final and binding.
 4. During grading operations, soil types other than those analyzed in the geotechnical report for the project, may be encountered.
 5. Consult the Geotechnical Engineer to determine the suitability of these soils.
 6. Onsite soils (except Young Bay Mud) and fills can be used as new fills, with geotechnical approval.
- B. Engineered Fill Material:
1. New fills placed at the site shall consist of engineered fills that meet the requirements listed in the geotechnical report, except for landscaping materials which are placed on level ground.
 2. All engineered fills shall have an organic content of less than 3% by volume and shall not contain rocks or lumps larger than 4-inches in greatest dimension with not more than 15% larger than 2.5 inches.
 3. Onsite soils (native, except for Young Bay Mud) and fills may be used as new fills as approved by the geotechnical Engineer.
 4. Imported fills not used as non-expansive fill shall be predominantly granular, have a liquid limit less than 40%, and have a plasticity index not exceeding 20.
 5. Imported, non-expansive fills shall consist of sub-angular to angular particles, have a plasticity index not exceeding 12, and have a significant fine content.
 6. All imported fill shall not contain environmental contaminants or debris and shall be non-corrosive.
7. Native Fill Requirements:
1. Approved native materials shall have a particle size not exceeding 4 inches as determined by ASTM D422 with not more than 15 percent larger than 2.5 inches, at least 90 percent by weight passing the 1 inch sieve and less than 3 percent organic content by volume.
8. Per Section 321123 Aggregate Base and as indicated in plans.

PART 3 - EXECUTION

3.1 CONSTRUCTION

- A. Surplus Material: Unless otherwise specified, surplus excavated material shall be disposed of off-site in accordance with applicable ordinances and environment requirements at the expense of the Contractor.
- B. Hauling
1. When hauling is down over highways or city streets, loads shall be trimmed and the vehicle shelf areas shall be cleaned after each loading.
 2. Loads shall be watered after trimming to eliminate dust.
- C. Subgrade:
1. Unless directed otherwise on the drawings, soil subgrades in areas to receive engineered fill, slabs-on-grade, or pavements shall be scarified to a depth of at least 12 inches, moisture conditioned to approximately 3 percent above optimum water content and compacted to the requirements for engineered fills.
 2. Locally weak fills and soils shall be excavated and replaced, or otherwise stabilized as recommended by the Geotechnical Engineer at the time of earthwork operations.
 3. The prepared subgrade surface shall be firm, unyielding, and kept moist during construction.
 4. The subgrade shall be protected from damage caused by weather and construction traffic. If the subgrades are left exposed to weather for extended periods of time or are disturbed by construction traffic, the Geotechnical Engineer shall be consulted for subgrade moisture

reconditioning and/or scarifying and recompacting to eliminate shrinkage cracks and disturbances.

- D. Fill Placement and Compaction:
1. Within the upper 5-feet of the finished ground surface, engineered fills shall be compacted to at least 90% relative compaction, as determined by ASTM D1557.
 2. Engineered fills below a depth of 5-feet shall be compacted to at least 95% relative compaction.
 3. The upper 6-inches of subgrade soils beneath pavements shall be compacted to at least 95% relative compaction.
 4. Fill material shall be spread and compacted in lifts not exceeding approximately 8-inches in uncompacted thickness.
 5. Engineered fills shall be moisture conditioned to approximately 3 percent above optimum water content. To achieve satisfactory compaction of fill materials, it may be necessary to adjust the water content at the time of earthwork operations. This may require that water be added to soils that are too dry, or that aeration be performed in any soils that are too wet. To achieve satisfactory compaction of on-site excavated soils from near or below the existing groundwater level will require drying at the time of construction.
- E. Finish Grading
1. Finish surfaces shall be smooth, compacted and free from irregularities. The degree of finish shall be that normally obtainable with a blade-grader.
 2. Finish grades shall be as specified on the plans, except where a local change in elevation is required to match existing conditions, or to ensure proper drainage.
 3. When the work is at an intermediate stage of completion, lines and grades shall be as specified within 0.1 foot or as necessary to provide adequate drainage.

3.2 FIELD QUALITY CONTROL

- A. Fill material shall be placed in horizontal layers and compacted with power tampers, rollers, idlers, or vibratory equipment. Within the upper 5 feet of the finished ground surface, engineered fills shall be compacted to at least 90% relative compaction, as determined by ASTM D1557, or as approved by the Geotechnical Engineer. The upper 6 inches of subgrade soils below pavements shall be compacted to 95% relative compaction or as indicated in the plans. Fill material shall be spread and compacted in lifts not exceeding 8-inches in uncompacted thickness.

3.3 TESTS

- A. Inspection Trenches
1. Owner will direct Contractor to construct inspection trenches in compacted or consolidated backfill to determine that Contractor has complied with these Specifications.

END OF SECTION

This Page Intentionally Left Blank

SECTION 312319
DE-WATERING

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Specifications and procedure for the de-watering of excavations and disposal of water.

1.2 SUBMITTALS

- A. Prior to installation of the de-watering system, submit shop drawings and design data indicating the following:
 - 1. The proposed type of de-watering system
 - 2. Arrangement, location and depths of system components
 - 3. Complete description of equipment and instrumentation to be used, with installation, operation and maintenance procedures
 - 4. Methods of disposal of pumped water
 - 5. Necessary permits for water disposal

PART 2 - PRODUCTS

2.1 EQUIPMENT

- A. Furnish all materials, tools, equipment, facilities, and services as required for providing the necessary de-watering work and facilities.
- B. Provide backup equipment as necessary for the replacement and for unanticipated emergencies.

PART 3 - EXECUTION

3.1 DE-WATERING

- A. Keep excavation reasonably free from water during construction.
- B. Disposal of water shall not damage property or create a public nuisance.
- C. Have on hand pump equipment and machinery in good working condition for emergencies and workmen available for its operation.
- D. De-watering systems shall operate continuously until trenches are backfilled.
- E. Groundwater shall be controlled to prevent softening of the bottom of excavations, or formation of "quick" conditions.
- F. De-watering systems shall not remove natural soils.
- G. Control surface runoff to prevent entry or collection of water excavations.
- H. Release of groundwater shall be controlled to prevent disturbance of the natural foundation soils or compact fill.
- I. There shall be no discharge of turbid or hazardous water on site.
- J. Discharge or disposal of water shall be controlled to prevent erosion.

SECTION 312324
TRENCH EXCAVATION AND BACKFILL

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Perform all excavation, shoring, dewatering, backfilling, compaction, pavement restoration, and grading necessary or required for the construction of the work as covered by these Specifications, Geotechnical Report, and indicated in the Drawings. The excavation shall include, without classification, the removal and disposal of all materials of whatever nature encountered, including water and all other obstructions that would interfere with the proper construction and completion of the required work.
- B. Related Sections
 - 1. Section 321123, "Aggregate Base"
 - 2. Section 321216, "Asphaltic Concrete Paving"
 - 3. Section 312319 "De-Watering"
 - 4. Section 331000 "Water Utilities"
 - 5. Section 333300 "Site Sanitary Sewerage System"
 - 6. Section 334000 "Storm Drainage System"

1.2 REFERENCES

- A. American Society for Testing and Materials (ASTM).
- B. State of California, Department of Transportation, Standard Specifications (Standard Specifications) July 1992.
- C. State of California, Department of Transportation, Manual of Test (California Test).

1.3 SUBMITTALS

- A. Submit the following:
 - 1. Sheeting and Shoring Plan: Refer to Paragraph 1.05 below.
 - 2. Potholing Report as described in Paragraph 3.02.
 - 3. Samples and Test Results: Furnish, without additional cost to the Owner, such quantities of import materials as may be required by the Owner's Representative for test purposes. Cooperate with the Owner's Representative and furnish necessary facilities for sampling and testing of all materials and workmanship. Submit test results for import materials. Tests shall have been performed within 60 days of submission. All material furnished and all work performed shall be subject to rigid inspection, and no material shall be delivered to the site until it has been favorably reviewed by the Owner's Representative, or used in the construction work until it has been inspected in the field by Inspector of Record.

1.4 QUALITY ASSURANCE

- A. Source Quality Control: Test import materials proposed for use to demonstrate that the materials conform to the specified requirements. Tests shall be performed by an independent testing laboratory.
- B. Field Quality Control:
 - 1. The Owner will:
 - a. Review and test materials proposed for use.
 - b. Inspect placement and compaction of fill.
 - c. Test soils during placement of fill.
 - 2. Contractor shall excavate holes for in-place soil sampling. Contractor shall be responsible for costs of additional inspection and re-resting resulting from non-compliance.

- C. Testing Methods:
 - 1. Durability Index: Manual of Test, State of California, Department of Transportation.
 - 2. Specific Gravity: ASTM D854.
 - 3. Laboratory Compaction: ASTM D1557, Method A or C.
 - 4. In-Place Density: ASTM D2922.
 - 5. Particle Size Analysis of Soils: ASTM D422.
 - 6. Plastic Limit and Plasticity Index: ASTM D4318.
 - 7. Soil Classification: ASTM D2487.
 - 8. In-Place Moisture Content: ASTM D3017.

1.5 EXCAVATION AND TRENCHING

- A. General Protection: Pursuant to Labor Code Sections 6705 and 6707, Contractor shall include in its base bid all costs incident to the provision of adequate sheeting, shoring, bracing or equivalent method for the protection of life and limb which shall conform to the applicable Federal and State Safety Orders.
- B. Before beginning any excavation five (5) feet or more in depth, submit to the Owner's Representative a detailed plan showing the design of shoring, bracing, sloping or other provisions to be made for worker protection from the hazard of caving ground during excavations. Comply with the Standards established by the State of California Construction Safety Orders Title 24 of the California Administrative Code. If the detailed plan varies from such shoring system Standards it shall be prepared by a registered civil or structural engineer whose name and registration number shall be indicated on the Drawing. If a dispute arises as to whether the plan must be prepared by a registered civil or structural engineer, the Owner's Representative's determination of the matter shall be final and conclusive. The cost of required engineering services shall be borne by the Contractor and shall be deemed to have been included in the amount of bid for the work as stated in the Agreement.
- C. Neither the review nor approval of any plan showing design of shoring, bracing, sloping or other provisions for worker protection shall relieve Contractor from his obligations to comply with Construction Safety order Standards and Title 24 CAC for design and construction of such protective work, and Contractor shall indemnify Owner and Owner's Representative from any and all claims, liability, costs, actions and a cause of action arising out of or related to the failure of such protective system. The Contractor shall defend the Owner, its officers, employees and agents and the Owner's Representative in any litigation or proceeding brought with respect to the failure of such protective systems.
- D. The Contractor shall comply with Section 382 of the Civil Code of the State of California relating to lateral, general and sub-adjacent supports wherever structures or improvements adjacent to an excavation may be damaged by such excavation.
- E. Contractors must still comply with the State of California Construction Safety Orders, Article 6 – Excavations, Trenches, Earthwork. The requirements of Article 6 apply whether the excavation, trench or earthwork is less than 5', or 5' or more.
- F. The Contractor shall select, install and maintain shoring, sheeting, bracing, and sloping as necessary to maintain safe excavations. The Contractor shall be responsible for ensuring such measures: (1) comply fully with 29 CFR Part 1926 OSHA Subpart P Excavations and Trenches requirements, (2) provide necessary support to the sides of excavations, (3) provide safe access to the Engineer's sampling and testing within the excavation, (4) provide safe access for backfill, compaction, and compaction testings, and (5) otherwise maintain excavations in a safe manner that shall not endanger property, life, health, or the project schedule. All earthwork shall be performed in strict accordance with applicable law, including local ordinances, applicable OSHA, CalOSHA, California Civil Code, and California Department of Industrial Safety requirements.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Crushed Rock: ¾-inch maximum crushed virgin drain rock with a minimum durability rating of 58.
- B. Import Backfill: Class 2, ¾-inch maximum aggregate base, Standard Specifications Section 26. Paragraphs 26-1.06 and 26-1.07 are not applicable.
- C. Light Weight Backfill: Naturally-occurring volcanic rock with a maximum unit weight of 65 pounds per cubic foot, minimum Durability Index of 35 (California Test 229), minimum R-Value of 50 (California Test 301), wrapped in geotextile fabric, with the following gradation requirements:

<u>Sieve Size</u>	<u>Percentage Passing</u>
1-1/2 inch	100
1 inch	95 to 100
¾ inch	90 to 100
3/8 inch	15 to 85
No. 4	0 to 9

- D. Geotextile Fabric: Mirafi FW300 or equivalent
- E. Water: The water used shall be potable and free of objectionable quantities of silt, oil, organic matter, alkali, salts and other impurities. Water quality must be acceptable to the Owner's Representative.
- F. Sandy Clay Loam: Provide sandy clay loam backfill in the top 18 inches in unpaved areas, 85% compaction.
 - 1. Sandy Clay Loam Analysis: Submit a sample of sandy clay loam proposed for use to an accredited Soils Laboratory for "agricultural suitability" analysis report, including particle size, and evaluation of physical and chemical properties of soil and recommendations for adding amendments and fertilizers to the soil.
 - 2. Upon approval of the Laboratory's report by the Owner's Representative, the recommendations in the report shall become a part of the Specifications and the quantities of soil amendment, fertilizer and other additives shall be adjusted to conform with the report at no additional cost to the Owner. Request Testing Laboratory to send one copy of test results directly to Owner's Representative.
 - 3. Test Laboratory: Soil and Plant Laboratory, Inc. 352 Matthew Street (PO Box 153), Santa Clara, CA 95052, Tel. (408) 727-0330; or Root Zone Associates, PO Box 18911, San Jose, CA 95118, Tel. (408) 264-7024.
- G. Controlled Density Fill (CDF):
 - 1. Materials:
 - a. Cement: ASTM C150, Type II or V. A maximum of twenty (20) lbs. of cement per cubic yard.
 - b. Aggregate shall consist of fine aggregate, with our without coarse aggregate, with a maximum size of 1-inch, free of clay, organics, and other deleterious materials. Less than 10 percent by weight shall pass the No. 200 sieve, and materials passing the No. 40 sieve shall be nonplastic as determined in accordance with ASTM D4318.
 - c. Water: Potable.
 - d. Fly Ash: ASTM C618, Class F unless otherwise approved.
 - 2. Mix Design:
 - a. Performance Requirements: The CDF shall be proportioned to be a non-segregating, free flowing, self-consolidating, low shrink slurry.
 - b. Mix Design Requirements: The Contractor and its supplier shall determine the materials and proportions used to meet the requirements of these Specifications. Design the mixes far enough ahead of placement to allow completion of trail mix testing and submittal of test results. The mix design(s) shall be prepared for the range of aggregate gradations that is expected to be used. The Contractor shall make daily checks of the aggregate gradation and adjust the mix design as required to meet these Specifications.
 - c. Material Strength Requirements: The unconfirmed compressive strength at 28 days

shall be 100 psi as per ASTM D4832.

- H. Concrete: Concrete encasement used for conduit backfill shall be rated 4000 psi at 28 days and shall have red dye additive. Submit mix design for approval.
- I. Trench Plugs: Clayey soils as approved by the Geotechnical Engineer

PART 3 - EXECUTION

3.1 CONTROL OF WATER

- A. All excavations shall be kept free from water and all construction shall be in the dry.
 - 1. It should be presumed that the presence of groundwater will require dewatering operations. Furnish, install, maintain, and operate all necessary pumping and other equipment for dewatering all excavations. At all times have on the project sufficient pumping equipment for immediate use, including standby pumps for use in case other pumps become inoperable.
 - 2. Provide a sufficient number of pumps so as to hold the groundwater level at an elevation of not less than 1 foot below the lowest elevation of the pipe, duct or other material to be placed.
 - 3. Dispose of water in such a manner as to cause no injury or nuisance to public or private property, or be a menace to the public health.
 - 4. The dewatering operation shall be continuous, so that the excavated areas shall be kept free from water during construction, while concrete is setting and achieves full strength, and until backfill has been placed to a sufficient height to anchor the work against possible flotation.
 - 5. Continue dewatering during backfilling operations such that the groundwater is at least 1 foot below the level of the compaction effort at all times. No compaction of saturated materials will be allowed.
 - 6. Dewatering devices must be adequately filtered to prevent the removal of fines from the soil.
 - 7. The Contractor shall be responsible for any damage to the foundations or any other parts of existing structures or of the new work caused by failure of any part of the Contractor's protective works. After temporary protective works are no longer needed for dewatering purposes, they shall be removed by the Contractor.
 - 8. If pumping is required on a 24-hour basis, requiring engine drives, then engines shall be equipped in a manner to keep noise to a minimum.
 - 9. Prevent disposal of sediments from the soils to adjacent lands or waterways by employing whatever methods are necessary, including settling basins and holding tanks for disposal off site
- B. The Contractor shall be responsible for furnishing temporary drainage facilities to convey and dispose of surface water falling on or passing over the site.

3.2 EXISTING UTILITIES

- A. General: The known existing buried utilities and pipelines except building connections are shown on the Drawings in their approximate location. The Contractor shall exercise care in avoiding damage to all utilities, as they will be held responsible for their repair if damaged. There is no guarantee that all utilities or obstructions are shown, or that locations indicated are accurate. Utilities are piping, conduits, wire, cable, ducts, manholes, pull boxes and the like.
- B. Check on Locations (Potholing):
 - 1. The Owner performed a limited investigation and has recorded those findings on the Contract Documents. The Contractor shall be responsible for all additional potholing to verify location of existing utilities as needed to complete the work indicated in the Contract Documents.
 - 2. The Contractor shall clearly paint the location of all affected utility underground pipes, conduits and other utilities on the pavement or identify the location with suitable markers if not on pavement. In addition to the location of metallic pipes and conduits, non-metallic

pipe, ducts and conduits shall also be similarly located using surface indicators and detection tape if present and shall then be similarly marked.

3. After the utility survey is completed, commence "potholing" to determine the actual location and elevation of all utilities where crossings, interferences, or connections to the new pipelines are shown on the Drawings, or indicated by surface signs. Prior to the preparation of piping shop drawings, or the excavating for any new pipelines or structures, the Contractor shall locate and uncover these existing utilities to a point 1-foot below the utility. Submit a report identifying each underground utility and its depth and station. Any variation in the actual elevations and the indicated elevations shall be brought to the Owner's Representative's attention.
 4. Excavations around underground electrical ducts and conduits shall be performed using extreme caution to prevent injury to workmen or damage to electrical ducts or conduits. Similar precautions shall be exercised around gas lines, telephone and television cables. Contractor shall be responsible for all coordination with the applicable utility agencies for work in and around existing utility mains.
 5. Excavations shall have surface dimensions of no more than 18" x 18". Air spades and vacuum excavators shall be used to limit the size of excavations and damage to adjacent facilities. Backfill after completing potholing. In existing streets, repave with project typical pavement section or match existing pavement section, whichever is greater.
- C. Interferences:
1. If interferences occur at locations other than shown on the Drawings, the Contractor shall notify the Owner's Representative, and a method for correcting said interferences shall be supplied by the Owner's Representative. Payment for interferences that are not shown on the plans, nor which may be inferred from surface indications, shall be in accordance with the provisions of the General Conditions. If the Contractor does not expose all required utilities prior to shop drawing preparation, he shall not be entitled to additional compensation for work necessary to avoid interferences, nor for repair to damaged utilities.
 2. Any necessary relocations of utilities, whether shown on the Drawings or not, shall be coordinated with the Owner if instructed to do so in writing from the Owner's Representative.
- D. Overhead Facilities: There may be existing overhead electric and telephone transmission lines on the site. These overhead utilities are not shown on the Drawings. Extreme caution shall be used when working in the vicinity of overhead utilities so as to prevent injury to workmen or damage to the utilities. The Contractor shall be required to comply with the applicable provisions of the California Construction Safety Orders when working anywhere on this project.
- E. Existing gas, water, sewer and communications laterals are not specifically shown on the Drawings but do exist along the existing utility corridors. Protect all service laterals from damage due to construction operations. If any laterals are damaged, notify the Owner's Representative immediately. The cost of repair shall be borne by the Contractor.

3.3 GENERAL CONSTRUCTION REQUIREMENTS

- A. Site Access: Access to the site will be over public and private roads. Exercise care in the use of such roads and repair at the Contractor's expense any damage thereto caused by Contractor's operations. Such repair shall be to the satisfaction of the Owner or agency having jurisdiction over the road. Take whatever means are necessary to prevent tracking of mud onto existing roads and keep roads free of debris. Contractor shall provide access plan for all phases of work for approval by Owner's Representative prior to trenching operations.
- B. Traffic Regulation: Provide such flagmen, lighted barricades, flares, lights, warning signs, and safety devices as may be required for control of traffic adjacent to all areas of work. A minimum of one 12-foot-wide lane of traffic shall be kept open at all times.
- C. Open Excavations: Provide chain link fence around all excavations left open during non-working hours in unpaved areas. In all paved areas (walkways and fire lanes) excavations left open during non-working hours shall be covered with steel plates.
- D. Access: Free access must be maintained to all fire hydrants, water valves and meters, and

- driveways.
- E. Open Trench Limitations: The Owner's Representative shall have the authority to limit the amount of trench to be opened or left open at any one time. In roads, excavation and pipe laying shall be coordinated to the end that a minimum of interference with public traffic will result. Trenches in streets and pathways shall be covered with trench plates at the end of each day. An open trench in existing streets shall be defined as any trench that has not been completely backfilled, satisfactorily compacted, and capped with the permanent pavement.
 - F. Demolition of Pavement: Where trenching or excavation occurs in paved areas, the pavement shall be scored and broken ahead of the trenching or excavation operation. The extent of paving removed shall be limited to the minimum necessary for the excavation. The final trench repair shall have sawcut edges.
 - G. Dust Control: Take proper and efficient steps to control dust.

3.4 TRENCH EXCAVATION

- A. There is no room on site for storing excavated material. All excavated material shall be disposed of off campus. All backfill material shall be imported.
- B. Excavation to the extent shown on the drawings and under the drip line of trees shall be hand excavated to a level below the root zone of the trees – **NO EXCEPTIONS**.
- C. Excavation for pipe and duct shall be in open cut. The trench shall be as wide as necessary for sheeting and bracing and the proper performance of the work up to the maximum width permitted by the typical cross-sections shown on the Drawings. The sides of the trenches shall be vertical in existing streets. The bottom of the trench shall be constructed to the grades and shapes indicated on the Drawings. Should the Contractor desire to use other equivalent methods, he shall submit his method of construction to the Owner's Representative for favorable review prior to its use.
- D. Take care not to overexcavate. Accurately grade the bottom of the trenches to provide uniform bearing and support for each section of the pipe at every point along its entire length, except for the portions of the pipe sections where it is necessary to excavate for bell holes and for the proper sealing of pipe joints, and as hereinafter specified. Dig bell holes and depressions for joints after the trench bottom has been graded, and, in order that the pipe rest on the bedding for as nearly its full length as practicable, bell holes and depressions shall be only of such length, depth and width as required for properly making the joint. Remove stones as necessary to avoid point bearing.
- E. Backfill and compact overexcavations to 95% of its maximum dry density with Class II Aggregate Base material. Provide filter fabric (Mirafi, or equal) above, below, and on both sides of aggregate base as directed by the Owner's Representative. There shall be no additional payment to the Contractor for overexcavations not directed by the Owner's Representative. Remove unsatisfactory material encountered below the grades shown as directed by the Owner's Representative and replace as directed. Payment for removal and replacement of such unsatisfactory material directed by the Owner's Representative shall be made in accordance with the provisions of the General Conditions.
- F. Grade trenches so that they are uniformly sloped between the pipe elevations shown on the Drawings. Comply with the minimum and maximum trench widths shown on the Drawings. Notify the Owner's Representative if the trench width exceeds the maximum allowable width for any reason.
- G. For all piping or conduits to be placed in any excavated and backfilled area, such as at manholes or for building connections, the structural backfill shall be first compacted to a level at least 3 feet above the top of the piping or conduit elevation and then retrenched to pipe grade.
- H. Provide ladders for access to the trench by construction and inspection personnel.

3.5 SAFETY BARRICADES AND LIGHTS

- A. Where required for protection of workmen, public safety, or as required by State Laws, substantial barricades shall be provided for the areas where excavation, trenching, construction and demolition work are being performed. Safety Barricades shall not be used in lieu of

required guardrails on temporary bridges crossing trenches, excavations or other openings. For protection of the *Visually Impaired*, safety barricades shall be joined together with 3" yellow *Caution* tape as follows:

1. Two strands of caution tape running continuous from barricade to barricade, one at the tops of the barricades and one at a height of from 4" to 12" above grade or mounting level.
2. In addition battery-operated warning lights shall be maintained on such barricades, whenever visibility is restricted, and at night.

3.6 BACKFILL AND COMPACTION

- A. Place bedding and backfill materials true to the lines, grades, and cross-sections indicated on the Drawings and compacted to the degree specified on the Drawings. Place bedding and backfill materials in horizontal lifts not to exceed 8 inches in thickness measured before compaction. The difference in level on either side of a pipe or duct shall not exceed 4 inches.
- B. Backfill material shall not be placed over the pipe or duct until after it has been inspected by the Owner's Representative.
- C. It shall be incumbent upon the Contractor to protect the pipe or duct from damage during the construction period. It shall be the Contractor's responsibility to repair broken or damaged pipe or duct at no extra cost to the Owner. Tamping of backfill over the pipe shall be done with tampers, vibratory rollers and other machines that will not injure or disturb the pipe or duct. Carefully place backfill around and over the pipe or duct.
- D. Do not allow construction traffic nor highway traffic over the pipe trench until the trench backfill has been brought back even with existing adjacent grade.
- E. Add water to the backfill material or dry the material as necessary to obtain the optimum moisture content for the compaction shown on the Drawings or specified. If the Owner's Representative determines that the nature of the ground in which the trench lies precludes compaction of the backfill to the specified density, the backfill shall be compacted to the maximum practicable density. Employ such means as may be necessary to secure a uniform moisture content throughout the material of each layer being compacted. After the material has been moisture conditioned, compact it with compaction equipment approved by the Owner's Representative to achieve specified compaction. The Contractor shall be responsible for obtaining the densities specified. Should the Contractor fail, through negligence or otherwise, to compact to specified density, or to backfill and compact to surface grade, thus permitting saturation of the backfill material from rains or from any other source, the faulty material shall be removed and replaced with approved material which shall be compacted to the specified density at optimum moisture content, and no additional payment will be made for doing such work or removal and replacement.
- F. Compaction by flooding, ponding or jetting will not be permitted.

3.7 CONTROLLED DENSITY FILL (CDF)

- A. Trench Backfill:
 1. Contractor can choose to backfill trench with CDF in place of Class II Aggregate Base. (See trench sections on drawings.)
 2. CDF shall be placed into the trench so that the CDF is placed evenly to prevent uneven loading of the pipe. CDF shall not be placed directly onto the pipe. The maximum depth of the first lift of CDF shall not allow the pipe to move or float. Subsequent lifts of CDF shall be placed so that that pipe does not shift or float. CDF placed in trenches with steep slopes shall be placed in lifts to prevent flotation of the pipe, and the Contractor shall install approved sand bags as needed to secure the pipe in place during placement of the CDF.
 3. The maximum temperature of the CDF shall be 74°F at the time of placement. The minimum temperature of the CDF shall be 40°F at the time of placement. CDF shall be placed in lifts not exceeding 6 inches. Each lift shall be allowed to cure long enough to lose its fluid properties before placing the next lift.

3.8 SUPPORT OF EXCAVATIONS

- A. Adequately support excavation for trenches and structures to meet all applicable requirements in the current rules, orders and regulations. Excavation shall be adequately shored, braced and sheeted so that the earth will not slide or settle and so that all existing structures and all new pipe and structures will be fully protected from damage. Keep vehicles, equipment and materials far enough from the excavation to prevent instability.
- B. Take all necessary measures to protect excavations and adjacent improvements from running, caving, boiling, settling, or sliding soil resulting from the high groundwater table and the nature of the soil excavated. Attention is directed to Section 832 of the Civil Code of the State of California relating to lateral and subjacent supports, and wherever structures or improvements adjacent to the excavation may be damaged by such excavation, the Contractor shall comply with this law.
- C. The support for excavation shall remain in place until the pipeline, duct or structure has been completed. During the backfilling of the pipeline or structure, the shoring, sheeting and bracing shall be carefully removed so that there shall be no voids created and no caving, lateral movement or flowing of the subsoils.

3.9 FINISH GRADING

- A. Except where shown otherwise in the Drawings, restore the finish grade to the original contours and to the original drainage patterns. Grade surfaces to drain away from structures. The finished surfaces shall be smooth and compacted.

3.10 DISPOSAL OF EXCAVATED MATERIAL

- A. Dispose of all excavated material offsite in a legal manner.

END OF SECTION

SECTION 312513
EROSION CONTROLS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Slope protection, erosion control, and rip rap placement shall consist of furnishing all labor, materials, tools, equipment, and maintaining all permanent and temporary erosion control features as indicated for the purpose of preventing on-site erosion and maintaining all sediments within the project boundaries and comply with the requirements of the District.

1.2 SCHEDULING

- A. Apply erosion control features within five days after completion of all other work in each area.
- B. Apply erosion control features as necessary for wet weather conditions and as directed by District.

1.3 REPLACEMENT

- A. Any area in excess of 100 square feet of dead or damaged erosion control material shall be replaced.
- B. The replaced erosion control shall be of the same formulation and quality as the original.

2 PRODUCTS

2.1 EROSION CONTROL BLANKETS

- A. Erosion control blankets shall be North American Green single net straw blanket, Western Excelsior excel SR-1, or equivalent.

2.2 FIBER ROLLS

- A. Fiber rolls shall be netted tubes, at least 12 inches in diameter, filled with straw or equivalent biodegradable product. Installation shall be in accordance with "Erosion and Sediment Control Field Manual" (latest edition) by the California Regional Water Quality Control Board, San Francisco Bay Region.

2.3 SILT FENCE

- A. Silt fence shall be per "Erosion and Sediment Control Field Manual" (latest edition) by the California Regional Water Quality Control Board, San Francisco Bay Region.

2.4 RIP RAP

- A. Rip rap shall conform to the weight requirement of Caltrans Section 72 for light rip rap.
- B. Geotextile fabric shall be Mirafi 600X Filter Fabric or equivalent.

C. Placing

1. The Contractor shall place a geotextile stabilization fabric over the areas to receive rip rap. Fabric edges shall overlap at least one and one-half feet.
2. Rip rap shall be placed to the line, grade and depth shown on the plans. Rip rap shall be placed in such a fashion (Caltrans Method A Placement) as not to puncture or tear the underlying fabric. The contractor shall replace torn sections of fabric with a piece of the same fabric. Fabric overlap in these areas shall be at least three feet.
3. Rip rap shall be placed in such a manner that the material does not segregate itself into areas of larger and smaller rip rap.

2.5 ROCK FILTER AND GRAVEL CONSTRUCTION ENTRANCE

- A. Rock to be used for the rock filters gravel construction entrance and for the protection of the construction entrance shall consist of Class 1, Type B Drain Rock conforming to Caltrans Section 13.7.03B Materials, unless otherwise noted.

2.6 EQUIPMENT, MATERIALS, AND FACILITIES

- A. Furnish all materials, tools, equipment, facilities, and services as required for providing the necessary erosion controls.

3 EXECUTION

3.1 APPLICATION

- A. Erosion Control Blankets: Shall be installed and staked according to manufacturer's recommendations for slopes.
- B. Silt Fences: Install to intercept and detain sediment prior to entering storm drainage.
- C. As erosion control measures near capacity for silt retention, the Contractor shall remove the silt materials. The Contractor shall remove the materials from the site or to an area that is designated by the Owner. The Contractor shall then reestablish the silt fences, fiber rolls, straw bales, or rip rap to its original state.

3.2 INSPECTION

- A. Silt fences, fiber rolls, and rip rap shall be inspected immediately after each rainfall and at least daily during prolonged rainfall. Any required repairs shall be made immediately, to the satisfaction of the Owner.

END OF SECTION

SECTION 31 32 13

DEEP MIXING METHOD (DMM) GROUND IMPROVEMENT

PART 1 - GENERAL

1.1 SCOPE

- A. The Deep Mixing Method (DMM) Contractor shall furnish all plant, equipment, labor, and materials required to construct and perform Quality Control of the DMM in accordance with the DMM Design Plans and Specifications.
- B. The purpose of DMM ground improvement is to reduce seismically induced slope displacements and settlements to acceptable levels and to provide vertical and lateral support for shallow foundation systems for the Laney College Library & Learning Resource Center (LLRC) building for both static and seismic loadings. The DMM ground improvement consists of continuous underground overlapping deep mixed (DM) columns forming a series of DM walls that are arranged in a grid pattern to form a series of DM walls and blocks. The dimensions and layout of DM grids and blocks are shown on the DMM Design Plans and are described in Section 3.2 of this Specification.
- C. This specification has been developed as a combination of performance and method specifications. The intent is that the DMM Contractor will select the means and methods for satisfying the acceptance criteria. The DMM Contractor will then demonstrate that the means and methods will satisfy the acceptance criteria using one or more test sections. Once the test section indicates satisfactory results, as determined by the Geotechnical Engineer, the DMM Contractor will follow the means and methods used to satisfy the acceptance criteria for all of the production DMM construction. If the DMM Contractor desires to change the means and methods during the course of production DMM, the changes need to first be approved by the Geotechnical Engineer and CGS. The Geotechnical Engineer may require additional test sections prior to approval of changes in means and methods.
- D. The DMM Contractor shall be responsible for performing Quality Control (QC) during DMM construction, which includes QC documentation preparation and submittal, and sample collection, storage, and transportation. Sample testing shall be performed by a DSA approved testing laboratory hired by the Owner to verify that the acceptance criteria are satisfied. The Geotechnical Engineer shall make the determination as to whether the acceptance criteria have been met.
- E. Upon completion of DMM installation, an as-built submittal package shall be prepared by the DMM Contractor and the Geotechnical Engineer to document that the installed DMM meets the project performance requirements. The as-built submittal package shall be submitted to CGS for approval. The submittal shall include test section results, daily quality control reports, DMM core and lab test results, as-built DMM record drawings, and any other information needed to document the work.

1.2 REFERENCES

- A. American Concrete Institute (ACI)
- B. American Society of Testing and Materials (ASTM)
- C. American Petroleum Institute (API)

1.3 DEFINITIONS

- A. Area Replacement Ratio (Ar): A ratio of the surface area of soil-cement to the total surface area of ground to be improved within a given Treatment Zone. The total area of each Treatment Zone is measured to the outer tangent lines of the DMM columns along the entire Treatment Zone perimeter.
- B. DMM: In situ ground treatment in which soil is blended with cementitious and/or other binder materials to improve strength, permeability, and/or compressibility characteristics (synonym terms include DSM, deep mixing, CDSM, and soil cement mixing).
 - 1. The DMM grids and blocks are formed by an arrangement of at least two soil mixing shafts with overlapping augers and blades (paddles), guided by a lead mounted on a crawler base machine.
 - 2. The mixing shafts shall be driven by a power source sufficient to provide torque for the wide range of expected drilling conditions, indicated by the available boring and CPT logs and other test data included in the Geotechnical Investigation Report (GIR) and planned future CPT logs prior to construction.
 - 3. As the mixing shafts are advanced into the soil, grout is pumped through the hollow stem of the shafts and injected into the soil at the shaft tips. Auger flights and mixing blades on the shafts blend the soil with grout in a pugmill fashion. When the design depth is reached, the mixing shafts are withdrawn while the mixing process is continued.
 - 4. The mixing shafts are positioned so as to overlap one another to form continuously mixed overlapping columns. After withdrawal, two (or more) overlapping soil-cement columns remain in the ground.
 - 5. The process is then repeated to form grids and blocks of overlapping DMM columns.
- C. DMM Design Addendum (DA): DMM Design Addendum No. 1 prepared by Fugro USA Land, Inc. dated June 10, 2022, and subsequent addenda.
- D. DMM Elements: DMM columns will be used to create DMM grids and DMM blocks of treated soil referred to as ground improvement. A DMM grid will consist of interconnected DMM walls formed by partially overlapping columns arranged in a grid pattern with a replacement ratio less than 100 percent. A DMM block used to support a building footing will consist of interconnected DMM walls formed by overlapping columns arranged in a parallel pattern with a replacement ratio of 100 percent or less as shown in project plans and drawings. For this project, individual DMM Element refers to the grouping of columns installed simultaneously during single penetration of the DMM rig.
- E. DMM Contractor: The firm performing the DMM construction.
- F. DMM Layout Plan: The alternate DMM construction layouts designed by the DMM Contractor, which satisfy the requirements of this Specification. The DMM Layout Plans shall be reviewed and approved by the Geotechnical Engineer and Structural Engineer.

- G. Cement Dosage: The amount of cement (in terms of dry weight) used to treat a given initial volume of in-situ soil.
- H. Cone Penetrometer Test (CPT): A geotechnical exploration tool, as defined in ASTM D 5778.
- I. Core Run: The total length reported by the driller as the actual depth penetrated by coring, including both recovered and unrecovered lengths.
- J. Geotechnical Investigation Report (GIR): Geotechnical Investigation Report prepared by Fugro USA Land, Inc. dated February 28, 2020, and subsequent addenda. Note the DMM Design Addendum No. 1 (DA) supersedes the GIR.
- K. Geotechnical Engineer: The geotechnical engineer of record responsible for the DMM design, who is hired by the Owner.
- L. Ground Improvement Area: The plan area contained within a single perimeter shown on the DMM Design Plans that surrounds:
 - 1. All planned soil-cement grids/blocks.
 - 2. Unmixed soil within the grids.
- M. Grout: A stable colloidal mixture of water, Portland cement, and admixtures. The purpose of the grout is to assist in loosening the soils for penetration and optimum mixing, and upon setting, to strengthen the in-situ soil.
- N. Grout-Soil Ratio: A volumetric ratio of grout to in-situ soil to be mixed.
- O. Owner: Peralta Community College District and its representatives.
- P. Structural Engineer: The structural engineer of record responsible for designs of structure foundations supported by DMM, who is hired by the Owner.
- Q. Testing Laboratory: The testing laboratory of record performing construction material testing, which is hired by the Owner and approved by the Geotechnical Engineer. The Testing Laboratory shall be selected from the DSA approved laboratory list.
 - 1. Treatment Zone: A spatial zone of soil targeted for ground improvement. The vertical and lateral (horizontal) extents of the Treatment Zones are defined on the DMM Design Plans.

1.4 SUBMITTALS

- A. Evidence of conformance to the referenced standards and requirements shall be submitted by the DMM Contractor to the Geotechnical Engineer for the following, but not limited to, in accordance with the requirements in this Specification.
 - 1. Cement: Certificate of compliance for each truck load delivery.
 - 2. Admixtures: If used, certificate of compliance for each load or lot of material delivered.
 - 3. Preliminary Mix Design: Proposed mix designs including all materials and quantities and documentation of calibration of the grout mixing plant.
 - 4. Proposed Test Section Program, Sampling Plan, and Laboratory Testing Program, conforming to the requirements described in this Section.
 - 5. Construction Schedule: Submit a detailed schedule that identifies start dates and duration of each major task in the work. The schedule shall at a minimum include information

- regarding equipment mobilization, equipment setup, soil-cement mixing test section, production installation, and verification testing.
6. Site Work Plan: Submit a site plan showing staging area for all on-site equipment, including anticipated sections of the streets which may require blocking of parking spaces or traffic clearances.
 7. DMM Layout Plans: Submit 1"=20' scale drawings showing proposed layout of DMM Elements (including test section(s) and production DMM), including column diameters, column overlap, grid sizes, tip elevations, top elevations, coordinates of the corners, foundations, and proposed column and element numbering scheme prior to site mobilization in hard copy and electronic format using the project coordinate system at least 14 calendar days prior to beginning DMM construction. The DMM Contractor must obtain the Geotechnical Engineer's approval of the proposed column layout prior to beginning DMM construction.
 8. Equipment and Procedures: Submit a detailed description of the equipment and procedures to be used during all DMM work including, but not limited to, construction of DMM test section(s), production DMM work, and collecting samples for laboratory confirmation testing. Procedures shall include methods for locating the DMM Elements in the field and confirming that the columns are plumb. In addition, while it is recognized that the specific responses to field difficulties are dependent on several factors, the DMM Contractor shall submit their anticipated responses to the following possible situations that could occur during construction and testing of the DMM columns including poor core sample recovery or inability to retrieve core samples, and failing production test results (e.g., repair and/or treatment of failed area and modification to approved procedures or mix design).
 9. The DMM Contractor shall also submit the anticipated cement dosages (proportions) to achieve the acceptance criteria outlined under acceptance criteria in Section 3.15 of this Specification.
 10. Quality Control Program, as outlined in the Execution Section of this Specification.
 11. Daily Quality Control Reports: Prior to construction, submit a proposed Daily Quality Control Report format for approval by the Geotechnical Engineer. Submit the Daily Quality Control Report at the end of the next working day. The report should be in conformance with quality control in Section 3.14 of this Specification.
 12. DMM Test Results: Submit all QC test results as outlined in quality control in Section 3.14 of this Specification.
 13. Calibrations: Submit all metering equipment calibration test results including mixing systems, delivery systems, alignment systems, and mixing tool rotational and vertical speed.
 14. Record Drawing: Submit record drawings prepared by the DMM Contractor indicating the as-built location and elevations of the DMM Elements in terms of project coordinates and vertical datum. The record drawings shall also indicate the above structure foundation designs and locations.
- B. Upon completion of DMM installation, the as-built submittal by the DMM Contractor to the Geotechnical Engineer, Structural Engineer, and CGS shall include test section results, daily quality control reports, DMM core and lab test results, DMM record drawings, and any other information needed to document the work.

PART 2 - PRODUCTS, MATERIALS, AND EQUIPMENT

2.1 MATERIALS

- A. Grout: The material added to the blended in situ soils shall be a water-based Portland cement grout. The purposes of the grout are to assist in loosening the soils for penetration and optimum mixing, and upon setting, to strengthen the in-situ soils. The grout shall be premixed in a mixing plant which combines dry materials and water in predetermined proportions.
- B. Cement used in preparing the grout shall conform to ASTM C150 "Standard Specification for Portland Cement Type II". The cement shall be adequately protected from moisture and contamination while in transit to and in storage at the job site. Reclaimed cement or cement containing lumps or deleterious matter shall not be used.
- C. Water: Fresh water, free of deleterious substances that adversely affect the strength and mixing properties of the grout, shall be used to manufacture grout.
- D. Admixtures: Admixtures are ingredients in the grout other than Portland cement, and water. Admixtures of softening agents, dispersions, pozzolans, retarders or plugging or bridging agents may be added to the water or the grout to permit efficient use of materials and proper workability of the grout. However, no admixtures shall be used except as approved by the Geotechnical Engineer.

2.2 EQUIPMENT

The DMM equipment shall meet the following requirements:

- A. The mixing tools shall have mixing augers and blades (paddles) configured in such a manner so that they are capable of thoroughly blending the in-situ soils and grout.
 - 1. Multi-shaft mixing equipment (machines with at least two soil mixing shafts with overlapping augers and blades) shall be used.
 - a. The mixing augers and blades shall be minimum 3 feet and maximum of 6 feet in diameter.
 - b. Allowable wear to mixing augers and blades will be limited such that equipment produces a column no less than the design diameter listed on the DMM Layout Plans.
 - c. The overlapping between any two adjacent DMM columns shall be at least 30 percent of the column diameter.
 - 2. The power source for driving the mixing shafts shall:
 - a. be sufficient to provide torque for the wide range of expected drilling conditions, indicated by available boring and CPT logs and other test data included in the Geotechnical Investigation Report (GIR) and DMM Design Addendum (DA).
 - b. be sufficient to maintain the required revolutions per minute (RPM) and penetration rate from a stopped position at the maximum depth required.
- B. The DMM rig shall be equipped with electronic sensors built into the leads to determine vertical alignment in two directions: fore-aft and left-right.
 - 1. The sensors shall be calibrated at the beginning of the project and the calibration data shall be provided to the Geotechnical Engineer. The calibration shall be repeated at intervals not to exceed three months per rig.

2. The output from the sensors shall be routed to a console that is visible to the operator and the Geotechnical Engineer during penetration and reported. The console shall be capable of indicating the alignment angle in each plane.
- C. The DMM equipment shall be adequately marked to allow the Geotechnical Engineer to confirm the penetration depth to within 6 inches during construction.
 - D. The grout shall be premixed in an on-site mixing plant, using a batch process, which combines dry materials and water in predetermined proportions. The mixing plant shall consist of a grout mixer, grout agitator, grout pump, batching scales, and a computer control unit.
 1. Dry materials shall be stored in silos. The dry materials shall be transported to the project site and blown into the on-site storage tanks using a pneumatic system.
 2. The air evacuated from the storage tanks during the loading process shall be filtered before being discharged to the atmosphere.
 3. Automatic batch scales shall be used to accurately determine mix proportions for water and cement during grout preparation.
 4. The dry admixtures, if used for mixing with water and cement, can be delivered to the mixing plant by calibrated auger. However, the DMM Contractor shall demonstrate that the calibrated auger can deliver the quantity of dry admixture with accuracy equivalent to that measured and delivered by weight.
 5. Calibration of mixing components shall be done at the beginning of the project and repeated at intervals not to exceed three months thereafter and after each move of the batch plant.
 - E. Positive displacement pumps shall be used to transfer the grout from the mixing plant to the mixing tool head. The grout shall be delivered to each slurry-injecting tool head by an individual positive displacement pump.
 - F. The DMM rig shall be equipped with sensors to continuously monitor and record the mixing tool penetration/withdrawal speed, mixing tool rotation speed, and injection rate.
 1. The output from these sensors shall be visible to the Operator and Geotechnical Engineer during penetration and withdrawal.
 2. The DMM Contractor may propose alternative display/monitoring systems; however, the systems shall first be reviewed and approved by the Geotechnical Engineer prior to use.
 3. Calibration of this equipment shall be performed at the beginning of the project and the calibration data shall be provided to the Geotechnical Engineer. The calibration shall be repeated at intervals not to exceed three months.

2.3 PRODUCTS

- A. DMM: The in-place grout mix together with the soils shall meet all of the acceptance criteria specified in Section 3.15 of this Specification, determined according to the quality control, sampling, and testing methods specified in Section 3.14 of this Specification.

PART 3 - EXECUTION

3.1 OBSERVATION OF WORK

- A. The work covered by these specifications shall be performed under the observation of the Geotechnical Engineer, who shall be retained and paid by the Owner. The Geotechnical Engineer will be present at the site during the conduct of work to observe the work, and to perform field and laboratory tests, as deemed necessary by the Owner. The DMM Contractor shall cooperate with the Geotechnical Engineer in performing the observations and tests. At the completion of their work, the Geotechnical Engineer shall submit a report to the Owner, including a tabulation of all tests performed. The Geotechnical Engineer's costs for observing the construction, testing, and the repair of unsatisfactory work performed by the DMM Contractor shall be billed to the Owner. The Owner shall pay them and then shall deduct the amount from monies due to the DMM Contractor.
- B. This work falls under the jurisdiction of the California Division of State Architect (DSA) who will review submittals and may observe portions of the work.

3.2 GENERAL

- A. The soil-mixing shall be constructed by the DMM Contractor to the lines, grades, and cross sections indicated on the DMM Design Plans example layouts or an alternate layout approved by the Geotechnical Engineer, Structural Engineer, and CGS. Revisions to the approved layouts shall be submitted to Geotechnical Engineer of Record (GEOR) for review and approval. DMM ground improvement within a single structure shall be arranged in an uninterrupted grid that follows the structure column lines and underlies all footings and moment frame grade beams, tie beams, and shear walls as shown on the DMM Design Plans.
- B. As shown on the DMM Design Plans, the DMM shall underlie the entire structure footprints and extend laterally to include any attached structures which are deemed to be essential parts of the structures.
- C. Grading after the site demolition may be required to provide suitable level ground for constructing the DMM. The DMM contractor is responsible for coordinating with the site grading operation to define the Drill-Through Zone.
- D. The minimum Area Replacement Ratio (A_r) for DMM grids and blocks and the maximum spacing for DMM grids depends on the specified unconfined compressive strength ($q_{dm,spec}$) as shown in Table A.1. Additional DMM Elements may be added within the untreated area to meet or reduce the slab free span distance as instructed by the Geotechnical and Structural Engineer.

Table A.1: Minimum DMM A_r and Maximum DMM Grid Spacing

Option	Specified Unconfined Compression Strength, $q_{dm,spec}$ (psi)	Minimum A_r (%)	Zone B Maximum DMM Center-to-Center Grid Spacing ¹	Zones A1 and A2 Maximum DMM Center-to-Center Grid Spacing ¹
1	125	50	3.2d	4.0d
¹ d = DMM column diameter				

- E. DMM elements shall extend to at least the elevations indicated on the DMM Design Plans based on the penetration of the shortest mixing shafts.
- F. The top of the DMM shall extend to the base of the ground floor slab section, the bottom of footings, the bottom of moment frame grade beams, and the bottom of elevator pits, as indicated in the DMM Design Plans.
- G. Any proposed plan and Area Replacement Ratio by the DMM contractor should be approved by the Geotechnical Engineer and CGS.
- H. Elevator pits shall be supported entirely by DMM.
- I. The DMM columns shall be essentially vertical columns as stated in this Specification, with a minimum diameter of 3 feet and a maximum diameter of 6 feet and shall extend from the top to the bottom of the Treatment Zone indicated on the DMM Design Plans.
- J. The overlapping between any two adjacent columns at ground surface shall be a minimum of 30 percent of column diameter.
- K. The completed DMM shall be a homogeneous mixture of grout and the in-situ soils. Mixing is to be controlled by shaft rotational speed, drilling speed, and grout injection rate.
- L. Monitoring of construction parameters and confirmation testing will be used to verify that the acceptance criteria have been satisfied.
 - 1. The DMM Contractor shall establish consistent procedures to be employed during DMM construction to ensure a relatively uniform product is created.
 - 2. These procedures are to be defined in the equipment and procedures submittal as defined in Section 1.4 of this Specification and subsequently modified, if necessary, based on the results of the pre-production testing or quality control testing.
- M. The DMM Contractor may request that the established grout mix/grout-soil ratio design, equipment, installation procedure, or test methods be modified. However, the Geotechnical Engineer may require additional testing, at no additional cost to the Owner, to verify that acceptable results can be achieved.
 - 1. The DMM Contractor shall not employ modified grout mix/grout-soil ratio design, equipment, installation procedures, or sampling or testing methods until approved by the Geotechnical Engineer in writing.
 - 2. The Geotechnical Engineer, at his sole discretion, may reject any modification proposed by the DMM Contractor.

3.3 CONSTRUCTION SITE SURVEY

The location of both active and abandoned buried utilities at the site can have significant impact on the design and construction of deep mixing works. Careful consideration of the presence and location of all utilities is required.

- A. Prior to bidding, the contractor should review the available subsurface information and visit the site to assess the site geometry, equipment access conditions, location of existing structures, and above-ground utilities and facilities.
- B. The contractor should field locate and verify the locations of all utilities prior to starting work. The contractor should maintain uninterrupted service for those utilities designated to remain in service throughout the work. The contractor should notify the engineer of any utility locations different

from those shown in the plans that may require relocation of deep mixed elements or structure design modification. Subject to owner's geotechnical engineer's approval, the contractor should be compensated for additional costs of element relocation and/or structure design modifications resulting from utility locations different from those shown in the plans.

3.4 SITE ACCESS FOR SOIL SAMPLES

- A. After award of the Contract, the DMM Contractor will have the option of accessing the jobsite to collect additional soil samples for use in mix designs with the following requirements:
 - 1. Prior to commencing with field work, the DMM Contractor shall obtain all necessary permits for sampling activities, including drilling permits from Alameda County Public Work Agency, if applicable.
 - 2. The DMM Contractor shall submit to the Geotechnical Engineer a sampling plan indicating in detail the sampling activities proposed, and the proposed methods for backfilling boreholes or excavations and restoring the site.
 - 3. Cement grout backfill for boreholes per Alameda County Public Work Agency is required.
 - 4. The soil sampling and testing will be performed by DMM Contractor. The costs of additional soil sampling and testing (if performed) are to be included in the project DMM construction costs.

3.5 TEST SECTIONS

- A. The DMM Contractor shall construct a minimum of one test section on site to demonstrate that the proposed mix design, equipment, and procedures will meet the specified requirements. The location(s) of the test section(s) shall be determined by the DMM Contractor with the approval of the Geotechnical Engineer.
- B. Additional test sections may be performed at the DMM Contractor's option to optimize the mix design and procedures.
- C. Each test section must extend at least to the deepest DMM design depth as indicated by the DMM Design Plans.
- D. The costs of the test section(s) are to be included in the project DMM construction costs.
- E. Each test section shall consist of at least two full strokes of the DMM equipment. For example, if the DMM rig uses three augers, then the test section shall consist of 2 strokes times 3 columns equal 6 columns.
- F. Test sections shall not be located directly below proposed footings, moment frame grade beams, and elevator pits. However, the test sections may be constructed in place of other production DMM columns, provided it is later demonstrated that the test sections meet all acceptance criteria. If the test sections are found to fail the acceptance criteria, the DMM Contractor shall make necessary repairs or replace the DMM Elements to the written satisfaction of the Geotechnical Engineer and CGS.
- G. During the time interval between construction of the test section(s) and the completion of laboratory test results, the DMM Contractor may proceed with production DMM installation at their own risk. Any production DMM found to fail the acceptance criteria must be repaired at the DMM Contractor's expense, to the written satisfaction of the Geotechnical Engineer and CGS.

- H. A minimum of two (2) full-depth cores shall be obtained from each test section, according to the procedures detailed in this Specification.
- I. Laboratory tests, as specified in this Specification, shall be performed on a minimum of ten samples per full-depth core or a minimum of one sample per core run, whichever is greater, from each test section, as selected by the Geotechnical Engineer. Additional cores may be performed to retrieve enough test samples.

3.6 HORIZONTAL ALIGNMENT

- A. The DMM Contractor shall accurately stake the location of DMM Elements using a surveyor before beginning installation. The main survey control for a given area shall be established by a California licensed surveyor; layout of individual DMM Elements does not require a licensed surveyor. Horizontal alignment of DMM columns shall conform to the geometric tolerances in the acceptance criteria of this Specification.
- B. The DMM Contractor shall provide an adequate method to allow the Geotechnical Engineer to verify the as-built location of the DMM during construction.
- C. Movement of the crawler base machine shall provide the preliminary alignment of the augers and the final alignment shall be adjusted by hydraulic manipulation of the leads.
- D. One stroke of the machine shall construct a DMM Element consisting of at least two overlapping columns.
- E. The DMM shall be advanced stepwise by overlapping the adjacent columns of the previous strokes.
- F. Following DMM construction, the DMM Contractor shall submit as-built drawings indicating the location of the DMM elements in terms of project coordinates and elevation datum.
- G. The DMM contractor should provide a construction plan at least two (2) weeks prior to the start of construction that includes the plan showing the numbering and location of the DMM columns, tip elevations or depths, and cut-off (top) elevations. The daily work plan should be provided to the Geotechnical Engineer at the beginning of workday and work progress should be checked and confirmed by the Geotechnical Engineer during and at the end of each day. The DMM contractor should provide a summary progress report to the Geotechnical Engineer at the end of each workday.
- H. The location of known obstructions or utilities at or near the treatment area should be marked on the project drawings and on the ground before construction begins. Existing obstructions within the treatment zone area should be removed prior to construction. It is not anticipated that drilling obstructions will be encountered within the Treatment Zone during DMM construction unless further site investigation reveals otherwise.
 - 1. If an obstruction preventing drilling advancement is encountered, the DMM Contractor shall investigate the location and extent of the obstruction using methods approved by the Geotechnical Engineer. The DMM Contractor shall propose remedial measures to clear the obstruction for approval by the Geotechnical Engineer.
 - 2. While the investigation for an obstruction is underway, the DMM Contractor shall continue to install columns in areas away from the obstruction location. No stand-by delay will be allowed for equipment and operations during the investigation of an obstruction.

3. The DMM Contractor will be compensated for removal or clearing of obstructions as a Changed Condition, paid in accordance with the General Conditions.
 4. The DMM Contractor will not be compensated for removal or clearing of obstructions without prior approval by the Geotechnical Engineer and the Owner.
- I. The DMM Contractor will not be compensated for DMM Elements that are located outside of the tolerances specified in the acceptance criteria.

3.7 VERTICAL ALIGNMENT

- A. The equipment operator shall control vertical alignment of the auger stroke. Verticality shall be monitored with respect to two orthogonal horizontal axes. Vertical alignment of DMM columns shall conform to the geometric tolerances in the acceptance criteria of this Specification.

3.8 DMM DEPTH

- A. DMM depths shall extend to the line and grades shown on the DMM Design Plans.
- B. The total depth of penetration shall be measured either by observing the length of the mixing shaft inserted below a reference point on the mast, or by subtraction of the exposed length of shaft above the reference point from the total shaft length.
1. For each stroke, the elevation of the reference point on the mast must be established within one inch using measurements from a surveyed control point.
 2. The final depth and bottom elevation of the stroke shall be noted and recorded on the Daily Quality Control Report by the DMM Contractor. The equipment shall be adequately marked to allow the Geotechnical Engineer to confirm the penetration depth during construction.
- C. If rigs with varying mixing shaft lengths are used, the shortest shafts shall extend to the minimum DMM depths indicated on the DMM Design Plans.

3.9 GROUT PREPARATION

- A. Dry material shall be stored in silos and fed to mixers for agitation and shearing. In order to accurately control the mixing ratio of grout, the addition of water and cement shall be determined by weight using the automatic batch scales in the mixing plant.
1. The admixtures, if used, for mixing with water and cement, can be delivered to the mixing plant by calibrated auger. However, the DMM Contractor shall prove that the calibrated auger can deliver the quantity of dry admixture with accuracy equivalent to that measured and delivered by weight.
- B. A minimum mixing time of one minute and a maximum holding time of four hours will be enforced for the grout.
1. The grout hold time shall be calculated from the beginning of the initial mixing.
- C. The specific gravity of the grout shall be determined during the design mix program for double checking grout proportions.
1. The specific gravity of the grout shall be checked by the DMM Contractor at least twice per shift per rig using the methods outlined in ASTM D4380.
 2. The specific gravity of the grout measured in the field should not deviate by more than 3 percent of the calculated specific gravity for the design cement ratio.

3. If the specific gravity is lower than that required by the design mix, the DMM Contractor shall add additional cement and remix and retest the grout at no cost or schedule impact to the Owner.
4. The specific gravity measurements shall be indicated on the Daily Quality Control Report.

3.10 SOIL-GROUT MIXING

- A. Installation of each column shall be continuous without interruption.
 1. If an interruption of more than one hour occurs, the column shall be remixed (while injecting grout at the design grout ratio) for the entire height of the element at no additional cost to the Owner.
 2. If an interruption of more than ten minutes occurs, the DMM Contractor shall inject a volume of grout equal to that required for three feet of auger penetration, while maintaining constant auger elevation. Once the specified volume of grout has been injected, auger penetration may continue.
- B. The completed CSDM shall be a uniform mixture of cement grout and the in-situ soils.
 1. Soil and grout shall be mixed together in place by the specially designed overlapping augers or blades on the mixing shafts.
 2. The grout shall be pumped through the mixing shafts and injected from the tip of the shafts. The shafts shall break up the soil and blend it with cement grout.
 3. The mixing action of the shafts shall blend, circulate, and knead the soil over the length of the column while mixing it in place with the grout.

3.11 SHAFT ROTATIONAL SPEED AND PENETRATION/WITHDRAWAL RATE

- A. The mixing shaft rotational speed (measured in RPMs) and penetration/withdrawal rates shall be established before beginning work. It may be adjusted with the approval of the Geotechnical Engineer to achieve adequate mixing.
- B. The contractor shall obtain the suitable shaft rotational speed during the installation of test section. The rotational speeds and penetration/ withdrawal rates shall be recorded on the Daily Quality Control Report.
- C. The established rotational speeds and penetration/withdrawal rates shall be used during the work. If these parameters are varied more than ten (10) percent from those determined during the test section(s), the Geotechnical Engineer may require additional testing, at no additional cost to the Owner, to verify that the acceptance criteria are met.
- D. The DMM Contractor may request that the established mixing parameters be modified during the production DMM installation. To verify acceptable results for the modified parameters, the Geotechnical Engineer may require additional testing at no additional cost to the Owner.

3.12 GROUT INJECTION RATE

- A. The grout injection rate per no more than three vertical feet of column shall be in accordance with the requirements of the design mix.
 1. The required mix design and grout-soil ratio shall be determined during the test section(s).
 2. The grout injection rate shall be constantly monitored and controlled.

3. The DMM Contractor shall record the volume of grout injected continuously for each column on the Daily Quality Control Report.
- B. If the volume of grout injected per three vertical feet of column is less than the amount required to meet the grout-soil ratio established during the test section, the DMM columns shall be remixed and additional grout injected (at the design grout-soil ratio) to a depth at least 3 feet below the deficient zone or until design depth is met, at no additional cost to the Owner.
 - C. The DMM Contractor may request that the established grout-soil ratio be modified during the production DMM installation.
 1. To verify acceptable results for the modified grout-soil ratio, the Geotechnical Engineer may require additional testing or a new test section at no additional cost to the Owner.

3.13 CONTROL OF SPOILS

- A. The DMM Contractor shall control and process all spoils created during the DMM construction.
 1. Prior to stockpiling materials greater than 10 feet in height, stockpile locations and heights shall be submitted for review and approval to Geotechnical Engineer. The DMM Contractor shall consider the locations of and avoid damage to existing utilities, structures, and other improvements, as well as recently constructed DMM Elements when stockpiling material. Lesser stockpile heights may be necessary in some areas.
 2. The spoils shall be processed until they have cured to a sufficient level to allow them to be stockpiled such that they will not reform a cemented mass in the stockpile. The DMM Contractor shall dispose of spoils in accordance with all local laws, codes, and ordinances in a manner acceptable to the Owner or coordinate with the project grading contractor for the spoils be reused as fills at the project site.

3.14 QUALITY CONTROL PROGRAM

- A. The DMM Quality Control Program shall be the responsibility of the DMM Contractor and shall include, as a minimum, the following components:
 1. An approved pre-construction test program on soils obtained from the project site, to establish appropriate design parameters such as cement dosage and water content.
 2. Field monitoring by the DMM Contractor of construction parameters during DMM construction.
 3. Sample collection including full depth continuous coring, sample storage, and sample transportation to the Testing Laboratory.
 4. Reporting of the field monitoring and sampling performed by the DMM Contractor.
 5. Reporting of the core strength testing performed by the Testing Laboratory.
- B. Prior to site mobilization, the DMM Contractor shall submit a detailed work plan for the Quality Control Program for review and approval by the Geotechnical Engineer. The work plan shall include, as a minimum:
 1. A description of all installation, monitoring, sampling, and testing procedures to be implemented. The proposed auger penetration and withdrawal rates shall be proposed by the DMM Contractor at this time.
 2. Descriptions of all sampling equipment.
 3. A list of parameters to be monitored.
 4. Tolerances for the parameters monitored.
 5. Names of any subcontractors.

- C. The DMM Contractor shall provide all the personnel and equipment necessary to implement the Quality Control Program. Contractor to provide the number of years/projects, project descriptions, and reference list for all cases below:
1. The DMM Contractor must have at least 7 (seven) years of previous successful experience with at least 5 (five) DMM projects for soil conditions and project scope similar to that of the project being bid.
 2. The DMM contractor must have a registered California Professional Engineer (PE) who have had at least 5 (five) years of experience with at least 3 (three) DMM projects.
 3. The DMM Contractor must have assign a project manager who have had at least 5 (five) years of experience on at least 3 (three) DMM projects.
 4. The DMM Contractor must have assign a project engineer/ supervisor who have had at least 3 (three) years of experience with at least 2 (two) DMM projects.
 5. The DMM Contractor must assign a full-time project superintendent with at-least 3 (three) DMM projects with at least 150,000 cubic yard of total treatment volume in DMM construction.
 6. The DMM equipment operator must have at least three years of experience with the equipment and DMM construction.
 7. Written requests for substitution of these key personnel must be submitted prior to personnel changes. Documentation must be submitted to the owner that demonstrates that the substitute meets the requirements listed. Substitution may not be made until written approval is provided by the owner.
- D. The Geotechnical Engineer will continuously observe the DMM construction. The Geotechnical Engineer will review DMM Contractor submittals to check that the Quality Control Program is being properly implemented.
- E. The established quality control procedures shall be maintained throughout the production DMM installation to ensure consistency in the installation and to verify that the work complies with all requirements indicated in the DMM Design Plans and Specifications, unless modifications to the procedures are approved in writing by the Geotechnical Engineer.
- F. DMM Contractor shall perform sample collection, storage, and transportation.
1. DMM Contractor shall collect one full-depth continuous coring should be made for every 3% of the total DMM elements or for every 900 square feet of treated ground, whichever produces the greater number of cores at locations specified by the Geotechnical Engineer.
 - a. The coring rig shall be a triple-barrel rig approved by the Geotechnical Engineer and capable of achieving the required recovery. The ability to achieve the recovery criteria is solely the Contractor's responsibility.
 - b. Full-depth samples obtained by the DMM Contractor shall have a diameter of at least 3 inches.
 - c. The continuous core sample shall extend from the top through the bottom of the Treatment Zone, and to at least 5 feet below the Treatment Zone to sample the foundation soil directly below the Treatment Zone.
 - d. Unless otherwise directed by the Geotechnical Engineer, the full-depth samples shall be obtained along an essentially vertical alignment located one-fourth of a column diameter from the column center and not within column overlaps.
 - e. The DMM Contractor shall perform all full-depth sampling in the presence of the Geotechnical Engineer.
 - f. Full-depth core samples shall be retrieved using triple tube continuous coring techniques after the soil-grout mixture has hardened sufficiently.
 - g. Each core run shall be a minimum 4 feet in length.
 - h. Following logging, the engineer will select at least five specimens from each full-depth continuous core for strength testing. Each test specimen should have a length-to-diameter ratio of 2 or greater.

- i. A minimum recovery of 85 percent for each 4-foot core run shall be achieved for cores from within the Treatment Zones. During coring, the elevation of the bottom of the holes shall be measured after each core run in order that the core recovery for each run can be calculated.
 - j. The DMM Contractor shall determine the time interval between column installation and coring except that the interval shall be no longer than required to conduct 28-day strength testing.
 - k. The DMM contractor should photograph each core run and submit to the Geotechnical Engineer for test sample selection.
 - l. Upon retrieval, the core runs shall be provided to the Geotechnical Engineer for logging, uniformity inspection, and test specimen selection.
 - m. Following logging and test specimen selection by the Geotechnical Engineer, the entire full-depth core, including the designated test specimens, shall be immediately sealed in plastic wrap to prevent drying and transported to the laboratory by the DMM Contractor. Alternatively, the DMM Contractor may transport only the selected test specimens to the laboratory and store the remaining core on-site in a humidity and temperature-controlled storage facility as described in this Specification.
 - n. All core holes shall be filled with cement grout that will obtain a 28-day strength equal to or greater than the strength of the DMM. However, the Contractor shall not grout the core holes until after acceptable core recover and uniformity has been confirmed by the Geotechnical Engineer.
 - o. The DMM Contractor shall notify the Geotechnical Engineer at least one business day (24 hours) in advance of beginning core sampling operations.
2. In addition to coring, the DMM Contractor should obtain wet grab samples from the DMM elements at the presence of Geotechnical engineer.
- a. 3 (three) wet samples from each mixed design used in each test section as directed by the geotechnical engineer.
 - b. One wet sample (i.e., one selected depth at one location) should be retrieved every 2 (two) production days or for every 2,500 cubic yards of treated soil, whichever produces the higher sampling frequency.
 - c. The contractor proposes locations for wet sampling as outlined in the QC program, considering input from the geotechnical engineer based on subsurface conditions, DMM layout, review of the QC results, and observation of the soil mixing operation.
 - d. The contractor should report all attempts, successful and unsuccessful, to obtain wet samples. Some deep mixed material may not be able to be sampled readily because either the mixture is too stiff or the material may not flow back into the void left after the sampler is extracted, possibly leaving a damaged element.
 - e. The sampling tool is inserted into the DMM column to a designated depth, filled with treated soil, and lifted to the ground surface. The treated soil material is then poured into a container, screened for oversized lumps (gravel versus unmixed soil), and placed in 3-inch (76-mm)- diameter, 6-inch (152 mm)- long molds. Eight test specimens should be prepared from each wet sample.
 - f. The wet treated material should be placed into the mold in three to five layers. After the placement of each layer, the specimens must be tapped or vibrated to remove trapped air bubbles. The specimens should be sealed to prevent moisture from entering or leaving the specimens, and the sealed specimens should be stored in a humid environment in accordance ASTM C192.
 - g. For field validation testing, unconfined compressive strength testing may be performed on specimens at 3, 7, 28, and 56 or more days. For full production work, unconfined compressive strength testing may be performed at 3, 7 and 28 days.
 - h. The DMM contractor should deliver the samples for testing to a local lab as directed by the geotechnical engineer.
 - i. If wet samples produce results that are consistently acceptable, the frequency of wet sampling can be reduced as the project progresses.

- j. The engineer may request additional test specimens for QA testing.
 - 3. Untested portions of the full-depth samples shall be retained at the laboratory until completion and acceptance of all DMM, for possible inspection and confirmation testing by the Geotechnical Engineer.
- G. The DMM Contractor shall be responsible for handling of test specimens, including storing of untested specimens and transporting test specimens to the Testing Laboratory.
 - 1. The laboratory testing shall be performed by the DSA accepted Testing Laboratory hired by the Owner and approved by the Geotechnical Engineer.
 - 2. The samples shall be stored in a moist room as specified in ASTM C 192 until the test date.
 - 3. Testing for 28-day unconfined compressive strength shall be conducted in accordance with ASTM D2166.
- H. In addition to confirmation tests performed by the Testing Laboratory, additional tests may be requested by the Geotechnical Engineer on samples collected by the DMM Contractor. Both the Testing Laboratory's testing and the Geotechnical Engineer's requested additional testing (if performed) shall demonstrate that the acceptance criteria are met prior to acceptance of the work.
- I. Daily Quality Control Report
 - 1. The DMM Contractor shall submit Daily Quality Control Reports to the Geotechnical Engineer at the end of the next working day. The Daily Quality Control Report shall document the progress of the DMM construction, present the results of the QC parameter monitoring, present the results of the strength testing, and clearly indicate if the columns have met the acceptance criteria. The DMM Contractor shall make all Daily Quality Control Reports available to the Geotechnical Engineer
 - 2. The Daily Quality Control Report shall include as a minimum the results of the following QC parameter monitoring for each column:
 - a. Rig number
 - b. Type of mixing tool
 - c. Date and time (start and finish) of column construction
 - d. Column number and reference drawing number
 - e. Column diameter
 - f. Column top and bottom elevations
 - g. Grout mix design designation
 - h. Slurry specific gravity measurements (refer to Section 3.9 for number of tests and tolerance)
 - i. Description of obstructions, interruptions, or other difficulties during installation and how they were resolved
 - 3. The Daily Quality Control Reports shall also include the following parameters recorded automatically for each column continuously and submitted in the form of either tables or figures (as agreed to by the Geotechnical Engineer):
 - a. Elevation in feet vs. real time
 - b. Shaft rotation speed in RPMs vs. depth
 - c. Penetration and withdrawal rates in feet per minute vs. depth
 - d. Grout injection rate in gpm vs. depth
 - e. The average quantity of grout in gallons per foot injected per 3-foot (or less) vertical increment of column vs. depth

3.15 ACCEPTANCE CRITERIA

- A. The Geotechnical Engineer and CGS shall make the sole determination as to whether the acceptance criteria have been satisfied. The in-place grout-soil mixture comprising the DMM Elements shall meet the following acceptance criteria:

1. The DMM within the Treatment Zone shall be installed within the following geometric tolerances:
 - a. The horizontal alignment of the DMM blocks shall be within 4 inches of the location shown on the approved DMM Layout Plans.
 - b. The vertical inclination of the DMM columns shall be no more than 1: 100 (horizontal to vertical).
 - c. Overlap between any two adjacent columns shall be a minimum of 30 percent of column diameter for the entire depth, as calculated based on depth of column embedment and measured auger lateral and longitudinal inclination.
 - d. The tops of the columns shall be at or higher than the elevations indicated on the DMM Design Plans.
 - e. The bottoms of the columns shall extend to or lower than the levels indicated on the DMM Design Plans.
 2. Two alternative specified unconfined compressive strengths are provided with corresponding minimum A_r and maximum grid spacing in Table A.1. The DMM Contractor shall select one of these options for the entire project.
 3. The unconfined compressive strength shall be determined by ASTM D2166 at 28 days on samples taken by coring of the constructed DMM.
 4. 80 percent of all unconfined compressive strength testing on core samples determined by ASTM D2166 from each tested deep mixed element shall equal or exceeds the specified strength. If a strength specimen falls below the specified strengths due to an obviously unrepresentative lump of unmixed soil in the specimen, the Geotechnical Engineer has the option to select another specimen from the same core run and allow the Testing Laboratory to test the replacement specimen and substitute the strength from the replacement specimen for the strength from the unrepresentative specimen that failed to satisfy the strength requirement. Only one such retest will be allowed per core run.
 5. 90 percent of all the test results on core samples across the site should equal or exceed the specified strength.
 6. To prevent a weak layer at one elevation in the DMM foundation system, strengths below the specified strength are not permitted within 10 feet of the same elevation in more than 2 nearby cored elements.
 7. Uniformity of mixing within the target zone shall be evaluated by the Geotechnical Engineer based on the full-depth samples recovered by the DMM Contractor from the columns.
 - a. Lumps of unimproved soils shall not amount to more than 15 percent of the total volume of any core run from a continuous full-depth core sample. For evaluating the volume of unimproved lumps of soil, all of the unrecovered core length shall be assumed to be unimproved soil.
 - b. Any individual or aggregation of lumps of unimproved soil shall not be larger than 12 inches in greatest dimension.
 - c. Continuous core recovery shall be at least 85 percent over any full-length core.
- B. If the acceptance criteria specified in this Specification are not achieved for production DMM, the failed section of DMM shall be rejected.
1. Unless otherwise determined by the Geotechnical Engineer, the failed section of DMM shall be considered to include all DMM columns constructed during all rig shifts that occurred between the times of construction when passing tests were achieved.
 2. The DMM Contractor may conduct additional sampling and testing to better define the limits of the failed area at no additional cost to the Owner.
 3. The DMM Contractor shall submit a proposed plan for remixing or repair of failed sections for review and approval by the Geotechnical Engineer and CGS.
 4. If the treated soil that failed to meet the uniformity criteria is concentrated in a narrow elevation range forming weak planes or zones, the contractor could propose re-drilling and remixing to 3 feet below and above the deficient zone. IF re-drilling and remixing cannot be done efficiently, the contractor must replace the elements to the full depth. If the treated

zone in the narrow elevation meets the uniformity criteria but fails to meet the strength criteria, the contractor could propose to redrill and remix the deficient zone or to assign a lower strength level to the deficient zone and install additional elements to compensate for the strength deficiency.

5. If the treated soil that failed to pass cannot be isolated in a specific zone, the contractor must provide remedial measures for all elements constructed during all rig shifts that occurred between passing elements.
6. Remedial measures are subject to coring and application of the specification acceptance criteria.

END OF SECTION

SECTION 316100

FOOTINGS

PART 1 - GENERAL

1.1 GENERAL

Work of this Section shall conform to requirements of Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification sections.

1.2 SCOPE

The work covered by this Section shall include all labor, material, equipment, permits, engineering and other services necessary for the fabrication and installation of footings and related work, complete, in accordance with the Drawings and as specified herein.

1.3 RELATED WORK SPECIFIED IN OTHER SECTIONS

Submittals	Division 1
Quality Control	Division 1
Quality Assurance: Structural Testing and Inspection	Section 014505
Concrete Reinforcement and Embedded Assemblies	Section 032000
Cast-In-Place Concrete	Section 033000
Thermal and Moisture Protection	Division 7
DMM Ground Improvement	Section 313213

1.4 CODES AND STANDARDS

A. Building Code: Footing work shall conform to the requirements of the Building Code identified on the structural General Notes, and OSHA requirements, except where more stringent conditions or criteria occur in the standards referenced below and on the Drawings.

B. Standards:

1. ACI 117 – Standard Specifications for Tolerances for Concrete Construction and Materials.
2. ACI 301 – Standard Specifications for Structural Concrete.
3. ACI 315 – Details and Detailing of Concrete Reinforcement.
4. ACI 318 – Building Code Requirements for Reinforced Concrete.
5. American Concrete Institute “Manual of Concrete Practice”, various committee reports as referenced herein.
6. American Society for Testing and Materials "ASTM Standards in Building Codes", various standards as referenced herein.
7. AWS D1.4 – Structural Welding Code-Reinforcing Steel.

C. Definitions:

1. See Section 033000.

2. The term Owner's Geotechnical Engineer in this Specification is defined as the Owner's representative specifically authorized to perform the responsibilities defined herein.

1.5 CONTRACTOR QUALIFICATIONS

- A. The Footing Installer shall be a company which specializes in installing footings, with a minimum of 10 years of documented successful experience. Installation shall be performed by skilled workmen thoroughly experienced in the necessary execution.
- B. The Contractor's Field Supervisor shall have 10 years of experience in installing footings and provide full-time supervision.
- C. The Contractor's Professional Surveyor shall have 10 years of previous experience in laying out foundation locations to perform surveys, layouts, and measurements for footing work. The Contractor's Professional Surveyor shall be licensed California. Conduct layout work for each footing to lines and levels required before excavation, and actual measurements of each footing's horizontal location, top elevations, deviations from specified tolerances, and other required data.

1.6 SUBMITTALS

- A. Required Submittals - Where the SUBMITTALS section of this Specification is in conflict with Division 1 Submittals, the more stringent requirements for the Contractor apply. Required submittal items are listed here; see below for detailed requirements. Do not submit items not requested.

- (1) Submittal Schedule
- (2) Footing Construction Methods
- (3) Installer Qualifications
- (4) Shop drawings
- (5) Construction Log
- (6) Contractor's Survey Report
- (7) Submittals required by Related Documents
- (8) Mill Certificates
- (9) Owner's Concrete Testing Agency Reports
- (10) Product Data

1. Submittal Schedule: See Section 033000.
2. Footing Construction Methods: Submit for record, footing construction procedures developed by the Footing Contractor.
3. Installer Qualifications: Submit proof of qualifications as stated in the CONTRACTOR QUALIFICATIONS section of this Specification.
4. Shop drawings in accordance with 032000 and 033000, and as noted.
 - a) Concrete mix designs in accordance with Section 033000.
 - b) Footing reinforcement in accordance with Section 032000 and 033000.
 - c) Footing layout drawing showing the location of each footing (with respect to building gridlines), size and depth of footing, and top of footing elevation.

5. Construction Log: Testing Agency shall document, sign, and submit for record, a record of each footing construction, including:
 - a) Footing designation, top and where possible bottom elevation, and size of footing.
 - b) Size, length, and location of installed reinforcement.
 - c) Deviation of centerline plan location.
 - d) Actual allowable Deep Mixing Method column bearing capacity
 - e) Inspection and testing
 - f) Method of concrete placement, time of beginning and ending concrete discharge for each truck, (including any delays in concreting and location of construction joints in shafts) and any deviation from planned construction methods.
 - g) Volume of concrete supplied to footing and ratio of actual volume to theoretical volume.
6. Contractor's Survey Report: Submit for record plans sealed and signed by a Professional Surveyor licensed California, indicating as built plan locations of footing centerlines (with respect to building gridlines), top and where possible bottom elevations, and identifying deviations of footing centerlines from design plan locations. Footings that are outside of specified tolerances shall be specifically identified on the plan.
7. Submittals required by Related Documents.
8. Mill Certificates: Per Specification section 032000, submit for record certified reports for physical and chemical properties of following materials:
 - a) Reinforcement bars.
9. Owner's Concrete Testing Agency Reports: Submit for record
 - a) Reports of field observations.
 - b) Reports of field quality control tests, as related to concrete and reinforcement.
 - c) Immediately notify the Design Professionals of any deviations from the Drawings.
10. Product Data: Submit for record for each type of product identified in Part 2. Product Data shall be clearly marked to indicate all technical information which specifies full compliance with this section and Contract Documents, including published installation instructions and ICC reports, where applicable, for products of each manufacturer specified in this section.

- B. Submittal Process: See Section 013300.
- C. SER Submittal Review: See Section 033000.
- D. Substitution Request: See Section 012513.
- E. Request for Information (RFI): See Section 033000.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. See Sections 032000 and 033000.

1.8 PROJECT SITE CONDITIONS

- A. Geotechnical Information: Contractor to examine site, records of test borings, soil samples, and Geotechnical Report and Addendum that are available from the Owner. Soil boring test results are provided by the Owner for information and are not guaranteed to represent conditions that are present at footing locations. Soil boring test results are not intended as representations or warranties of the continuity of the reported conditions. It is expressly understood that the Owner will not be responsible for interpretation or conclusions drawn by Contractor from the Geotechnical Report and Addendum. At no additional cost to the Owner, evaluate the available data and provide additional test borings and other investigations as necessary for installing footings.
- B. Site Survey: Survey of site, existing utilities, and existing construction available from the Owner represent conditions known to Owner. Other obstructions may be encountered.

1.9 QUALITY ASSURANCE BY OWNER'S TESTING AGENCY

- A. See Section 014505.

1.10 QUALITY CONTROL BY CONTRACTOR

- A. See Section 033000.
- B. The Contractor's Geotechnical Engineer shall be qualified to perform the type of work required by the Project. The Engineer shall be a Licensed Professional/Geotechnical Engineer in California. The engineer shall develop a site dewatering plan and advise on footing construction techniques, including assistance in the development of construction procedures and the development of solutions to construction problems.

1.11 OBSERVATIONS AND CORRECTIONS BY DESIGN PROFESSIONALS

- A. See Section 033000.

1.12 PERMITS AND WARRANTY

- A. Permits: See Sections 007213 and 033000.
- B. Drawings and calculations prepared by the Contractor's Licensed Professional/Structural/Geotechnical Engineer in California for temporary shoring and/or earth retention shall be submitted to DSA for review.
- C. Warranty: See Sections 017836 and 033000.

PART 2 - PRODUCTS

2.1 CONCRETE

- A. See Section 033000.

2.2 REINFORCEMENT

- A. See Section 032000.

PART 3 - EXECUTION

3.1 PROTECTION OF EXISTING UTILITIES AND STRUCTURES

- A. Before installing footings adjacent to known existing utilities, notify utility owner to ensure that protective work will be coordinated and performed by Contractor in accordance with requirements of the owner of utility or building. If any existing service lines, utilities, and utility structures to remain in service are uncovered or encountered during work, protect the uncovered element from damage and provide support where necessary.
- B. Should uncharted or incorrectly charted piping or other utilities be encountered during footing excavation, immediately notify the Owner, Design Professionals and utility owner. Cooperate with Owner and utility owner in keeping their respective services, utilities and facilities in operation. Repair damaged utilities to entire satisfaction of Owner and utility owner concerned.
- C. Do not interrupt existing utility service facilities occupied and used by Owner and others, except when permitted in writing by the Design Professionals and then only after acceptable temporary utility services have been provided.
- D. Protect structures, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, vibration, and other hazards created by footing operations.

3.2 SITE DEWATERING

- A. Before installing footings, provide site dewatering based on the Contractor's site dewatering plan.
- B. Provide and maintain pumping equipment to keep excavations free of water before placing concrete. If excessive water is encountered and drilling operations must be halted, consult the Geotechnical Engineer before using alternate methods of construction.
- C. If excessive seepage is coming in from below the bottom of the footing excavation, removal by pumping within the excavation is inappropriate, as this may affect the Deep Mixing Method (DMM) columns and reduce the bearing soil capacity; therefore, an alternate means of dewatering will be required.

3.3 GENERAL FOOTING EXCAVATION

- A. Tolerances: Plan location tolerance is 2% of footing dimension but no greater than 2 inches (50 mm), whichever is greater, If indicated tolerances are exceeded, see "Footing Corrective Measures" in Part 3.
- B. Forming Sides of Footings:

1. Provide forms for footings and grade beams if soil or other conditions are such that earth trench forms are unsuitable.
 2. When trench forms are used, provide an additional 1" (25 mm) of concrete on each side of the minimum design profiles and dimensions indicated.
- C. Cleanup of Footing Bottom: Excavate bottom to a level plane. Remove loose materials or free water as determined by Owner's Geotechnical Engineer.

3.4 ADDITIONAL EXCAVATION AND FOOTING DEPTH

- A. If obstructions are encountered that interfere with new construction, remove such existing elements or develop corrective methods. The Contractor shall propose corrective actions and their recommendations in writing and submit them for review by the Design Professionals. Efforts shall be made to address obstructions at no additional cost to the Owner.

3.5 DISPOSAL OF EXCAVATED MATERIALS

Dispose excavated materials off site in a manner that will not interfere with other construction activities. Keep construction site at all times clean and free of soil and other debris that could affect progress of other construction activities.

3.6 FOOTING REINFORCEMENT

- A. Fabrication in accordance with 032000 from approved shop drawings.

3.7 FOOTING BEARING

- A. Footing Bearing and Verification
1. Footings shall be founded on Deep Mixing Method (DMM) columns with bearing capacity indicated on Drawings. Footings shall not be excavated until test results by Owner's Geotechnical Engineer confirm allowable bearing values indicated on Drawings, but shall be excavated immediately thereafter.
 2. DMM columns must be inspected and be acceptable to the Owner's Geotechnical Engineer before placing concrete

3.8 CORRECTIVE MEASURES

- A. If unforeseen field conditions require corrective installation methods, immediately notify the Design Professionals.
1. Where a change to the construction installation method result in an as-built footing in compliance with the Contract Documents, submit installation method for record.
 2. Where the as-built footing does not meet the design intent of the Contract Documents. The Contractor shall propose corrective actions and their recommendations in writing and submit them for review by the Design Professionals.
- B. If footings are installed outside allowable tolerances, develop and provide corrective methods at no extra cost to the Owner including calculations based on actual locations of footings, taking into account eccentricity between final centerline of footing and design

location of column centerline. The Contractor shall propose corrective actions and their recommendations in writing and submit them for review by the Design Professionals. Calculations shall be sealed and signed by a Professional/Structural/Geotechnical Engineer licensed California.

- C. Where the Contractor requests that the Design Professionals develop the corrective actions or review corrective actions developed by others, the Design Professional shall be compensated as outlined in Part 3 – CORRECTIVE MEASURES section of Specification 033000.

END OF SECTION

SECTION 320100
LANDSCAPE MAINTENANCE PERIOD

PART 1 – GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Weed Control and Prevention.
 - 2. Pest Control and Prevention.
 - 3. Disease Control and Prevention.
 - 4. Fertilization.
 - 5. Pruning of Plant Material.
 - 6. Replacement of Dead or Unhealthy Plant Material.
 - 7. Repair of Staking and Guying System.
 - 8. Watering Plant Material.
 - 9. Mowing.
 - 10. Monitoring, Adjustment and Repair of Irrigation System.
 - 11. Monitoring Changing Soil Moisture and Weather Conditions Relative to Plant Material Water Requirements.
 - 12. Adjusting Length of Watering Cycles According to Changing Soil and Weather Conditions.

- B. For Irrigation, see Section 328400.

- C. For Grasses, see Section 329200.

- D. For Soil Preparation and Soil Mixes, see Section 329113.

- E. For Planting Area Finish Grading, see Section 329119.

- F. For Plant Material, see Section 329300.

1.2 DEFINITIONS

- A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of District’s representative in writing.

- B. IPM — Integrated Pest Management: An approach to pest control that utilizes regular monitoring to determine if and when treatments are needed and employs physical, mechanical, cultural, biological and educational tactics to keep pest numbers low enough to prevent intolerable damage or annoyance. Least-toxic chemical controls are used as a last resort.

1.3 REFERENCES

- A. ANSI — American National Standards Institute:
 - 1. Z60.1 — American Standard for Nursery Stock. Most current edition.
 - 2. A300 – Pruning. Most current edition.
- B. NAA — National Arborist Association:
- C. Pruning Standards for Shade Trees. Most current edition.
- D. ICBN — International Code of Botanical Nomenclature.
- E. ICNCP — International Code of Nomenclature of Cultivated Plants.
- F. ISA — International Society of Arboriculture.

1.4 SUBMITTALS

- A. Product Purchase and Delivery Documentation:
 - 1. Fertilizer: Within 5 working days of each application submit purchase orders, invoices and receipts showing supplier name and address, person who sold product, date of purchase, specific product purchased, quantity purchased, and delivery date.
- B. Manufacturer's Current Printed Instructions:
 - 1. Fertilizer.
 - 2. Required chemicals.
- C. Documentation of Accepted Conditions: Within 7 working days after District's acceptance of maintenance, submit color photographs and a written report documenting the accepted conditions of the plant material.
- D. Inspection Reports:
 - 1. Monthly plant inspection report documenting signs of stress.

1.5 QUALITY ASSURANCE

- A. Contractor Qualifications:
 - 1. Maintenance Contractor: Minimum 10 years experience in maintenance of commercial landscape projects.
 - 2. Maintenance Supervisor: Minimum of 10 years experience in landscape maintenance supervision, with experience and training in integrated pest management, turf management, entomology, pest control, soils, fertilizers and plant identification.
 - 3. Labor Force: Thoroughly familiar and trained in the work to be accomplished and perform the task in a competent, efficient manner acceptable to the District.
 - 4. Supervision: Directly employ and supervise the Work force at all times.
- B. Notification of Change in Supervision: Notify District of changes in supervision.
 - 1. Identification: Provide proper identification for landscape maintenance firm's labor force.

C. Regulatory Requirements:

1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.
2. Provide for inspections and permits required by Federal, State, or local authorities in furnishing, transporting, and installing of chemicals.
3. Submit a record of herbicides, insecticides and disease control chemicals used to the County Agricultural Commissioner's Office as required by law.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Plant Material: Meet requirements of Section 329300.

1.7 SITE CONDITIONS

A. Environmental Requirements:

1. Do not apply chemicals during windy conditions.

1.8 SEQUENCING AND SCHEDULING

A. Work Schedule:

1. Perform maintenance during hours accepted by District.
2. Be present at the project site at least once a week and as often as necessary to perform specified maintenance.

B. Chemical Applications:

1. Notify District in advance of required chemical applications.
2. Obtain District's approval of application schedule.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Gro-Power Products:

1. Gro-Power Co. – www.gropower.com.
2. Or equal.

B. Other Fertilizers:

1. Agri Tab Corporation – www.agritab.com.
2. Delta Bluegrass Company, www.deltabluegrass.com.
3. Or equal.

C. Rock Mulch:

1. Lyngso. – www.lyngsogarden.com
2. Or equal.

D. Herbicide:

1. Avenger Organic – www.avengerorganics.com.
2. Or equal.

- E. Polymer:
 - 1. Complete Green, El Segundo, CA, www.completegreencompany.com
 - 2. Or equal.

2.2 MATERIALS

- A. Replacement Plant Material:
 - 1. Match existing genus, species, cultivar and size.
 - 2. Meet requirements of Section 32 9300.
 - 3. Meet requirements of ANSI Z60.1, ICBN and ICNCP.
- B. Seed or Sod: Match existing genus, species and cultivar.
- C. Fertilizers:
 - 1. Gro-Power Plus 5-3-1.
 - 2. Gro-Power Hi-Nitrogen (14-4-9) and Gro- Power Premium Hi-Nitrogen 18-3-7.
 - 3. Gro-Power Controlled Release 12-8-8.
 - 4. Bolero Lawn Food.
 - 5. Or equal.
- D. Fertilizer Tablets for Replacement Plants:
 - 1. Gro-Power 21 Gram Planting Tablets 20-10-5.
 - 2. Or equal.
- E. Gypsum: Agricultural grade product containing 80-percent minimum calcium sulfate.
- F. Herbicides, Insecticides, and Fungicides:
 - 1. Legal commercial quality nonstaining materials with original manufacturers' containers, properly labeled with guaranteed analysis, least toxic required.
- G. Mulches:
 - 1. Same as original installation.
- H. Polymer: Soil drain / PAM.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Protection of Existing Conditions:
 - 1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
 - 2. Provide barricades, fences or other barriers to protect existing conditions from damage during maintenance operations.
 - 3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants.
 - 4. Submit written notification of damaged plants and structures to District and District's representative immediately.

3.2 GENERAL MAINTENANCE

- A. Maintenance Period for Trees, Shrubs, Groundcover, Vines, Perennials, Grasses, Turf Lawn and Hydroseeded Grasses: Continuously maintain each plant and each portion after installation, during progress of work, and for a minimum period of 90 days after Final completion until District accepts maintenance.
- B. Integrated Pest Management: Employ principles of integrated pest management for each aspect of maintenance.

3.3 TREE AND SHRUB MAINTENANCE

- A. Watering:
 - 1. Using a soil sample tube, check rootball moisture and surrounding soil moisture at representative plants at least twice a week.
 - 2. Maintain watering basins around trees and shrubs so that enough water can be applied to establish moisture through root zones.
 - 3. In rainy season, open basins to allow surface drainage away from the root crown where excess water may accumulate.
 - 4. Restore watering basins at end of rainy season.
 - 5. Adjust frequency and length of time for watering cycles according to changing soil and weather conditions.
 - 6. For supplemental hand watering of watering basins, use a water wand to break the water force.
 - 7. Do not permit crown roots to become exposed to air through dislodging of soil and mulch.
 - 8. Maintain depth of mulch to reduce evaporation and frequency of watering.
- B. Settled or Leaning Plants: Reset plants to proper grades or upright position.
- C. Weed Control:
 - 1. Keep mulched areas between plants and watering basins weed free.
 - 2. As a last resort use least toxic herbicides.
 - 3. Avoid frequent soil cultivation that destroys shallow roots.
- D. General Pruning:
 - 1. Meet requirements of Pruning Standards for Shade Trees.
 - 2. Prune trees to eliminate diseased or damaged growth.
 - 3. Reduce toppling and wind damage by thinning out crowns.
 - 4. Prune trees to maintain growth within space limitations, maintaining a natural appearance and balancing crown with roots.
 - 5. Retain lower branches in a "tipped back" or pinched condition to promote caliper trunk growth.
 - 6. Do not cut back to fewer than six buds or leaves on branches.
 - 7. Prune damaged trees or those that constitute health or safety hazards at any time of year.
 - 8. Make cuts clean and close to the trunk, without cutting into the branch collar.
 - 9. Make larger cuts (one inch in diameter or larger) parallel to shoulder rings, with the top edge of the cut at the trunk or lateral branch.

- E. Fertilizing Acid Loving Plants:
 - 1. Feed 1 tablespoon of 3-12-12 fertilizer per each foot width of plant.
 - 2. Spread evenly around plant and water thoroughly.
 - 3. Start feeding when buds have formed until the plant is finished blooming at approximately 4 week intervals.

- F. Replacement of Plants: Replace, without cost to District, and as soon as weather conditions permit, plants not in a vigorous, thriving condition, during and at the end of the maintenance period.

3.4 GRASSES MAINTENANCE

A. First three weeks after installation.

- 1. Watering:
 - a. For the first three weeks after installation, keep the sod and soil moist throughout the day but never allow the soil to become soggy.
 - b. Apply water slowly so as to penetrate the entire root zone, without erosion of soils. Pending weather and soil conditions, water four to six times during the day, for approximately five to six minutes each time until roots have become fully established. Adjust watering length and cycle as required to not overwater or underwater the turf. If water is standing under the sod for more than a few minutes after an irrigation set has finished or if the soil is soggy, reduce the amount of water being applied.
 - c. Root establishment will usually begin within seven to fourteen days depending on the time of year and microclimate.
 - d. Reduce the frequency of watering cycles just before the first mowing to allow the soil to firm up prior to the first mowing.
 - e. Water at night or early mornings.
- 2. Mowing:
 - a. Approximately 14 days after the sod has been installed, mow approximately 1/3 of the grass blades.

B. Three weeks and beyond after installation:

- 1. Watering:
 - a. Reduce the frequency of watering at a gradual pace.
 - b. Validate the establishment of roots by pulling up a corner of the sod. Once resistance is found, eliminate the last irrigation set of the day. Adjust accordingly in response to temperature, length of day, season, rainfall and soil types.
 - c. Once the roots have gotten firmly established, add a couple minutes to each irrigation
 - d. After approximately a week, repeat process until you are watering once a day.

2. Mowing:
 - a. Mow when turf is dry.
 - b. Mow with a "mulching rotary lawn mower".
 - c. Mow as required to maintain height of 3 to 4 inches.
 - d. Never remove more than 1/3 of leaf blade per mowing cycle.
3. Amendments and Fertilization During Growing Season:

2. Four to Six weeks after installation, fertilize with Bolero Lawn Food according to manufacturer's current printed instructions.
3. Allow for 10 pounds of gypsum per 1000 square feet for every 4 weeks after planting until Owner accepts maintenance. Apply gypsum by hand or tractor mounted broadcaster. Contingent upon season, application may not be necessary. Confirm with Landscape Architect prior to installation. If not used, submit credit to District.
4. Apply evenly over planting areas by spreading half in one direction and half in a direction 90 degrees to the first direction to assure even application.
5. Apply with either a broadcast centrifugal or gravity spreader.
6. Water thoroughly after application.

4. Resodding of Grass Areas: Resod without cost to District, and as soon as weather conditions permit, grass areas not in a vigorous, thriving condition, during and at the end of the maintenance period.

3.5 INSECTS, PESTS, AND DISEASE CONTROL

A. General:

1. Employ principles of IPM in the selection of preventative and control measures for plant pests and diseases.
2. Insignificant pests will be tolerated providing they do not seriously threaten planting health and appearance.
3. Monitor the site closely and take timely action to address problems identified.
4. Use personnel licensed and experienced using materials approved by the EPA and conform to applicable laws, codes and regulations, under the direction of a licensed certified pest control operator.
5. Spray with extreme care to avoid hazards to any person, pet, or automobile in the area or adjacent areas.
6. Meet requirements of chemical manufacturer's current printed instructions.
7. The Contractor shall be held liable for plant damage due to the use of chemicals.

B. Inspection:

1. Inspect plant material weekly for signs of stress and damage.
2. Submit a written and photographic inspection report of findings monthly to Owner and Owner's representative.
3. Spraying:
4. When necessary apply the least toxic chemical required for the existing problem.
5. Apply in strict accordance with manufacturer's current printed instructions.

- C. Apply sprays only if a pest or disease is a serious threat and cease application after problem is under control.

3.6 IRRIGATION SYSTEM

A. Damages:

1. Repair without charge to District damages to system caused by Contractor's operations.
2. Perform repairs within one watering period.

B. Cleaning and Monitoring the System:

1. Continually monitor the irrigation systems to verify that they are functioning properly as designed.
2. Clean filters and strainers at least once a month and as often as necessary to keep the irrigation systems free of sand and other debris.
3. Set and continuously adjust and program automatic controller for seasonal water requirement.
4. Make program adjustments as required by changing field conditions.
5. At least once a week, daily when required, use a soil sampling tube to check the rootball moisture of representative plants as well as the surrounding soil.
6. Prevent spraying on windows, building walls, and game courts, etc. by balancing the throttle control on the remote control valves and the adjustment screws on the sprinkler heads.
7. Do not allow water to atomize and drift.

3.7 FIELD QUALITY CONTROL

A. Maintenance Review:

1. At the end of the maintenance period, request a review by the District's representative to determine whether maintenance Work meets the requirements of the Contract Documents.
2. Submit a written request at least five working days prior to the anticipated date of review.
3. If it is found that the maintenance Work does not meet the requirements of the Contract Documents, the Contractor will receive written notification from the District's representative of corrective Work preventing District acceptance of the maintenance Work.
4. Perform corrective Work within ten calendar days after the review.
5. Upon completion of the corrective Work, request another review to determine whether the maintenance Work meets the requirements of the Contract Documents.
6. Corrective Work followed by review will be required until the corrective Work is found by the Owner's representative to meet the requirements of the Contract Documents.

A. Payment for Additional Maintenance Review Field Trips: If additional trips are required after the first review because of incomplete work, reimburse District for expenses and fee required to have District's representative make additional field trips.

B. District's Acceptance of Maintenance:

When the District's representative determines that the maintenance Work conforms to the requirements of the Contract Documents the Contractor will receive written notification designating the day which the District will accept maintenance responsibility.

1. Continue maintenance of landscape Work until the District accepts maintenance.

END OF SECTION

**SECTION 321123
AGGREGATE BASE**

PART 1 - GENERAL

1.1 SUMMARY

- A. Specifications for furnishing, spreading, and compacting aggregate base course for pavements as indicated.

1.2 REFERENCES

- A. American Society for Testing and Materials (ASTM):
 ASTM D2922 Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
 ASTM D3017 Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth)
- B. State of California, Department of Transportation (Caltrans), Standard Specifications:
 Section 17 Watering
 Section 26 Aggregate Bases
- C. State of California, Department of Transportation (Caltrans), Standard Test Methods:
 Calif. Test 201 Method of Soil and Aggregate Sample Preparation Aggregates
 Calif. Test 202 Method of Tests for Sieve Analysis of Fine and Coarse Aggregates
 Calif. Test 205 Method of Determining Percentage of Crushed Particle
 Calif. Test 216 Method of Test for Relative Compaction of Untreated and Treated Soils and Aggregates
 Calif. Test 217 Method of Test for Sand Equivalent
 Calif. Test 229 Method of Test for Durability Index
 Calif. Test 301 Method of Test for Resistance "R" Value of Treated and Untreated Bases, Subbases and Basement Soils by the Stabilometer

PART 2 - PRODUCTS

2.1 AGGREGATE BASE MATERIAL

- A. Class 2 aggregate base shall be free of vegetable matter and other deleterious substances. Coarse aggregate, material contained on the No. 4 sieve, shall consist of material of which 25 percent by weight shall be crushed particles as determined by California Test Method No. 205. Class 2 aggregate base shall conform to one of the following gradings, determined in accordance with California Test Method No. 202:

Sieve	Percentage Passing Sieves
	3/4 inch Maximum
2 inch	—
1 ½ inch	—
1 inch	100
¾ inch	90-100
No. 4	35 - 55
No. 30	10 - 30
No. 200	2 - 9

- B. Class 2 aggregate base shall conform to the following additional requirements:

Tests	Test Method No. Calif.	Requirements
Resistance (R-Value)	301	78 min.
Sand Equivalent	217	22 min.
Tests	Test Method No. Calif.	Requirements
Durability Index	229	35 min.

- C. Light Weight Backfill: Naturally-occurring volcanic rock with a maximum unit weight of 65 pounds per cubic foot, minimum Durability Index of 35 (California Test 229), minimum R-Value of 50 (California Test 301), wrapped in geotextile fabric, with the following gradation requirements:

Sieve Size	Percentage Passing
1-1/2 inch	100
1 inch	95 to 100
3/4 inch	90 to 100
3/8 inch	15 to 85
No. 4	0 to 9

- D. Geotextile Fabric: Mirafi FW300 or equivalent

2.2 SOURCE QUALITY CONTROL

- A. Submit certificate of compliance for approval prior to installation of material.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Call for an inspection by the Engineer and obtain written acceptance of the prepared subgrade or subbase before proceeding with the placement of aggregate base course.
- B. The subgrade or subbase to receive aggregate base course, immediately prior to spreading, shall conform to the compaction and elevation tolerances indicated for the material involved and shall be free of standing water and loose or extraneous material.

3.2 INSTALLATION STANDARDS

- A. Aggregate base course shall be applied over the prepared subgrade or subbase and compacted in accordance with Section 26 of the Caltrans Standard Specifications.
- B. Aggregate base course shall be minimum uniform thickness after compaction of dimensions indicated. Where not indicated, compacted thickness shall be six inches for driveways/sidewalks and eight inches for roadways.
- C. All compaction expressed in percentages in this section refers to the maximum dry density as determined by California Test Method No. 216.

3.3 SPREADING OF MATERIAL

- A. Aggregate for base course shall be delivered as uniform mixture of fine and coarse aggregate and shall be spread in layers without segregation.
- B. Aggregate base course material shall be free from pockets of large and fine material.

- Segregated materials shall be remixed until uniform.
- C. Aggregate base material shall be moisture-conditioned to near optimum moisture content in accordance with the applicable requirements of geotechnical report or as approved by the Engineer.
 - D. Aggregate base course six inches and less in thickness may be spread and compacted in one layer. For thicknesses greater than six inches, the base course aggregate shall be spread and compacted in two or more layers of uniform thickness not greater than six inches each.

3.4 COMPACTING

- A. Relative compaction of each layer of compacted aggregate base material shall be not less than 95 percent as determined by California Test Method No. 216.
- B. Thickness of finished base course shall not vary more than 3/4 inch from the indicated thickness at any point. Base which does not conform to this requirement shall be reshaped or reworked, watered, and recompact to achieve compliance with specified requirements.
- C. The surface of the finished aggregate base course at any point shall not vary more than 3/4 inch above or below the indicated grade.

3.5 FIELD QUALITY CONTROL

- A. Perform field tests in accordance with ASTM D2922 to determine compliance with specified requirements for density and compaction of aggregate base material, and with ASTM D3017 to determine moisture-content compliance of the installed base course.

SECTIONS 321216
ASPHALTIC CONCRETE PAVING

PART 1 - GENERAL

1.1 SUMMARY

- A. Specifications for providing asphaltic concrete paving as indicated.
- B. Related Sections
 - 1. Section 321123, "Aggregate Base"

1.2 REFERENCES

- A. State of California, Department of Transportation (Caltrans), Standard Specifications

- Section 39 Asphalt Concrete
 - Section 92 Asphalt Binders
 - Section 94 Asphaltic Emulsions

- B. State of California, Department of Transportation (Caltrans), Standard Test Methods

- Calif. Test 202 Method of Tests for Sieve Analysis of Fine and Coarse Aggregates
 - Calif. Test 304 Method of Preparation of Bituminous Mixtures for Testing
 - Calif. Test 366 Method of Test for Stabilometer Value
 - Calif. Test 375 Determining the In Place Density and Relative Compaction of AC Pavement

1.3 PROTECTION

- A. Protect concrete pavements and walks, curbs and bases, and other improvements adjacent to the operations with suitable materials. The Contractor shall be responsible for any damage caused by the Contractor's employees or equipment and shall make necessary repairs. Building and other surfaces shall be covered with paper or other protection, where required. All damage caused by the Contractor's operations shall be prepared or replaced as required.

PART 2 - PRODUCTS

2.1 BASE COURSE MATERIAL

- A. Class 2 Aggregate Base. Percentage composition by weight of aggregate base material shall conform to the 3/4 inch maximum grading when determined by California Test 202.

2.2 TACK COAT

- A. Tack Coat: Diluted SS-1 or SS-1h emulsion or undiluted RS-1 emulsion in conformance with Section 94 or the Caltrans Standard Specifications.

2.3 ASPHALT PAVING MATERIALS

- A. Paving Asphalt: All purpose, aged residue, steam refined, PG 64-10 grade, in accordance with Section 92 of the Caltrans Standard Specifications.
- B. Aggregate: Type A, with the grading of the combined aggregate conforming to 1/2 inch maximum size, medium grading, as specified in Section 39 of the Caltrans Standard

Specifications.

- C. Mixing Facilities: Asphalt concrete surfacing material shall be furnished from an approved commercial asphalt central mixing plant.

2.4 SOURCE QUALITY CONTROL

- A. Contractor shall submit Certificate of Compliance from manufacturer for approval prior to installation.

PART 3 - EXECUTION

3.1 PLACING OF BASE COURSE

- A. The Contractor shall call for an inspection by the Engineer and obtain written approval of the subgrade before proceeding with the base course.
- B. Base course shall be minimum uniform thickness after compaction of dimensions indicated.
- C. Base course shall be placed over finished subgrade and compacted in accordance with Section 32 11 23 - Aggregate Base.
- D. After base course has been completed, the Contractor shall call for an inspection by the Engineer and obtain written approval before proceeding with application of the asphalt wearing surface.

3.2 PLACING OF TACK COAT

- A. The Contractor shall call for an inspection by the Engineer and obtain written approval of the subgrade before proceeding with the tack coat.
- B. The tack coat shall be applied using a calibrated distributor truck spray bar, hand spraying, squeegee and brush application in locations where required and per manufacturers requirements. Tack coat shall be applied in accordance with Section 39-4 of the Caltrans Standard Specifications at the rate of from 0.22 to 0.28 gallons per square yard.

3.3 PLACING ASPHALT CONCRETE

- A. Areas to be paved shall be covered with a layer of hot asphalt concrete surfacing not to exceed 3.0 inches after compaction.
- B. Paving asphaltic concrete shall be delivered, laid, rolled, and finished in accordance with Section 39 of the Caltrans Standard Specifications.
- C. Before placing asphalt concrete, a tack coat (paint binder) shall be applied to all vertical surfaces against which asphalt concrete surfacing will be placed. Tack coat shall be applied in accordance with Section 37-3.03B(6) of the Caltrans Standard Specifications at the rate of from 0.8 to 0.15 gallons per square yard.
- D. Finish surface of the wearing course shall be thoroughly compacted, smooth, and free from ruts, humps, depressions, cold joints, or other irregularities.
- E. Finish paving shall conform to slopes, lines, and finish grades indicated, and shall drain properly. Where adjacent surfaces are intended to be flush (as at concrete gutters, walks, and paving), they shall conform smoothly at all joints.
- F. Ridges, indentations, and other objectionable marks left in the surface of the asphalt concrete by paving or rolling equipment shall be eliminated by rolling. The use of equipment that leaves ridges, indentations, or other objectionable marks in the asphalt concrete shall be discontinued, and other acceptable equipment shall be employed.
- G. Where cold joints are indicated or necessary, cut back the placed and compacted cold asphalt a minimum of three inches with a concrete or masonry power saw, so that a vertical face of compacted full thickness material is exposed. Treat this surface with a tack coat before proceeding with the placement of new asphaltic concrete surfacing.
- H. Finish paving shall conform to finish elevations within plus or minus 0.01 of a foot and shall be

level to within plus or minus 1/4 inch in 10 feet when measured with a 10 foot straightedge in any direction.

3.4 FIELD QUALITY CONTROL

- A. The Contractor shall control the quality of the work and shall provide adequate testing to assure compliance with these Specifications.
- B. After completion of paving work, all paving shall be flooded with water, and any resulting “ponds” shall be ringed with chalk. Such hollows shall be corrected with addition of asphalt paving materials and rerolling until all paving is completely level and free from hollows and high spots.
- C. The Engineer shall perform in-place density and compaction tests of the completed pavement in accordance with California Test 375 to determine compliance with specified requirements. Test shall be performed as often as necessary to verify compliance, but not less frequently than the following:
 - 1. One test required.

3.5 MAINTENANCE OF PAVEMENT

- A. Upon completion of final rolling, traffic shall not be permitted on the finished pavement for at least six hours, and until the asphalt concrete has cooled sufficiently to withstand traffic without being deformed. Finished pavement shall be maintained in finished clean condition until the work is accepted by the Engineer.

SECTION 311316

SITE CONCRETE

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Formwork.
 - 2. Reinforcement.
 - 3. Expansion Joint Fill Material.
 - 4. Concrete Placement.
 - 5. Finishing.
 - 6. Curing.
 - 7. Downspout Nozzle
 - 8. Skate Deterrents.
 - 9. Cast Iron Detectable Warning Plate Type 1.
- B. For Earthwork, see Division 31.
- C. For Irrigation, see Section 32 84 00.
- D. For Site Concrete Water Repellents, see Section 07 09 21.
- E. For Site Concrete Sealants, see Section 32 13 73.
- F. For Site Furnishings, see Section 32 30 00.
- G. For Soil Preparation and Soil Mixes, see Section 32 91 13.
- H. For Planting Area Finish Grading, see Section 32 91 19.
- I. For Plant Material, see Section 32 93 00.
- J. For Landscape Drainage, see Section 33 41 01.
- K. For Sustainable Design Requirements, see Section 01 81 13.

1.2 DEFINITIONS

- A. Acceptance: Wherever the terms "acceptance" or "accepted" are used herein, they mean acceptance of Owner's representative in writing.
- B. Finishing Tolerances:
 - 1. "Class A": True plane within 1/8" in ten feet as determined by a 10-foot straightedge placed anywhere on the slab in any direction.
 - 2. "Class B": True plane within 1/4" in ten feet as determined by a 10-foot straightedge placed anywhere on the slab in any direction.

1.4 SUBMITTALS

A. Product Data:

1. Expansion joint fill material
2. Color admixtures.
3. Micro-reinforcement.
4. Top Cast Surface Retarder
5. Skate Deterrent
6. Cast Iron Detectable Warning Plate Type 1

B. Samples:

1. Expansion Joint Fill Material: Submit one 12-inch length.
2. Skate Deterrent: Submit one unit.

C. Shop Drawings:

1. Detail installation of CIP Concrete Walls and CIP Concrete Biotreatment Planter Walls. Indicate wall locations, plans, elevations, cross sections, dimensions, limits of each finish, edge radii, skate deterrents and types of reinforcement, including special reinforcement and footings.
 - a. Detail loose and cast-in hardware, connections and joints, including accessories.
 - b. Detail form board and tie hole layout for concrete retaining wall. Refer to Architecture drawings for tie hole layout

D. Design Data:

1. Concrete mix.

E. Test Results:

1. Concrete Cylinder Tests.

1.5 QUALITY ASSURANCE

A. Contractor Qualifications: Use adequate numbers of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

B. Regulatory Requirements: Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.

C. Field Samples:

1. Provide one 6-feet by 6-feet sample of concrete paving. Include the specified color admixture, finish, control joints, expansion joint materials and sealant, and edge treatments.
2. Provide one 9-feet long segment of concrete planter wall. Include 9" wide weep depression, stepped offset walls with openings for planting. Include the specified color admixture, finish, control joints, expansion joint materials and sealant, and edge treatments.
3. Provide one 6-feet long segment of concrete retaining wall at tallest location per Grading Plan. Include the specified color admixture, control joints, expansion joint materials, tie holes, edge treatments, water repellent and anti-graffiti coating (See Site Concrete Water Repellents).

4. Construct as many samples as necessary to achieve an accepted finish over the entire surface of the sample.
5. Samples which are completely or partially finished incorrectly will be rejected.
6. Remove rejected samples immediately from the site.
7. Place the accepted sample in a location where the finishers can easily reference the sample finish.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Welded Wire Fabric: Leave tags designating size and spacing on each roll until installed.

1.7 SITE CONDITIONS

- A. General Environmental Requirements: Protect concrete against extreme cold and heat, frost, rapid drying and damage by rain.
- B. Environmental Requirements for Dowel Epoxy: Meet requirements of manufacturer's current printed instructions.

1.8 WARRANTY

- A. General Description: In addition to manufacturer's warranties, warrant Work for a period of one year from the Date of Final Completion against defects in materials and workmanship.
- B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship.
- C. Exceptions: Contractor shall not be held responsible for failures due to ordinary wear, neglect by Owner, vandalism, or other causes beyond the Contractor's control.

1.9 LEED SUBMITTALS

- A. Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - MRc3 - Sourcing of Raw Materials - **Recycled Content**: Provide product data for pre- and post- consumer recycled content.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

- A. Dowel Epoxy or Resin:
 1. The Rawlplug Company, Inc. – www.rawlplug.com
 2. Hilti, Inc. – www.us.hilti.com.
 3. Sika Corporation – usa.sika.com.
 4. Or accepted equal.

- B. Expansion Joint Material:
 1. Williams Products, Inc. – williamsproducts.net.
 2. Or accepted equal.
- C. Coloring Admixtures for Colored Concrete:
 1. Sika – www.usa.sika.com.
 2. Or accepted equal.
- D. Form Sealer:
 1. Nox-Crete – www.noxcrete.com.
 2. Or accepted equal.
- E. Form Release Agent:
 1. Nox-Crete – www.noxcrete.com.
 2. Or accepted equal.
- F. Skateboard Deterrent:
 1. Grinder Minders – www.grindtoahalt.com.
 2. Or accepted equal.
- G. Concrete Top Surface Retarder:
 1. GCP Applied Technologies – www.GCPAT.com
 2. Or accepted substitute.
- H. Cast Iron Detectable Warning Plate Type 1:
 1. Neenah Foundry – www.nfco.com.
 2. Or accepted substitute.

2.2 MATERIALS

- A. Cement for Grey Cement Concrete:
 1. ASTM C 150, Type I Portland Cement.
- B. Coarse Aggregate for Grey Cement Concrete:
 1. ASTM C 33, ACI 304R.
- C. Fine Aggregate for Grey Cement Concrete:
 1. ASTM C 33-03, ACI 304R, hard, durable and clean sand. Do not use sand coated with injurious amounts of silt, loam or clay or other deleterious matter. Fine aggregate and sand shall be from a single source and shall be like in visual appearance.
 2. Type: Orca Sand
- D. Reinforcing Bars:
 1. ASTM A 615, grade 60, deformed billet-steel bars, clean and free from rust, scale, or coating that will reduce bond.
- E. Welded Wire Fabric:
 1. ASTM A 185 plain wire, ASTM A 497 deformed wire.

- F. Tie Wire:
 - 1. 16 gauge or heavier, black annealed wire.
- G. Supports for Reinforcement:
 - 1. Meet requirements of CRSI-MSP-1.
 - 2. For exposed-to-view concrete surfaces, where legs of supports are in contact with forms, provide supports with legs which are stainless steel protected.
- H. Dowels:
 - 1. Quality: ASTM A 615, smooth, billet-steel bars.
 - 2. Size: As shown on Drawings.
- I. Water: Clean, potable, concrete mixing water free from injurious amounts of salts, oils, acids, alkalis, organic materials, iron, rust or other deleterious substances which would cause staining.
- J. Air Entrainment: ASTM C 260, non-staining.
- K. Coloring Admixtures for Colored Concrete: ASTM C 979, Chromix P Admixture, color as indicated on Drawings, as available from Sika.
- L. Expansion Joint Material: ASTM D 1752 Type II cork, or ASTM D 1752 Type I, sponge rubber with 30 to 40 pounds per cubic foot density, 95 percent minimum recovery and compatible with joint sealant to be used.
- M. Form Release Agent: Non-staining material.
- N. Chemical Admixtures: ASTM C 494, colored and water-reducing and/or retarding compatible, Type A or Type D, as required.
- O. Admixture Restrictions for Colored Concrete: Do not use calcium chloride or other accelerating admixtures containing calcium chloride, fly ash, or any admixtures that will stain colored and white concrete.
- P. Top Surface Retarder: Top Cast Acid Etch 01
- Q. Curing Paper: ASTM C 171.
- R. Dowel Epoxy: ASTM C 881, 2-part, chemical resistant, structural epoxy, designed for use in anchoring threaded rods, bolts, reinforcing bars, and smooth dowels to solid material.
- S. Curing Compounds for Non-Colored Concrete: ASTM C 309, non-staining.
- T. Dowel Sleeve: Plastic dowel cap, 4" length sized to fit dowels.
- U. Concrete Planter/Retaining Walls and Stairs Forming Material:
 - 1. MDO or HDO composite overlaid plywood for face forms.
 - 2. Synthetic Polyethylene or milled wood for reveals and corner forms.
- V. Form Sealer: Nox-Crete Clear Pre-Form transparent, penetrating polyurethane wood sealer.
- W. Aggregate Base for on-grade Installation: Per Geotechnical Investigation Report.
- X. Skateboard Deterrent:

1. Type: GrinderMinder - Cylinder
2. Finish: Solid Stainless Steel 316 with Brushed Finish Standard

Y. Expansion Joint Sealant:

1. Product: 890FTS-TXTR
2. Color: To be selected in field with final mock up

Z. Cast Iron Detectable Warning Plate Type 1:

1. Type: 24" x 36" Quick Connect Plates
2. Finish: Cast Iron
3. Quantity: See Drawings

2.3 MIXES

A. Concrete Paving (Vehicular and Pedestrian), Topping Slab, CIP Planter Walls, and CIP Biotreatment Planter Walls:

1. Mix design to match approved mock-up for architectural concrete wall design.
2. Meet applicable requirements of ACI 303R for mix proportioning and mixing.
3. Meet applicable requirements of ACI 304R for mix proportioning and mixing, except as modified by ACI 303R.
4. Employ commercial testing laboratory to design concrete mixes with 3,000 psi minimum strength at 28 days, maximum 4 inch slump and admixtures compatible with color admixture.
5. Submit mix design data to Owner's representative for review prior to mixing.
6. For colored concrete elements incorporate color admixture into mix by meeting the requirements of the color admixture manufacturer's current printed instructions and do not exceed 10 percent of mix content by weight.

B. Non-Architectural Concrete:

1. Mix design to match approved structural concrete mix design.
2. Meet requirements of ACI 304R for mix proportioning and mixing.
3. Employ commercial testing laboratory to design concrete mixes with 3,000-psi minimum strength at 28 days, maximum 4-inch slump and admixtures compatible with color admixture.
4. Submit mix design data to Owner's representative for review prior to mixing.

2.4 LEED REQUIREMENTS

- A. **PS EPD:** Products specified under this section must have a Type III Product Specific EPD.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.

- B. Subgrade Verification: Verify that subgrade is properly compacted and installed at correct elevations.
- C. Notification of Unsuitable Conditions: Before proceeding with Work, notify Owner and Owner's representative in writing of unsuitable conditions.

3.2 PREPARATION

- A. Protection:
 - 1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
 - 2. Provide barricades, fences or other barriers to protect existing conditions to remain from damage during construction.
 - 3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
 - 4. Submit written notification of damaged plants and structures to Owner and Owner's representative.
- B. Surface Preparation: Remove water and other materials which could be absorbed by concrete from substrate or base.

3.3 EARTHWORK

- A. For Earthwork, see Division 31.

3.4 FORMWORK

- A. General:
 - 1. Meet applicable requirements of ACI 303R.
 - 2. Meet applicable requirements of ACI 304R, except as modified by ACI 303R.
 - 3. Construct forms accurately to dimensions, plumb and true to line and grade.
 - 4. Use forms that are strong, mortar tight, braced and tied so as to maintain position and shape during placing of reinforcing and concrete.
 - 5. Wavy surfaces and bulged walls or slab surfaces resulting from settlement or springing of formwork will be rejected.
 - 6. Carefully verify and check forms for alignment and level as the Work proceeds.
 - 7. Make needed adjustments or add additional bracing prior to pouring concrete.
- B. Form Materials at Exposed Surfaces:
 - 1. Smooth metal or MDO or HDO composite overlaid plywood for smooth finish, assembled with Class A formed finish for minimal surface deviation.
 - 2. Boards shall be sealed to avoid lignin-induced retardations of set of the surface fines, and resulting dusting.
- C. Reveals: Reveals shall be formed with sealed synthetic materials or milled wood.
- D. Tolerances:

1. Concrete Paving (Vehicular, Pedestrian and Topping Slab) to meet Class A tolerances. Slope of concrete to be constant with no depressions. True plane within 1/8" in ten feet as determined by a 10-foot straightedge placed anywhere on the slab in any direction.
 2. Concrete Planter Walls, Concrete Biotreatment Walls and Concrete Walls to meet Class B tolerances. Vertical and horizontal surfaces true plane within 1/4" in ten feet as determined by a 10-foot straightedge placed anywhere on the slab in any direction.
- E. Joints:
1. Construct forms and assemble them in such a manner so that joints occur at accepted locations.
 2. Provide a means to seal forms at joints such as foam tape, caulking or other gasket devices to avoid fines leaking out and rock pockets.
- F. Corners:
1. Form intersecting planes to provide true, clean-cut corners, with edge grain of plywood not exposed to face of concrete.
 2. Form exposed corners to produce square smooth, solid unbroken lines, unless indicated otherwise.
- G. Coordination of Trades: After forms have been placed notify other trades in sufficient time to complete installation of their Work.
- H. Other Trade Requirements:
1. Construct chases, slots and recesses as required.
 2. Consult other trades for definite locations, sizes and shapes.
 3. Locate inserts, anchor plates and other items to be embedded in concrete where required, properly place and securely anchor.
- I. Recesses and Openings: Provide as shown on the Drawings.
- J. Prior to Pouring Concrete:
1. Thoroughly clean out forms to be used.
 2. Thoroughly wet wood forms where form coatings are not used.
- K. Placement:
1. Allow zero drop to minimize entrapped air and eventual surface defects.
 2. Placement can use a tremie tube.
 3. Vibration shall be carefully done.
- L. Form Ties:
1. Ties shall be laid out in a regular pattern and per accepted Shop Drawings.
 2. Tie holes shall be partially patched per accepted Field Sample.
- M. Form Member Sealing:
1. After form boards have been placed in final form position, seal forming members and corner/reveal members.
 2. Apply in two coats, wet-on-wet, and according to manufacturer's current directions.
- N. Removal of Forms:
1. Do not remove supporting forms or shoring until concrete has sufficient strength to carry its own weight and other loads upon it.

2. Remove forms only after concrete has properly set and without damaging concrete.

O. Re-use of Forms:

1. Do not reuse if there is any evidence of surface wear or tear which would impair quality of finishes.
2. Store formwork and form materials in such a manner as to prevent damage or distortion.
3. Clean forms after each use, and coat with form release agent as often as required to ensure separation from concrete without damage to concrete finish.

3.5 REINFORCEMENT

- A. Fabrication and Placement: Meet applicable requirements of CRSI-MSP-1, ACI 318, ACI 303R and ACI 304R.
- B. Coordination with Other Trades: Coordinate other trades' schedules to avoid disturbing or moving Work already installed by one trade to admit the Work of another.
- C. Supports:
1. Accurately and securely fasten or support reinforcements to prevent displacement before or during pouring.
 2. Hang footing bars from forms.
 3. Support wire mesh with metal cradles.
- D. Reinforcement Splices:
1. Overlap welded wire fabric one mesh minimum.
 2. Overlap reinforcing bar 24 times the bar diameter minimum, except as otherwise noted.
- E. Dowel Epoxy: Meet requirements of manufacturer's current printed instructions.

3.6 CONCRETE PLACEMENT

- A. Other Requirements: Meet applicable requirements of ACI 303R and ACI 304R, except as modified below.
- B. Hot Weather Placement: Meet requirements of ACI 305R.
- C. Cold Weather Placement: Meet requirements of ACI 306R.

3.7 FINISHES

- A. Floated Finish:
1. After the concrete has been placed, consolidated, struck off, and leveled, do not work the concrete further until ready for floating.
 2. Begin floating when the water sheen has disappeared and when the surface has stiffened sufficiently to permit the operation.
 3. During or after the first floating, check the planeness of the surface with a ten foot straightedge applied at not less than two different angles.
 4. Cut down high spots and fill low spots, and produce a surface with a Class B tolerance throughout.

5. Re-float the slab immediately to a uniform sandy texture.

B. Steel Troweled Finish:

1. Prior to steel float troweling, provide a preliminary floated finish.
2. Trowel initial surface relatively free from defects, with some trowel marks visible.
3. Thoroughly consolidate surface by a second troweling with steel trowel.
4. Provide a finished surface essentially free from trowel marks, uniform in texture and appearance, and in a plane of Class A tolerance for horizontal surfaces and Class B for vertical surfaces.
5. See Top Cast finish for further finishing requirements.

C. Top Cast Finish:

1. Prior to top cast, provide a troweled finish on horizontal and vertical surfaces for all exposed Concrete Paving and Concrete Wall surfaces. For vertical surfaces construct formboards with seam 2" minimum below finish grade to allow for removal vertical formboards to allow for trowel face-finishing of vertical surfaces prior to application of Top Cast Finish, per timing requirements of manufacturer's printed instructions.
2. Apply Top Cast surface retarder per manufacturer's instructions, using same application rates, time of application post troweling, duration and crew as accepted field sample, using similar removal methods and same crew.
3. Remove Top Cast surface retarder per manufacturer's printed instructions, using the same duration, removal methods and crew as accepted field sample.
4. Perform Top Cast surface retarder in as continuous an operation as possible, utilizing the same work crew to provide a finish matching the accepted field sample.
5. Surface shall match the accepted field sample and be slip-resistant in compliance with ADA requirements.

3.8 SKATEBOARD DETERRENTS

- A. Install at locations shown on the Drawings, shall be level and installed per manufacturer's current printed instructions.

3.9 CONTROL JOINTS

- A. Type and Location: As detailed on the Drawings.
- B. Saw-cut joints: Saw-cut grooves so that a smooth uniform impression is obtained.
- C. Tooled joints: Form in fresh concrete using a jointer to cut the groove so that a smooth uniform impression is obtained.

3.10 EXPANSION JOINTS

- A. Locations and Widths: Provide joint material as shown on the Drawings, and where concrete paving abuts walls, curbs, or other structures.
- B. Installation:
1. Place joint materials with top edge below the paved surface as shown on the Drawings.
 2. Secure in place to prevent movement.

3. Install a rigid joint cap over the top of the fill material if required to keep top of fill material straight.
4. Apply Expansion Joint Sealant per manufacturer's instructions and to match accepted field sample.

3.11 CURING

- A. Other Requirements:
 1. Meet requirements of the ACI 303R except as modified by requirements below.
 2. Meet requirements of ACI 308, except as modified by ACI 303R and requirements below.
- B. Colored Concrete: Do not use curing compounds.
- C. Hot Weather Curing: Meet requirements of ACI 305R.
- D. Cold Weather Curing: Meet requirements of ACI 306R.

3.12 PATCHING

- A. Projections: Remove projecting fins, bolts, wire, nails, etc., not necessary for the Work, or cut them back 1 inch from the surface and patch in an inconspicuous manner.
- B. Voids:
 1. Fill holes with an accepted patching material the same color as the adjoining concrete.
 2. Mix and place patching material and finish flush with the adjacent surface.
- C. Corrective Patching:
 1. Correct defects in concrete Work.
 2. Chip voids to a depth of at least 1 inch with the edges perpendicular to the surface and parallel to form markings
 3. Fill voids, surface irregularities, or honey-combing by patching or rubbing.
 4. Insure that concrete surfaces so repaired duplicate the appearance of the unpatched Work.
- D. Defective Work: Remove in its entirety and replace defective concrete Work which after corrective patching fails to duplicate the appearance of un-patched Work as determined by the Owner's representative and fails to meet the requirements of these Specifications.

3.13 FIELD QUALITY CONTROL

- A. Test Cylinders:
 1. Provide minimum three 6-inch by 12-inch cylinders for each 150 cubic feet or 5,000 square feet of pour.
 2. Test 1 cylinder at 7 days, test second cylinder at 28 days, and test third cylinder only if needed for confirmation of compressive strength.
 3. Submit test results to Civil Engineer and Owner's representative.
- B. Field Observation Reviews by Owner's representative: Coordinate and schedule with Owner's representative.

3.14 CLEANING AND SEALING

A. Concrete Work:

1. The day prior to final review, remove stains, dirt and other materials using water and mild detergents.
2. Do not use other methods of cleaning unless accepted by the Owner's representative.
3. See Site Concrete Water Repellents 07 09 21.

3.15 PROTECTION

- A. Concrete Work: Protect Work against damage and defacement during subsequent construction operations until Final Completion by installing fencing, barriers and protective coverings.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 321373
SITE CONCRETE SEALANTS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Expansion Joint Sealant.
- B. For Site Concrete, see Section 321316.
- C. For Site Concrete Water Repellents, see Section 070921.
- D. For Precast Concrete Specialties, see Section 034800.

1.2 DEFINITIONS

- A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of District’s representative in writing.

1.3 REFERENCES

- A. ASTM — American Society for Testing and Materials:
 - 1. C 920 — Specification of Elastomeric Joint Sealants. Most current edition.
 - 2. C 1193 — Guide for Use of Joint Sealants. Most current edition.

1.4 SUBMITTALS

- A. Product Data:
 - 1. Sealant.
 - 2. Bond Breaker.
 - 3. Joint Primers.
 - 4. Backup Material.
- B. Samples:
 - 1. Sealant Colors.
 - 2. Bond Breaker.
- C. Manufacturer’s Instructions:
 - 1. Sealant manufacturer’s current printed installation instructions.

1.5 QUALITY ASSURANCE

- A. Contractor Qualifications: Use adequate numbers of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

1.6 WARRANTY

- A. General Description: In addition to manufacturer's warranties, warrant Work for a period of one year from Date of Final Completion against defects in materials and workmanship.
- B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship.
- C. Exceptions: Contractor shall not be held responsible for failures due to neglect by District, vandalism and other causes outside the Contractor's control.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Expansion Joint Sealant:
 - 1. Pecora Corporation – <http://www.pecora.com>.
 - 2. Or accepted equal.

2.2 MATERIALS

- B. Expansion Joint Sealant:
 - 1. 890FTS-TXTR
 - 2. Color: To be selected in Field with Field Sample
- C. Joint Primers: Use only those primers which have been tested for durability on the surfaces to be sealed and are specifically recommended for this installation by the manufacturer of the sealant used.
- D. Backup Materials: Use only those backup materials which are non-absorbent, non-staining, and specifically recommended for this installation by the manufacturer of the sealant used.
- E. Masking Tape: For masking around joints, provide an appropriate masking tape which will effectively prevent application of sealant on surfaces not scheduled to receive it, and which is removable without damage to substrate.
- F. Bond Breakers: Use only those bond breakers which are specifically recommended by the sealant manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.
- B. Joint Size Verification: Verify that the required proportion of width of joint to depth of joint has been provided.
- C. Notification of Unsuitable Conditions: Before proceeding with Work, notify District and District's representative in writing of unsuitable conditions.

3.2 PREPARATION

- A. Protection:
 - 1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the work.
 - 2. Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.
 - 3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
 - 4. Submit written notification of conditions damaged during construction to the District and District's representative immediately.

- B. Preparation of Concrete Surfaces:
 - 1. Clean surfaces to be dry, sound, and free from dust, concrete residue and other materials which could weaken bond or conflict with sealant width and depth.
 - 2. At open joints, remove dust by mechanically blown compressed air if required.
 - 3. Remove oil and grease, use sandblasting or wire brushing.
 - 4. Where surfaces have been treated, remove the surface treatment by sandblasting or wire brushing.

3.3 INSTALLATION

- A. Priming:
 - 1. Meet requirements of the manufacturer's current printed instructions.
 - 2. Meet requirements of ASTM C 1193, except where in conflict with manufacturer's instructions.

- B. Bond-Breaker Installation:
 - 1. Meet requirements of the manufacturer's current printed instructions.
 - 2. Provide bond-breaker where recommended by the manufacturer of the sealant, and where indicated by the Drawings.

- C. Backup Installation:
 - 1. Install back-up material where shown on the Drawings.
 - 2. Use a blunt-surfaced tool of wood or plastic, having shoulders designed to ride on the adjacent finished surface and a protrusion of the required dimensions to assure uniform depth of backup material below the sealant.
 - 3. Do not use a screwdriver or similar sharp-ended tool to install backup material.
 - 4. Using the blunt surfaced tool, smoothly and uniformly place the backup material to the depth required by the sealant manufacturer's current printed instructions, compressing the backup material no more than 25 percent and securing a positive fit.
 - 5. When using backup of tube or rod stock, avoid lengthwise stretching of the material.
 - 6. Do not twist or braid hose or rod backup stock.

- D. Masking: Thoroughly and completely mask joints on exposed surfaces.

- E. Equipment:
 - 1. Apply sealant under pressure with power-actuated hand gun or manually-operated hand gun, or by other appropriate means.

2. Use guns with nozzle of proper size, and providing sufficient pressure to completely fill the joints as designed.

F. Sealant Thickness: Meet requirements of the manufacturer's current printed instructions.

G. Tooling Sealant:

1. Tool sealant to insure complete filling of the joint to eliminate air pockets and voids and to insure positive adhesive of the sealant with the bonding surfaces.
2. Tool joints to the profile shown on the Drawings or if such profiles are not shown on the Drawings provide uniformly smooth joints with slightly concave surface.
3. Do not use tooling agent unless specifically recommended in writing by the manufacturer of the sealant.

3.4 FIELD QUALITY CONTROL

A. Field Observation Reviews by District's representative: Coordinate and schedule with District's representative.

3.5 CLEANING

A. Sealant Residue: Before it hardens, clean sealant from adjacent surfaces as the installation progresses, using solvent or cleaning agent recommended by the manufacturer of the sealant used.

END OF SECTION

SECTION 321413
INTERLOCKING CONCRETE PAVER

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Specifications and procedure for furnishing and installing interlocking concrete paver system,
- B. System shall consist of precast concrete Narrow Modular Paving Units, (NMP), with Portland cement mortar-set as indicated in plans.
- C. Related Sections:
 - 1. 321123 Aggregate Base
 - 2. 32 16 13 Concrete Curbs, Gutters, and Sidewalks

1.2 REFERENCES

- A. American Society for Testing and Materials (ASTM)
 - ASTM C33 Concrete Aggregates
 - ASTM C39 Concrete Compressive Strength
 - ASTM C144 Aggregate for Masonry Mortar
 - ASTM C150 Portland cement
 - ASTM C595 Standard Specification for Blended Hydraulic Cements
 - ASTM C642 Water Absorption, Density, Voids in Hardened Conc
 - ASTM C666 Rapid Freeze/Thaw Resistance of Conc
 - ASTM C979 Pigments for Integrally Colored Concrete
 - ASTM C1028 Coefficient of Friction

1.3 SUBMITTALS

- A. Samples: Submit two full-sized samples of each type of precast concrete paving units to show the full range of color and texture of unit for selection and approval. If sealer is to be applied to precast concrete paving slab, apply sealer on one sample.
- B. Warranty: Provide certified copies of manufacturer's product warranties.
- C. Shop drawings: Layout drawings showing pattern of pavers for each paved area, indicate pavers requiring cutting, indicate setting bed methods in each area and indicate details at vertical surfaces.

1.4 QUALITY ASSURANCE

- A. Compliance with Regulations: Comply with requirements of state and local building codes and with rules and regulations relating to building accessibility.
- B. Qualifications of Manufacturer: Company specializing in manufacture of precast concrete paving units with a minimum of 10 continuous years of documented experience.
- C. Qualifications of Subcontractor: Subcontractor shall submit evidence of skill and not less than 5 years of experience in this product type.
- D. Pre-installation Conference: As directed by the Architect
- E. Precast concrete paving units shall have a compressive strength of 5,000 psi minimum.

PART 2 - PRODUCTS

2.1 PAVER UNIT

Stepstone, Inc., 17025 South Main Street, Gardena, CA 90248, (310) 327-7474, (800) 572-9029, www.stepstoneinc.com or approved equivalent.

- A. Precast concrete paving units shall be Narrow Modular Pavers, (NMP), precast concrete, consisting of Portland cement, aggregate, and color admixtures.
 - 1. Portland Cement: ASTM C 150, Type III, high early strength.
 - 2. Aggregate: ASTM C 33.
 - 3. Color Admixture: By Davis Colors, or equal, as required to achieve color as selected.
 - 4. Aggregate for exposed aggregate surface: As selected.
 - 5. Portland Cement Mortar that meets or exceeds ANSI A118.4 requirements when mixed with water or a latex admixture, and is designed for installation of large format tile – Pedestrian and vehicular Installation.
 - 6. Grout that meets or exceeds ANSI A118.7 when mixed with water or a latex admixture.

- B. Precast concrete paving unit style:

Narrow Modular Pavers – 4" thick (5-7/8" x 11-7/8" x 4"). Compressive strength: Minimum 5,000 psi. Integrated spacer tabs allow Narrow modular pavers to be placed together and maintain even spacing throughout the installation. Minor adjustments may be necessary to maintain consistent joint lines. Narrow Modular Paver: 4 inches thick: 44 pounds per square foot. Water absorption: Not more than 6.0 % average, not more than 7.0 % for any individual unit for standard colors. Pavers shall have radius top edge to reduce chipping. All pavers have drafted sides

- C. Color and Finish

Colors: 1404 French Gray

All finishes shall be Light Sandblasted. Walking surfaces of precast concrete paving units shall have minimum coefficient of friction of 0.60, wet and dry.

2.2 FABRICATION

- A. Narrow Modular Pavers shall be hand-made, wet-cast of cement conforming to ASTM C 150, Type III, aggregates conforming to ASTM C 33, and pigments for integrally colored concrete conforming to ASTM C979.

2.3 SOURCE QUALITY CONTROL

- A. Concrete for Narrow Modular Pavers shall be tested frequently to assure that mixes provide units having not less than 5,000 psi compressive strength at 28 days (average test strength not less than 4,500 psi).
- B. Minor chips, hairline cracks, air voids and slight variations in color and finish are normal in precast concrete. When viewed in typical daylight illumination from a distance of 20 feet, minor chips, hairline cracks and air voids that cannot be seen with the naked eye are not grounds for rejection.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine all surfaces.
- B. Verify all dimensions of in-place and subsequent construction.
- C. Notify the Contractor in writing of conditions detrimental to the proper and timely completion

- of the work.
- D. Do not proceed with the work until unsatisfactory conditions have been corrected.
 - E. Installation of precast concrete pavers and associated construction constitutes acceptance of the adjacent and underlying construction.

3.2 INSTALLATION - GENERAL

- A. Installation shall comply with requirements of applicable building codes and state and local jurisdictions.
- B. Install Narrow Modular Pavers in a mortar bed in accordance with the manufacturer's recommendations.
- C. Clean any mortar off the face of the pavers immediately. Never leave a 'cement haze' on the concrete paver's surface.
- D. Follow expansion and control joint materials manufacturer's instructions.
- E. Typical joints between the pavers at the top of paving surface shall be roughly 3/16" to 1/4" wide.
- F. Fill joints completely with polymeric joint sand designed for use over an impervious base, such as a concrete slab. Follow polymeric joint sand manufacturer recommendations for installation of joint sand. Note: do not allow polymeric sand residue to stain/discolor the surface of the paver.
- G. After sand is compacted seal sand with sealer appropriate for joint sand and concrete pavers. Follow sealer manufacturer recommendations for installation of sealer.

3.3 CLEANING:

- A. Clean exposed surfaces of precast concrete paving units. Use cleaners appropriate for precast concrete finishes and colors. Acid based cleaners will permanently alter finish and color.

3.4 COMPLETION

- A. Protect precast concrete paving units from damage due to subsequent building operations.
- B. After installation and before completion, inspect precast concrete paving units for construction damage and obtain new precast concrete paving units if required.
- C. Immediately prior to final acceptance of project, clean precast concrete paving units.

END OF SECTION

This Page Intentionally Left Blank

SECTION 321613
CONCRETE CURB, GUTTERS, RAMPS AND WALKWAYS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Coordination with the City of Oakland to obtain the necessary Encroachment Permit for all work within the City right-of-way and providing concrete curbs, gutters, and sidewalk per City of Oakland standard drawing S-1, as modified in the plans, and as specified herein.

Provide concrete driveway approach and curb ramp as indicated in the plans and as specified herein.

1.2 REFERENCE SPECIFICATIONS

- A. Wherever the words "Standard Specifications" are referred to, the reference is to the State of California, Department of Transportation, Standard Specifications, latest edition.

1.3 SUBMITTALS

- A. Submit certificate of compliance indicating that the concrete complies with the specifications as Product Information submittals.

PART 2 - PRODUCTS

2.1 CONCRETE

- A. Comply with the Standards Specifications, Paragraph 73-1.01.
 - 1. Cement: Type II Modified.
 - 2. Provide air-entrainment of three percent with admixture conforming to ASTM C260.
 - 3. Nominal size of large aggregate shall be 1".
 - 4. Minimum strength of concrete shall be 4000 psi.
 - 5. Lampblack shall be added to the concrete mix in the amount not less than one pound or more than two pounds of best quality lampblack to each cub yard of concrete.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with the Standard Specifications, Section 73, Paragraph 1.03 Construction, inclusive, except as modified in the plans and herein.
- B. Contractor shall coordinate with the City of Oakland to obtain the necessary Encroachment Permit for all work within the City right-of-way.
- C. Unless shown otherwise on the Drawings, replace existing curbs and sidewalks in kind within the City of Oakland right-of-way.
- D. Adjust structures such as valve boxes, manhole frames and covers, and electrical vaults to grade after the curb and gutter or sidewalk has been constructed for a reasonable distance on all sides of the structure. Complete the concrete work after the structure is adjusted.
- E. New concrete sidewalk within the City of Oakland right-of-way shall be colored with approximately 1-1/2 pounds of lamp black per cubic yard to match existing concrete sidewalk.
- F. When installing concrete curbs, gutters, and sidewalks within the City of Oakland right-of-way the Contractor shall provide continuous access and concrete protection by whatever

means necessary for the concrete until it dries. The Contractor shall replace any new concrete that is marked with graffiti before it dries at no additional cost to the Owner.

- G. Control and expansion/construction joints shall be located and installed as indicated in the plans.
- H. Concrete finish shall be as indicated in the landscape plans.

END OF SECTION

SECTION 323000
SITE FURNISHINGS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Combo Waste and Recycling Receptacle
 - 2. Bicycle Rack
 - 3. Removable Bollard
 - 4. Tree Grate
 - 5. Bike Locker
 - 6. Skate Deterrents
 - 7. Fabrication of Site Furnishings.
 - 8. Placement of Site Furnishings.

- B. For Precast Concrete Specialties, see Section 03 48 00.

- C. For Site Concrete, see 32 13 16.

1.2 DEFINITIONS

- A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of Owner’s representative in writing.

1.3 REFERENCES

1.4 SUBMITTALS

- A. Product Data:
 - 1. Bike Rack: Manufacturer spec sheet, to include dimensions, finish and color, installation instructions
 - 2. Bike Locker: Manufacturer spec sheet, finish and color, installation instructions
 - 3. Trash Receptacle: Manufacturer spec sheet, finish and color, installation instructions
 - 4. Waste Receptacle: Manufacturer spec sheet, finish and color, installation instructions
 - 5. Bollard: Manufacturer spec sheet, finish and color, installation instructions
 - 6. Skate Deterrents: Manufacturer spec sheet, finish, installation instructions
 - 7. Tree Grate: Manufacturer spec sheet, finish, installation instructions
 - 8. Tree Grate Frame: Manufacturer spec sheet, finish, installation instructions
- B. Samples:
 - 1. Combo Trash and Recycling Receptacle: 4-inch segment of finish
 - 2. Bicycle Rack: 4-inch segment of finish
 - 3. Removable Bollard: 4-inch segment of finish
 - 4. Tree Grate: 12-inch segment of grate and attachment.
 - 5. Bike Locker: 4-inch sample of finish
- C. Shop Drawings:
 - 1. Provide shop drawings for Tree Grate and Tree Grate Frame. Show shop and erection details, to scale, including dimensions, sizes, thicknesses, gauges, finishes, joining, segments, joints, attachments, holes, welds, bolts, elevations and relationship of work to adjoining construction. Prepare details at not less than 3 inches = 1 foot.
 - 2. Where items must fit and coordinate with finished surfaces and/or constructed spaces, take measurements at site and not from the Drawings.
 - 3. Indicate welded connections using AWS A2.0 welding symbols.
- D. Manufacturer's Current Printed Instructions:
 - 1. Furniture Manufacturer's Cleaning Instructions.

1.5 QUALITY ASSURANCE:

- A. Fabricator Qualifications:
 - 1. Established international reputation having work similar to that specified, in use for a minimum of 10 years.
 - 2. Shop shall have proper equipment for Work specified, including application of finish.

3. Fabricators and finishers shall be recognized experts in the Work they are engaged to perform.
- B. Regulatory Requirements:
1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over such Work.
 2. Provide for inspections and permits required by federal, state and local authorities in furnishing, transporting, and installing materials.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Loading and Shipment:
1. Carefully pack the units for shipment free from stains and other deleterious material.
 2. Exercise precautions against damage in transit.
- B. Storage:
1. Store units on non-staining wood skids or pallets at least four inches above grade.
 2. Place and stack skids and units to distribute weight evenly and to prevent breakage or cracking.
 3. Protect and store units from weather and soiling with waterproof non-staining covers or enclosure, but allow air to circulate around units.
- C. Handling:
1. Handle units to prevent chipping, breakage, soiling or other damage.
 2. Do not use pinch or wrecking bars without protecting edges of units with wood or other rigid materials.
 3. Lifts with wide-belt type slings wherever possible.
 4. Do not use wire rope or ropes containing tar or other substances which might cause staining.
 5. If required, use wood rollers and provide cushion at end of wood slides.

1.02 WARRANTY

- A. General Description: In addition to manufacturer's warranties, warrant Work for a period of one year from Date of Final Completion against defects in materials and workmanship.
- B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship.
- C. Exceptions: Contractor shall not be held responsible for failures due to normal wear, neglect by Owner, vandalism and other causes outside the Contractor's control.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Combo Waste and Recycling Receptacle:
1. mmcite – www.mmcite.com.
 2. Or accepted equal.
- B. Bicycle Rack:

1. mmcite – www.mmcite.com.
2. Or accepted equal.

C. Bike Locker:

1. Dero – www.dero.com.
2. Or accepted equal.

D. Removable Bollard

1. mmcite – www.mmcite.com.
2. Or accepted equal.

E. Tree Grate

1. Urban Accessories – www.urbanaccessories.com
2. Or accepted equal.

2.2 MANUFACTURED UNITS

A. Combo Waste and Recycling Receptacle:

1. Type: Crystal CS210x – Custom adjoin (2) units
2. Finish: Powder-coated Steel
3. Color: Gray Aluminum RAL 9007
4. Capacity: 15 gallon (per unit)
5. Weight: 96 lb (per unit)
6. Inner Bin: Bent Zinc Coated
7. Label: Symbols for Waste and Recycling per manufacturer's standard graphics
8. Quantity: See Plans

B. Bicycle Rack:

1. Type: Elk110
2. Finish: Powder-coated Steel
3. Color: Gray Aluminum RAL 9007
4. Quantity: 4

C. Bike Locker:

1. Type: Single Locker
2. Finish: Powder-coated Steel
3. Color: Iron Gray
4. Quantity: 2

D. Removable Bollard:

1. Type: Elias SE150
2. Finish: Powder-coated Steel
3. Color: Gray Aluminum RAL 9007
4. Quantity: See plans

E. Tree Grate

1. Type: Jamison

2. Material: Ductile Iron
3. Finish: Rust conditioner
4. Quantity and Size: See Plans

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verification of Conditions: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.
- B. Notification of Unsuitable Conditions: Before proceeding with Work, notify Owner and Owner's representative in writing of unsuitable conditions.

3.2 PREPARATION

- A. Protection:
 1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the Work.
 2. Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.
 3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
 4. Submit written notification of conditions damaged during construction to the Owner and Owner's representative within 2 working days of observed damage and before damage is covered.

3.3 INSTALLATION

- A. General: Install as indicated on Drawings.
 1. Contractor is responsible for all coordination with PG&E staff for stand by in the installation of all site furnishings within the PG&E easement.

3.4 FIELD QUALITY CONTROL

- A. Field Observation Reviews by Owner's representative: Coordinate and schedule with Owner's representative.

3.5 CLEANING

- A. General: Clean and keep clean until Owner accepts maintenance.
- B. Furniture Cleaning Method: Meet requirements of manufacturer's current printed instructions.

3.6 PROTECTION

- A. Furniture Storage: Protect furniture from damage due to construction Work operations and vandalism by storing in secure interior storage room until day of final review.

END OF SECTION

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 328400

IRRIGATION

PART 1 - GENERAL

1.0 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.1 DESCRIPTION OF WORK

- A. Provide all products and execute all labor to achieve installation of the irrigation system complete as indicated by the Drawings and Specifications.

1.2 RELATED WORK IN OTHER SECTIONS

- A. Related Landscape Work:

1. Section 329119, Planting Area Finish Grading
2. Section 329113, Soil Preparation and Soil Mixes
3. Section 329300, Plant Material
4. Section 320100, Landscape Maintenance Period

- B. Other Related Work: Consult all other relevant Specification Sections to determine the extent and character of work specified elsewhere, but related to that included herein.

1.3 REQUIREMENTS OF REGULATORY AGENCIES

- A. Laws, Codes and Regulations: Perform work in accordance with all applicable laws, codes, and regulations required by authorities having jurisdiction over such work.
- B. Inspections and Permits: Provide for all inspections and permits required by federal, state and local authorities in furnishing, transporting and installing materials.
- C. Refer to Section 019100 General Commissioning. Irrigation systems are required to be commissioned by 2019 Calgreen code.

1.4 TRAFFIC CONTROL

- A. It is the responsibility of the contractor to ensure adequate protection and controls for pedestrian and vehicular traffic in the vicinity of the project areas. The contractor shall provide all signs, barricades, flagmen, etc., necessary to meet all traffic requirements for this project at his own expense.

1.5 APPLICABLE STANDARDS

- A. Comply with the current applicable specifications and guidelines of the following:

1. DIV — Division of Industrial Safety.
2. UPC — Uniform Plumbing Code published by the Association of Western Plumbing Officials.
3. ASTM — American Society for Testing and Materials.
4. NSF — National Sanitation Foundation.

1.6 SUBMITTALS

- A. Product data: Prior to delivery to site, submit 5 copies of current manufacturer's specifications and catalog cuts for the complete list of materials and assemblies to be installed.
- B. Final Record Documents: Submit Final Record Documents to the Landscape Architect at Preliminary Review.

1.7 RECORD DOCUMENTS

- A. Progress Record Documents:
 1. Maintain on the construction site at all times a record of all materials and equipment installed each day.
 2. Daily record information neatly to scale, on full-size prints of the irrigation construction documents.
 3. Record information neatly to scale, on full-size prints of the irrigation construction documents.
 4. Information shall include all changes, substitutions, and manufacturer's names and catalogue members for materials and equipment. Show actual locations of all valves and irrigation piping. Show dimensions from easily-identifiable permanent structures such as walls, curbs, fences, buildings or walks.
- B. Final Record Documents:
 1. Transfer all information noted on Progress Record Documents.
 2. After Work completion, transfer information noted on prints. Submit Progress Record Documents to the landscape architect for review of general information content (landscape architect will not be responsible for errors or omissions).
 3. Contractor shall be responsible for accuracy of information and errors or omissions.
 4. If first submittal is not accepted by landscape architect, resubmit until accepted.
 5. Once accepted, submit accepted final Record Documents to Owner

1.8 SERVICE MANUALS

- A. Submittal Procedure: At Preliminary Review, submit five individually bound Service Manuals to the Landscape Architect.
- B. Content:

1. Complete drawings, diagrams and spare parts lists of all equipment installed showing components and catalog numbers together with the manufacturer's name and address.
2. Index sheet indicating the Contractor's name, address and telephone number.
3. Copies of equipment, warranties and certificates.
4. Complete operating and maintenance instructions in sufficient detail to permit operating personnel to understand, operate, and maintain all equipment.

1.9 DEFINITION OF ACCEPTANCE

- A. Wherever the terms "acceptance" or "accepted" are used herein, they mean acceptance of Landscape Architect in writing.

1.10 INTENT OF DRAWING AND SPECIFICATIONS

- A. It is the intent of the Drawings and Specifications to provide a complete operable irrigation system. Any items not specifically shown in the Drawings or called for in the Specifications, but which are normally required to conform with such intent, are to be considered as part of the work.

1.11 SUBSTITUTIONS

- A. Written Acceptance: Specific reference to manufacturer's names and products specified in these sections are used as standards; this implies no right to substitute other materials or methods without written acceptance of the Landscape Architect.
- B. Contractor's Responsibility: Installations of accepted substitution(s) must be made to the satisfaction of Landscape Architect and without additional cost to Owner.

1.12 REVIEW OF SITE

- A. Visit project site and review conditions as they exist prior to submitting bid.

1.13 WORK SCHEDULE

- A. Submit a proposed work schedule to the Landscape Architect for acceptance at least fourteen days prior to start of irrigation work. Submit revised schedule(s) to the Landscape Architect immediately.

1.14 COORDINATION

- A. Coordinate and cooperate with other contractors to enable the work to proceed as rapidly and efficiently as possible in a workmanlike manner.

1.15 PROTECTION OF EXISTING CONDITIONS

- A. General: The Contractor shall use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the work.
- B. Barriers: Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.
- C. Operations: Do not store materials or equipment, permit burning, or operate or park equipment under the drip line of existing plants to remain.

- D. Notification of Damages: Submit written notification of all conditions damaged during construction to the Owner and Landscape Architect immediately.
- E. Determination of Damage: Landscape Architect will determine the extent of damage and value of damaged plant material.
- F. Replacement of existing plant material: Replace existing plants to remain which are damaged during construction with plants of the same species and size as those damaged at no cost to the Owner.
- G. Replacement of Existing Irrigation System: Immediately repair damage to existing systems. After making repairs remove all heads in repaired circuit(s) and flush lines clear of all dirt and foreign matter. After cleaning lines replace heads and return system to operating status.

1.16 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Labeling: Furnish standard products in unopened manufacturer's standard containers bearing original labels showing quantity, analysis and name of manufacturer.
- B. Storage: Store products with protection from weather or other conditions which would damage or impair the effectiveness of the product. Protect PVC pipes and fittings from direct sunlight. Beds on which pipe is stored must be full length of pipe.

1.17 ANALYSIS OF SAMPLES AND TESTS

- A. Analyses: Samples of materials may be taken and analyzed for conformity to specification at any time. The Contractor shall furnish samples as requested.
- B. Rejected Materials: Contractor shall remove rejected materials immediately from the site.
- C. Cost of Testing: The Contractor shall pay cost of testing of materials not meeting specifications.

1.18 HYDROSTATIC TESTING REVIEW

- A. Time of Review: The Landscape Architect will review the completed irrigation work during the hydrostatic testing prior to the backfilling of the trenches.
- B. Notification of Review: Notify the Landscape Architect and Owner's Representative at least 72 hours prior to the anticipated review.

1.19 PRELIMINARY ACCEPTANCE, FINAL ACCEPTANCE AND COMMENCEMENT OF THE MAINTENANCE PERIOD

- A. See Section 320100, Landscape Maintenance Period.

1.20 WARRANTY

- A. In addition to manufacturer's guarantees or warranties, work shall be warranted for 1 year from the date of Final Acceptance against defects in material, equipment and workmanship. Warranty shall also cover repair of damage to any part of the premises resulting from leaks or other defects in materials, equipment, and workmanship to the satisfaction of the Owner.

1.21 WARRANTY FOR SPRINKLER IRRIGATION SYSTEM

- A. Include the following warranty on contractor's letterhead with service manuals:

1. WE HEREBY WARRANT THAT THE SPRINKLER IRRIGATION SYSTEM WE HAVE FURNISHED AND INSTALLED IS FREE FROM DEFECTS IN MATERIALS AND WORKMANSHIP, AND THE WORK HAS BEEN COMPLETED IN ACCORDANCE WITH THE DRAWINGS AND SPECIFICATIONS. WE AGREE TO REPAIR OR REPLACE ANY DEFECTS IN MATERIAL OR WORKMANSHIP, ANY SETTLING OF BACKFILLED TRENCHES, WHICH MAY DEVELOP DURING THE PERIOD OF ONE YEAR FROM DATE OF ACCEPTANCE AND ALSO TO REPAIR OR REPLACE ANY DAMAGE CAUSED BY ANY DEFECTS IN THE IRRIGATION SYSTEM OR RESULTING FROM THE REPAIRING OR REPLACING OF SUCH DEFECTS AT NO ADDITIONAL COST TO THE OWNER. ORDINARY WEAR AND TEAR, UNUSUAL ABUSE OR NEGLIGENCE ARE EXCEPTED. WE SHALL MAKE SUCH REPAIRS OR REPLACEMENTS, INCLUDING COMPLETE RESTORATION OF ALL DAMAGED PLANTING, PAVING, OR OTHER IMPROVEMENTS OF ANY KIND, WITHIN A REASONABLE TIME, AS DETERMINED BY THE OWNER, AFTER RECEIPT OF WRITTEN NOTICE. IN THE EVENT OF OUR FAILURE TO MAKE SUCH REPAIRS OR REPLACEMENTS WITHIN A REASONABLE TIME AFTER RECEIPT OF WRITTEN NOTICE FROM THE OWNER, WE AUTHORIZE THE OWNER TO PROCEED TO HAVE SAID REPAIRS OR REPLACEMENTS MADE AT OUR EXPENSE AND WE WILL PAY THE COSTS AND CHARGES THEREFORE UPON DEMAND.

PART 2 - PRODUCTS

2.1 PIPE

A. General: All pipe shall be NSF approved.

B. Piping on Pressure Side of Control Valves:

1. ASTM D 1785 polyvinyl chloride (PVC) 1120-1220, Class 315 for 2 inch and larger, Schedule 40 for 1.5 inch and smaller.

- C. Piping on Non-pressure Side of Control Valves:
 - 1. ASTM D 1785 polyvinyl chloride (PVC) 1120-1220, Schedule 40.
 - 2. Subsurface Dripline: As listed on Drawings.

2.2 FITTINGS

- A. Fittings for Pressurized Solvent-Welded Pipe:
 - 1. ASTM D 2466 Schedule 40 PVC as provided by the same manufacturer as the pipe.
 - 2. Connections of Mains to Remote Control and Quick-coupling Valves: ASTM D 2467 Schedule 80 PVC solvent-weld socket fittings.
- B. Fittings for Non-Pressurized Solvent-Welded Pipe:
 - 1. ASTM D 2466 and ASTM D 2467 Schedule 40 and Schedule 80, polyvinyl chloride, standard weight, as manufactured by "Sloane," "Lasco," or equal. Refer to installation details.
 - 2. Threaded PVC Nipples: Schedule 80 PVC.

2.3 NIPPLES

- A. Non-Ferrous: Schedule 40 red brass (85% copper, 15% zinc) with MIPT at both ends; ASTM B43.
- B. Plastic: Schedule 80, Type I, Grade 1 polyvinyl chloride (PVC); threaded both ends; ASTM D1784 and D1785; uniformly grey in color.
- C. Flexible: Factory made and assembled consisting of flexible polyvinyl chloride (PVC) hose fitted at each end with Schedule 40 PVC male adaptors; test rated at 200 psi static.

2.4 SLEEVE FOR CONTROL WIRE AND WATER LINE

- A. PVC 1120-1220, Schedule 40 pipe.

2.5 IRRIGATION CONTROLLER, MASTER CONTROL VALVE, AND FLOW METER

- A. As shown on the Drawings.

2.6 REMOTE CONTROL VALVES

- A. As shown on the Drawings.

2.7 CONTROL WIRE

- A. As shown on the Drawings.
- B. Splicing Materials: DBR/Y-6 as manufactured by 3M or equal.
- C. Sensor cable: As required by Controller Manufacturer.

2.8 VALVE BOXES FOR REMOTE CONTROL VALVES IN PLANTING AREAS

- A. Model No.: 1419B-12B.
- B. Color of Box and Lid: As shown on Drawings.

- C. Manufacturer: Oldcastle Precast, Inc., 1002 15th Street SW, Auburn, WA 98001, (800) 735-5566. Or equal.

2.9 VALVE BOXES FOR QUICK COUPLING VALVES IN PLANTING AREAS

- A. Model No.: 910-12B.
- B. Color of Box and Lid: As shown on Drawings.
- C. Manufacturer: Oldcastle Precast, Inc., 1002 15th Street SW, Auburn, WA 98001, (800) 735-5566. Or equal.

2.10 VALVE BOXES

- A. For Remote Control Valves:
 - 1. Planted Areas: Injection-moulded of Polyesters and fibrous inorganic temperature resistant components. Box shall provide adequate clearance to operate and service valve. Box and lid to be black, as manufactured by "Oldcastle Precast" or equal.

PART 3 - EXECUTION

3.1 LAYOUT

- A. General: During installation, conform as closely as possible to Drawings. Drawings are diagrammatic to the extent that swing joints, offsets and all fittings are not shown.
- B. Coverage: Make any necessary minor adjustments to layout required to achieve full coverage of irrigated areas at no additional cost to Owner.
- C. Stubouts: Where connections to existing stubouts are required, make necessary adjustments should stubouts be located differently than shown on the Drawings.
- D. Piping: Where piping is shown to be under paved areas but running parallel and adjacent to planted area, install piping in planted areas, unless specifically noted to be installed under paved areas. Do not install directly over another line in same trench.
- E. Existing Irrigation System: Adjust new head layout as necessary where it abuts existing irrigation systems.

3.2 TRENCHING

- A. Trench Depths:
 - 1. 18-inch deep over pipe on pressure side of irrigation control valve and control wires.
 - 2. 12-inch deep on non-pressure side of irrigation control valve.
- B. Trench Slopes:
 - 1. Mains: Slope to drain to control valves.
 - 2. Laterals: Slope to or from control valves.

3.3 CONDUITS AND SLEEVES

- A. Conduit: Furnish and install conduit where control wires pass under or through structures or

paving. Conduits to be of adequate size to accommodate retrieval for repair of wiring and shall extend 12 inches beyond edges of walls.

- B. Sleeving: Install sleeves for all pipes passing through or under structures or paving as shown on Drawings. Sleeving to be of adequate size to accommodate retrieval of wiring or piping for repair and shall extend 12 inches beyond edges of paving or other structures.

3.4 PIPE LINE ASSEMBLY

A. General:

1. Install pipes and fittings in accordance with manufacturer's latest printed instructions.
2. Clean all pipes and fitting of dirt, scales and moisture before assembly.
3. Install pipe fittings with at least 2 inches clearance from other pipes or fittings.

B. Solvent-Welded Joints for PVC Pipes:

1. Use solvents and methods specified by pipe manufacturer.
2. Let solvents cure a minimum of 1 hour before applying any external stress on the piping and at least 24 hours before placing the joint under water pressure.

C. Threaded Joints for Swing Joints:

1. Use Teflon tape on threaded PVC fittings for swing joints only.
2. Use strap-type friction wrench only. Do not use metal-jawed wrench.

D. Laying of Pipe:

1. Remove from trench all rocks or clods 1 inch diameter or larger. Bed pipes in at least 2 inches of soil excavated from trench. Backfill on all sides of piping to provide a uniform bearing.
2. Snake pipe from side to side of trench bottom to allow for expansion and contraction. One additional foot per 100 ft. of pipe is the minimum allowance for snaking.
3. Install pipeline warning tape for all supplyline pipes supplied with cistern well water. Install longitudinally on supplyline and secure with duct tape every 5 feet.
4. Do not lay PVC pipe when there is water in the trench.

3.5 IRRIGATION CONTROL VALVES

- A. Valve Locations: Install control valves where shown on Drawings and group together where practical.
- B. Valve Box Locations: Where two or more valves are installed adjacent to each other, provide at least 12 inches separation between valve boxes and align boxes parallel to each other in a row.
- C. Valve Boxes: Install valve boxes over valves to be flush with accepted finish grade.

3.6 AUTOMATIC CONTROLLER

- A. General: Install per local code and manufacturer's latest printed instructions.

- B. Connection to Valves: Connect remote valves to controller in clockwise sequence to correspond with station setting beginning with Stations 1, 2, 3, etc.
- C. Labeling: Affix controller name (i.e., "CONTROLLER A") on inside of controller cabinet door with minimum of 1 inch high permanent letters.
- D. Irrigation Diagram: Affix a non-fading copy of irrigation diagram to cabinet door below controller name. Irrigation diagram to be sealed between two plastic sheets 20 mil. minimum thickness. Irrigation diagram shall be a reduced copy of the Record Drawing, clearly showing all valves operated by the controller, station number, valve size, and type of planting irrigated.
- E. Grounding and Certification: Per Manufacturers specifications and requirements.

3.7 IRRIGATION HEADS

- A. Bubbler Heads: Install all bubbler heads as detailed on the Drawings.

3.8 CONTROL WIRING

- A. Placement: Install control wires in common trenches with sprinkler mains and laterals wherever possible. Lay to the bottom side of pipe line. Provide a minimum of 2 feet of looped slack at valves.
- B. Detection Wire: Install a AWG size #12 or greater wire on top of the PVC supply line for the purpose of possible future mine detection search as the control wires are being installed on the bottom for the PVC supply line with electrical tape every 10 feet.
- C. Splicing: Crimp control wire splices at remote control valves. Seal with specified splicing materials. Line splices will be allowed only on runs of more than 2,500 feet.

3.9 CLOSING OF PIPE AND FLUSHING OF LINES

- A. Capping: Cap or plug all openings as soon as lines have been installed to prevent entrance of materials that would obstruct the pipe. Leave in place until removal is necessary for completion of installation.
- B. Flushing: Thoroughly flush out all water lines before installing heads, valves and other hydrants.
- C. Testing: Test as specified below. Upon completion of testing, complete assembly and adjust sprinkler heads for proper water distribution.

3.10 HYDROSTATIC TESTING

- A. Procedure: Make hydrostatic tests with risers capped when welded PVC joints have cured at least 24 hours. Center load piping with backfill to prevent pipe from moving under pressure. All couplings and fitting shall be exposed. Apply continuous static water pressure of 125 psi as follows:
 1. All Piping on the Pressure Side of Control Valves: Four hour test.
 2. All Piping on the Non-pressure Side of Control Valves: Two hour test.
- B. Leaks and Retest: Repair leaks observed from tests and repeat testing until system passes tests.

3.11 BACKFILLING AND COMPACTING

- A. Backfill Material at Planting Areas:
 - 1. After system is operating and required tests and reviews have been made, backfill excavations and trenches with clean sand and soil, free of debris.
 - 2. Backfill in 6-inch lifts with compaction performed between each lift.
- B. Backfill Material at Unsleeved Pipe Under Paving: Provide all PVC pipe under paving with minimum of 4 inches of sand backfill on all sides and 30 inches cover to bottom of paving.
- C. Backfill Material at Existing Underground Pipes: Use only backfill material which has been screened to eliminate all material larger than 3/8 inches when backfilling adjacent to existing underground pipe lines.
- D. Backfill Compaction:
 - 1. Regardless of the type of pipe covered, compact to minimum 95% density under pavements, and 85% in planted areas.
 - 2. Compact trenches in areas to be planted by thoroughly flooding or jetting.
 - 3. Compact trenches in paved areas in 6-inch lifts.
- E. Finish Grading: Dress off all areas to accepted finish grades. Refer to Section 32 91 19, Planting Area Finish Grading.

3.12 CLEAN-UP

- A. Daily: Keep all areas of work clean, neat and orderly at all times.
- B. Final: Clean up and remove all deleterious materials and debris from the entire work area prior to Final Review.

END OF SECTION

SECTION 329113
SOIL PREPARATION AND SOIL MIXES

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Subsoil Ripping of Planting Areas.
 - 2. Amendment of On-Grade Planting Area Soil.
 - 3. Mixing and Placement of Plant Pit Backfill Soil Mix.
 - 4. Mixing and Placement of Soil Mixes.
- B. For Earthwork, see Division 31.
- C. For Landscape Maintenance Period, see Section 320100.
- D. For Irrigation, see Section 328400.
- E. For Planting Area Finish Grading, see Section 329119.
- F. For Plant Material, see Section 329300.

1.2 DEFINITIONS

- A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of Owner’s representative in writing.

1.3 ALLOWANCE

- A. Allowance for Backfill Mixes and Soil Amendment Programs:
 - 1. Provide cash allowance based on materials specified assuming new materials are purchased and installed.
- B. Prior to purchase of materials, after final backfill mixes and amendment programs have been accepted by Owner’s representative, submit complete documentation of labor, materials and equipment comparing allowance with proposed installed costs of final mixes and amendment program.
- C. Credit unused monies to Owner.

1.5 SUBMITTAL

- A. Product Data:
1. Chemical Additives.
 2. Sand.
 3. Organic Compost.
 4. Peat Moss.
 5. Perlite.
 6. Fertilizers.
 7. Water Storing Polymer.
 8. Planter Pot Soil.
 9. Aggregate for Structural Soil Mix.
- B. Test Reports:
1. Provide a “Complete Standard Analysis” of site soils, imported soils, and organic compost indicating the following:
 - a. pH measurement in the Saturation Extract, Electrical Conductivity of the saturation extract and Sodium Adsorption Ratio of the saturation extract. Utilize the following procedures utilizing the Methods of the United States Salinity Laboratory as published in the Agricultural Handbook Number 60 entitled “Diagnosis and Improvement of Saline and Alkali Soils”:
 - (a) pH Method 21
 - (b) Saturation Extract Method 2
 - (c) Sodium Adsorption Ratio Method 20b

- (d) As determined by ammonium bicarbonate-DTPA: Methods of Soil Analysis, Part 1, Physical and Mineralogical Methods, Soil Science Society of America, Inc., 1986, identify the following nutrients and elements:
 - (e) Boron, calcium, copper, iron, magnesium, manganese, molybdenum, phosphorous, potassium, sodium, sulfur, and zinc.
 - (f) Analyze the saturation extract for calcium, magnesium, sodium, boron, chloride, phosphorus, nitrate and sulfate.
- b. Measure the following trace metals by the ammonium bicarbonate-DTPA extract: Methods of Soil Analysis, Part 1, Physical and Mineralogical Methods, Soil Science Society of America, Inc., 1986.
 - (a) Aluminum, arsenic, cadmium, chromium, cobalt, lithium nickel, selenium, silver, strontium, tin and vanadium.
 - c. Determine the presence of calcium carbonate and/or magnesium carbonate.
 - d. As determined by Methods of Soil Analysis, Part 3 Chemical Methods, Soil Science Society of America, Inc., 1996, identify Soil Texture (gravel, sand, silt and clay) and percent gravel.
 - e. As determined by Methods of Soil Analysis, Part 3 Chemical Methods, Soil Science Society of America, Inc., 1996, identify organic matter content by the measurement of organic carbon. The quality of organic matter shall be determined by measuring organic carbon and total nitrogen.
 - f. As determined by Method 34b of Agricultural Handbook Number 60, identify Water Infiltration Rate.
 - g. Interpretation of nutritional deficiencies or excesses and potential toxicities shall be given.
 - h. Define import soil source and organic matter locations.
 - (a) Provide copy of the planting plan with each composite sample keyed by number to the area from which the composite samples were taken.
 - i. Soil Test for Parasitic Nematodes (if required).
 - j. Soil Test for Herbicide Contamination (if required).
 - k. Samples shall include location of source material, date of samples, and project name.
 - l. Bulk density and particle size analysis, including the following gradient of mineral content (USDA Designation is size in mm)
 - (a) Gravel – over 2mm
 - (b) Sand – 0.05 – 2mm
 - (c) Silt – 0.002-0.05mm
 - (d) Clay – minus 0.002mm
 - m. Sieve Analysis performed and compared with USDA Soil Classification System. Sieve analysis shall be by a combined hydrometer and wet sieving using sodium hexametaphosphate as a dispersant in accord with particle size analysis, Chapter 15, Methods of Soil Analysis, Part 1, SSSA-ASA, Inc., 1986.
2. Structural Soil Mix Testing: Provide a two-gallon representative sample to Wallace Laboratories for an analysis of the structural soil mix indicating the following:
 - a. Particle size analysis, including the following gradient of mineral content (USDA Designation Size in mm):
 - (a) 3" (76mm)
 - (b) 2 ½" – 3" (63-76mm)
 - (c) 2" – 2 ½" (50-63mm)
 - (d) 1 ½" – 2" (37-50mm)
 - (e) 1" (25-37mm)
 - (f) ¾" (19-25mm)

- (g) Fine gravel – 1/8" – 3/4" (2-19mm)
 - (h) Sand – 0.05 -2mm
 - (i) Silt – 0.002-0.05mm
 - (j) Clay – minus 0.002mm
- b. Provide manufacturer's analysis of the following:
- (a) Loose and rodded unit weight.
 - (b) Bulk specific gravity and absorbance.
 - (c) Gravel dimension and surface texture description.
 - (d) Aggregate soundness and L.A. abrasion.
 - (e) Sample Collection Procedure:
 - (f) Collect a minimum of eight samples to make up the composite sample.
 - (g) Take samples from random locations in the stockpile varying from the top to the bottom and around the stockpile.
 - (h) Take at least half the samples from the lower third of the stockpile into a clean bucket
 - (i) Thoroughly mix material after samples are taken.
 - (j) Remove 2 gallon of material from bucket and fill a zip-lock plastic bag.
 - (k) Double bag the composite sample and label the bag with a permanent marker indicating the material name and date sample was taken.
3. Provide a percent pore space analysis as follows:
- a. $1 \text{ minus } [\text{rock specific gravity unit divided by the bulk specific gravity}] \text{ times}$

1.6 QUALITY ASSURANCE

- A. Requirements of Regulatory Agencies:
- 1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.
 - 2. Provide for inspections and permits required by federal, state and local authorities in furnishing, transporting, and installing materials.
- B. Contractor Qualifications:
- 1. Have successfully installed structural soil mixes similar to the quality specified for a period of not less than 5 years.
 - 2. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

1.7 SITE CONDITIONS

- A. Environmental Requirements:
- 1. Do not work soil when moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in the air or that clods will not break readily.
 - 2. Apply water, if necessary, to bring soil to an optimum moisture content for tilling.
 - 3. Do not work soil when muddy or frozen.
 - 4. Do not apply chemicals if wind conditions will cause hazardous drift to people or property.

- B. Existing Conditions:
 - 1. Prior to Work commencement review locations of existing public underground utilities and structures with appropriate utility companies and clearly mark in field.
 - 2. Prior to Work commencement review location of existing private underground utilities and structures with Owner and clearly mark in field.
 - 3. Prior to Work commencement and after reviewing the Owner's record irrigation documents, review and clearly mark in field heads, valve boxes and other underground equipment, materials and structures.

1.1 PROJECT CONDITIONS

- A. Areas to receive structural soils shall be inspected by Owner's Representative before starting work.
- B. Verify extent of work requirements, including but not limited to potential need for temporary storage and staging of soils, including moving soil stockpiles at site to accommodate other work and the need to protect installed soils from compaction, erosion and contamination.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

- A. Pre-Plant Fertilizer for On-Grade Planting Areas:
 - 1. Gro-Power, Inc. – <http://www.gropower.com>.
 - 2. Or equal.
- B. Other Commercial Fertilizers:
 - 1. Or equal.
- C. Humate:
 - 1. Humate International, Inc. – <http://www.humateintl.com>.
 - 2. Or equal.
- D. Polymer:
 - 1. Complete Green Company – <http://www.bettertopsoils.com>.
 - 2. Or equal.
- E. Soil Testing Agency:
 - 1. Wallace Laboratories – <http://us.wlabs.com>.
 - 2. Or equal.
- F. Geotextile Fabric
 - 1. Carthage Mills – <http://carthagemills.com>.
 - 2. TenCate Nicolon Corporation – <http://www.tencate.com>.
 - 3. Or equal.
- G. Structural Soil Mix:
 - 1. TMT Enterprises – <http://www.tmtenterprises.net>.
 - 2. Or equal.

2.2 MATERIALS

- A. Soil for Backfill Mix: Soil excavated from on-site plant pits.
- B. Organic Compost:
 - 1. Fully composted aerobic compost without presence of decomposition products.
 - 2. Redwood and cedar products are not acceptable.
 - 3. Ash content of not less than 8 percent and no more than 50 percent.
 - 4. pH between 6 and 7.
 - 5. Salt content shall be less than 10 millimho / cm @ 25 degrees (ECe less than 10) in a saturated paste extract.
 - 6. Boron content of saturated extract <1.0 parts per million.
 - 7. Silicon content (acid-insoluble ash) shall be less than 20 percent.
 - 8. Calcium carbonate shall not be present
- C. Peat Moss:
 - 1. Canadian Sphagnum Peat.
 - 2. Or equal.
- D. Potential Chemical Amendments Required by Accepted Amendment Programs and Backfill Mixes:
 - 1. Ground Limestone: Agricultural limestone containing not less than 85 percent of total carbonate, ground to such fineness that 50 percent will pass No. 1 sieve and 90 percent will pass No. 20 sieve
 - 2. Dolomite Lime: Agricultural grade mineral soil conditioner containing 35-percent minimum magnesium carbonate and 49-percent minimum calcium carbonate, 100 percent passing #65 sieve.
 - 3. Gypsum: Agricultural grade product containing 80-percent minimum calcium sulfate.
 - 4. Iron Sulfate (Ferric or Ferrous): Supplied by a commercial fertilizer supplier, containing 20- to 30-percent iron and 35- to 40-percent sulfur.
 - 5. Potassium Sulfate: Agricultural grade (0-0-50).
 - 6. Single Superphosphate: Commercial product (0-20-0).
 - 7. Treble Superphosphate: Commercial product (0-48-0).
 - 8. Ammonium Nitrate: Commercial product (30-0-0).
 - 9. Calcium Nitrate: Agricultural grade containing 15.5-percent nitrogen.
 - 10. Urea Formaldehyde: Granular commercial product containing 38-percent nitrogen.
 - 11. IBDU (Iso Butyldiene Diurea): Commercial product containing 31-percent nitrogen.
 - 12. Soil Sulfur: Agricultural grade sulfur containing a minimum of 96-percent sulfur.
 - 13. Iron Sequestrene: Geigy Iron Sequestrene 330 Fe
 - 14. Silicic Acid Calcium: Commercial grade.
- E. Perlite:
 - 1. Horticultural Perlite, 6.5 to 7.5 pH.
 - 2. Or equal.
- F. Volcanic Rock:

1. Clean, free of materials toxic to plant growth, 60 pounds per cubic foot (961 kilograms per cubic meter) maximum damp weight, size as specified.
 2. Or equal.
- G. Preplant Fertilizer for Trees, Shrubs, Ground Cover and Turf Areas:
1. Gro-Power Plus 5-3-1.
 2. Or equal.
- H. Polymer:
1. Soil drain / PAM.
 2. Or equal.
- I. Imported Loamy Sand for Landscape Fill Soils:
1. General: Soil shall be of uniform quality and free of phytotoxic compounds.
 2. Particle Size Analysis: Less than 80-percent and more than 60-percent sand; less than 40-percent silt; less than 20-percent clay.
 3. pH: Range 5.5 – 7.5.
 4. EC: Less than 2.0 ds/m (USDA Circular No. 982).
 5. SAR: Less than 6.0.
 6. Contaminants: Free of phytotoxic compounds and debris, seeds or rhizomes of noxious weeds, herbicides, pesticides, heavy metals, biological toxins, excesses of fertilizer, component toxic to plants or humans, and less than 2-percent gravel.
 7. Salts: The electrical conductivity of the soil shall not exceed 2.0 decismens per meter as determined by the saturated-soil test method described in USDA Circular No. 982. The sodium absorption ratio shall not exceed 6.0. Boron levels shall not exceed 1.0 ppm.
 8. Boron: Less than 1.0 ppm.
 9. Sodium: Less than 5.0 meq/1.
 10. Chloride: Less than 5.0 meq/1.
- J. Succulent Planting Soil
1. Ultra Soil Cactus and Succulent Blend
 2. Or equal.

2.3 MIXES

- A. Composition of Plant Pit Backfill Mix for Plants at Existing Site Soils for Bidding Only:
1. Content:
 - a. 6 parts by volume existing soil removed from excavated plant pit.
 - b. 4 parts by volume organic compost.
 - c. 2 pounds gypsum per cubic yard of mix.
 - d. 1 pound ureaform (38-0-0) per cubic yard of mix.
 - e. 1 pound humate per cubic yard of mix.
 - f. 1/3 pound of potassium sulfate (0-0-50) per cubic yard of mix.
 - g. ½-pound dry polymer per cubic yard of mix.
 - h. 1/3 pound of single superphosphate (0-20-0) per cubic yard of mix.
 2. Mixing:

- a. Mix materials uniformly in bulk at one area.
 - b. Mix in clean area or machine, free of materials which will contaminate mix.
 - c. Do not mix materials at each pit.
- B. Plant Pit Backfill Mix for Actual Installation: The accepted backfill mix based on the soil fertility test report.
- C. Imported Sand/Peat Soil Mix:
- 1. Content:
 - a. 80% by volume #20 medium sized clean sand.
 - b. 20% by volume medium sized peat similar to sand size, pH 4.0 to 6.5, ECe less than 3 millimho/cm, carbon:nitrogen ratio less than 25, minus 10 mesh, minimum cation exchange capacity is 50 millimoles per 100 grams, minimum 60% organic matter.
 - c. Adjust the ratio of sand and peat to achieve the desired level of soil organic matter.
 - d. 1/3 pound ureaform (38-0-0) per cubic yard of mix.
 - e. 1/2 pound of potassium sulfate (0-0-50) per cubic yard of mix.
 - f. 1/3 pound of triple superphosphate (0-45-0) per cubic yard of mix.
 - g. 1/2 pound of agricultural gypsum
 - h. Ground agricultural limestone (calcium carbonate) – amount as needed to adjust the acidity to achieve a final pH between 6.5 and 7.2
 - 2. Properties: Properties of mix shall be as follows:
 - a. Organic carbon – 2.0 to 3.5% by dry weight
 - b. Ammonium bicarbonate available DTPA nutrients
 - c. Potassium – 125 to 250 parts per million
 - d. Phosphorus – 25 to 40 parts per million
 - e. If the level of micronutrients are low, incorporate compost at 5% by volume and provide 2.5% to 4.0% organic carbon on a dry weight basis.
 - 3. Contaminants: Free of phytotoxic compounds and debris, seeds or rhizomes of noxious weeds, herbicides, pesticides, heavy metals, biological toxins, excesses of fertilizer, component toxic to plants or humans, and less than 2-percent gravel.
 - 4. Mixing:
 - a. Mix materials uniformly in bulk at one area.
 - b. Mix in clean area or machine, free of materials which will contaminate mix.
- Structural Soil Mix**
- 5. Content:
 - a. 4 parts structural soil aggregate.
 - b. 1 part soil, treated with polymer.
 - 6. Mixing:
 - a. Mix polymer (PAM) with soil 48 hours ahead of blending with aggregate to allow for proper bonding.
 - b. Cure polymer treated soil by allowing the soil to partially dry.
 - c. Based upon accepted mix design, blend materials off-site in a clean area using an experienced blending operator.
 - d. Uniformly blend materials so that they are even distributed throughout mixtures.
 - e. Maintain adequate soil moisture content during mixing process.
 - f. Soils and mix components shall easily shred and break down without clumping.
 - g. Soil clods shall easily break down into a medium crumbly texture material.

- h. Do not blend materials that are saturated or contain excessive water.
- i. Measure and monitor amount of soils moisture at mixing site periodically during mixing process.
- j. Protect materials and mixtures from contamination prior to, during, and after mixing operations.
- k. Store mixes in stockpiles prior to shipment to site in clean areas protected from contamination from other materials.
- l. Reblend the mix if the components have separated.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.
- B. Underground Utilities and Structures: Verify that the locations of utilities, structures and other underground items have been clearly marked.
- C. Notification of Unsuitable Conditions: Before proceeding with Work, notify Owner and Owner's representative in writing of unsuitable conditions and conflicts.

3.2 PREPARATION

- A. Protection of Existing Conditions:
 - 1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
 - 2. Provide barricades, fences or other barriers to protect existing conditions to remain from damage during construction
 - 3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
 - 4. Submit written notification of damaged plants and structures to Owner and Owner's representative immediately.
- B. Surface Preparation:
 - 1. Inspect soil surface for sticks, oils, chemicals, plaster, concrete, and other deleterious materials.
 - 2. Do Work required to remove and dispose of the deleterious materials.

3.3 SOIL TESTS TO DETERMINE AMENDMENT PROGRAM

- A. Take two 1-pound composite samples from 2 depths for each 2,500 square feet of planting area to be amended.
- B. Collect small portions of soil from a 4-inch depth and 24-inch depth at 5 evenly scattered locations within each 2,500 square feet of planting area to form the 2 composite samples.

- C. Keep the soil from each depth separate.
- D. For each 2,500 square feet area mix the soil from 4-inch depth to form the 1 composite sample and mix the soil from the 24-inch depth to form the other composite sample.
- E. Number samples and key numbers to a reproducible copy of the planting plan outlining each 2,500 square feet area that each pair of composite samples represent.
- F. Provide samples to Wallace Laboratories for "Complete Standard Analysis" report and amendment recommendations.
- G. At least 30 days prior to backfill mix or amendment Work, submit written "Complete Standard Analysis" report, including amendment recommendations, to Owner's representative for determination of the final backfill mixes and amendment program.

3.4 SOIL TESTS FOR NEMATODES AND HERBICIDE

- A. Parasitic Nematodes:
 - 1. Test soils which have been used for agricultural purposes within the prior 12 months for parasitic nematodes.
 - 2. Soil will be acceptable if the parasitic nematode population is less than 200 per 50 cubic centimeters of soil.
 - 3. Do not artificially dry soil prior to testing.
 - 4. Submit written test report to the Owner and Owner's representative.
- B. Herbicide Contamination:
 - 1. Perform a radish/rye grass growth trial on soils suspected of herbicide contamination.
 - 2. Submit written test report to the Owner's representative.

3.5 AMENDMENT OF TURF AND GROUND COVER SOIL

- A. Ripping of Compacted Areas Outside of Existing Tree Drip Lines: Where soil compaction has occurred, cross-rip to a depth of 12 inches prior to incorporating amendment
- B. Cultivation of Planting Areas Outside of Existing Tree Drip Lines: Rototill planting areas to a depth of 6 inches immediately prior to incorporating amendment.
- C. Cultivation Within Existing Tree Drip Lines:
 - 1. Carefully hand cultivate within the drip lines of existing trees to remain.
 - 2. Do not exceed 2 inches with depth of cultivation.
- D. Application Rates for bidding Purposes Only
 - 1. 6-cubic-yards nitrogen-treated pine bark per 1,000 square feet.
 - 2. 200 pounds pre-plant fertilizer per 1,000 square feet.
 - 3. 10 pounds iron sulfate per 1,000 square feet.

- E. Application Rates for actual Amendment Work: Apply appropriate amendments to the respective soil types at the rates recommended by the accepted amendment program based on the soil fertility test report.
- F. Incorporation of Amendments Outside Existing Tree Drip Lines: Incorporate uniformly within top 6 inches of soil layer with a rototiller, or other accepted method.
- G. Incorporation of Amendments Inside Existing Tree Drip Lines: Incorporate uniformly into upper 2 inches of soil with hand rake or manually operated garden cultivator, or other accepted method.

3.6 BACKFILL MIX INSTALLATION

- A. Scarification:
 - 1. Immediately prior to backfill mix placement, drill 2-inch diameter by 12-inch long holes at 18 inches on center in bottom and side soil surfaces of plant pits, no closer than 12 inches to finish grade.
 - 2. Do not drill through paving, curbs, or other structures or utilities.
- B. Placement: Place mix carefully into pits avoiding damage or contamination of other Work.
- C. Settlement Allowance: Place backfill mix to depth and elevation which allows for settlement.
- D. Mock-Up: Mock-up areas of backfill mix at the specified depths and apply irrigation to induce settlement, if required to help determine the amount of settlement which will be caused by irrigation and rain.

3.7 IMPORT PEAT/SAND SOIL MIX INSTALLATION

- A. Placement: Place mix carefully into pits or planters avoiding damage or contamination of other Work.
- B. Settlement Allowance: Place backfill mix to depth and elevation which allows for settlement.
- C. Mock-Up: Mock-up areas of backfill mix at the specified depths and apply irrigation to induce settlement, if required to help determine the amount of settlement which will be caused by irrigation and rain.

3.8 STRUCTURAL SOIL MIX INSTALLATION

- A. Place mix carefully to avoid damage or displacement of other materials such as paving, drain rock, geotextile fabric and irrigation piping.
- B. Do not mix subgrade soils on construction materials with mix.
- C. Remove soil mix contaminated with subgrade soil, construction materials or debris.
- D. Maintain mix in a moist, but not saturated, condition to prevent segregation of mix during placement.

- E. Install mix in 6 inch lifts in locations indicated on the Drawings.
- F. Compact lifts to 95 percent compaction in compliance with Geotechnical Investigation Report. Schedule the Geotechnical Engineer to perform nuclear density field tests after each lift of mix to confirm compaction.
- G. Install final lift of mix to elevations indicated on the Drawings.

3.9 FIELD QUALITY CONTROL

- A. Quality Control for Imported Loamy Sand Fill:
 - 1. Soil Test to Verify Soil Fertility and Texture:
 - a. Take representative samples from at least 5 locations at the source.
 - b. Provide samples to Wallace Laboratories for "Complete Standard Analysis" report and amendment recommendations.
 - c. At least 30 days prior to delivery, submit written "Complete Standard Analysis" report, including amendment recommendations to Owner's representative for verification of fertility and texture.
- B. Quality Control for Amended Soils and Soil Mixes:
 - 1. Have Wallace Laboratories take samples and perform soil tests to verify conformance of each soil mix composition with the Specifications.
 - 2. Have Wallace Laboratories determine the location(s) of samples to be taken.
 - 3. Have Wallace Laboratories take samples for testing of the first batch mixed and take samples at 25 cubic yard intervals thereafter.
 - 4. Submit for review and acceptance "Complete Standard Analysis" and corrective Work recommendations if required to meet requirements of the Specifications.
 - 5. If corrective Work is recommended by Wallace Laboratories perform the corrective Work before the commencement of backfill mix placement.
 - 6. After the corrective Work is complete, re-test soil mix(es) and submit the analysis and recommendations for acceptance.
 - 7. Perform the corrective Work followed by testing, and submittal of test analysis and recommendations until Wallace Laboratories indicates that the soil mix(es) meets the requirements of the Specifications.
 - 8. When the soil test indicates that the soil mix(es) meets the requirements of the Specifications the Contractor will receive written notification of acceptance from the Owner's representative.
 - 9. Upon receipt of written notification, the Contractor may commence with placement of backfill mix.
- C. Field Observation Reviews by Owner's representative: Coordinate and schedule with Owner's representative.

END OF SECTION

SECTION 329114
BIORETENTION SOILS

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Specifications for furnishing, placing, and compacting bioretention soils as indicated.
- B. Related Sections:
 - 312000 Earthwork
 - 224000 Storm Drainage System

1.2 SUBMITTALS

The contractor shall submit to the Engineer for approval:

- A. A sample of mixed bioretention soil.
- B. Certification from the soil supplier or an accredited laboratory that the Bioretention Soil meets the requirements of this guideline specification.
- C. Grain size analysis results of the fine sand component performed in accordance with ASTM D 422, Standard Test Method for Particle Size Analysis of Soils.
- D. Quality analysis results for compost performed in accordance with Seal of Testing Assurance (STA) standards, as specified in Section 1.4.
- E. Organic content test results of mixed Bioretention Soil. Organic content test shall be performed in accordance with by Testing Methods for the Examination of Compost and Composting (TMECC) 05.07A, "Loss-On-Ignition Organic Matter Method".
- F. A description of the equipment and methods used to mix the sand and compost to produce Bioretention Soil.
- G. Provide the following information about the testing laboratory(ies) name of laboratory(ies) including:
 - 1. Contact person(s)
 - 2. Address(es)
 - 3. Phone contact(s)
 - 4. E-mail address(es)
 - 5. Qualifications of laboratory(ies), and personnel including date of current certification by STA, ASTM, or approved equal

PART 2 - PRODUCTS

2.1 SAND FOR BIORETENTION SOIL

- A. General
 - 1. Sand shall be free of wood, waste, coating such as clay, stone dust, carbonate, etc., or any other deleterious material. All aggregate passing the No. 200 sieve size shall be non-plastic.
- B. Sand for Bioretention Soil Texture.
 - 1. Sand for Bioretention Soils shall be analyzed by an accredited lab using #200, #100, #40, #30, #16, #8, #4, and 3/8 inch sieves (ASTM D 422 or as approved by University), and meet the following gradation:

Sieve Size	Percentage Passing (by weight)	
	<i>Min</i>	<i>Max</i>
3/8 Inch	100	100
No. 4	90	100
No. 8	70	100
No. 16	40	95
No. 30	15	70
No. 40	5	55
No. 100	0	15
No. 200	0	5

Note all sands complying with ASTM C33 for fine aggregate comply with the above gradation requirements.

2.2 TOPSOIL FOR BIORETENTION SOIL

- A. General: Topsoil shall be free of wood, waste, or any other deleterious material.
- B. Topsoil for Bioretention Soil Texture: The overall topsoil texture shall be loamy sand as analyzed by an accredited laboratory. The overall dry weight percentages shall be 60-90% sand, with less than 20% passing than the #200 sieve and less than 5% clay of the total weight with no gravel.

2.3 COMPOSTED MATERIAL

Compost shall be a well decomposed, stable, weed free organic matter source meeting the standards developed by the US Composting Council (USCC). The product shall be certified through the USCC Seal of Testing Assurance (STA) Program (a compost testing and information disclosure program).

- A. Compost Quality Analysis Before delivery of the soil, the Contractor shall submit a copy of lab analysis performed by a laboratory that is enrolled in the US Composting Council's Compost Analysis Proficiency (CAP) program and using approved Test Methods for the Evaluation of Composting and Compost (TMECC). The lab report shall verify:
 1. Feedstock Materials shall be specified and include one or more of the following: landscape/yard trimmings, grass clippings, food scraps, and agricultural crop residues.
 2. Organic Matter Content: 35% - 75% by dry wt.
 3. Carbon and Nitrogen Ratio: C:N < 25:1.
 4. Maturity/Stability: shall have a dark brown color and a soil-like odor. Compost exhibiting a sour or putrid smell, containing recognizable grass or leaves, or is hot (120F) upon delivery or rewetting is not acceptable. In addition, any one of the following is required to indicate stability:
 - a. Oxygen Test < 1.3 O₂ /unit TS /hr
 - b. Specific oxy. Test < 1.5 O₂ / unit BVS
 - c. Respiration test < 8 C / unit VS / day
 - d. Dewar test < 20 Temp. rise (°C)
 - e. Solvita® > 5 Index value
 5. Toxicity: any one of the following measures is sufficient to indicate non-toxicity.
 - a. NH₄- : NO₃-N < 3
 - b. Ammonium < 500 ppm, dry basis
 - c. Seed Germination > 80 % of control
 - d. Plant Trials > 80% of control
 - e. Solvita® > 5 Index value
 6. Nutrient Content: provide analysis detailing nutrient content including N-P-K, Ca, Na, Mg, S, and B.
 - a. Total Nitrogen content 0.9% or above preferred.

- b. Boron: Total shall be <80 ppm; Soluble shall be <2.5 ppm
 - 7. Salinity: Must be reported; < 6.0 mmhos/cm
 - 8. pH shall be between 6.5 and 8. May vary with plant species.
-
- B. Particle size: 95% passing a 1/2" screen.
 - C. Bulk density: shall be between 500 and 1100 dry lbs/cubic yard
 - D. Moisture Content shall be between 30% - 55% of dry solids
 - E. Inerts: compost shall be relatively free of inert ingredients, including glass, plastic and paper, < 1 % by weight or volume
 - F. Weed seed/pathogen destruction: provide proof of process to further reduce pathogens (PFRP). For example, turned windrows must reach min. 55C for 15 days with at least 5 turnings during that period.
 - G. Select Pathogens: Salmonella <3 MPN/4grams of TS, or Coliform Bacteria <10000 MPN/gram
 - H. Trace Contaminants Metals (Lead, Mercury, Etc.) Product must meet US EPA, 40 CFR 503 regulations
 - I. Compost Testing. The Contractor will test all compost products within 120 calendar days prior to application. Samples will be taken using the STA sample collection protocol. (The sample collection protocol can be obtained from the U.S. Composting Council, 4250 Veterans Memorial Highway, Suite 275, Holbrook, NY 11741 Phone: 631-737-4931, www.compostingcouncil.org). The sample shall be sent to an independent STA Program approved lab. The Contractor will pay for the test.

PART 3 - EXECUTION

3.1 PLACEMENT AND COMPACTION OF BIORETENTION SOILS

- A. Place the bioretention soil in 8" to 12" lifts. Lifts are not to be compacted but are placed to reduce the possibility of excessive settlement. Allow time for natural compaction and settlement prior to planting. Bioretention soil may be watered to encourage compaction.

END OF SECTION

This Page Intentionally Left Blank

SECTION 329119
PLANTING AREA FINISH GRADING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Finish grading of planting area surfaces.
- B. For Earthwork, see Division 31.
- C. For Landscape Maintenance Period, see Section 320100.
- D. For Irrigation, see Section 328400.
- E. For Soil Preparation and Soil Mixes, see Section 329113.
- F. For Plant Material, see Section 329300.

1.2 DEFINITIONS

- A. Soil Subgrade: The soil surface on which topsoil is placed.
- B. Finished Grades: The required final soil surface grade elevations indicated on the Drawings.
- C. Aesthetic Acceptance of Grades: Acceptance by the Owner's representative in writing of the aesthetic correctness of the contours. Aesthetic acceptance does not address whether an area drains properly, whether the areas are at the correct elevations, or whether it has been compacted properly.
- D. Acceptance: Wherever the terms "acceptance," "accepted," or "acceptable" are used herein, they mean acceptance of Owner's representative in writing.

1.3 REFERENCES

- A. ASTM — American Society for Testing Materials:
 - 1. D 1557 Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort. Most current edition.
- B. Geotechnical Investigation Report: - Geotechnical Investigation and Geologic Hazards Evaluation, Laney College Library Learning Resource Center, Final Report, March 31, 2023 prepared by Fugro.

1.4 QUALITY ASSURANCE

- A. Finish Grade Smoothness Mockup:

1. Prepare a 20-foot by 20-foot area of finish graded soil representing the finished graded surface of the planting areas.
2. Locate mockup on site in a proposed planting area easily referenced by workers performing finish grading operations.
3. Protect accepted mockup from physical damage and erosion with fencing, canopies, sandbags or other accepted means until Final Completion.
4. The accepted mock-up shall be the standard by which finish grading is judged.

1.5 SITE CONDITIONS

A. Environmental Requirements:

1. Do not work soil when moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in the air or that clods will not break readily.
2. Apply water, if necessary, to bring soil to an optimum moisture content for grading.
3. Do not work soil when muddy or frozen.
4. Existing Conditions:
5. Prior to Work commencement review and clearly mark in field horizontal and vertical locations of existing public underground utilities and structures with respective utility companies.
6. Prior to Work commencement review and clearly mark in field horizontal and vertical locations of existing private underground utilities and structures with Owner.
7. Prior to Work commencement and after reviewing the Owner's record irrigation documents, review with Owner and clearly mark in field locations of field heads, valve boxes, and other underground equipment, materials and structures.

PART 2 - PRODUCTS

Not used.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. General: Examine site and verify that conditions are suitable for finish grading Work, and that no defects or errors are present which would interfere with or cause incorrect finish grading Work to occur.
- B. Excessive Compaction: Verify that the upper 18 inches of soil is compacted no more than 70 percent as determined by ASTM D 1557.
- C. Soil Preparation: Verify that subsoil ripping and soil preparation Work is complete.
- D. Notification of Unsuitable Conditions: Before proceeding with Work, notify Owner and Owner's representative in writing of unsuitable conditions and conflicts.

3.2 PREPARATION

- A. Protection of Existing Conditions:
 - 1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the Work.
 - 2. Provide barricades, fences or other barriers to protect existing conditions to remain from damage during construction.
 - 3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
 - 4. Submit written notification of conditions damaged during construction to the Owner and Owner's representative immediately.

3.3 FIELD ENGINEERING

- A. General:
 - 1. Establish lines and levels, locate and lay out by instrumentation and similar appropriate means for planting area finish grades.
 - 2. Provide grade stakes and string lines to achieve smooth finish grades with positive surface drainage.
- B. Hand Graded and Screeded Areas:
 - 1. Install grade stakes at maximum 10 feet on center each way.
 - 2. Install additional grade stakes if required to achieve smooth, positive draining surface acceptable to the Owner's representative.
- C. Machine Graded Areas:
 - 1. Install grade stakes at maximum 25 feet on center each way.
 - 2. Install additional grade stakes if required to achieve smooth, positive draining surface acceptable to the Owner's representative.
- D. High Points and Low Points: Provide grade stakes at high points and low points including top of berms, catch basin rims and area drain rims.

3.4 FINISH GRADING OPERATIONS

- A. General:
 - 1. Grade soil surface with smooth uniform slope between points where elevations are given, and between points where elevations are given and existing grades.
 - 2. Slope finish grades to drain surface water away from buildings, walks, paving, and other structures unless indicated otherwise.
 - 3. Slope finish grades to drain surface water to catch basins, area drains or trench drains as shown on the Drawings.
 - 4. Grade soil surface smooth to be free of high and low areas which will inhibit surface drainage.
- B. Excessive Compaction:

1. Take precautions to prevent soil from becoming compacted more than 70 percent as determined by ASTM D 1557.
 2. Rip to an 18 inch depth and rototill areas compacted more than 70 percent.
- C. Screeding of Special Lawn Turf Areas:
1. After soil amendment Work has been completed, screed soil surface of planting areas smooth with straight edges.
 2. Apply a minimum 1-inch of irrigation water to induce settlement and melt clods.
 3. Prior to planting Work, screed soil surface smooth, adding amended soil to low areas.
- D. Equipment: Use equipment of appropriate size and type to achieve the sculptural forms, profiles and smooth soil surface free of high areas, depressions and equipment tracks.
- E. Depressions and Loose Material: Fill and compact any depressions, and remove loose material to finish surface true to line and grade, presenting a smooth, compacted, and unyielding surface.

3.5 TOLERANCES

- A. Hand Graded Areas:
1. Grade to within 0.03 foot of grades indicated on the Drawings, except bring soil edge surface grades, paving, curbs, and other structures to within 0.01 foot of grades shown on the Drawings.
 2. Transition soil edge surface grades along paving, curbs, and other structures to areas of less strict tolerance over 5 feet distance.
- B. Machine Graded Areas: Grade to within 0.05 foot of grades indicated on the Drawings.
- C. Allowances: Make proper allowances for settlement, spoils from plant pits, and addition of soil amendment.

3.6 FIELD QUALITY CONTROL

- A. Aesthetic Acceptance of Grades:
1. Upon completion of finish grading Work, schedule with Owner's representative a review to obtain aesthetic acceptance.
 2. Provide three-days advance written notification.
 3. Do not commence sodding, seeding or other planting Work until receiving aesthetic acceptance.
- A. Field Observation Reviews by Owner's representative: Coordinate and schedule with Owner's representative.

END OF SECTION

SECTION 329300
PLANT MATERIAL

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Backfill Mixes.
 - 2. Drain Rock.
 - 3. Fertilizers.
 - 4. Plant Materials.
 - 5. Rock Mulch.
 - 6. Root Barriers.
 - 7. Root Ball Anchors.
 - 8. Steel Header and Stakes
 - 9. Angle Iron Header
 - 10. Wood Chip Mulch.
- B. For Earthwork, see Division 31.
- C. For Landscape Maintenance Period, see Section 320100.
- D. For Irrigation, see Section 328400.
- E. For Planting Soil Preparation, see Section 329113.
- F. For Planting Area Finish Grading, see Section 329119.
- G. For Landscape Drainage, see Section 334101.

1.2 DEFINITIONS

- A. Acceptance: Wherever the terms “acceptance”, “accepted”, or “acceptable” are used herein, they mean acceptance of Owner’s representative in writing, unless indicated otherwise.
- B. Tie Height: Lowest Height at which tree trunk will snap back to upright position when pulled to one side and released.
- C. Plant Height: Measurement of main body height, not measurement to top branch tip.
- D. Plant Spread: Measurement of main body diameter, not measurement from branch tip to tip.
- E. Caliper: Trunk diameter measured at a point 6 inches (150 mm) above natural ground surface for trees up to 4 inches (100 mm) in caliper, and measured at a point 12 inches (300 mm) above natural ground surface for trees over 4 inches (100 mm) in caliper.

1.3 REFERENCES

1.4 SUBMITTALS

- A. Product Data:
 - 1. Fertilizer Tablets.
 - 2. Geotextile Fabric.
 - 3. Root Barriers.
 - 4. Steel Header and Stakes
 - 5. Angle Iron Header
 - 6. Tree Stakes.
 - 7. Tree Tie.
 - 8. Wetting Agent and Soil Penetrant.
 - 9. Root Ball Anchors
- B. Samples:
 - 1. Auxiliary Stake — 6-inch length.
 - 2. Cross-tie — 6-inch length.
 - 3. Rock Mulch — 1/2 pound bag.
 - 4. Wood Mulch — 1/2 pound bag.
 - 5. Angle Iron Header – 12" length
- C. Plant Material Photographs:
 - 1. At least 14 days prior to submittal of plant material location data, submit three color photographs each of representative plants of each type of plant material.
 - 2. Include a scale object in each photograph such as a tape measure or person.
- D. Plant Material Location Data:
 - 1. Quantities and sizes of each plant material type at each nursery or other place of growth.
 - 2. Address, phone number, and contact person for each nursery or other place of growth.

1.5 QUALITY ASSURANCE

- A. Regulatory Requirements:
 - 1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.

2. Provide for inspections and permits required by federal, state and local authorities in furnishing, transporting, and installing materials.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Handling Plants:
 1. Do not lift or handle container plants by tops, stems or trunks.
 2. Do not bind or handle plants with wire or rope.
 3. Pad trunk and branches where hoisting cables or straps contact.
- B. AntiDesiccant:
 1. Spray plant material in full leaf immediately before transporting with antidesiccant.
 2. Meet requirements of anti-desiccant manufacturer's current printed application instructions.
- C. Digging Plants: Dig ball and burlap plants with firm, natural balls of earth of diameter meeting or exceeding requirements of ANSI Z60.1 and of sufficient depth as required to include the fibrous and feeding roots.
- D. Plant Storage Prior to Installation:
 1. Protect plant root balls from sun and drying winds.
 2. Keep root balls moist.
 3. Keep sun-sensitive plants shaded.
 4. Anchor plants to prevent damage from strong winds.

1.7 SITE CONDITIONS

- A. Environmental Requirements:
 1. Protect plant material being stored on site from sun and drying winds.
- B. Existing Conditions:
 1. Prior to Work commencement, review and clearly mark in field horizontal and vertical locations of public existing underground utilities and structures with respective utility companies.
 2. Prior to Work commencement, review and clearly mark in field horizontal and vertical locations of private underground utilities and structures with Owner.

1.8 WARRANTY

- A. Warranty Period: Warrant that plant material, except annuals, will be healthy and in vigorous, flourishing condition of active growth one year from date of Final Completion.
- B. Annuals: Warrant that annuals will be in a vigorous, flourishing condition of active growth until end of last annual change season.
- C. Delays: Delays in completion of planting operations which extend the planting into more than one planting season shall extend the Warranty Period correspondingly.
- D. Condition of Plants: Plants shall be free of dead or dying branches and branch tips, with foliage of a normal density, size and color.

- E. Incorrect Materials:
 - 1. During Warranty Period, replace at no cost to Owner, plants revealed as being untrue to name.
 - 2. Provide replacements of a size and quality to match the planted materials at the time the mistake is discovered.
- F. Replacements:
 - 1. As soon as weather conditions permit, replace, without cost to Owner, dead plants and plants not in a vigorous, thriving condition, as determined by the Owner's representative during and at the end of Warranty Period.
 - 2. Apply requirements of this Section to replacements.
- G. Exceptions: Contractor shall not be held responsible for failures due to neglect by Owner, vandalism and other causes outside the Contractor's control.

1.9 MAINTENANCE

- A. For Landscape Maintenance Period, see Section 32 01 00.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Fertilizer Tablets:
 - 1. Gro Power, Inc. – www.gropower.com.
 - 2. Grow Better – www.growbetter.com.
 - 3. Agri Tab Corporation – www.agritab.com.
 - 4. Or equal.
- B. Anti-Desiccant:
 - 1. Aquatrols Corporation – www.aquatrols.com.
 - 2. Or equal.
- C. Stress Reducing Agent: (DM – we need more manufacturers)
 - 1. EarthWorks – www.soilfirst.com.
 - 2. Or equal.
- D. Wetting Agent and Soil Penetrant:
 - 1. Aquatrols – www.aquatrols.com.
 - 2. Harell's – www.harrells.com.
 - 3. Or equal.
- E. Drain Rock
 - 1. American Soils Products, www.americansoil.com
 - 2. Or equal.
- F. Wood Chip Mulch:
 - 1. Lyngso – www.lyngsogarden.com
 - 2. American Soil Products – www.americansoil.com.

3. Or equal.
- G. Rock Mulch:
1. Lyngso – www.lyngsogarden.com
 2. American Soil Products – www.americansoil.com.
 3. Or equal.
- H. Deep Root / Aeration System:
1. Rootwell, Union Lake, MI., (888) 766-8935.
 2. Or equal.
- I. Geotextile Fabric:
1. mmCarthage Mills – www.carthagemills.com.
 2. Mirafi – www.tcmirafi.com.
 3. Or equal.
- J. Steel Header:
1. The J.D. Russell Company – www.jdrussellco.com
 2. Or equal.
- K. Root Barriers:
1. Deep Root – www.deeproot.com.
 2. Century Products – www.centuryrootbarrier.com.
 3. Or equal.
- L. Root Ball Anchors
1. Platipus Earth Anchoring Systems – www.platipus-anchors.com.
 2. Or equal.

2.2 SUBSTITUTIONS

- A. Plant Material: Accepted substitute plants shall be true to species and variety and shall meet requirements of this Section except that plants larger than specified may be used if accepted.

2.3 MATERIALS

- A. Plants:
1. Growing Practices: Nursery grown in accordance with best horticultural industry practices.
 2. Nomenclature: Plant nomenclature shall meet requirements of ICBN and ICNCP.
 3. Climatic Growing Conditions: Grown under climatic conditions similar to those of project for at least two years unless otherwise accepted.
 4. Container Growth Limitations: Container stock excluding annuals shall have been grown in the containers in which delivered for at least six months, but not over two years.
 5. Root Ball Size: Meet or exceed requirements of ANSI Z60.1.
 6. Branching: Structurally strong, able to stand upright without stakes or guys on a windless day; exceptionally heavy, symmetrical, tightly knit, so trained or favored in development and appearance as to be superior in form, number of branches, compactness and symmetry.
 7. Vigor: Sound, healthy and vigorous, well branched and densely foliated when in leaf.
 8. Disease and Pests: Free of disease, insect pests, eggs, or larvae.

9. Root System: Healthy well-developed root systems, free of kinked, circling, girdling and center roots, rootbound condition and cracked or broken root balls.
10. Measurements: Measure plants when branches are in their normal upright position.
11. Pruning: Do not prune, thin or shape plants before delivery without acceptance.
12. Unacceptable Conditions: Multiple leaders, unless specified, damaged or crooked leaders, bark abrasions, sun-scalds, disfiguring knots, or fresh cuts of limbs over 3/4-inch diameter which have not completely callused.

B. Fertilizer Tablets:

1. Grow-Power 21 gram tablets, 20-10-5 (NPK) formula.
2. Grow-Power 7 gram ADS tablets, 12-8-8 (N-P-K) formula.
3. Agri Tab Aquatic fertilizer, 12-20-8 in compressed spike form.
4. Agri Tab Aquatic fertilizer, 20-5-10 5 gram tablets.
5. Or equal.

C. Water: Clean, fresh and potable.

D. Drain Rock: ¾ inch round.

E. Wood Chip Mulch:

1. Match existing
2. Or equal.

F. Rock Mulch:

1. 3/8" crushed black basalt.

G. Anti-Desiccant: Commercially available spray protective coating, designed to reduce plant transpiration loss, which produces a moisture retarding barrier not removable by rain or snow.

H. Stress Reducing Agent:

1. Roots Concentrate.
2. Or equal.

I. Wetting Agent and Soil Penetrant:

1. AquaGro 2000M.
2. AquaGro 2000G.
3. Or equal.

J. Geotextile Fabric:

1. Mirafi Filterweave 140 NC non-woven geotextile composed of polypropylene fibers.
2. Carthage FX-300MF
3. Or equal.

K. Steel Header:

1. Flexible carbon steel, ¼ inch by 5 inches by minimum 16 feet minimum length pieces, black factory paint finish, double staked overlap joints and designed to receive tapered steel stakes.

L. Steel Header Stakes:

1. Steel, tapered, 16-inch minimum length, with black paint finish, designed specifically to anchor steel header in place, manufactured by manufacturer of the steel header for which they will be used.

M. Angle Iron Header

1. Material: A36 Steel Angle
2. Finish: Galvanized
3. Size: 4" x 4"

N. Root Barrier

1. UB 24-2
2. Deep Root, www.deeproot.com
3. Or equal.

O. Root Ball Anchoring

1. Platipus Earth Anchoring Systems, www.platipus-anchors.com.
2. Duckbill Model 68-RBK for trees up to 1 inches caliper.
3. Deadman System – Plati-Mat RF2RDMP for trees 1.5 to 6 inches caliper.
4. Or equal.

2.4 MIXES

- A. For Plant Pit Backfill, see Section 02920.

2.5 SOURCE QUALITY CONTROL

A. Plant Material Review and Tagging:

1. Trees will be reviewed, photographed and tagged by the Owner's representative at the nursery, or other place of growth prior to delivery of trees to site.
2. At Owner's representative's discretion, shrubs may or may not be reviewed, photographed, and tagged by the Owner's representative at the nursery or other place of growth.
3. Tagging of plant material at the nursery or place of growth does not cancel the right of the Owner's representative to reject plant material at the site, if damage or unacceptable conditions are found that were not detected at the nursery, place of growth or in the submitted photographs.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.
- B. Fine Grading and Soil Preparation: Verify that fine grading and soil preparation Work is complete.
- C. Verification Surface Drainage: Verify positive surface drainage of planted areas.

- D. Notification: Before proceeding with Work, notify Owner and Owner's representative in writing of unsuitable conditions.

3.2 PREPARATION

- A. Protection of Existing Conditions:
 - 1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
 - 2. Provide barricades, fences or other barriers to protect existing conditions to remain from damage during construction.
 - 3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
 - 4. Submit written notification of damaged plants and structures to Owner and Owner's representative immediately.

3.3 SUBSURFACE OBSTRUCTIONS

- A. Plant Pit Excavation: If rock, underground utilities, structures, tree roots or other obstructions are encountered in the excavation of plant pits, alternate locations may be accepted by the Owner's representative.
- B. Cost for Removal of Obstructions: Where locations cannot be changed, submit cost estimate for Work to remove the obstructions to a depth of not less than 6 inches below the required pit depth, and proceed with Work after Owner's approval.
- C. Irrigation Piping: Reroute around the plant root ball.

3.4 PLANT LAYOUT

- A. Trees:
 - 1. Stake location of trees where indicated on Drawings.
 - 2. Scale tree locations where no dimensions are given.
 - 3. Drive a 3-foot long wood lath stake at each tree location and mark each tree type with different color survey tape.
 - 4. Contact Owner's representative to review locations in field prior to excavating plant pits.
 - 5. Do not excavate plant pits until Owner's representative has accepted locations.
- B. Shrubs and Groundcover.
 - 1. Layout according to Drawings.
 - 2. Contact Owner's representative if there are any conflicts that would prevent plants from being laid out according to Drawings.
 - 3. Contact Owner's representative to determine if a review of locations in field, prior to excavating plant pits, is required.

3.5 EXCAVATION OF PLANT PITS

- A. Equipment:
 - 1. Excavate pits with a backhoe or hand digging.

2. Do not use an auger.
- B. Dimensions:
1. Excavate plant pits to a depth equal to the root ball height minus the amount needed to account for settlement and to install the root balls at the specified elevation relative to adjacent finished grade.
 2. Install top of plant root balls 1-inch above adjacent finished grade except where indicated otherwise.
 3. Excavate pits to a diameter which is 3 times the root ball diameter, except where indicated otherwise on the Drawings.
 4. Center plant pits on plant locations where possible.
 5. Where plant pits cannot be excavated to specified dimensions nor centered on plants due to obstructions such as paving, walls, curbs, or other structures excavate pits in directions without obstructions until pit volume equals the specified plant pit volume, except where indicated otherwise.
 6. Do not undercut adjacent obstructions unless accepted by the Owner's representative.
 7. Excavate plant pit sides along adjacent elements such as paving, walls, curbs, and other structures at a 45 degree angle sloping away from the bottom surfaces of the adjacent elements, except where indicated otherwise.

3.6 ROOT BARRIERS INSTALLATION

- A. Locations: Install root barriers where shown on Drawings and according to manufacturer's current printed instructions.

3.7 STEEL HEADER INSTALLATION

- A. Locations: Install where indicated on Drawings.
- B. Horizontal Alignment:
1. Install straight sections free of "wiggles" using string lines as guides.
 2. Install curved sections as smooth curves free of small "wiggles" following alignment marked with paint by Owner's representative in field.
- C. Vertical Alignment: Install parallel with finished grade.
- D. Stakes:
1. Install stakes in solid undisturbed soil.
 2. Recompact loose disturbed soil to at least 85 percent relative compaction before installing stakes.
 3. Install stakes at every location in header sections designed to attach stakes to headers.
- E. Damaged headers: Replace header sections damaged by construction operations.

3.8 PLANTING AND BACKFILL OPERATIONS

- A. Protection of Plants Prior to Installation:
1. Protect plant root balls from sun or drying winds.

2. Keep root balls of plants that cannot be planted immediately upon delivery in the shade, well protected and well watered.

B. Removal of Containers:

1. Remove canned stock carefully after cans have been cut on two sides with accepted cutter.
2. Do not use spade to cut containers.

C. Root Ball Scarification:

1. After removing plant from container, scarify side of root ball to prevent root-bound condition.
2. Loosen root ball soil surface to depth of 1/8 to 1/4 inch without damaging roots or breaking root ball.

D. Cutting Circling Roots:

1. If circling roots are encountered at root ball sides, notify Owner's representative for field review.
2. Upon Owner's representative's acceptance, cut roots on 4 sides of root ball 90 degrees apart at no extra cost to Owner.
3. Use a 4-inch wide sharp straight blade.
4. Cut roots by pushing spade or knife down sides of root ball 90 degrees to root ball surface and 2 inches into root ball.
5. Keep spade or knife sharp to cut roots cleanly.

E. Plant Placement:

1. Handling plant carefully, set plant root ball on pit bottom centered on accepted horizontal location.
2. Install plant root ball vertically so that top of root ball is 1 inch above adjacent finished grade after settlement except where indicated otherwise.

F. Removal of Root ball Wrapping Materials: Remove and dispose of burlap, nylon cord, wire baskets, twine and other materials prior to backfilling.

G. Backfill Mix Placement:

1. Place mix carefully as not to damage the plant root ball, trunk, branches, or foliage.
2. Fill pit until top of backfill mix is even with top of root ball.
3. Settle mix by watering evenly.
4. Fill settled backfill mix with additional soil mix as required to bring it even with top of root ball.
5. Continue filling and watering settled areas until settlement stops.

H. Settled Plant Adjustment: Raise plant root balls which settle so that top of root balls are at the specified elevation relative to adjacent finished grade.

I. Final Compaction: Compact soil mix by saturating with water.

J. Fertilizer Tablets:

1. Place maximum quantities recommended by the manufacturer's current printed instructions.
2. Place tablets between bottom of root ball and 1/3 way up root ball, 2 inches away from root ball.

3. Do not place tablets higher than 1/3 way up root ball.
4. Space tablets equally around root ball.
5. Install tablets at trees, shrubs, ground cover, ornamental grasses, and ferns.

K. Stress Reducing Agent:

1. After backfilling plant pits, drench backfill at rates recommended by manufacturer.
2. Drench backfill same day backfill is placed.

L. Wetting Agent and Soil Penetrant:

1. After backfilling plant pits, drench backfill at rates recommended by manufacturer.
2. Drench backfill same day backfill is placed.

3.9 ROOT BALL ANCHOR INSTALLATION

A. Manufacturer's Requirements: Meet requirements of manufacturer's current printed instructions.

B. Root Ball Characteristics:

1. Install anchors only on firm root balls.
2. Do not install anchors on trees grown in sand, sawdust or other loose growing mixes.

3.10 WOOD CHIP MULCH INSTALLATION

A. Depth: Install geotextile fabric and rock mulch at depths and locations shown on the Drawings.

B. Surface: Rake mulch surface smooth.

C. Woody Plant Stems: Slope mulch away from woody plant stems so that mulch does not touch stems.

3.11 ROCK MULCH INSTALLATION

A. Depth: Install geotextile fabric and rock mulch at depths and locations shown on the Drawings.

B. Surface: Rake mulch surface smooth.

C. Woody Plant Stems: Slope mulch away from woody plant stems so that mulch does not touch stems.

3.12 FIELD QUALITY CONTROL

A. Field Observation Reviews by Owner's representative: Coordinate and schedule with Owner's representative.

3.13 SCHEDULES

A. Root Ball Anchor Schedule:

<i>Tree Caliper at 12 Inches Above Grade</i>	<i>No. of Guys</i>	<i>Cable Size</i>	<i>Turn-buckle Size</i>	<i>Ground Anchors</i>
3 - 6 inches	3	1/8 inch 7 × 7	1/4 × 4 inches	4 × 4 × 24 × 18 inches deep deadmen (or) Laconia LA-4-40 SM (or) Duckbill 68
6 - 8 inches	3	3/16 inch 7 × 7	5/16 × 4-1/2 inches	6 × 6 × 30 × 30 inches deep deadmen (or) Laconia LA-6-60 (or) Duckbill 88

END OF SECTION

SECTION 331000
WATER UTILITIES

PART 1 - GENERAL

1.1 SECTION INCLUDES

- A. Specifications for providing water service and distribution and modification to existing water mains and services as indicated. The extent of water distribution is indicated on the Contract Drawings and includes furnishing, installing, testing, and disinfecting permanent water supply piping and services as indicated.
- B. The jurisdictional water utility district shall provide water services to the water meter as indicated on the Contract Drawings. The Contractor shall be responsible for making all such arrangements. All work on the jurisdictional agency's facilities shall be in accordance with the agency's adopted standards and performed by the agency or their representative.

1.2 RELATED SECTIONS

- A. Section 312324 – Trench Excavation and Backfill

1.3 REFERENCES

- A. Codes and Standards: The design and installation of underground water piping shall conform to the following codes and standards except as specifically noted in these standards.
 - 1. Latest edition of the California Plumbing Code (CPC)
 - 2. Latest edition of the California Fire Code
 - 3. Latest edition of the California Building Code
 - 4. Latest adopted edition of the National Fire Protection Association (NFPA) 24: Standard for the Installation of Private Fire Service Mains and Their Appurtenances
 - 5. American Water Works Association (AWWA) standards and manuals as appropriate for installation and materials including, but not limited to:
 - a. C-104 (2013): Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water
 - b. C-105 (2010): Polyethylene Encasement for Ductile-Iron Pipe Systems
 - c. C-150 (2008): Thickness Design of Ductile-Iron Pipe
 - d. C-151 (2009): Ductile-Iron Pipe, Centrifugally Cast for Water
 - e. C-504 (2010): Rubber-Seated Butterfly Valves
 - f. C-600 (2010): Installation of Ductile-Iron Water Mains and Their Appurtenances
 - g. C-605 (2013): Underground Installation of Polyvinyl Chloride (PVC) Pressure Pipe and Fittings for water
 - h. C-651 (2014): Disinfecting Water Mains
 - i. C-900 (2007): Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 4 in. Through 12 in. (100 mm Through 300 mm), for Water Transmission and Distribution
 - j. M-11 (2004): A Guide for Steel Pipe Design and Installation, 4th Ed.
 - k. M-14 (2014): Recommended Practice for Backflow Prevention & Cross-Connection Control, 4th Ed.
 - l. M-23 (2002): PVC Pipe - Design and Installation, 2nd Ed.
 - m. M-27 (2013): External Corrosion: Introduction to Chemistry and Control, 2nd Ed.
 - n. M-41 (2009): Ductile-Iron Pipe and Fittings, 3rd Ed.
 - o. M-55 (2006): PE Pipe—Design and Installation, 2nd Ed.

1.4 SUBMITTALS

- A. Shop Drawings, Product Data, and Samples
- B. Shop drawings showing all piping layout and pipe sizes, valves, backflow prevention device, and locations of tie-ins, buttresses, and thrust blocks.
- C. Manufacturer's product data for manufactured materials and equipment, including all valves and backflow prevention device.

1.5 SITE CONDITIONS

- A. Excavations in which products will be buried shall be dry.
- B. Coordinate the installation of water supply system with the jurisdictional water utility owner. Contractor shall coordinate with jurisdictional water utility owner for installation of the new domestic water meter and water lateral within the City right-of-way. The jurisdictional water utility owner shall install the new domestic water lateral from the existing water main to the new water meter. Contractor shall coordinate depth and location of new domestic water lateral with the jurisdictional water utility owner.
- C. Existing Underground Piping: Existing utilities and piping, where known, are shown on the Drawings. Exact locations and depths of existing lines must be determined in the field by the Contractor by exploration using methods which will not damage any existing improvements.
- D. Location and Alignment of New Work: Pipe alignments may be varied from those shown on the Drawings when field conditions indicate that the change would be advantageous. Any such proposed changes shall be brought to the attention of the Engineer. Changes shall not be made until written approval from Engineer has been obtained. Provide traffic cover plates over trenches at streets, parking areas and pedestrian pathways to maintain access, unless closure is permitted by the Engineer.
- E. Interference with Normal Operations at the Site: All pipe work shall be coordinated with the required excavation and backfill so that there will be a minimum of interruption in the normal use of roads, parking areas, pathways and other existing facilities.
- F. Shutdowns of Existing Systems: To the extent required for the installation of the new work, shutdowns of the existing facilities will be permitted. Perform Work that involves tie-in to existing systems at such times as will cause the least inconvenience to University activities. This may be at night and/or on weekends. Prior to any shutdown, Contractor shall notify Engineer in writing at least 10 days prior to the planned tie-in. The Engineer will then schedule the shutdown with campus facilities Service staff who will determine the actual time of the tie-in as close as possible to the Contractor's request. Include in Contractor's bid the cost of overtime necessary to perform the Work. No extra payment will be allowed for overtime to meet this requirement.
- G. At least one week prior to the shutdown the Contractor shall submit to the Engineer a schedule and plan showing the following: a) how connections to existing facilities are to be made; b) length of time required to accomplish the work and to get the systems into service, and c) a list of all equipment and materials required to make the tie-in. The shutdown will not be permitted to commence until the Contractor has received written permission from the Engineer and the Contractor has provided assurance to the Engineer that all necessary material, equipment and manpower will be available at the proper time so that the shutdown will proceed on schedule.

PART 2 - PRODUCTS

2.1 PIPE MATERIALS, SIZES AND OTHER REQUIREMENTS

- A. Water Distribution Main (pipe size 4 inches and larger)
 - 1. PVC AWWA C-900 DR-18 (Class 235); or
 - 2. Polyethylene Pipe (PE): PE 4710, ASTM F714, Pressure Class 200, DR9 , conforming to AWWA C906, if specifically approved by Facilities Services and the Designated Campus Fire Marshal; or

3. Ductile Iron Pipe (DIP): Pressure Class 350 pipe conforming to AWWA/ANSI C151/A21.5, cement-mortar lining conforming to AWWA/ANSI C104/A21.4, with standard thickness per AWWA/ANSI C150/A21.50. U.S. Pipe, American Cast Iron Pipe Company (ACIPCO), or approved equivalent.
 - a. Flanged ends shall conform to AWWA/ANSI C115/A21.15.
 - b. Rubber-gasket joints shall conform to AWWA/ANSI C111/A21.11.
- B. Water Service Line (pipe size 3 inches and smaller)
 1. Water lateral shall be ASTM B88 type "K" copper pipe with brazed joints using minimum 15 % silver brazing alloy.
 2. High Density Polyethylene Pipe (HDPE): PE4710, Pressure Class 200, DR 9 conforming to AWWA C901. J-M Manufacturing PIPE or approved equivalent.
- C. Underground conduit for fire alarm system shall be polyvinyl chloride pipe: Less than 6 inches nominal size: ASTM D3034, SDR 26. Joints: Elastomeric gasket joints, ASTM D3212. Gaskets: Submit two sample gaskets with an explanation of the markings. Above ground conduit for fire alarm system shall be flex steel-galvanized electrical conduit.
- D. Couplings and pipe thread adapters for copper tubing shall be Mueller 110 compression connection series or equal. Soldered joints are not allowed.
- E. All ferrous materials, restrainers, T-Head bolts, clamps, joint restraint clams, washers, tie rods, bolts and nuts shall have at least one coat of protective coating (bituminous mastic) of an approved type before backfilling.
- F. Mechanical joint ductile-iron fittings shall conform to ANSI A 21.53 (AWWA C153) – "Ductile-Iron Compact Fittings, 3-in. through 24-in. and 54-in. through 64-in. for Water Service". All mechanical joints shall be fully restrained with Mega Lug or an Engineer approved equal.
- G. Flanged fittings shall conform to ANSI A 21.10 (AWWA C110) – "Ductile-Iron and Gray-Iron Fittings, 3-in. through 48-in. for Water and Other Liquids".
- H. Push-on joint fittings are not allowed except for special circumstances approved in advance, in writing by Owner's Representative.
- I. All restrainers and ductile-iron fittings shall be wrapped with at least one layer of 10-mil plastic.
- J. All ductile-iron pipe shall be wrapped with at least one layer of 10-mil plastic.
- K. Hot tapping and use of saddles are not permitted unless approved in advance by the Engineer.

2.2 Valves

- A. Valves shall conform to AWWA C-504. Valves shall be Pratt Butterfly Valves (or equivalent)
- B. Indicating posts used for underground valves or wall indicating valves shall be of the type that use the words "OPEN" when the valve is open and "SHUT" when the valve is closed. Mueller gate valves with a resilient seal (or equivalent) shall be used.
- C. Valves shall open when turned counter-clockwise.
- D. A concrete pad shall be placed under all valves.

2.3 Water Supply Backflow Preventer Assemblies

- A. Backflow Prevention Devices
 1. Backflow preventers shall be as indicated in the plans.
 2. A three inch (3") outlet with bolted flange shall be provided downstream of the backflow preventer for testing purposes.
 3. All test openings in the backflow preventer shall be plugged.
 4. Select appropriate backflow prevention devices for the intended service. The following devices are listed in approximate decreasing order of effectiveness and reliability.
 5. Air-Gap Separations (a physical break between the supply pipe and a receiving vessel): The air gap shall be at least twice the diameter of the supply pipe, measured vertically above the overflow rim of the vessel with a minimum clearance of one inch (1"). This provides the maximum degree of protection and should be used wherever a non-pressurized supply is acceptable. It shall be used where sewage or toxic substances are involved.

6. Reduced-Pressure Backflow Preventers: Use for protection of all direct or indirect connections where the device may be subject to back pressure and for isolating industrial water systems from the domestic water system. Locate in an accessible location. Where spillage is unacceptable, discharge with an air gap into a floor drain. Install backflow preventer at least 12" above floor or ground. Test cocks must be accessible.
7. Pressure-Type Vacuum Breaker: Use only as protection for direct or indirect water connections to all types of polluted or contaminated liquids where the vacuum breakers are not subject to back pressures. These units may be installed under continuous line pressure. Install in an accessible location. Where spilling into room is objectionable, it shall be specified as modified with drain connection and waste.
8. Anti-Siphon Ballcocks: Use for tank-type water closets and urinals. The outlet of the backflow preventer shall be at least one inch (1") above the opening of the overflow pipe.
9. Vacuum Breakers for Flush Valves: Occurs at toilets or urinals. Specify installation at least four inches (4") above the overflow rim.

PART 3 - EXECUTION

3.1 GENERAL

- A. Contractor shall coordinate with domestic water service connection and meter installation with EBMUD. As indicated in plans, EBMUD will tap existing water main and install the domestic water meter. Contractor shall assume 6 – 9 months for installation of domestic water meter and service line following submittal of the new water meter application to EBMUD.
- B. Show valves at all services from mains and at other points to minimize disruption of building operations. Valves should be located at the building exterior and where mains enter the building.
- C. Use separate cold water services for domestic and fire where it is from the University system.
- D. Thrust blocks shall be as indicated in the plans

3.2 MAINTAINING WATER SERVICES

- A. Maintain water service and conduct operations at times selected to minimize duration and inconvenience of service interruption.
- B. Water valves in service owned by the jurisdictional water utility Owner shall be operated only by personnel of that jurisdictional water utility district.
- C. Except as specified otherwise herein, and where applicable, materials and construction methods shall be in accordance with the provisions of the jurisdictional water utility district standard drawings and specifications.

3.3 INSTALLATION

- B. Installation Requirements
 1. Excavating and backfilling, including bedding and compacting requirements, to the backflow preventer assemblies shall be in accordance with the provisions of the jurisdictional water utility district standard drawings and specifications. Excavating and backfilling, including bedding and compacting requirements, beyond the backflow preventer assemblies shall conform to Section 312324 – Trench Excavation and Backfill.
 2. Provide concrete thrust blocks for elbows, tees, valves, and appurtenances of buried piping. Thrust blocks shall be constructed as indicated.
 3. Install piping true to line and grade, supported and guided to assure alignment under all conditions.
 4. Install unions at each connection to valves.
 5. Make change in line with fittings. Do not spring joints to effect change of direction.
 6. Do not field cut pipe unless necessary. Make such necessary cuts by means of equipment designed for the purpose, ensuring a smooth square end.

7. For connection to existing pipe, provide pipe with suitable ends or adapters, after verification of size and type of existing pipe.
- C. Valves
1. Install valves in accordance with the valve manufacturer's installation instructions.
 2. Where valves are provided by the jurisdictional water utility, provide suitable access for operation of valves.
 3. Unless approved by the Engineer, campus personnel shall operate, open, or close any valve in the existing system.
 4. Valves shall conform to AWWA C-504. Valves shall be Pratt Butterfly Valves (or equivalent) except as required by section (5) (below).
 5. As applicable, indicating posts used for underground valves or wall indicating valves shall be of the type that use the words "OPEN" when the valve is open and "SHUT" when the valve is closed. Mueller gate valves with a resilient seal (or equivalent) shall be used.
 6. Valves shall open when turned counter-clockwise.
 7. A concrete pad shall be placed under all valves.
- D. Thrust Blocks and Harnessing
1. Provide for counteracting thrust caused by static and dynamic forces, including water hammer at bends, tees, reducers, valves, and dead-ends by installing harnessing as indicated or required. For other methods, submit details for approval of the Engineer prior to use.
 2. Provide concrete thrust blocks as indicated where harnessing is not practicable.
- E. Water Service Connectors
1. Make water service connections, as indicated, in accordance with California Plumbing Code and the installation instructions of the service pipe and fittings manufacturer.
- F. Acceptance Requirements
1. After installation of pipes, ends of pipes shall be either capped or plugged. No piping shall be buried before being inspected and tested.
- G. Corrosion Protection
- All buried ferrous metal fittings and appurtenances shall be provided with bituminous coating corrosion protection and as indicated in the design plans.
1. Ferrous metal fittings and appurtenance as herein referred to are: valves, tees, elbows, reducers, crosses, plug assemblies, pumping tees, services, blowoff installations, flexible couplings, leak clamps, tie rods, etc.
 2. Joints, fittings, and appurtenances that are required to be coated by the Contractor may be coated before or after installation in the trench.
 3. Cast-iron pipe or bare metal pipe extending into the soil from a concrete structure shall be insulated from the concrete and leak-proofed. The insulation shall extend through the concrete a minimum of three (3) inches on each side. The insulation shall consist of one layer of Scotchrap Tape No. 50 and two coats of bituminous paint. The pipe shall be clean, dry, and free from loose scale before applying the adhesive and tape. The edges of the tape shall be lapped not less than one-half (1/2) inch.
 4. Bituminous coating shall be applied in two coats with a minimum 20-mil dry thickness per coat. Applications shall be in accordance with manufacturer's instructions. Allow first coat to dry as recommended by the manufacturer before application of second coat. Allow second coat to dry before encasing in polyethylene tubing or wrap. Inspector must inspect coating prior to covering with polyethylene. Joints must be not be covered with polyethylene during the pressure test witnessed by the Owner's Representative.

3.4 TESTS

- A. Protection from Flooding
Provide positive measures to protect exposed, installed pipe and compacted pipe bedding from flooding during testing.
- B. Notice of Testing
 - 1. Give three (3) days notice of intention of testing to the Engineer and jurisdictional agency. The Contractor will furnish, install, and operate pumps, gages, meters, and individual pipe connections to test openings.
 - 2. Designate largest sections feasible for testing and sterilizing.
- C. Testing Requirements
 - 1. Prior to backfilling, isolate system by use of approved valves, caps and plugs, or other means.
 - 2. Maintain such isolation throughout the performance of leakage and pressure testing.
 - 3. Where valves are used for isolation, eliminate leakage through such valves if it occurs. Maintain new work isolated from existing water mains, except for test connections, until testing and sterilization have been completed.
 - 4. For hydrostatic tests, provide approved caps and plugs in sections to be tested and remove them after testing.
 - 5. Prevent leakage in pipes and fittings at openings. Temporarily block plugged and capped ends to prevent displacement.
 - 6. Install water source connection for testing, as directed.
 - 7. Provide labor and materials required for leakage testing, including excavation for installation and removal of pumps, gages, meters, and water source connections.
 - 8. Where leakage exceeds the Owner's standards, perform necessary corrective measures.
 - 9. Remove and replace defective pipes, joints, fittings, valves and appurtenances. Reset such items if displaced.
- D. Hydrostatic Tests
 - 1. Perform hydrostatic tests in accordance with the Owner's requirements. All such tests shall be witnessed by the representative. The Contractor shall be responsible for making all such arrangements.
 - 2. Test the fire water system hydrostatically in sections to a pressure of at least 200 psi or 50 psi + maximum static pressure, whichever is greater for not less than 120 minutes.
 - 3. Test the domestic water system for building service lateral(s) at 100 psi for 120 minutes. Pressure test pipe before backfilling. Repair leaks and retest the system until the system is leak free. Use instruments calibrated by a quality laboratory.
 - 4. The test pressure shall not drop during the test period.
 - 5. Leakage is permitted in accordance with NFPA 24 Section 10.10.2.2.4.
 - 6. Gauges shall be either:
 - A digital gauge having a 0.1-psi resolution and a 1% full scale accuracy or An analog gauge having a 3½ inch diameter face and a 1% full scale accuracy. The test pressure shall not exceed 75% of the analog gauge full scale. Gradations shall be in 1-psi increments

Test sequence shall be as follows:

 - a. Lines shall be fully flushed.
 - b. Lines shall be hydrostatically tested.
 - c. Lines shall be fully flushed.
 - d. Lines shall be fully disinfected.

3.5 SYSTEM DISINFECTION

- A. Standard Disinfection Procedure For Domestic Water System
 - 1. Supervision and Testing: Perform entire disinfection procedure under the supervision of Environment, Health and Safety (EH&S). Provide five (5) days' notice to schedule

- procedure.
2. Contractor's Responsibility: Furnish a copy of the California Department of Pesticide Regulation (DPR) Qualified Applicator License, equipment, materials and transportation to disinfect domestic hot and cold water systems and fire lines directly connected thereto, in conformity with procedures and standards described herein.
 3. Disinfecting Agent: An aqueous solution of sodium hypochlorite (minimum 5.25% available chlorine). The use of powdered hypochlorite and chlorine gas are prohibited unless specifically approved by Environment, Health and Safety (EH&S).
 4. Preliminary Preparations:
 - a. Service Cock: Provide within three feet (3'-0") of the entrance of the supply main to the building, a three-quarter inch (3/4") service cock, or valve, for the purpose of introducing the disinfecting agent.
 - b. Flushing: After final pressure tests and before draining for disinfection, open each fixture or outlet until the water flow is clear.
 5. Disinfection Procedure:
 - a. Drain entire domestic water system including fire line.
 - b. Post suitable warning signs at each outlet: Warning - Do Not Use - Water System Being Chlorinated.
 - c. Inject disinfectant solution into the system through the service cock by means of a pump, or other pressure device, at a slow continuous rate, simultaneous with a reduced flow from the water main, until the Ortho-Tolidin test for residual chlorine at each outlet shows a concentration of at least 50 ppm, but note more than 100 ppm.
 - d. Close all outlets and valves, including the service valve at the main and the injection cock. Retain the chlorinated water in the system for 24 hours.
 - e. After the 24 hour holding period, the residual chlorine concentration shall be not less than 50 ppm as shown by the Ortho-Tolidin test.
 - f. Drain and flush entire domestic water system until Ortho-Tolidin tests show background residual chlorine concentration at any and all outlets.
 - g. Environment, Health and Safety (EH&S) shall determine whether samples of water must be collected and analyzed for the determination of bacteriological quality.
 6. Standards Necessary for Approval:
 - a. The water system shall have been uniformly chlorinated under the supervision of Environment, Health and Safety (EH&S) as outlined above.
 - b. The results of water sample analysis shall be negative for the Coliform organisms.
 - c. If the test for the bacteriological quality of the water in the system does not meet the standards, repeat the disinfection procedure until the specified standards are met.
 - d. Final Approval: Environment, Health and Safety (EH&S) shall give written approval to the University for acceptance and use of the water system after the above procedures have been successfully completed and the standards met.

END OF SECTION

This Page Intentionally Left Blank

SECTION 333000
SITE SANITARY SEWERAGE SYSTEM

PART 1 - GENERAL

1.1 THE REQUIREMENT

- A. The CONTRACTOR shall provide all materials, equipment, and labor necessary to furnish and install all solid wall pipe as indicated in the Drawings; and all appurtenant work, complete and operable, including all manholes, cleanouts, fittings and connections as shown on the Drawings and as specified herein.
- B. Piping under existing pavement and retaining walls may be installed by jacking, boring or by hydraulic driving except as otherwise indicated in Drawings or directed. Use existing sleeves where applicable. At location where cutting is required make all cuts clean using power saws. Replace and restore all surfaces to original conditions, including grades and landscaping. Match restoration work with original work in every respect, including type, strength, texture and finish.

1.2 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 312324 Trench Excavation and Backfill

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

- A. Commercial Standards:
 - ASTM A 48 Specification for Gray Iron Castings.
 - ASTM C 150 Specification for Portland Cement.
 - ASTM C 478 Specification for Precast Reinforced Concrete Manhole Sections.
 - ASTM D 1784 Specification for Rigid Poly Vinyl Chloride (PVC) Compounds and Chlorinated Poly Vinyl Chloride (CPVC) Compounds.
 - ASTM D 2241 Specification for Poly Vinyl Chloride (PVC) Pressure-Rated Pipe (SDR-Series).
 - ASTM D 3034 Specification for Type PSM Poly Vinyl Chloride (PVC) Sewer Pipe and Fittings.
 - ASTM D 3212 Standard Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals
 - ASTM F 477 Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe

1.4 CONTRACTOR SUBMITTALS

- A. Certificates of Compliance: Certificates of Compliance shall be provided for all products and materials proposed to be used under this Section.
- B. Submit plan and profile drawings for sewer connection showing pipe sizes, location, alignment of sewer service and elevations along with the details associated with the improvements, location of boring pits.

1.5 QUALITY ASSURANCE

- A. Tests: All materials used in the manufacture of the pipe shall be tested in accordance with the requirements of the referenced standards as applicable.
- B. All costs of such inspection and tests shall be borne by the CONTRACTOR.

- C. The pipe shall be subjected to the specified hydrostatic strength tests, flexure tests, and crushing tests. The crushing tests shall be made on samples taken from the center of full-length sections of pipe.

1.6 PROJECT CONTROLS

- A. Interruption of Existing Sanitary Sewerage: Do not interrupt service to facilities occupied by District or others unless permitted under the following conditions and then only after arranging to provide temporary service according to the requirements indicated:
 - 1. Notify the ENGINEER no fewer than eleven (11) working days in advance of the proposed interruption of service.
 - 2. Do not proceed with interruption of service without ENGINEER'S written permission.
 - 3. Submit plans to the ENGINEER showing rerouting of the temporary sanitary sewer service and obtain written approval from ENGINEER prior to proceeding with the work.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All solid wall pipes shall be continuously and permanently marked in conformance with the appropriate ASTM.
- B. The CONTRACTOR shall also require the manufacturer to mark the date of extrusion on the pipe.
- C. Pipe shall be of the pipe pressure class as shown on the Drawings.

2.2 PIPE

- A. All PVC pipe shall conform to the following requirements, unless otherwise specified, or as shown on the Drawings:
 - 1. Gravity sewer laterals shall be High-Density Polyethylene (HDPE) SDR-17 pipe; with a minimum standard diameter ratio (SDR) of 21. Other materials may be used based on site conditions as approved by the Engineer.
 - 2. Sanitary sewer pipes shall be green colored. If not manufactured green, sanitary sewer pipes shall be wrapped with Christy™ TA-33-PW21, 2" x thick green 10mil polywrap, or approved equal.

2.3 FITTINGS

- A. All fittings including wyes and sanitary sewer lateral cleanouts for PVC pipe shall conform to the requirements of ASTM D 2241. The ring groove and gasket ring shall be compatible with PVC pipe ends.
- B. The strength class of the fittings shall be not less than the strength class of any adjoining pipe.

2.4 BEDDING MATERIAL

- A. Unless otherwise specified or shown, all material used for pipe bedding shall conform to the requirements for bedding in Section 312324 "Trench Excavation and Backfill".

2.5 FLEXIBLE COUPLINGS

- A. Flexible couplings used for repairs shall be rubber, full-circle, clamp-on type conforming with ASTM C 425 and provided with 2 stainless steel band screw-clamps to secure the coupling tightly to entering and exiting pipes. All screw-clamp hardware shall be Type 304 or Type 316 stainless steel. Rubber material shall be suitable for use on sewage systems.

Sanitary sewer connection at the building point of connections shall be made by using Calder Couplings or approved equal.

2.6 SANITARY SEWER CLEANOUTS

- A. At grade, cleanouts shall have adjustable sleeve-type housing, threaded brass plug with countersunk slot, and cast iron frame and cover.

2.7 LATERAL CONNECTIONS TO SANITARY SEWER

- A. Service lateral connections to new sewers shall be made with Wye fittings, installed as the sewer pipe is laid.
- B. Service lateral connections to existing sewers shall be made by "Tap-Tite" method, or with approved "Sealtite" type saddle fittings which utilize neoprene gasket seals and stainless steel bands, or equal.

PART 3 - EXECUTION

3.1 GENERAL

- A. All laying, jointing, testing for defects and for leakage shall be performed in the presence of the ENGINEER, and shall be subject to its approval before acceptance. All material found during the progress to have defects will be rejected and the CONTRACTOR shall promptly remove such defective materials from the site of the WORK.

3.2 TRENCHING AND BACKFILL

- A. Trench excavation and backfill shall conform to the requirements of Section 312324 "Trench Excavation and Backfill" and as specified herein.

3.3 PIPE LAYING

- A. The pipe shall be installed in conformance with the requirements of ASTM D 2321, as specified herein and as shown on the Drawings. The pipe sections shall be closely jointed to form a smooth flow line. Immediately before placing each section of pipe in final position for connecting joints, the bedding for the pipe shall be checked for firmness and uniformity of surface.
- B. Proper implements, tools, and facilities as recommended by the pipe manufacturer's printed instructions shall be provided and used by the CONTRACTOR for safe and efficient execution of the work. All pipe, fittings, and accessories shall be carefully lowered into the trench by means of derrick, ropes, or other suitable equipment in such a manner as to prevent damage to pipe and fittings. Under no circumstances shall pipe or accessories be dropped or dumped into the trench.
- C. Cutting and machining of the pipe shall be accomplished in accordance with the pipe manufacturer's standard procedures for this operation. Pipe shall not be cut with a cold chisel, standard iron pipe cutter, nor any other method that may fracture the pipe or will produce ragged, uneven edges.
- D. Installation of pipes in prepared trenches shall start at the lowest point, with the spigot ends pointing in the direction of flow.
- E. The pipe and accessories shall be inspected for defects prior to lowering into the trench. Any defective, damaged or unsound pipe shall be repaired or replaced. All foreign matter or dirt shall be removed from the interior of the pipe before lowering into position in the trench. Pipe shall be kept clean during and after laying. All openings in the pipe line shall be closed with water tight expandable type sewer plugs or PVC test plugs at the end of each day's operation or whenever the pipe openings are left unattended. The use of burlap, wood, or other similar temporary plugs will not be permitted.

- F. Adequate protection and maintenance of all underground and surface utility structures, drains, sewers, and other obstructions encountered in the progress of the work shall be furnished by the CONTRACTOR at its own expense.
- G. Installation of Warning Tape shall be THOR ENTERPRISES, CALPICO, or equal. Tape to hold the wire in place shall be pipe wrap tape, 2 inches wide, 10 mil.

3.4 PIPE HANDLING

- A. Handling of all pipe shall be done with care to insure that the pipe is not damaged in any manner during storage, transit, loading, unloading, and installation.
- B. Pipe shall be inspected both prior to and after installation in the trench and all defective lengths shall be rejected and immediately removed from the working area.

3.5 PVC FIELD JOINTING

- A. Each pipe elastomeric-gasket joint shall be installed in conformance with the manufacturer's printed recommendations. Elastomeric Gaskets shall conform to ASTM D3212.
- B. The ring and the ring seat inside the bell shall be wiped clean before the gasket is inserted. Lubricant other than that furnished with the pipe shall not be used. The end of the pipe shall be then forced into the ring to complete the joint.
- C. The pipe shall not be deflected either vertically or horizontally in excess of the printed recommendations of the manufacturer.
- D. When pipe laying is not in progress, the open ends of the pipe shall be closed to prevent trench water from entering pipe. Adequate backfill shall be deposited on pipe to prevent floating of pipe. Any pipe which has floated shall be removed from the trench, cleaned, and re-laid in an acceptable manner. No pipe shall be laid when, in the opinion of the ENGINEER, the trench conditions or weather are unsuitable for such work.

3.6 FITTINGS

- A. All fittings shall be installed utilizing standard installation procedures. Fittings shall be lowered into trench by acceptable means without damage to the fittings. Fittings shall be carefully connected to pipe or other facility, and joint shall be checked to insure a sound and proper joint.

3.7 SANITARY SEWER CLEANOUTS

- A. Where indicated in plans, install two-way Sanitary Sewer Clean outs on 4 inch sanitary sewer laterals. Clean outs shall be cast iron ANACO, Two-Way Combination Clean-out; American Brass and Iron; or equal. Sanitary sewer cleanouts on 6 inch and larger pipe shall be a combination Wye and 1/8th bend, ANACO; American Brass and Iron; or equal.

3.8 TESTING

- A. Testing Requirements
 1. Conduct a mandrel test to ensure that the line is free of obstructions subsequent to the placing of intermediate backfill material over the line.
 2. Upon completion of the test and determination that the line is free of obstructions, plug, cap or otherwise close the open end or ends of the installed piping to prevent the entrance of debris into the lines.
 3. Supply all tools, equipment, and water necessary to make all tests.
 4. Flush all sewer lines prior to testing and accumulated materials shall be removed at each manhole and no materials shall be allowed to enter the existing sewer system.
 5. The Contractor shall be responsible for making all necessary arrangements with the jurisdictional sanitary utility owner for performing and witnessing the required tests.

- B. Sanitary Sewer Pipeline Tests
1. Perform air test on all installed sanitary sewer pipes upon completion of backfill.
 2. Test all sewers 24" or less in diameter with low pressure.
 3. Sewers with a diameter greater than 24 inches may be tested by visual inspection.
- C. Low Pressure Air Test (Gravity Pipe)
1. Clean set sections of pipe to be tested before starting air test.
 2. Plug pipe outlets with pneumatic plugs capable of resisting internal testing pressures without requiring external bracing.
 3. Immediately following pipe cleaning and wetting, slowly supply air to plugged pipe until internal air pressure reaches 5 psi. Allow at least two minutes for temperature to stabilize before proceeding, except slowly add air to maintain a minimum of 4.5 psig but less than 5 psig pressure. While temperature is stabilizing, spray plugs, pipes, and hoses with soap solution and eliminate air leaks.
 4. After temperature has stabilized, measure time required (10 minute min.) for pressure to drop of 1 psig so that the pressure at the end of the test is at least 3.5 psig. If measured time exceeds allowable time, pipe will not be accepted.
 5. Time, in seconds, for pressure to drop from 4.5 to 3.5 psig shall be not less than the following; time for intermediate lengths shall be interpolated:

Length	Pipe Diameter, Inches						
	8	10	12	15	18	21	24
Pipe (Ft)	8	10	12	15	18	21	24
25	18	28	40	62	89	121	158
50	35	55	79	126	178	243	317
75	53	83	119	186	267	364	475
100	70	110	158	248	356	485	634
125	83	138	198	309	444	595	680
150	110	165	238	375	510	595	680
175	123	193	277	425	510	595	680
200	141	220	317	425	510	595	680
225	158	248	340	425	510	595	680
250	176	275	340	425	510	595	680
275	194	283	340	425	510	595	680
300	211	283	340	425	510	595	680
350	227	283	340	425	510	595	680
400	227	283	340	425	510	595	680

END OF SECTION

SECTION 334000
STORM DRAINAGE SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Furnish and install all structures, piping, fittings, and accessories, and perform all earthwork, grading, adjustments of inlets and flushing of all existing systems as shown on the Drawings, described in these specifications, and as required to construct a complete and operable storm water runoff drainage system.

1.2 REFERENCES

- A. American Association of State Highway and Transportation Officials (AASHTO)
- B. State of California, Department of Transportation, Standard Specifications (Standard Specifications) Current Edition.
- C. Standard Specifications for Public Works Construction written by the Southern California Chapter, American Public Works Association

1.3 SUBMITTALS

- A. Submit the following in the Product Information category.
 - 1. Shop Drawings: Submit detailed drawings and specifications on all precast drop inlets, junction boxes and accessories, including gratings, covers and frames.

1.4 QUALITY ASSURANCE

- A. All products and materials furnished under this Section shall be of a manufacturer who has been regularly engaged in the design and manufacture of said products and materials for a period of at least 5 years. If the product of an alternate supplier is proposed, it shall be demonstrated to the satisfaction of the Owner's Representative to be of a quality and serviceability equal to the product made by the manufacturer specifically named herein.
- B. The Owner will inspect and verify percent of slope.

PART 2 - PRODUCTS

2.1 PRECAST DRAIN INLETS, GRATES AND FRAMES

- A. Drain Inlets and Junction Boxes: Precast concrete structures, sizes appropriate designed to withstand an AASHTO H-20 loading. Provide interlocking joints where depth requires more than one unit. Minor variations from the drawings may be accepted to permit the use of manufacturer's standard methods of fabrication. Manufacturers: Santa Rosa Cast Products Company; Christy; or equal. Contractor shall be responsible for field verifications for sizing of all storm drain elements.

2.2 STORM DRAINAGE SYSTEM PIPES

- A. Polyvinyl Chloride Pipe (PVC):
 - 1. Pipe and Fittings: Polyvinyl chloride sewer pipe: Less than 12 inches nominal size: ASTM D3034, SDR 26.
 - 2. Joints: Elastomeric gasket joints, ASTM D3212.
 - 3. Gaskets: Submit two sample gaskets with an explanation of the markings.
- B. High Density Polyethylene Pipe (HDPE): PE 4710, Pressure Class 160, DR 13.5, conforming to AWWA C906. Driscoplex 4000/4100, or approved equivalent.

- C. Perforated Pipe: PVC conforming to ASTM D2729 or HDPE SDR 17 conforming to AWWA C906. Perforations shall be 2 rows of ½” holes on 5” centers, 120° apart, or as approved by the Engineer.
- D. Inlets
 - 1. Grates and frames shall be ADA compliant, bicycle-proof and supplied by the manufacturer of the catch basin and be matched to the Drain Inlet.
- E. Pop-up Emitters
 - 1. NDS (size per plan), green, or as approved by the Engineer

PART 3 - EXECUTION

3.1 CLEANING

- A. Thoroughly clean the inside of each existing piping system of all dirt, loose scale, sand, and other foreign material. Cleaning shall be by sweeping, flushing with water, or blowing with compressed air, as appropriate for the size and type of pipe. Flushing shall achieve a velocity of at least 3 feet per second. Contractor shall be responsible for collection and disposal of all debris gathered from cleaning operations.

3.2 FIELD TESTING

- A. Perform leakage tests on all pipe installed in this project. Water exfiltration test or air pressure test in accordance with Section 306-1.4 of the Standard Specifications for Public Works Construction written by the Southern California Chapter, American Public Works Association, et al.

3.3 INSTALLATION OF PRECAST DRAIN INLETS

- A. Install drain inlets, level and set to grade, on a 6-inch sand or gravel leveling course, compacted to 95% relative density. Grout firmly in place to form a tight seal.
- B. Install trench drain level and set to grade as indicated in plans. Grout firmly in place to form a tight seal.

END OF SECTION

SECTION 334101
LANDSCAPE DRAINAGE

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Drain Rock.
 - 2. Geotextile Fabric.
 - 3. Pipe and Fittings.
 - 4. Trench Drain and Frame.
 - 5. Paving Area Drain Cover.
 - 6. Planting Area Drain Cover.

- B. For Trenching and Backfilling, see Section 312333.

- C. For Landscape Maintenance Period, see Section 320100.

- D. For Site Concrete, see Section 321316.

- E. For Irrigation, see Section 328400.

- F. For Soil Preparation and Soil Mixes, see Section 329113.

- G. For Planting Area Finish Grading, see Section 329119.

- H. For Plant Material, see Section 329300.

- I. For Site Storm Drainage Utilities, see Section 334000.

1.2 DEFINITIONS

- A. Acceptance: Wherever the terms “acceptance” or “accepted” are used herein, they mean acceptance of Owner’s representative in writing.

- B. PVC: Polyvinyl Chloride.

- C. SDR: Standard Dimensional Ratio.

1.3 REFERENCES

- A. ASTM — American Society for Testing and Materials:
 - 1. D 698 — Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort. Most current edition.
 - 2. D 1557 — Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort. Most current edition.
 - 3. D 2729 — Specification for PVC Sewer Pipe and Fittings. Most current edition.
 - 4. D 3034 — Specification for Type PSM PVC Sewer Pipe and Fittings. Most current edition.

5. F 679 — Specification for PVC Large-diameter Plastic Gravity Sewer Pipe and Fittings. Most current edition.
- B. Caltrans Standard Specifications – Most current edition.

1.4 SUBMITTALS

- A. Product Data:
1. Pipe and Fittings.
 2. Geotextile Fabric.
 3. Paving Area Drain.
 4. Planting Area Drain.
 5. Trench Drain and Frame.
 6. Drain Rock.
- B. Shop Drawings:
1. Provide shop drawings for Trench Drain, Trench Drain Grates and Paving Area Drain. Show shop and erection details, to scale, including dimensions, sizes, thicknesses, gauges, finishes, joining, segments, joints, attachments, holes, welds, bolts, elevations and relationship of work to adjoining construction. Prepare details at not less than 3 inches = 1 foot.
 2. Where items must fit and coordinate with finished surfaces and/or constructed spaces, take measurements at site and not from the Drawings.
 3. Indicate welded connections using AWS A2.0 welding symbols.
- C. Samples:
1. Trench Drain Frame and Grates, 12 inches in length.
- D. Record Documents:
1. Maintain on the construction site a record of materials and equipment installed each day.
 2. Daily record information neatly to scale, on full-size prints of the irrigation construction documents.
 3. Include changes, substitutions, and manufacturer's names and catalog numbers for materials and equipment.
 4. Show actual locations of drains, grates, clean-outs and piping.
 5. Show dimensions from easily-identifiable permanent structures such as walls, curbs, buildings or walks.
 6. Procure reproducible sepia mylars of the current construction documents from the Owner's representative.
 7. After Work completion, transfer information noted on prints to the reproducible mylars and submit to the Owner's representative for review of general information content (Owner's representative will not be responsible for errors or omissions).
 8. Contractor shall be responsible for accuracy of information and errors or omissions.
 9. If first submittal is not accepted by Owner's representative, resubmit until accepted.
 10. Submit accepted final record documents to Owner.

1.5 QUALITY ASSURANCE

- A. Contractor Qualifications:

1. Have successfully installed landscape drainage similar to the quality specified for a period of not less than 5 years.
 2. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.
- B. Regulatory Requirements: Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Storage:
1. Store products with protection from weather or other conditions which would damage or impair the effectiveness of the product.
 2. Protect PVC pipes and fittings from direct sunlight.
 3. Store pipe on beds equal to or longer than pipe.

1.7 SITE CONDITIONS

- A. Environmental Requirements:
1. Lay and join pipe in dry trenches.
- B. Existing Conditions:
1. Prior to Work commencement review locations of existing public underground utilities and structures with appropriate utility companies and clearly mark in field.
 2. Prior to Work commencement review location of existing private underground utilities and structures with Owner and clearly mark in field.
 3. Prior to Work commencement and after reviewing the Owner's record irrigation documents, review and clearly mark in field heads, valve boxes and other underground equipment, materials and structures.

1.8 WARRANTY

- A. General Description: In addition to manufacturer's warranties, warrant Work for a period of one year from date of Final Completion against defects in materials and workmanship.
- B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship and trench backfill settlement.
- C. Exceptions: Contractor shall not be held responsible for failures due to ordinary wear, neglect by Owner, vandalism, and other causes outside the Contractor's control.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

- A. Plastic catch basins, planting area drains and grates:
1. National Diversified Sales (NDS) – <http://www.ndspro.com>.

2. Or accepted equal.
- B. Geotextile fabric:
1. Mirafi – www.tcmirafi.com.
 2. Carthage Mills – www.carthagemills.com.
 3. Or accepted equal.
- C. Worm drive hose clamps:
1. McMaster-Carr Supply Company – <http://www.mcmaster.com>.
 2. Or accepted equal.
- D. Vehicular Rated Trench Drains:
1. Urban Accessories – www.urbanaccessories.com.
 2. Or accepted equal.
- E. Vehicular Rated Paving Area Drain:
1. Urban Accessories – www.urbanaccessories.com.
 2. Or accepted equal.
- F. Flexible Couplings:
1. Fernco Inc., Sparks – <http://www.fernco.com>.
 2. Or accepted equal.

2.2 MATERIALS

- A. Perforated and Solid Non-perforated Pipe:
1. ASTM D 3350 Cell, Classification 324420C
 2. ASTM D 1248 Type III, Class C, Category 4, Grade P33
 3. AASHTO M252 double-wall, corrugated, HDPE, smooth-interior wall.
 4. Or equal.
- B. Perforated and Solid Corrugated Pipe Fittings:
1. ASTM F 405, HDPE.
 2. Or equal.
- C. Saddle Fitting for Connections to HDPE Pipe:
1. Fittings recommended by HDPE pipe manufacturer.
 2. Or equal.
- D. Couplings for Cast-iron Area Drain Pipe to Solid Pipe:
1. Fernco flexible coupling as recommended by pipe manufacturer.
 2. Or equal.
- E. Plastic Planting Area Drains:
1. Type: Round flat grates
 2. Color: Black
 3. Quantity: See Drawings
- F. Vehicular Rated Trench Drain and frame:
1. Type: Jamison (7" x 36")

2. Metal: Cast Ductile Iron
3. Finish: Rust Conditioner
4. Or accepted equal

G. Vehicular Rated Area Drain:

1. Type: Slot T-24 (5 1/4" DIA, 8" DIA, See Plans)
2. Metal: Cast Ductile Iron
3. Finish: Rust Conditioner
4. Quantity: See Drawings
5. Or accepted equal.

H. Geotextile Fabric:

1. Mirafi 140 NC (for California Clay Soils – for tree subdrainage and french drains)
2. Or accepted equal.

I. Drain Rock:

1. Crushed clean pea gravel, 1/4-inch diameter.

J. Cleanout for Planting Areas:

1. Schedule 80 female adaptor with brass male pipe thread plug.

K. Sand Backfill: Durable particles, free of thin or elongated pieces, lumps of clay, soil, loam or vegetable matter, with the following particle size gradation:

Sieve Size (Square)	Percent Passing
4	100
16	80-100
50	20-60
100	10-40
200	0-10

L. Granular Embedment:

1. Free flowing sandy material which contains no clay, reasonably free of organic material.

M. Planting Area Backfill for Upper 12 Inches:

1. Upper 12 inches of soil excavated from trenches stockpiled separately on site.

N. Water for Sprinkling Backfill:

1. Clean, potable.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protection:

1. Use every possible precaution to prevent damage to existing conditions to remain.
2. Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.
3. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
4. Submit written notification of conditions damaged during construction to the Owner and Owner's representative within 2 working days of observed damage and before damage is covered.

3.2 TRENCH EXCAVATION

A. Excavation:

1. In planting areas excavate and stockpile separately upper 12 inches of soil to be used later for backfilling upper 12 inches of trenches in planting areas.
2. Pile materials suitable for back-filling a sufficient distance from banks of trenches to prevent slides or caveins.
3. Coordinate trench excavation with pipe installation to avoid open trenches for prolonged periods.
4. Excavate width of the trench to provide adequate space for workers to place and joint the pipe or culvert properly, but hold the clear space between the barrel of the pipe and trench wall to the minimum required for a satisfactory installation.
5. Excavate trench to width necessary for sheeting and bracing and proper performance of the Work.
6. Accurately grade bottom of trenches to provide uniform bearing and support for each section of pipe on undisturbed soil or the required thickness of bedding material at every point along its entire length, except for portions of pipe sections where it is necessary to excavate for bell holes and for proper making of pipe joints.
7. Dig depressions for joints after trench bottom has been graded and only 1/2 inch greater length, depth and width than the bell, as required for properly making the particular type of joint, and to insure that the bell does not bear on the bottom of the hole.
8. Over-cut with sand cushion may also be employed for pipe at Contractor's option.
9. Pile excavated material on one side only of trenches to permit ready access to and use of existing fire hydrants, valves, manholes and other utilities system appurtenances.
10. Remove and dispose of excavated materials not required or satisfactory for backfill.
11. Keep surface drainage of adjoining areas unobstructed.
12. Remove water by pumping or other accepted method and discharge at a safe distance from the excavation.

B. Unsatisfactory Fill:

1. When unsatisfactory fill incapable of properly supporting pipe is encountered in bottom of trench, notify Owner and soils engineer in writing.
2. Upon Owner approval, remove unsatisfactory fill to depth accepted by the soils engineer.
3. Backfill over-depths with material accepted by the soils engineer.
4. Compact over-depth fill material to 95 percent as determined by ASTM D 1557.
5. Back-filling of unauthorized overdepths shall be at the expense of the Contractor.

3.3 PIPE INSTALLATION

- A. Manufacturer's Requirements: Meet requirements of the manufacturer's current printed instructions.
- B. Pipe Laying:
 - 1. Furnish and place in position necessary batter boards, string lines, plummets, graduated poles, etc., required in establishing and maintaining the lines and grades.
 - 2. Protect batter boards and location stakes from possible damage or change of location.
 - 3. Begin laying of the pipe on the prepared foundation at the outlet or downstream end with the spigot or tongue end of the pipe joint pointing downstream and proceed toward the inlet or upstream end with each abutting section of pipe properly matched, true to the established lines and grades.
 - 4. Provide acceptable equipment for hoisting and lowering the sections of pipe into the trench without disturbing the prepared bedding foundation or the sides of the trench.
 - 5. Clean ends of the pipe carefully before the pipe is placed in the trench.
 - 6. As each length of pipe is laid, protect openings to prevent the entrance of earth or bedding material.
 - 7. Fit and match pipe so that when laid in the prepared bedding it will form a smooth, uniform conduit.
- C. Jointing: Meet requirements of pipe manufacturer's current printed instructions.

3.4 GEOTEXTILE FABRIC, DRAIN ROCK AND PERFORATED PIPE INSTALLATION

- A. Wrapped Drain Rock Around Perforated Pipe:
 - 1. Center fabric strip over trench.
 - 2. Overlap uphill fabric edges over downhill fabric edges a minimum of 12 inches.
 - 3. Install drain rock and pipe as shown on Drawings.
 - 4. After drain rock is installed, fold fabric over top of drain rock with minimum 12 inch overlap.
 - 5. Attach fabric ends to pipe as shown on the Drawings.
 - 6. Immediately backfill 2 inches depth sand layer on lapped fabric.

3.5 TRENCH BACK-FILLING OVER SOLID PIPE

- A. General Backfill:
 - 1. Coordinate backfilling with testing of utilities.
 - 2. Where damage is likely to result from withdrawing, leave sheeting in place and cut off a minimum of 24 inches below finished grade.
 - 3. Carefully backfill trenches with granular backfill and deposit in 9 inch maximum layers, loose depth.
 - 4. Bring up granular backfill material evenly on both sides of pipe for its full length and thoroughly and carefully compact until pipe has a cover of not less than 1 foot.
 - 5. Reopen trenches and excavation pits improperly backfilled, or where settlement occurs, to the depth required to obtain the specified compaction, then refill and compact, and restore the surface to the specified grade and compaction.
- B. Backfill Under Paving:
 - 1. Backfill as specified above for general backfill, except that remainder of trench above the granular backfill material shall be backfilled with field sand in 6 inch maximum layers, and

each layer moistened and compacted to 95 percent of the maximum density obtained at optimum moisture as determined by ASTM D 1557.

2. Backfill to permit the rolling and compaction of the filled trench with the adjoining material to provide the required bearing value so that paving of the area can proceed immediately after backfilling is complete.

C. Backfill in Planting Areas:

1. Backfill as specified above for general backfill except bring granular fill up to 12 inches below finish grade.
2. Compact granular fill to a maximum 75 percent as determined by ASTM D 1557.
3. Backfill upper 12 inches with stockpiled soil from upper 12 inches of trench excavation.
4. Settle upper 12 inches of soil by sprinkling with minimum 2 inches of water.

3.6 FIELD QUALITY CONTROL

- A. Field Observation Reviews by Owner's representative: Coordinate and schedule with Owner's representative.

3.7 CLEANING

- A. General: Clean and keep clean until Owner accepts maintenance.

1. Executive Summary

The Red Car Analytics Commissioning Team has developed this Commissioning Plan to provide direction on the commissioning process and scope of commissioning, defining related activities and team responsibilities. The Plan includes definitions of commissioning terms, descriptions of commissioning processes, a comprehensive team directory, detailed information on roles and responsibilities, project and system descriptions, lists of documents related to commissioning, commissioning schedule milestones, coordination and communication protocols, and resolution pathways and procedures. It describes the scope, approach, time frame, responsibilities, and technical requirements for the commissioning activities.

The Commissioning Authority (CxA) is Red Car Analytics.

1.1. Abbreviations

A/E	Architect & Design Engineers	IC	Irrigation Contractor
BAS	Building Automation System	IOM	Installation and Operations Manuals
BOD	Basis of Design	IOR	Inspector of Record
CC	Controls Contractor	MC	Mechanical Contractor
CM	Construction Manager	MEP	Mechanical Electrical Plumbing
Cx	Commissioning	O&M	Operations and Maintenance
CxA	Commissioning Authority (Red Car)	OPR	Owner’s Project Requirements
CxC	Commissioning/MEP Coordinator (GC)	OR	Owner’s Representative
EC	Electrical Contractor	PC	Project Coordinator
EOR	Engineer of Record	PM	Project Manager
FM	Fire Marshal	SOO	Sequence of Operation
FPT	Functional Performance Test	TAB	Test-Adjust-Balance
GC	General Contractor		

1.2. General Project Information

Project:	Laney Library and Learning Resource Center
Location:	Oakland, CA
Building Certification:	targeting LEED NC v4 Certification
Total Square Footage:	73,746 gsf
Construction Period:	Nov 2021 to Nov 2023

2. Commissioning Team Roles and Responsibilities

The Commissioning Authority (CxA) reports results, findings, and recommendations directly to the Owner. In general, the CxA shall coordinate the commissioning activities directly with the design team and the MEP coordinator (CxC), and shall distribute reports to the General Contractor, Project Manager, Architect/Engineers, and Commissioning Coordinator. The design team roles and responsibilities are identified in this Cx Plan. The contractors’ commissioning responsibilities are detailed in the project specifications and this Cx Plan.

Where items in this plan differ from the specifications, the CxC shall bring these issues to the attention of the Owner’s Representative and the Commissioning Authority for resolution.

2.1. Commissioning Team Directory

Name	Company	Role	Phone	email
Greg Cheifetz	Peralta Community College	Owner		
Eric Skiba	Noll & Tam	Architect	510.542.2200	eric.skiba@nollandtam.com
Gavin Ross	Noll & Tam	Architect	510.542.2260	gavin.ross@nollandtam.com
Anna de Anguera	Cavagnero	Architect	510.499.6427	annad@cavagnero.com
Angela Wisely	Brightworks	Sustainability Consultant	415.230.2136	angela.wisely@brightworks.net
Glenn Friedman	Taylor Engineering	Mechanical & Plumbing Engineering	510.220.5895	gfriedman@taylor-engineering.com
Joe Arnstein	Taylor Engineering	Mechanical & Plumbing Engineering	704.582.2081	jarnstein@taylor-engineering.com
Stefan Gracik	Alter Engineering	Energy Modeling	724.968.6938	stefan@alterengineers.com
Paul Carey	O’Mahony & Myer	Electrical Engineering	415.218.0629	pcarey@ommconsulting.com
Sean Henderson	Mantlela	Landscape/Irrigation Engineering	513.532.4685	sean@mantlela.com
Michele Sagehorn	Red Car Analytics	Commissioning Authority	707.591.4555	michele@redcaranalytics.com

2.2. General Descriptions and Responsibilities

General descriptions of the commissioning roles are as follows:

Owner or Owner's Representative (OR)

- Oversees the work of the CxA
- Assists the CxA with directing the project team
- Provides final approval and sign-off of Cx Plan
- Responsible for the development of the Owner's Project Requirements document
- Arbitrate disagreements between the CxA and others

Commissioning Authority (CxA)

- Defines the project specific scope and requirements of commissioning
- Develops and oversees the Commissioning Plan and related activities
- Assists the team with implementation of the Commissioning Plan
- Advises the Owner on acceptance of design, construction and commissioning

Architect

- Assists Owner in development of the Owner's Project Requirements document
- Coordinates/Manages submittal documents
- Provides resolution to design-related issues
- Participates as needed in commissioning process

Engineers

- Provides Basis of Design document
- Completes and signs T24 Commissioning Design Checklist Compliance forms
- Reviews submittals and provides comments
- Provides clarifications to design intent
- Provides resolution to design-related issues
- Participates as needed in commissioning process

General Contractor (GC)

- Provides a competent person in the role of MEP Coordinator (CxC)
- Provides coordination with subcontractors for all commissioning related activities
- Incorporates commissioning activities into the master construction schedule
- Directs subcontractors to provide resolution to construction issues
- Notify the commissioning agent of any change orders that may affect commissioned systems
- Coordinates owner training with subcontractors and commissioning agent
- Assists in resolving any warranty issues raised during the End-of-Warranty Review

MEP Coordinator of the GC (CxC)

- Acts as the representative of the construction team and main point of contact for the CxA
- Delegates commissioning tasks to the subcontractors
- Coordinates and manages subcontractors and commissioning schedule
- Collects, assembles and manages commissioning documentation from subcontractors
- Works with subcontractors to correct installation/commissioning deficiencies as quickly as possible
- Provides support for functional testing as needed

MEP Subcontractors (Subs)

- Reviews and comments on multiple releases of the Cx Plan
- Provides competent personnel to execute commissioning tasks
- Coordinates with GC on scheduling of commissioning tasks and potential conflicts
- Demonstrates and documents approved installation and operation of equipment
- Assists the team to provide resolution to construction issues
- Coordinates with equipment vendors for proper documentations and procedures

TAB Subcontractor

- Coordinates with the commissioning team in the weeks prior to balancing
- Completes air and water balancing, per AABC or NEBB requirements and project specifications
- Provides a field copy to CxA prior to functional testing
- Identifies and reports on issues discovered in the field while balancing
- Demonstrates TAB results to CxA during Functional Performance Tests
- Coordinates with MEP Coordinator and CxA for resolution to issues

Controls Subcontractor (CC)

- Performs all the tasks of MEP Subcontractors as listed above
- Provide Point-to-Point checks and calibration of all sensors prior to FPTs
- Provide point trends and assistance with remote access to building automation system
- Provide a person capable of demonstrating Functional Performance Test scripts and proper system operation
- Provide list of all schedules, set points, and alarms

Equipment Vendors

- Provides documentation on furnished equipment, including complete submittals, equipment data, installation manuals, O&M manuals, start-up procedures, and warranties

2.3. Project Management Protocols

The following protocols will be used on this project:

- The CxA will communicate directly to the appropriate party and inform both the OR and CxC
- Deficiencies found during testing shall be corrected by the contractor within 7 days of receiving an Issues Log from the CxA
- Resolution of minor deficits during Functional Performance testing may be permissible, as determined by the CxA at the point when the deficient are found
- Problem solving: The CxA may recommend solutions to problems, however the burden of responsibility to solve, correct and retest problems is with the contractor
- The OR shall arbitrate disagreements between the CxA and others.

Issue	Protocol
Requests for information or formal documentation requests:	The CxA goes through the architect, engineer, or CxC.
Minor or verbal information and clarifications:	The CxA communicates directly to the informed party and informs the CxC.
Notifying contractors of significant deficiencies:	The CxA documents and communicates deficiencies through the CxC and OR. The CxA may discuss deficiency issues with contractors on an informal basis and will immediately notify the CxC or GC.
Scheduling commissioning meetings:	The CxA coordinates with the CxC. The CxC will coordinate meeting attendance for all required parties and will provide advance notification to the CxA.
Making a request for significant changes:	The CxA has no authority to issue change orders or construction directives. Any actions or observations of the CxA that might result in changes to the contract documents shall be approved by the PM and the design team will issue the changes.
Making small changes in specified Sequences of Operation (SOO)	The CxA notifies A/E of suggested change, which, if approved, is then implemented via RFI. Implemented changes in the SOO shall be documented by the CC in the as-built records, will become part of the O&M/ Systems Manuals, and the CC will notify the CxC and OR of the change in writing.
Making small changes to correct deficiencies	The CxA may request small changes to correct deficiencies from the responsible contractor. The CxA will immediately inform the GC's CxC of any such request. The respective contractor will be required to notify the CxC of the deficiency and correction.
Subcontractors disagreeing with requests or interpretations by the CxA	The OR will arbitrate disagreements between the CxA and others.

2.4. Project Management Protocols

The CxA will use a platform to store and share the commissioning documents, so that they can be viewed/downloaded at any time by all commissioning team members. The platform used will be either **Microsoft sharepoint or box**, where specific folders will be organized to make it easy to find the essential documents (e.g. – current version cx plan, etc.).

Red Car Analytics uses a cloud based program to document and maintain the commissioning issue logs (design/construction). The use of this program is simple and requires no password or special software, only the participants' email. The issue log(s) are essentially an excel spreadsheets, but allows parties to collaborate and to always have access to the latest update. The software also allows attachments to be stored and tracked with the associated issue. The use of this software allows for more detail and history that may prove useful to the owner or operator of the building.

3. Systems to be Commissioned

The following systems and equipment will be commissioned in this project. All general references to equipment in this document refer only to systems and equipment that will be commissioned.

Mechanical

- HVAC System & Controls
- Air Handling Unit(s)
- Hydronic Pump(s)
- VAV Terminal Unit(s)
- Building fan(s)
- Building Management System/Controls

Plumbing

- Domestic HW System

Electrical/Lighting

- Lighting and Controls

Miscellaneous

- Irrigation/Irrigation Controls

4. Commissioning Process – Design Phase

The general sequence of Cx tasks and timing within the design schedule is shown below. The Architect and/or General Contractor are responsible to include commissioning tasks into the design and construction schedules and organize the participants.

Commissioning Schedule	Schematic Design	Design Development	Construction Documents	Bidding and Contract Award
Cx Review/Kickoff Meeting	[Red bar spanning Schematic Design, Design Development, and Construction Documents]			
Verify Owner Project	[Red bar spanning Schematic Design, Design Development, Construction Documents, and Bidding and Contract Award]			
Basis of Design	[Red bar spanning Schematic Design, Design Development, Construction Documents, and Bidding and Contract Award]			
Develop Cx Plan		[Red bar spanning Design Development, Construction Documents, and Bidding and Contract Award]		
LEED Design Review	[Red bar spanning Schematic Design, Design Development, Construction Documents, and Bidding and Contract Award]			
Title 24 CXR-E Design Review		[Red bar spanning Design Development, Construction Documents, and Bidding and Contract Award]		
Cx Specifications		[Red bar spanning Design Development, Construction Documents, and Bidding and Contract Award]		
Controls Integration Meeting		[Red bar spanning Design Development, Construction Documents, and Bidding and Contract Award]		
Development of Training Requirements		[Red bar spanning Design Development, Construction Documents, and Bidding and Contract Award]		
Development of System Manual Content		[Red bar spanning Design Development, Construction Documents, and Bidding and Contract Award]		

[Red bar] MEP Cx

4.1. Title 24 Cx Schematic Design Kickoff Meeting

Title 24-2013 requires a meeting in early Schematic Design between the owner, Cx Design Reviewer, and the design team. The intent of the meeting is to lay out the process and timing for the design review(s) and provide the team with the Title 24 forms. It is recommended that the facility manager and/or facility mechanics participate in the design phase.

4.2. Owner's Project Requirement

Identifying and documenting the project's design intent, or Owners Project Requirements, provides the design and construction teams with an understanding of the design goals for the project. The OPR is used to evaluate the design and construction efforts, assuring the goals are met, as well as helping to develop Functional Performance Tests. The OPR is developed by the CxA with guidance from the owner/owner representative at the beginning of the project. It is a living document and should be updated throughout the project. The CxA reviews the OPR for clarity and completeness.

The OPR should be documented during programming or schematic design, including:

- Energy efficiency goals
- Ventilation requirements
- Project program, including facility functions and hours of operation, and need for afterhours operations
- Equipment and systems expectations

4.3. Basis of Design

The Basis of Design documents the thought processes and assumptions behind design decisions and is meant to show compliance with the OPR. The Basis of Design includes general information about the project, as well as specific technical design information about the proposed equipment and systems. This includes HVAC load calculations, overview of the sequence of operations, assumptions about temperature, light, hours of occupancy, etc. Plumbing and electrical BOD are developed to indicate how the domestic hot water and lighting controls are integrated into the building as well. This document may also be used during functional testing to confirm the design strategy and to help troubleshoot issues that may arise.

4.4. Commissioning Plan

The Commissioning Plan (Cx Plan) is the roadmap for all activities related to Title 24 2013 and LEED commissioning. Commissioning begins during early design and continues through construction and into the post-occupancy period; therefore this document is intended to provide requirements for both design and construction teams. A preliminary Cx Plan is developed during the early design phase and updated by the CxA as needed throughout the project.

4.5. Commissioning Design Review

A review of the project's design drawings and specifications is performed as a part of the commissioning requirements prior to the completion of Construction Documents. An initial review is initiated at mid-construction documents, with a back-check in subsequent issues. These reviews are conducted by the CxA, as a consultant to the owner, but not as the Engineer of Record. Issues related to the design must ultimately be resolved by the Engineer of Record.

The review focuses on the functionality of the systems, completeness and coordination of the drawings and specifications, maintainability of the systems, and overall compliance with the OPR and BOD. A Design Issue Log is maintained by the CxA to track all issues, responses, and actions related to commissioning. A/E members shall provide a written response to items found in the Design Issues Log.

4.6. Title 24 Code Design Review

There is a compliance form that are required by code to be submitted to the building department when filing for a building permit. The initial in-person design review meeting is to be held during the schematic phase of design. The owner, design team representatives (including the project architect and mechanical and electrical design engineers), and Design Reviewer meet to discuss the following:

- Project coordination, including involvement with the Design Reviewer
- Project scheduling, including design review
- Project scope
- Owner's Project Requirements
- Basis of Design
- Design elements and assumptions
- HVAC system selection
- Construction Documents Design Review checklists
- Energy efficiency measures

At the 90% CD phase, drawings and specifications are provided to the Design Reviewer, who reviews the construction documents using form NRCC-CXR-E. The Design Reviewer reviews the construction documents for clarity, completeness, and adherence to the owner's goals.

The NRCC-CXR-E acknowledges the design review has been executed, with signatures from the responsible engineer(s), and Design Reviewer. The form is provided to the Architect and placed on drawings to be submitted with the application for the building permit.

4.7. Commissioning Specifications

Commissioning specification language is incorporated into the construction documents. Section 019113 in Division 1 is dedicated to the General Commissioning Requirements. This language communicates commissioning roles and responsibilities to the construction team including the following:

- Components and systems that are commissioned
- Parties involved and their respective responsibilities for the commissioning process
- Commissioning schedule management
- Issue and non-compliance management
- Submittal review requirements and approval
- Definition of terms
- Scope and rigor of the start-up process, including responsibility for developing and executing startup checklists, and for the approval of these documents
- Scope and rigor of Functional Performance Testing, including responsibility for writing, executing, witnessing, and signing-off the tests
- Operations and Maintenance documentation requirements
- Training requirements for facility staff and building users (or Owner's representatives?)
- System manual requirements

4.8. Development of the System Manual

The CxA shall develop and outline the requirements of the Systems Manual with input from the Owner. The Systems Manual provides future operating staff with the information needed to understand and optimally operate the commissioned systems. It provides Facilities staff with the information necessary to monitor, maintain, and optimize system operations on an ongoing basis, and aids in the long-term success of building operations' energy efficiency strategies according to the design intent. The Systems Manual will be updated after Functional Performance Tests are complete, and within ten (10) working days of receiving as-built BAS drawings, Sequences of Operation, and other documentation from the CxC.

The Systems Manual will include the following documentation submitted by the CxC:

- 1) System Single Line Diagrams
- 2) As-built Sequences of Operations, control drawings, and as-built setpoints
- 3) Operating instructions for integrated building systems
- 4) Recommended schedule of maintenance requirements and frequency, if not included in the project O&M manuals
- 5) Recommended schedule for calibrating sensors and actuators
- 6) Basic Operation:
- 7) Written narrative of equipment operation
- 8) Interfaces, interlocks and interaction with other equipment and systems

4.9. Development of Training Requirements

The CxA shall review the training requirements and confirm that they meet the scope of the owner's requirements for the operator training. The training requirements must be completed before the bid documents are finalized, and be incorporated into the commissioning specifications as part of the bid package.

The training requirements shall include the following:

- List of those who should receive operational training, by position and name
- List of systems that require operator training
- Level of instruction required for each system
- Determination of whether the training provided by the equipment manufacturer is acceptable
- Tracking method to ensure that all required positions or persons receive training

4.10. Controls Integration

They are essentially a series of meetings that go over the project's control issues to enhance an understanding of the full sequences of control and interactions. When conducted during design, the meeting will reduce change orders and Requests for Information (RFIs). When conducted during design and again during submittal review in construction, the meetings will shorten the time required to program and reprogram the controls, perform testing and troubleshooting, and will enhance building operation and control for facility staff.

In design phase the meeting(s) include at minimum; the MEP engineers, controls contractor (if available), CxA, and owner representative. Discussion will include integration and interoperability issues between equipment, systems and disciplines to ensure that integration issues and responsibilities are clearly described in the specifications. The controls design as well as the sequence of operations for each system will be reviewed and clarified for all parties.

5. Commissioning Process – Construction Phase

The general sequence of Cx tasks and timing within the construction schedule is shown below.

Commissioning Schedule	Early Construction Phase	Installation	Start-up	Project Close-out	Post-Occupancy
Construction Team Kickoff Meeting	██████████	██████████	██████████		
Submittal Review	██████████	██████████	██████████	██████████	██████████
Controls Integration meeting	██████████				
Installation Verification Checklists or Mockup Performance Test Witness	██████████	██████████			
Equipment Start-up (Verification) or Witness Installation		██████████	██████████	██████████	██████████
Test and Balancing (Verification)		██████████	██████████		
Functional Testing		██████████	██████████	██████████	██████████
Owner Training / Verification		██████████	██████████	██████████	
Cx Report					██████████
Systems Manual					██████████
Post-Occupancy / Warranty Review			██████████	██████████	██████████

MEP Cx

5.1. Commissioning Kick-Off Meeting

A commissioning kick-off meeting shall be conducted by the CxA. In attendance shall be the respective representatives of the OR, GC, CC, PC, MC, EC, IC, TAB, and all subs installing equipment to be commissioned. At the meeting, the commissioning process will be reviewed, and management and reporting lines will be determined. The flow of documents will be reviewed, and process questions will be addressed. The general list of each party's responsibilities, including the development of the Installation Verification and Startup Checklists and Functional Performance Tests for each piece of equipment, deliverables, proposed commissioning schedule, training and close-out will be presented and finalized.

The intent of the meeting is to provide an understanding with all parties as to the project's commissioning process and their respective responsibilities. The CxA will develop meeting minutes and a list of action items to be distributed to all key participants.

5.2. Commissioning Schedule

The CxA shall develop an initial commissioning schedule. The CxC shall incorporate the Cx schedule into the overall construction schedule. The Cx schedule shall be updated and refined by the CxA as construction progresses.

The following sequential priorities will be followed in the development of the commissioning schedule:

1. Equipment is not temporarily started (for heating or cooling), until Installation Verification Checklist and Start-up checklist items and all manufacturers' pre-start procedures are completed, and moisture, dust and other environmental and building integrity issues have been addressed.
2. TAB is not performed until the envelope is completely enclosed and ceiling complete, unless the air is ducted.
3. The controls system and equipment it controls are not functionally tested until all points have been calibrated and Installation Verification Checklists have been completed.
4. Functional testing does not begin until Installation Verification Checklists, Start-up and TAB have been completed for a given system. This does not preclude a phased approach.

5.3. Submittals and Documentation

5.3.1. Submittals and Sequence of Approvals

Description	Responsible Party	Delivery
HVAC, DHW, Lighting Controls, Electrical, Renewable Energy Systems, Irrigation Systems		
Equipment Submittal	Subcontractors	Prior to ordering equipment
Manufacturer’s Installation and Operations Manuals	Subcontractors	8 weeks prior to startup
Single Line Diagram - showing equipment configuration	A/E or Subcontractor	8 weeks prior to startup
Sequence of Operations	A/E	Prior to construction (100% CD)
Startup & Installation verification Checklist - Draft Submittal	Subcontractors	8 weeks prior to startup
Procedure for piping, flushing and ductwork testing	MEP Sub	8 weeks prior to startup
Completed Startup & Installation Verification Checklists	Subcontractors	After Startup Checklist approval
Draft Functional Test Scripts for Team review	CxA	4 weeks prior to FPTs
Completed Controls Point-to-Point Checklist	BAS Sub	After Start-ups
Vibration/Sound Control Devices	MEP/TAB Sub	Provide report to CxA
Completed Piping, Flushing, Ductwork documentation	MEP Sub	After approval of procedures
Test and Balance Report-including vibration/sound requirements	TAB Sub	After approval of Completed Startup Checklists
Title 24 Acceptance Tests	Subcontractors	Prior to Functional Performance Tests
Functional Performance Tests (FPT)	Team	After approval of TAB Report
Response to Issues Logs	Team	As Issues are remedied
Training Agenda Submittal	Subcontractors	2 weeks prior to training
Training of Staff & Maintenance	Subcontractors	After Training Agenda approval
Training Log	GC	After Training is complete

5.4. Equipment Submittals

Equipment submittals are provided to the CxA at the same time as the EOR is reviewing the documents. The CxA will send all comments to the EOR several days prior to the architect's deadline. The EOR will review and merge the comments as necessary. It is the responsibility of the architect to incorporate all party's comments prior to returning the equipment submittal to the subcontractor. CxA review is based on adherence to contract documents, though may also have a focus on maintainability, access, and other functional aspects of the equipment.

5.5. Contractor Documentation

Once the equipment submittals are approved, each MEP subcontractor shall submit additional Contractor Documentation that is used in the commissioning process. These documents are to be provided as a package within 4 weeks of the approved submittals. Included in this package are the following:

5.5.1. Manufacturer's Installation and Operations Manual (IOM)

This manual generally can be downloaded from the manufacturer's website. The document may or may not be the same as the Operations and Maintenance Manual. It includes the recommended steps and procedures for proper installation, calibration, and configuration of the equipment. Include project Tag Numbers on all documents. Identify options that are being provided and/or cross out sections that are not appropriate to this project's installation.

5.5.2. Single Line Diagrams (SLDs)

Single line diagrams show equipment connections to integrated systems.

5.5.3. Sequence of Operations (SOO)

The contract documents generally contain the SOO, developed by the EOR. If this is not included in the drawing or specifications, the controls contractor (or subcontractor) submits the SOO to the EOR for review and approval.

Additionally, if there is a piece of equipment that is stand-alone or using its own internal controls; a sequence of operation is required from the manufacturer for that specific piece of equipment.

Other systems may finalize their sequence of operation during the submittal process. Such systems might include; Emergency Electrical/Security Protocols, Lighting systems, Automatic Shades, etc.

The SOO is a narrative describing the equipment and systems' startup, shutdown, capacity modulation, emergency and failure modes, alarms, and interlocks to other equipment. The CxA shall review and comment on the approved SOO and request clarifications and/or suggestions for all commissioned systems.

5.5.4. Installation Verification Checklists

These are the checklists that incorporate steps to install, configure, and calibrate the components of the equipment. Included are steps found in the manufacturer's recommendations, contract document requirements, and the contractor's standard procedures. These are sometimes references as Pre-Start, pre-checks, or pre-functional checks and are generally performed prior to the equipment being operated. They may be combined with the Start-up Checklists as long as all the procedures are incorporated.

5.5.5. Startup Checklists

Startup Checklists are designed to verify the equipment is configured and adjusted to comply with the manufacturer requirements and contract specifications. These steps include procedures involving the equipment's operational functions. Typically, pressure and temperature adjustments and verifications, modification of settings and schedules, and confirmation of functional operations are all part of the Startup Checklist. The contractor's standard Startup Checklist can be incorporated into these other requirements. If vendors are providing the startup, a copy of their checklist is required for review and acceptance. Ultimately, the subcontractor is responsible for the Startup procedures to be complete.

5.5.6. TAB Outline Plan

The CxC shall submit the outline of the TAB plan and approach prepared by the TAB contractor to the CxA and the BAS contractor at the same time when other submittals and contractor documentation is being processed. A full description of the procedures and the equipment to be verified, along with the design values, shall be provided.

A written explanation of the intended use and specific requirements of the BAS for the successful and timely completion of the TAB should be included in the plan. The EOR shall review and approve the plan. The CxA shall review the proposed plan for understanding and coordination issues and may provide comment, but is not responsible for approving the TAB plan.

5.6. CxA Reviews

The CxC shall submit equipment and contractor documentation provided by the manufacturer and developed by the installing contractor for review by the CxA. The CxA shall suggest additional startup procedures to be incorporated, based on contract documents and manufacturers recommendations.

5.7. Special Submittals and Notifications

5.7.1. Changes to Previous Submittals

The Subs, GC or A/E shall notify the CxA of any new design intent or operating parameter changes, modified control strategies or sequence of operation, or other change orders that may affect commissioned systems.

5.7.2. Controls Points List

The MEP EOR shall provide the CxA with a project specific full points list, at least thirty (30) days prior to performing the functional tests.

5.8. Controls Integration Meetings

The CxA, CxC, EOR, CC and OR (or Owner’s designated Facility Representative) will conduct controls integration meeting(s) in coordination with team members as appropriate, including the controls programmer for the project. The meetings shall occur after the software and database drawings are issued for initial review, but prior to the development of the database and code for any piece of equipment. The meetings shall discuss and clarify the following issues:

- Points database
- Sequence of Operation, setpoints, and schedules
- Functional interlocks
- Operator workstation graphics
- Field sensor and panel location
- Integration with other systems

5.9. Miscellaneous Meetings

The CxA may attend selected planning and job-site meetings in order to remain informed on construction progress and to update parties involved in commissioning. The CxC shall provide the CxA with information regarding substitutions, RFIs, change orders and any Architect’s Supplemental Instructions (ASI) that may affect commissioning of equipment, systems or the commissioning schedule.

During construction, meetings between various commissioning team parties will be scheduled by the CxA through the CxC.

5.9.1. Site Observations

The CxA shall make periodic visits to the site to observe equipment and system installations. Additional visits may be made to observe the contractor’s pre-functional testing and verification of installations. The CxA shall be given adequate notice (no less than seven working days) by the CxC.

5.10. Startup

Installing Subs are responsible for each part of Installation Verification Checklists and Startup Checklists for commissioned equipment and systems. The parties responsible for each part of these checklists are identified on the checklists. The startup procedures are directed and executed by the Sub or equipment vendor.

The Subs shall provide to the CxC the manufacturer checklists, Installation Verification, and Startup Checklists, including actual field checkout sheets used by the field technicians. The CxC shall forward the documents to the CxA. These documents shall become part of the Commissioning Final Report.

5.10.1. Execution of Startup Checklists and Startup

The Installation and Startup Checklists are directed and executed by the Sub or vendor. To document the process of startup, the site technician performing the tasks shall check off items on the checklists as they are completed. Only individuals having direct knowledge of a line item being completed shall check or initial the forms.

The Subs and/or vendors execute the checklists and submit a signed and dated copy of the completed Installation and Startup Checklists to the CxC, who shall forward it to the CxA. The CxA may review Startup Checklists in progress.

5.10.2. Deficiencies and Non-Conformance

The Subs shall clearly list any outstanding items from the startup procedures that were not successfully completed. The procedures form and deficiencies shall be provided to the CxA within two (2) days of test completion. The Subs and vendors shall correct and retest any deficiencies or uncompleted items, involving the CxC as necessary, prior to the start of functional performance testing. The CxC shall notify the CxA when all deficiencies and uncompleted items have been resolved.

5.10.3. Electrical Systems Checkout Plan

The Electrical contractor shall use the approved Electrical Checkout plan; which will include MOPs (Methods of Procedure) and required testing forms as their start-up verification. The Electrical contractor shall review the FPTs in advance when provided by the CxA and provide written comments and detailed amendments no less than fourteen (14) days prior to the start of functional testing. The CxA shall consider the written comments in finalizing the FPTs within seven (7) days of receipt.

5.10.4. Controls and Checkout Plan

The BAS contractor shall utilize the BAS Point-to-Point and calibration checks as their startup verification.

All controls-related Startup Checklists and verifications must be completed and accepted by the CxA prior to TAB. The BAS contractor shall execute the assigned tests and trend logs and be available for assistance for mechanical system Functional Performance Tests.

5.10.5. Startup Document Review

The Subs shall provide the CxC with copies of the completed Installation Verification Checklists, Startup Checklists, and manufacturer's startup forms for all commissioned equipment and systems. The CxC shall forward the completed Cx documentation to the CxA as it is submitted, and in all cases, a minimum of five (5) working days prior to the start of Test Adjust Balance.

5.11. Test and Balance (TAB)

The final TAB plan (as refined from the TAB outline plan) shall be provided to the CxA for review at least thirty (30) days prior to the commencement of TAB work. The TAB report shall be provided to the CxA upon completion, no later than five (5) days following completion of TAB work and 10 days prior to functional testing.

The TAB contractor shall submit weekly written lists of completed tests and reports of discrepancies to the CxC. The CxC shall forward to the CxA.

In general, TAB work does not begin until the BAS control system has been verified by Point-to-Point and calibration checks and these documents are accepted by the CxA.

The BAS contractor shall also meet with the TAB contractor prior to the start of TAB and review the TAB plan to determine the capabilities of the control system for use in TAB. The BAS contractor shall provide the TAB contractor with any necessary instruments for configuring terminal unit boxes and instruct the TAB contractor in their use. The BAS contractor shall also provide a technician qualified to operate the controls to assist the TAB contractor in performing TAB activities, as needed.

5.12. Functional Performance Test (FPT) and Verification Procedures

Functional testing is the dynamic testing of systems (rather than just components) under full operation. Systems are tested under all modes of operation as defined in the sequences of operations, such as during cooling and heating loads, low and high loads, component failures, occupied and unoccupied modes, varying outside air temperatures, emergency and power failure, alarms, interlocks, and other operating conditions. Testing proceeds from components- to subsystems- to systems- and finally to interlocks and connections between systems.

Functional testing and verification shall be achieved by manual testing, by monitoring the performance and analyzing the results using the BAS trend log capabilities, or by stand-alone data-loggers, depending on the equipment and sequence as referenced in the FPTs. The systems shall be run through all of the control system's sequences of operation and verified to be responding as stated.

5.12.1. Development of FPTs

The CxA shall develop the Functional Performance Test procedures in a sequential written form. The CxA reviews all equipment submittals, manufacturer's recommended tests, and any change orders affecting equipment or systems, updated points list, control sequences and setpoints. The CxA may require clarification from the CxC, Subs and the A/E regarding sequences and operation for this purpose. The CxA shall utilize this data in preparing test forms and sequential test procedures to verify proper operation of each piece of equipment and system. Tests are prepared to yield results that are predictable and repeatable.

FPT procedures shall be distributed for review by all parties in advance of the scheduled tests. FPTs shall be submitted to the A/E for approval and finalized by the Commissioning Authority prior to the start of testing.

The BAS contractor shall review the FPTs in advance when provided by the CxA and provide written comments and detailed amendments no less than fourteen (14) days prior to the start of functional testing. The CxA shall consider the written comments in finalizing the FPTs within seven (7) days of receipt.

5.12.2. Contractor Review and Approval of FPTs

Thirty (30) days prior to performing any functional tests, proposed FPTs will be provided to the subcontractors. The Subs shall review and provide the CxA with their review of any procedures that are inconsistent with their understanding of the equipment operations, or conditions that may be unsafe or incompatible with maintaining the warranty.

5.12.3. Functional Test Prerequisites

Prior to the initiation of Functional Performance Tests, the CxA shall verify that Startup Checklists have been completed. BAS installation must be substantially completed (automatic operation) and their conformance to test requirements must be documented and accepted by

the CxA before commencing functional testing of systems. TAB for air and hydronic systems must be completed and at a minimum, the preliminary reports from the field submitted to the CxA.

5.12.4. Title 24 Acceptance Tests

Contractors are to submit a copy of all Title 24 Acceptance Tests to CxC, who will forward to CxA prior to the start of Functional Performance Tests. These tests are a further verification, beyond the other startup procedures, that the equipment is properly configured and ready for testing.

5.12.5. Execution of Functional Testing Procedures

5.12.5.1. Process

The CxA shall schedule Functional Performance Tests through the CxC. A meeting shall be held by the CxC at the start of the FPTs to review the planned tests and assure the required parties are prepared.

The CxA shall oversee, witness, and document the Sub's demonstration of the Functional Performance Test procedures for all equipment and systems according to the Specifications and the Cx Plan. The Subs or manufacturer's representatives shall execute and demonstrate the tests following the procedures developed by the CxA.

5.12.5.2. Preliminary Testing

The controls contractor, subcontractor, or vendor shall run through all functional testing prior to demonstrating the functional tests to the CxA. This is done to ensure that all readily observable deficiencies are corrected prior to witness testing. If, during functional performance testing, it becomes clear that preliminary testing by the Sub was not performed or not completed effectively, testing may be postponed at the discretion of the CxA. Testing shall recommence or resume after completion of preliminary testing.

5.12.5.3. Deficiencies and Re-Testing

In the process of witnessing Functional Performance Tests, the CxA will document non-compliant tests and significant system deficiencies on the procedure or test form. The CxA will notify the PC and CxC of deficiencies or non-conformance issues by documenting them on the Commissioning Issues Log in a timely fashion. Corrections of minor deficiencies may be made during the test demonstrations at the discretion of the CxC and CxA.

Decisions regarding minor deficiencies and corrections will be made at as low a level as possible; e.g., from the CxA, CxC and the Sub. The CxC and Subs will schedule re-testing as required, providing written notification to the CxA. For disputed items, the Owner will be the final authority.

Any additional retesting and site visits necessitated by equipment or systems not being fully functional when otherwise stated by the responsible contractor shall be at the expense of the responsible contractor.

Any additional verification or back-checks of issues due to equipment or systems not being functional when otherwise signed off by the responsible contractor shall be at the expense of the responsible contractor.

5.12.5.4. Issues Log

The CxA shall document all deficits found throughout commissioning in an Issues Log that is updated, distributed, and sent to the commissioning team. This document represents the observations by the CxA, as a third party representative of the owner. Subs shall correct deficiencies, sign them off, and notify the CxA in writing when ready for re-testing. It is the responsibility of each responsible party to address each issue by responding in writing as to what remedy or response the contractor has to the identified item. The CxA shall schedule re-testing through the GC.

5.12.5.5. Facilities Staff Participation

Facilities Operations staff is encouraged to attend and participate in the testing process. This process neither constitutes nor replaces formal training.

5.12.6. Execution of Functional Testing Procedures

Prior to functional testing, the GC's Controls Contractor (CC) shall set up trends on the BAS as specified in the FPTs and/or contract documents. The CC shall download and submit trend data to the GC, who shall forward it to the CxA for review. The data must be electronic and in spreadsheet or database format.

Trending Requirements:

- Trend logs must be established before functional testing; Commissioning Agent to review 24 hours of trend data prior to functional testing
- Remote access must be established prior to functional testing and the CxA shall be given access
- Submit trends for all points listed in specifications. Equipment should be trended during a period similar to design conditions
- Trend data must be saved in CSV (Comma delimited) (*.csv) format or database format
- All data is to be within the 14 day trend period for any particular submittal period
- Status or Change of Value (COV) data may be saved with other COV data in a single file, but not with Time Series data
- Provide 14 continuous days of data, 24 hours a day, with time intervals as specified in Functional Performance Tests

5.13. O&M Manuals and Warranty Documentation

The CxC shall assemble all the turn-over documents required by the contract documents; this may include O&M manuals, equipment warranties, contractor guarantees, and as-builts. Typically these documents are reviewed and accepted by the A/E team. Additionally, the CxC should furnish these documents to the Operations Staff for internal review and input, and as a precursor to training. The CxC shall also review the turn-over package for completeness, approve each equipment warranty and will verify that all requirements for maintaining the warranty are valid and clearly stated. The CxA shall be provided the final turn-over package and will verify that it complies with the contract requirements.

5.14. Final Commissioning Report

A final summary report by the CxA will be provided to the OR. The report shall include an executive summary, list of participants and roles, overview of commissioning and testing scope, and a general description of testing and verification methods and results. All outstanding non-compliance items shall be specifically listed. Recommendations for improvement to equipment, system interactions or operations, future actions, commissioning process changes, etc. may also be listed.

5.15. Systems Manual

The CxA shall develop the Systems Manual with input from the CxC, Subs, OR, CC, TAB, and Operations staff. The Systems Manual provides future operating staff with the information needed to understand and optimally operate the commissioned systems. It provides Facilities staff with the information necessary to monitor, maintain, and optimize system operations on an ongoing basis, and aids in the long-term success of building operations' energy efficiency strategies according to the design intent. The Systems Manual will be developed after Functional Performance Tests are complete, and within ten (10) working days of receiving as-built BAS drawings, Sequences of Operation, and other documentation from the CxC.

The Systems Manual will include the following documentation submitted by the CxC:

1. System Single Line Diagrams
2. As-built Sequences of Operations, control drawings, and as-built setpoints
3. Operating instructions for integrated building systems
4. Recommended schedule of maintenance requirements and frequency, if not included in the project O&M manuals
5. Recommended schedule for calibrating sensors and actuators if not included in O&M manuals.
6. Basic Operation:
 - a. Written narrative of equipment operation
 - b. Interfaces, interlocks and interaction with other equipment and systems

5.16. Training and Orientation of Personnel

Owner training and orientation on equipment and systems shall be provided by the GC and Subs in accordance with the contract documents. The GC and Subs shall submit training plans to the CxA at least 30 days prior to scheduling training. Training plans shall include the name and qualifications of the trainer, the targeted audience, and a list of topics to be covered. The CxA shall review the training for system overview, design intent, and design criteria.

The operations personnel should be trained on the safe and proper operation, maintenance, diagnosis and repair of each piece of equipment. Submitted O&M information should be used during these training activities.

5.16.1. Training Sessions / Agenda

For each piece of equipment or system, a written training agenda will be developed and submitted for review and approval. OR and CxA will review and comment on each agenda in accordance with the training plan and project specifications. Recommended topics include:

1. Systems and equipment conceptual overview – what is the equipment, what is its function, and with what other systems or equipment does it interface
2. Sequences of operation in all modes of operation
3. Review of information in the System Manual
4. Review of the pertinent record drawings
5. Warranty details
6. Relevant health and safety practices and concerns
7. Common problems and their diagnosis and/or repair
8. Review and demonstration of servicing and preventive maintenance
9. Hands-on training for Facility staff
10. Proper maintenance schedules, tasks and procedures with demonstrations
11. Emergency response and recovery procedures in accordance with 2012 NFPA 3, Section A.1.3.2(5)
12. Emergency response and recovery procedures in accordance with 2012 NFPA 3, Section A.1.3.2(5)

5.16.2. Training Record

Following the training, the CxC and the Contractor will prepare a Training Record which will include, for each piece of equipment, a check-off of training covering each topic per the Project Training Plan. A log with the trainer and attendees signatures and date shall be included. PM, CxA, and the A/E will review the final Training Report.

5.17. Current Facility Requirements

New to LEED version 4 is the requirement for the CxA to assemble and maintain a current facility requirements (CFR) and operations and maintenance (O&M) plan that contains the necessary information to operate the building efficiently. The minimum documentation for the plan are listed below:

- Sequences of operation for the building
- Building occupancy schedule
- Equipment run-time schedule
- Setpoints for all HVAC equipment
- Lighting levels throughout the building
- Minimum outside air requirements
- Changes in schedules or setpoints for different seasons, days of the week, and times of day
- Systems narrative describing the mechanical and electrical systems and equipment
- Preventive maintenance plan for building equipment described in the systems narrative
- Cx program that includes periodic Cx requirements, ongoing Cx tasks, and continuous tasks for critical facilities.

5.18. Warranty Period Commissioning

The CxA will conduct a Post-Occupancy and Warranty Period Commissioning Review. Post-Occupancy Commissioning will include a site visit approximately 8 – 10 months after occupancy, but before the warranty period has expired. During this site visit the CxA will interview the owner’s representative and/or facility staff to identify any problems with commissioned equipment, or concerns they have with operating the building as originally intended. Any unresolved items on the Issues Log will be reviewed. The CxA will participate in forming a plan with the owner to have these items resolved. The CxA may witness deferred testing. The CxA will document their findings in a site visit report.

5.18.1. Post-Occupancy Trend Analysis

The CxA may analyze the trend data for systems integration issues and to review operation over variable conditions and times. Trend reviews provide a record of actual operating conditions and may reveal anomalies in settings, schedules, or responses that are inconsistent with the prescribed sequence of operations, where energy efficiencies or equipment operations may be compromised. This method of assessment is also an example of the recommended long term continuous commissioning to assure building operations are optimally maintained.

5.19. Ongoing Commissioning Plan

The CxA shall issue an ongoing Commissioning Plan (Cx Plan) before or as part of the 10-month review of the building operation. The Ongoing Commissioning Plan is effectively a recurrence of the functional performance testing, monitoring based commissioning, and reporting procedures to ensure the building continues to perform according to the OPR, BOD and approved design and construction documentation throughout the lifetime of the building. The CxA shall provide blank functional performance tests for all commissioned systems, the issues log and direction for testing new and retrofitted equipment over time.

Ongoing Cx activities can be performed by in-house operating personnel or by a third party CxA and is required to occur at least twice a year to account for the seasonal variation.

March 31, 2023

Dear Ms. Smith,

Fugro is pleased to submit this final geotechnical investigation and geologic hazards evaluation report for the proposed new Library Learning Resource Center project at Laney College in Oakland, California. Our work was authorized by the District professional service agreement (Requisition No. 2-129461, PO No. 3-118689) dated February 19, 2019, Amendment No. 1 (Requisition No. 2-135365, PO No. 3-122826) dated December 11, 2019, Amendment No. 2 (Requisition No. 2-145003, PO No. 3-131458) dated September 1, 2021, and the Amendment No. 3 (PO No. PCCD1-3000135642) dated August 3, 2022 and was executed in general accordance with the scopes listed in our Proposals No. 04.72189129-P-001(Rev.02), No. 04.72190021-P-001(Rev.00), No. 04.72160021-P-002(02), and No. 04.72190021-P-003 (01), dated February 19, 2019, July 19, 2019, July 12, 2021, and April 27, 2022, respectively.

This report was prepared to identify the key geologic and geotechnical aspects of the site and provide geotechnical recommendations for design and construction of the project. This report also summarizes the results of our geotechnical and geologic site data review, field exploration, laboratory testing, and geologic and seismic hazard evaluations for the project site. We appreciate this opportunity to be of service to the District. Should you have any questions or require additional information, please contact us.

Sincerely,

Reza Rahimnejad, PhD, PE
Senior Engineer

1. Introduction

This report presents the results of the geotechnical investigation and geologic hazards evaluation conducted by Fugro USA Land, Inc. (Fugro) for the new Library Learning Resource Center on the Laney College campus. The campus is located at 900 Fallon Street in the City of Oakland and County of Alameda, California, as shown on the Vicinity Map (**Plate 1**). A topographic map of the area, along with coordinates for the site (Lat. 37.794899°N and Long. 122.262363°W) are presented on the Topographic Site Map (**Plate 2**). Previously, Fugro performed a geotechnical study of the same site in 2002 and the results were presented in a report dated March 27, 2002.

This report was prepared in accordance with guidance from the California Geological Survey (CGS) – Note 48, *Checklist for the Review of Engineering Geology and Seismology Reports for California Public Schools, Hospitals, and Essential Services Buildings*, (CGS, 2019), the American Society of Civil Engineers (ASCE) ASCE/SEI 7-16 Standard, *Minimum Design Loads for Buildings and Other Structures* (ASCE, 2016), and following the regulations of the 2019 California Building Code (2019 CBC; California Building Standards Commission, 2019).

Because the course of the design changed during the review process by California Geology Survey (CGS) and the Department of the State Architects (DSA), relevant information throughout the body of the previous report dated February 28, 2022, is updated in this report.

In addition, the design team decided to use Deep Mixing Method (DMM) ground improvement and shallow foundation system in lieu of proposed deep foundation and retaining wall system in our 2020 report. The detailed design assumptions, discussions, recommendations, and specifications are presented in DMM Design and Recommendations, **Supplement I**. Updated information and discussions shown in **Appendices I** and **J** supersede the similar subject in this report.

1.1 Project Description

According to the preliminary building layout plan provided by Noll & Tam Architects and Planners and as shown on the Site Plan (**Plate 3**), we understand that the proposed Library Learning Resource Center site is in the southeast corner of the Laney College main campus and is bounded by 7th Street on the southwest, Lake Merritt Channel on the east, a cooling tower structure and Building E on the northeast, and a handicap parking lot on the northwest. The site is located about 100 feet southwest of the Bay Area Rapid Transit (BART) underground tube easement. According to site survey information provided by CSW/Stuber-Stroeh Engineering Group, Inc. (April 2019), the existing surface elevations at the proposed building area varies from Elevations of +18 feet to +21 feet (NAVD 88).

The new building is planned to be an at grade, 3-story high building with an estimated footprint area of about 24,197 square feet and project size of 75,622 square feet. The proposed building location is about 130 to 160 feet away from the edge of the Lake Merritt Channel west bank. No significant raising of the existing site grade is anticipated for the project according to the project drawings provide by Noll & Tam Architects dated October 14, 2022.

At the time of our study, the site was occupied by several portable classroom buildings, a small bathroom structure, a small storage shed, and associated concrete walkways and landscaping. Short retaining walls up to about 3 feet high were located to the northeast of the classroom buildings, which retained the existing generally level pad of the existing improvements. Based on available aerial photographs of the site, these existing improvements appeared to be installed between August 2007 and September 2008. These improvements will be removed prior to the new construction.

1.2 Scope of Services

The purpose of our geotechnical investigation and geologic hazards evaluation was to identify key geotechnical, geologic hazards, and seismology aspects of the site in accordance with CGS Note 48 that could impact the project and provide geotechnical recommendations for design and construction of the project. The scope of our services performed included the following:

- Compile and review available geotechnical and geologic data that is contained in our files and provided by others, including existing geologic and seismic hazard maps and other generally available related literature.
- Review previous geotechnical investigation reports for the site and vicinity by Fugro and others, including results of previous exploratory borings, Cone Penetration Tests (CPT), and laboratory testing.
- Conduct a field exploration program including one (1) exploratory boring to a depth of about 76-1/2 feet and eight (8) CPTs to a maximum depth of about 75-1/2 feet;
- Perform geotechnical laboratory testing on selected soil samples for classification, index, strength, consolidation, and corrosivity testing.
- Identify the site geotechnical and geologic conditions (e.g., stratigraphy, subsurface soil characteristic and engineering properties, depths to groundwater, and geologic hazards) that could impact the project, as mandated by CGS Note 48.
- Perform engineering analyses using the field and laboratory data, including detailed liquefaction triggering, post-liquefaction deformation, dynamic densification, lateral spreading, and slope stability evaluations.
- Develop site-specific seismic design criteria per 2019 California Building Code (CBC), including a site-specific ground motion response analysis and a Probabilistic Seismic Hazard Analysis (PSHA).
- Respond the CGS and DSA review comments.

- Provide ground improvement design, drawings, and specifications.
- Communicate with the structural engineer and assist in finalizing the foundation design.
- Prepare this report to summarize the results of our geotechnical and geologic data review, field exploration, laboratory testing, geologic hazards evaluations, and engineering analyses, and to provide geotechnical conclusions and recommendations for design and construction of the project.

Chemical analytical assessment of onsite materials or groundwater for contaminants was beyond our scope of work.

2. Data Review, Exploration and Laboratory Testing

2.1 Review of Existing Data

As part of our study, Fugro reviewed relevant geotechnical, geologic, and seismic data, as well as results of previous explorations and laboratory testing performed in the vicinity of the project site, including the following reports, literature, and maps. The conclusions from our review of the existing data are presented in subsequent sections of this report.

2.2 Field Exploration

Fugro performed a geotechnical field exploration program that consisted of one (1) exploratory boring to a depth of about 76-1/2 feet and eight (8) CPTs (Cone Penetration Tests) to a maximum depth of about 75-1/2 feet on March 29, 2019, and January 2, 3, and 7, 2020. In addition, three (3) shallow hand auger borings to a maximum depth of about 6 feet were also performed at three (3) CPT locations (2019-CPT-1 through 2019-CPT-3). During the design of the Deep Mixing Method (DMM) ground improvement and to better define the bottom of Young Bay Mud (YBM) layer, we performed 10 additional CPTs to a maximum depth of about 100 feet on November 17, 18, and 22, 2022. The new CPTs are used to develop cross sections for the DMM Design and Recommendations, **Supplement I**. The approximate locations of the borings and CPTs are shown on the Site Plan (**Plate 3**). The locations were determined by pacing or tape measurement from field landmark references; and should be considered accurate only to the degree implied by the method used.

Drilling permits were attained from Alameda County Public Work Agency (ACPWA) for the subsurface explorations. Underground Service Alert (USA) was notified, and a private utility

locating company, Bess Testlab, Inc. (BTL) of Hayward, California, was retained to clear the boring and CPT locations prior to explorations. In addition, a hand auger was also used to clear the top 5 to 6 feet of soils for utilities below existing ground surface at some of the boring and CPT locations.

The boring was performed by a State of California C-57 licensed driller, Geo-Ex Subsurface Exploration (GeoEx) of Dixon, California, using a track-mounted CME 75 drill rig equipped with a mud rotary wash system and a 140-lb automatic trip hammer. According to a hammer calibration report provided by Geo-Ex, the 140-pound automatic trip hammer used at the site for soil sampling had been rated as having an average energy transfer ratio of about 91 percent (calibrated on December 18, 2018).

CPTs were performed by both Fugro and Gregg Drilling, LLC (Gregg) of Martinez, California, in general accordance with ASTM D5778. Fugro used a 25-ton truck-mounted rig with an electronic piezocone penetrometer that has a tip area of 15 cm², a friction sleeve area of 225 cm², and a tip end area ratio of 0.59. Gregg used a 20 and 25-ton truck-mounted rig and a self-anchoring mini track-mounted rig with an electronic piezocone penetrometer that has a tip area of 15 cm², a friction sleeve area of 225 cm², and a tip end area ratio of 0.8. The cones were advanced at a standard rate of 2 cm/sec into the ground to measure tip resistance, sleeve friction, and excess pore pressure. Pore water pressure dissipation tests were also performed at selected depths. In addition, in-situ soil shear wave velocity measurements were performed at an approximate 5-foot interval at the 2020-CPT-07 location. The CPT logs and interpretations are presented in **Supplement A**.

Our field engineer continuously logged soils encountered in the borings in the field. The soils are classified in general accordance with the Unified Soil Classification System (ASTM D2487 and D2488). The logs of the borings as well as a key for the classification of the soils are included in **Supplement A**. Upon completion of our field explorations, the borehole and CPT holes were backfilled with neat cement grout in accordance with ACPWA requirements. All drilling derived soil cuttings and fluids from mud rotary wash drilling were containerized in 55-gallon metal drums and transported to appropriate facilities for disposal by Geo-Ex.

Representative soil samples were obtained during drilling using a Modified California split-barrel drive sampler (outside diameter of 3.0 inches, inside diameter of 2.5 inches) and a Standard Penetration Test (SPT) split-barrel drive sampler (outside diameter of 2.0 inches, inside diameter of 1.375 inches). Soil samples were transmitted to laboratories for evaluation and appropriate testing. The sampler types are indicated in the "Sampler" column of the boring log as designated in **Plate A-1**.

Resistance blow counts were obtained with the drive samplers by dropping a 140-pound automatic trip hammer through a 30-inch free fall in general accordance with ASTM D1586. The

samplers were driven 18 inches, or a shorter distance where hard resistance was encountered, and the number of blows were recorded for each 6 inches of penetration. The blows per foot recorded on the boring logs represent the accumulated number of blows that were required to drive the last 12 inches. When the SPT split spoon sampler was used, these blow counts are the standard penetration resistance values (N values). However, due to the large diameter of the Modified California sampler, the blow counts recorded for this sampler are not standard penetration resistance values. These values were multiplied by a conversion factor of 0.63 for the Modified California Sampler and the calculated approximate equivalent N values are presented on our logs within parenthesis. No hammer energy correction had been applied on the N values presented on the logs.

Previously, several exploratory borings and CPTs were performed in 2002 by Fugro and in 1965 by Woodward-Clyde-Sherard and Associates (WCS) at the site and vicinity. The approximate locations of these previous explorations are also shown on the Site Plan (**Plate 3**). Logs of these previous explorations and laboratory testing results are included in **Supplement C** for reference. The results of these previous explorations and laboratory testing are also incorporated into this report.

2.3 Laboratory Testing

Our geotechnical laboratory testing program was directed toward a quantitative and qualitative evaluation of the physical and mechanical properties of the soils underlying the site. This program included:

- Fifteen (15) moisture content and dry unit weight determinations per ASTM D2937,
- Eight (8) hydrometer, sieve, and percent passing #200 sieve analyses per ASTM D422 and D1140,
- One (1) plastic and liquid limits per ASTM D4318,
- Two (2) unconsolidated undrained triaxial shear strength tests (TXUU) per ASTM D2850,
- One (1) incremental consolidation test per ASTM D2435, and
- Three (3) organic content determinations per ASTM D2974.

All tests were performed by Fugro's geotechnical laboratory in Ventura, California and Cooper Testing Laboratory in Palo Alto, California. Our laboratory testing results are included in **Supplement B**. Some of the test results are also presented on the boring logs (**Supplement A**) at the corresponding sample depths.

Corrosivity tests that include redox, pH, chlorides, sulfates, and resistivity were performed by CERCO Analytical, Inc. in Concord, California, on two representative onsite near-surface soil samples (from 2019-CPT-01 at about 2-1/2 feet and 2019-CPT-03 at about 4 feet). The test results and a brief evaluation report prepared by CERCO regarding the onsite near-surface soil corrosivity are also included in **Supplement B**.

3. Geologic and Seismic Setting

This section summarizes the regional geologic and tectonic setting, the local geologic setting, the site geology, and regional active faults and seismicity.

3.1 Regional Geologic and Tectonic Setting

The project site is located near the east shore of the San Francisco Bay in the Coast Ranges geomorphic province (CGS, 2002). The Coast Ranges are northwest-trending mountain ranges, typically rising to 2,000 to 4,000 ft. in elevation, with intervening elongated valleys. The oldest rocks in the range were formed from the subduction of the Farallon Plate beneath the North American Plate during the Jurassic and Cretaceous periods. The Franciscan Formation in the San Francisco Bay area is a complex of graywacke sandstone, shale, and other lithologies that accumulated in the offshore trench in the subduction zone, then were pushed up onto the continent. Later, Tertiary continental sediments and volcanic rocks were deposited over the Franciscan Formation.

Subduction was followed by strike-slip faulting along the San Andreas fault system starting in southern California about 28 million years ago as subduction gradually consumed the Farallon Plate, and the Pacific Plate and the North American Plate boundary migrated northward. The strike-slip motion along faults in the San Francisco Bay Area developed over the past 5 to 10 million years (Atwater, 1970; Wallace, 1990; Atwater & Stock, 1998). At the present time, the San Andreas fault and sub-parallel faults such as the Hayward fault form the boundary zone between the Pacific and North American plates in the San Francisco Bay area. Deformation over the past few million years along various faults of the San Andreas fault system has produced a series of northwest-trending valleys and mountain ranges, including the East Bay Hills, the San Francisco Peninsula, and the intervening San Francisco Bay.

The Hayward fault extends along the western front of the East Bay Hills along the east side of San Francisco Bay and forms an approximate boundary between two distinctly different geologic and physiographic provinces. Based on work by Radbruch (1969), basement rocks underlying the area west of the Hayward fault are primarily those of the Jurassic to Cretaceous Franciscan Complex (about 200 to 80 million years old). East of the Hayward fault, the basement rocks are Jurassic to Cretaceous sedimentary rocks of the Great Valley Sequence (about 140 to 65 million years old). These Mesozoic rocks are overlain by Tertiary volcanic and sedimentary rocks (65 to 2.5 million years old) in the East Bay hills. The San Francisco Bay Area experienced several episodes of uplift and faulting during late Tertiary time (about 25 to 2 million years ago).

The surficial deposits of the flatlands that lie between the hills and the bay are derived from erosion of the Mesozoic and Tertiary rocks in the hills. They are Quaternary in age, or less than

about 2 million years old, and consist primarily of alluvial deposits laid down by streams draining the hills. These deposits form and underlie the wide, gently sloping East Bay Plain and provide the relatively level building sites for most of the development in the East Bay. Sediments that reach the bay are deposited as estuarine deposits in the tidal marshes, mud flats, and the floor of the bay.

The position of the Bay shoreline varied throughout the Quaternary as sea level rose and fell in response to glacial cycles. During peak of the last major glaciation, around 15,000 years ago, sea level was about 330 feet lower than it is today and the San Francisco Bay was a wide valley with streams flowing across the valley floor, joining together to flow out the Golden Gate and finally meeting the sea near the Farallon Islands. As the ice from the great continental glaciers melted, sea level began to rise, with the sea entering the Bay about 10,000 years ago. The present sea level was reached within the Bay about 6,000 years ago (Atwater et al., 1977).

As a result of these sea level fluctuations, the thick sequence of sediments in and adjacent to the bay includes layers of estuarine silts and clays deposited during interglacial periods, alternating with layers of sandy alluvial deposits laid down during glacial periods (Atwater et al., 1977; Sloan, 2006). Borehole data to depths of 300 feet in the central part bay show strata from as many as four glacial-interglacial cycles.

3.2 Local Geologic Setting

In the area of the site, thick Quaternary deposits overlie the basement rocks. The Quaternary deposits represent several stages of deposition, which have taken place over the last 2 million years or so. The combined thickness of the sediments above the Franciscan bedrock is estimated to be on the order of 500 feet based on deep boreholes drilled in downtown Oakland (Rogers & Figuers, 1991).

Structurally, the project site is in an area dominated by the active San Andreas Fault system that includes from west to east, the San Gregorio, San Andreas, Hayward-Rodgers Creek, Calaveras, Concord-Green Valley, and Greenville faults, as well as many other minor faults. The Hayward fault borders the western margin of the East Bay Hills in the eastern San Francisco Bay Area. The site lies about 2-1/2 miles southwest of the toe of Oakland Hills, which are part of the Diablo Range that separates the San Francisco Bay from the San Joaquin Valley. The nearest bodies of surface water are the Oakland Inner Harbor, located about 1/2 mile to the south, and Lake Merritt, located 1/4 mile to the north.

3.3 Site Geology

According to Witter et al. (2006), and as shown on the Quaternary Geologic Map (**Plate 4**), the site is located bayward of the historical shoreline, on former tidal flats adjacent to the Lake Merritt Channel that were filled to make land. The site is roughly in the middle of the estimated

500- to 1,400-foot-wide natural outlet channel of Lake Merritt, which had been dramatically reduced in width with development of the region after the 1860s. Filling of this area occurred between 1894 and 1915 based on the study by Rogers and Figuers (1991).

The historical artificial fill overlies Holocene estuarine mud (afem), which is known locally as Young Bay Mud. According to Helley and Graymer (1997), most of the fill placed before 1965 in San Francisco Bay Area was not compacted and consists of dumped or hydraulically emplaced materials. Based on the results of subsurface geotechnical explorations, the site is generally underlain by about 8 to 25 feet thick of heterogenous man-made fills that locally contain various amounts of concrete, brick, and wood debris.

The Young Bay Mud is a water-saturated estuarine deposit, predominantly gray, green and blue clay and silty clay deposited in tidal marshlands and mud flats of San Francisco Bay. The mud generally contains a few lenses of well-sorted, fine sand and silt, a few shelly layers, and peat. The Young Bay Mud was deposited during the post-Wisconsin rise in sea-level, about 12,000 years to present, and interfingers with and grades into fine-grained alluvial deposits at the distal edge of Holocene alluvial fans.

3.4 Regional Faulting and Seismicity

The San Francisco Bay Area is recognized by geologists and seismologists as one of the most seismically active regions in the United States. As described in Section 3.1 and as shown on the Regional Fault and Seismicity Map (**Plate 5**), numerous major fault zones cross through the San Francisco Bay Area, generally trending northwest-southeast. These faults and other local faults have produced many strong earthquakes, magnitude 6.0 and greater, over the last two centuries within about 60 miles (100 km) of the site, as detailed in Section 3.5.

As shown on **Plate 5**, the site is located about 3.5 miles southwest of the Hayward fault zone. The Alquist-Priolo (AP) Earthquake Fault Zone Map of the Oakland West Quadrangle (**Plate 6**) shows that the site is not located within an earthquake fault zone, as designated by the State of California (California Geological Survey (CGS), 1982).

The Hayward fault exhibits typically geomorphic evidence of Holocene (less than 11,000 years) displacement such as shutter ridges, offset drainages, and aligned topographic sags and scarps. The Hayward fault zone varies in width, from relatively narrow traces of 5 to 10 meters in width, to a zone of subparallel strands several hundred meters wide, or more in fault stepovers. Fault creep occurs at the ground surface along most of the Hayward fault, with average measured creep rates of about 4 to 5 mm/year in the Oakland-Berkeley area (WGCEP, 2003).

Active faults located within about 60 miles (100 km) of the project site, and their generalized fault rupture parameters from the U.S. Geological Survey (USGS) are summarized in Table 3.1.

Table 3.1: Regional Active Faults and Generalized Rupture Parameters

Fault	Approximate Closest Distance from Site to Fault (miles)	Direction from Site to Fault	Estimated Maximum Moment Magnitude (Mw)	Fault Length (km)	Slip Rate (mm/yr)
Hayward-Rodgers Creek	3.4	NE	7.3	150	9
Mount Diablo	13.4	N	6.7	25	2
Calaveras	13.9	NE	7.0	123	15
San Andreas	14.6	SW	8.0	472	17
Green Valley	16.5	NE	6.8	56	4.7

Maacama-Garberville	58.7	NW	7.4	221	9

Sources: USGS, 2008. *National Seismic Hazard Maps – Source Parameters* website

Earthquakes on the faults in Table 3.1 or on smaller, mapped or unmapped faults could cause strong ground shaking at the site. A USGS Fact Sheet (Aagaard et al., 2016) indicates there is a 72 percent chance of at least one magnitude 6.7 or greater earthquake striking the San Francisco Bay region between 2014 and 2043. Earthquake intensities will vary throughout the San Francisco Bay Area depending upon the magnitude of the earthquake, the distance of the site from the causative fault, the type of materials underlying the site, and other factors.

According to 2019 CBC and ASCE 7-16, and based on an average soft clay soil site condition (Site Class E), the site geometric mean peak ground acceleration (PGA_M) from the Maximum Considered Earthquake (MCE) is estimated to be about 0.80g. The MCE peak ground acceleration has a 2 percent probability of being exceeded in 50 years (a mean return period of 2,475 years), except where deterministically capped along highly active faults.

3.5 Historical Seismicity

Major earthquakes have been recorded along the San Andreas Fault system and across California since the late 1700s. Table 3.2 presents large magnitude ($M \geq 6.0$) regional earthquakes within about 60 miles (100 kilometers) of the site from 1800 to 2018, arranged in chronological order. The Northern California Earthquake Data Center (NCEDC) and National Atlas of United States database was accessed to obtain the historical seismicity information presented in Table 3.2. The epicenter locations are shown on the Regional Fault and Seismicity Map (**Plate 5**).

Table 3.2: Large Magnitude ($M \geq 6.0$) Earthquakes Within About 60 Miles (100 km) of the Site

Epicenter Location	Date	Magnitude	Distance (mi)	Direction from Site to Epicenter
Near San Francisco	6/21/1808	6.0	13.1	W
In the San Francisco Bay Area	6/10/1836	6.8	3.4	E
In the San Francisco Area	6/1838	7.0	15.5	SW
North of San Jose	11/26/1858	6.1	28.4	SE
In the Santa Cruz Mountains	10/8/1865	6.3	45.6	SSE
Near Hayward	10/21/1868	6.8	11.0	SE
West of Antioch	5/19/1889	6.0	24.3	NE
Near Vacaville	4/19/1892	6.4	44.4	NNE
Near Winters	4/21/1892	6.2	52.5	NNE
Near Mare Island	3/31/1898	6.2	28.9	NNW
Near San Francisco	4/18/1906	7.8	14.8	SW
Near Coyote Hills	7/1/1911	6.6	46.9	SE
Near Morgan Hill	4/24/1984	6.2	45.1	SE
Loma Prieta	10/17/1989	6.9	56.3	SSE
Napa	8/24/2014	6.0	29.1	N

Several of these events were strong enough to cause structural damage to buildings in Oakland. The estimated $M_{6.8}$ 1868 Hayward earthquake ruptured the Southern Hayward fault from Hayward northward to Oakland and damaged or destroyed numerous buildings in Hayward, San Leandro, Oakland, and San Francisco (Lawson, 1908). The 1868 Hayward earthquake apparently resulted in damage in Oakland corresponding to Modified Mercalli Intensity (MMI) VIII (partial damage to buildings, walls); however, there is little reported information on ground shaking and damage in Oakland, largely because the area was sparsely populated at the time of these earthquakes (Topozada & Park, 1982; Topozada, 2000).

During the moment magnitude (M_w) 7.8 1906 San Francisco earthquake, the San Andreas fault ruptured over a distance of about 296 miles (474 km) from Shelter Cove near Cape Mendocino

southward to near San Juan Bautista. Maximum lateral displacements of 15 to 20 feet (4.6 to 6.1 meters) occurred north of the Golden Gate at Olema in Marin County (Lawson, 1908). Landslides, liquefaction, and ground settlement occurred throughout the Bay Area and in the vicinity of the surface rupture as a result of this earthquake. The ground shaking in Oakland during the 1906 earthquake is characterized as MMI VII to IX (minor to major damage to and collapse of structures; Lawson, 1908; Boatwright & Bundock, 2005). Significant damage occurred to masonry buildings across the city (Lawson, 1908). Ground failure effects, including liquefaction, lateral spreading, and settlement occurred in several areas along the Oakland-Alameda Estuary and at the southern end of Lake Merritt, (Youd & Hoose, 1978; Knudsen et al., 2000).

The most significant recent seismic event to occur in the San Francisco Bay Area was the October 17, 1989, Loma Prieta earthquake. The epicenter of this earthquake was located approximately 56 miles southeast of the site. This moment magnitude 6.9 earthquake ruptured a 22-mile (35-km) section of a splay of the San Andreas fault. The 1989 Loma Prieta earthquake produced MMI VII to VIII effects in the vicinity of the site (McNutt & Topozada, 1990). Specific ground failure effects near the project site at Lake Merritt and the estuary channel resulting from the 1989 Loma Prieta and 1906 San Francisco earthquakes are described in the Section 5.2.1.

In addition to the damage from liquefaction near the site, the 1989 Loma Prieta Earthquake caused minor to significant damage to structures in the vicinity of the project site, including collapse of the elevated Cypress Structure on the west side of Oakland, and damage to buildings in downtown Oakland. The recorded peak ground acceleration from strong ground motion stations near the site is listed in Table 3.3; the nearest sites (within one mile of the project site) had PGAs of 0.18 to 0.26g.

Table 3.3: Strong Ground Motion Recordings from the 1989 Loma Prieta Earthquake

Station Number and Name	Site Conditions	Peak Ground acceleration (g)	Station Distance from Site (Miles)
58483 – Oakland – 24 story residential building	Alluvium	0.18 (ground)	0.35 NE
58224 – Oakland Title Ins. & Trust – 2 story building	Alluvium	0.26 (ground) 0.21 (revised NGA)	0.8 NNW
58334 – Piedmont – 3 story school office building	Serpentinite	0.08 (ground) 0.18 (structure)	2.4 NE
58338 – Piedmont Junior High School grounds	Weathered serpentinite	0.08 (ground)	2.5 NE
58472 – Oakland-Outer Harbor Warf	Fill/Bay Mud	0.29 (ground)	3.4 WNW
1662 – Emeryville – 6363 Christie	Alluvium	0.25 (ground, revised NGA)	3.8 NW

4. Site Conditions

This section describes historical and present land use and topography at the project site, subsurface soils and geologic strata, and groundwater conditions based on project geotechnical data.

4.1 Surface Conditions

At the time of our study and as shown on the attached Site Plan (**Plate 3**), the proposed Library Learning Resource Center site is in the southeast corner of the Laney College main campus and is bounded by 7th Street on the southwest, Lake Merritt Channel on the east, a cooling tower structure and Building E on the northeast, and a handicap parking lot on the northwest.

The site is occupied by several portable classroom buildings, a small bathroom structure, a small storage shed, and associated concrete walkways and landscaping. Several large and small diameter trees were located around the perimeter of the site. Short retaining walls up to about 3 feet high are located to the northeast of the classroom buildings, which retained the existing generally level building pad. Based on available aerial photographs of the site, these existing improvements appeared to be installed between August 2007 and September 2008.

According to site survey information provided by CSW/Stuber-Stroeh Engineering Group, Inc. (April 2019), the existing surface elevations at the proposed building location varies from Elevations of +18 feet to +21 feet (NAVD 88). The areas to the east of the proposed building location sloped gently downward toward the Lake Merritt Channel with inclinations of about 6:1 (horizontal to vertical) to 10:1. The top of the adjacent channel bank is at about Elevation of 7 feet.

Comparing the topographic information contained on the site plan Figure 1 of the 2002 Fugro report, the current site grade appears to have been modified to create the generally level pad for the portable classroom buildings. We estimated minor cut and fill grading of up to about 2 to 3 feet had been performed at the site during the portable classroom development in 2007 or 2008. The actual details of the previous grading are unknown. We recommend any available previous grading and construction records be forwarded to us for further review.

In addition, based on our review of historical USGS topographic maps from 1915 to 1980 and aerial photographs of the site vicinity from 1993 to 2018, it is our understanding that the Lake Merritt Channel had been re-aligned and widened in 1970s to the current alignment. In the site area, the old channel west bank was located about 140 feet east of the current west bank.

4.2 Subsurface Conditions

The subsurface soil conditions encountered by our borings and CPTs at the proposed Library Learning Resource Center site are consistent with Quaternary geologic mapping of the project site vicinity that shows artificial fill overlying estuarine mud. Similar subsurface soil conditions were also reportedly encountered by previous borings and CPTs by Fugro and others in 1965 and 2002 at the site and vicinity. Our interpretations of the site subsurface soil conditions are presented on the Cross-Sections A-A' through E-E' (**Plates 7** through **11**, respectively).

The subsurface soils below the site generally consisted of predominately medium dense sandy fills that extended to depths of about 8 to 25 feet (Elevation of about +8 feet to -5 feet). Clayey fills of about 2 to 4 feet thick were also encountered in some areas. These fills are heterogenous and locally contain various amounts of concrete, brick, and wood debris. An unknown obstruction was also previously encountered at about 5 feet deep at the 2002-CPT-1 location. Most of these fills appear to be derived from the historical filling of the natural Lake Merritt outlet channel between 1860s and 1940s, and the later development of the Laney College campus in 1960s. Most likely these fills were not compacted to current acceptable geotechnical engineering standards.

Below the surficial fill layer, very soft to soft, high moisture content, and low shear strength Young Bay Mud was encountered to a depth of about 30 feet (Elevation of about -10 feet) at the northwest side of the proposed building location and about 50 feet (Elevation of about -30 feet) at the southeast side of the proposed building location. Some thin loose to medium dense sand lenses about 2 to 6 feet thick were also encountered within the Young Bay Mud layer. About 15-feet of loose to medium dense sands were also encountered between the surficial fill and the Young Bay Mud layers in 2019-CPT-3. These sands could be either historical fills placed in the natural Lake Merritt outlet channel or natural sand deposits that existed within the channel.

Underlying the Young Bay Mud layer, medium dense to very dense sands and stiff to hard clays were encountered to the maximum depth explored of about 76-1/2 feet (or elevation of about -60 feet).

The thin surficial layers of clayey fills are considered to have a low to medium plasticity and low to moderate expansion potential; the sandy fills are non-expansive. Our logs and interpretations of borings and CPTs are presented in **Supplement A**. Our laboratory testing results of the onsite soil samples are included in **Supplement B**. Logs of historic explorations and results of lab testing are included in **Supplement C** for reference.

4.3 Groundwater

Based on CPT pore pressure dissipation tests at selected depths, the site groundwater table is estimated to be at depths of about 5 to 18 feet (Elevations of about 0 to +9 feet). In addition,

groundwater was reportedly encountered at 2002-CPT-2 location at a depth of about 11 feet (Elevation about +8 feet). The previous borings (2002-EB-1 through 2002-EB-3) also reportedly encountered groundwater at depths of about 15 to 45 feet (Elevations of about +5 to -27 feet). It should be noted that these borings might not have been left open for a sufficient period of time to establish equilibrium groundwater conditions. Fluctuations in the groundwater level could occur due to change in seasons, variations in rainfall, tidal effects, and other factors. According to CGS Seismic Hazard Zone report for the Oakland West Quadrangle (CGS, 2003), as shown on **Plate 13**, historically high groundwater in the site region had been reported at a depth of about 10 feet.

We recommend a design groundwater Elevation of +8 feet be used for the project designs, which generally corresponds to both the top elevation of Young Bay Mud layer within the project area and the top elevation of the adjacent Lake Merritt Channel bank.

5. Geologic Hazards Evaluation

Site geologic hazard evaluations were performed in accordance with guidance from the CGS Note 48 (CGS, 2019). The opinions, conclusion, and recommendations in the following sections were based on the results of our review of available information relating to geotechnical, geologic, and seismic data within the vicinity of the site, project field exploration and laboratory programs, and site-specific engineering analyses.

Hazard evaluations are grouped into five sections, addressing: 1) fault rupture, 2) seismic ground shaking effects (liquefaction, dynamic densification, and lateral spreading, 3) slope stability, 4) compressible soils (settlement of non-engineered fills and young sediments), and 5) other hazards (expansive soils, corrosive soils, volcanic eruptions, flooding and dam inundation, tsunami and seiche, naturally occurring asbestos, and hydrocompaction).

5.1 Fault Rupture Hazard Evaluation

Surface fault rupture occurs when an earthquake results in displacement of the ground surface along the trace of an active fault. Based on existing geologic maps and literature, there are no known active fault traces within, adjacent to, or trending towards the project site. The closest known active fault is the Hayward Fault, located approximately 3.6 miles (5.8 kilometers) to the northeast. The site is not located within a Fault-Rupture Hazard Zone, as shown on the Earthquake Fault Zone Map for the Oakland West Quadrangle (CGS, 1982). No other faults are mapped or known to occur near the project site. Based on this information, the potential for surface fault rupture at the site is very low.

5.2 Seismic Ground Shaking Effects

Strong ground shaking at the project site is anticipated during a moderate to severe earthquake occurring anywhere in the Bay Area. Strong ground shaking can cause direct damage to structures; and has the potential of inducing other phenomena that can cause indirect damage to structures. These phenomena include soil liquefaction, dynamic densification of dry soils, lateral spreading, and ground cracking, seismically induced waves, such as tsunamis and seiches, inundation due to dam or embankment failure, and landsliding.

Detailed discussions of liquefaction, dynamic densification and lateral spreading with respect to the site are presented in the subsequent paragraphs of this section. Discussions of landsliding, both static and seismically induced, are presented in Section 5.3, and discussions of tsunami, seiche, and flooding due to dam or embankment failure are presented in Section 5.5.

5.2.1 Liquefaction and Dynamic Densification

Soil liquefaction is a phenomenon primarily associated with saturated cohesionless soil layers. These soils can dramatically lose strength due to increased pore water pressure during cyclic loading, such as imposed by earthquakes. During the loss of strength, the soils acquire mobility sufficient to permit both horizontal and vertical movements. Soils that are most susceptible to liquefaction are clean, loose, uniformly graded, saturated sands that lie close to the ground surface; although, liquefaction can also occur in fine-grained soils, such as low-plasticity silts. In addition, dynamic densification may occur within loose to medium dense, dry sand layers located above groundwater level.

According to Witter et al. (2006) and the Association of Bay Area Governments (ABAG) Resilience Program Liquefaction Susceptibility Map, the site (as shown on **Plate 12**) is located in an area that has been characterized as having a very high liquefaction susceptibility. The Seismic Hazard Zones Map of the Oakland West Quadrangle (CGS, 2003) indicates the site is located within a liquefaction seismic hazard zone (as shown on **Plate 6**), as designated by the State of California.

Our site liquefaction evaluations, which included liquefaction history review and liquefaction triggering and post-liquefaction deformation analyses, are presented in the following sections. In addition, potential for dry sand dynamic densification was also evaluated.

5.2.1.1 Historical Liquefaction in Site Region

According to the seismic hazard zone report of Oakland West Quadrangle (CGS, 2003), several historical liquefaction events had been documented from past earthquakes. Youd and Hoose (1978) compiled observed ground failures caused by earthquake shaking in northern California, including the 1906 San Francisco and 1868 Hayward earthquakes. Following the 1906 earthquake, a 24-inch steel pipe crossing 12th Street at Lake Merritt dam (Site 175 as indicated on **Plate 13**) was reportedly snapped from the settling of the flood gate. The foundation of Lake Merritt dam was also reported as "cracked and broken". Along the west shore of Lake Merritt, the bank had been cracked and broken, and caved off into the lake.

In addition, liquefaction related ground failures caused by earthquake shaking occurred during the 1989 Loma Prieta earthquake throughout the San Francisco Bay Area and are summarized by Tinsley et al. (1998). Ground settlement and several sand boils (Site 43) were observed along Lake Merritt Channel Park and Peralta Park, adjacent to the Laney College campus. The ground settlement resulted in the rupture of 6-, 12-, and 36-inch diameter main pipelines. Lateral spreading apparently occurred on the western bank of Lake Merritt during the 1906 event, but this bank was not distressed during the 1989 earthquake.

It is also our understanding damage to the original Laney College swimming pool, located to the north of Building E, was reported after the 1989 earthquake (Kaldveer, 1991), probably as the result of soil liquefaction. A replacement swimming pool was constructed in mid-1990s.

5.2.1.2 Liquefaction Evaluation Methodology

We performed both CPT- and SPT-based liquefaction triggering and post-liquefaction deformation analyses for the site generally in accordance with the guidelines listed in the CGS Special Publication 117A (2008) and the recommended procedures by Southern California Earthquake Center (SCEC, 1999).

Our analyses were based on a peak ground acceleration from a Maximum Considered Earthquake (MCE) event. A geometric mean MCE peak ground acceleration (PGA_M) of 0.81g (adjusted for a Site Class E soil condition) with a mean earthquake magnitude of Mw 7.0 and a modal magnitude of Mw 7.5 were determined for the site per ASCE 7-16 and seismic hazard deaggregation (USGS 2014 model). Our recommended project design groundwater level, at Elevation of +8 feet, was used in the analyses to assess its impacts on liquefaction and liquefaction induced ground surface damage potential.

For comparison and sensitivity evaluation purposes, both methodologies described by NCEER (2001) and by Boulanger and Idriss (BI, 2014) were used for CPT-based analyses. Post-liquefaction deformations were calculated for all layers by using Ishihara and Yoshimine procedures (1992) for NCEER method and EERI Monograph 12 procedures (Idriss & Boulanger, 2008) for BI 2014 Method. Sensitivity analysis was performed with changing earthquake Magnitude to Mw 7.6. Sensitivity analyses show the estimated settlements are not sensitive to earthquake Magnitude as the volumetric strain models saturate at the already low Factors of Safety estimated in this study.

The SPT-based analyses generally followed the methodology described in the EERI Monograph 12 (MNO-12, Idriss & Boulanger, 2008). Per CGS Note 48 requirements, post-liquefaction deformations were calculated for soil layers that have a factor of safety against liquefaction less than 1.3.

5.2.1.3 Liquefaction Evaluation Results and Conclusions

Our results from both CPT- and SPT-based analyses generally indicate that the saturated, loose to medium dense sand layers of various thicknesses located both above and within the Young Bay Mud layer have a high potential for liquefying when they are subjected to an MCE earthquake event. The majority of these sand layers were encountered in borings and CPTs at the site within depths of about 30 to 40 feet (above Elevation of about -15 feet). The extent of the potentially liquefiable soils, factors of safety against liquefaction triggering, and calculated

liquefaction-induced cumulative ground settlements at each boring and CPT location are presented in **Supplement D**.

We calculated that the MCE earthquake-induced liquefaction in these sand layers would result in residual volumetric strains varying from about 1 to 4 percent and total ground surface settlements (without reduction associated with the depth of occurrence) ranging from as little as 1 inch to up to about 6-1/2 inches. The table below summarizes the calculated liquefaction-induced settlement using the three different methods referenced above for the site boring and CPT locations. It should be noted the actual ground settlements may differ from our estimates due to uncertainties in the current liquefaction triggering and settlement analysis methodology. In addition, it is a generally accepted idea that the contribution of liquefiable soil layers to surface settlement diminishes as the depths of the layers increase.

Table 5.1: CPT- and SPT-Based Liquefaction Analysis Results

Location	Liquefiable Soil Elevation (ft)	Calculated Cumulative Ground Settlement (inches)		
		MNO-12 SPT Method	NCEER 2001 CPT Method	BI 2014 CPT Method
2019-CPT-01	+8 to +1.5 -5 to -7.5	-	3-1/4	3-1/2
2019-CPT-02	+7 to -2.5 -26.5 to -31	-	2-1/2	3
2019-CPT-03	+7 to +3.5 +2 to -14 -37.5 to -39	-	5	6-1/2
2020-CPT-04	+8 to +6 -9 to -13	-	1-1/2	1-3/4
2020-CPT-05	+7 to +5 -12.5 to -14.5 -17 to -19 -24 to -29	-	2-1/4	2-3/4
2020-CPT-06	+8 to +4.5 -0.5 to -3 -38 to -40 -43 to -45.5	-	2	2-3/4
2020-CPT-07	+8 to +7 -33 to -35 -38 to -40.5	-	1	1
2020-CPT-08	+3.5 to 2 -12.5 to -16 -27 to -31	-	2	2-1/4
2002-CPT-2	+7 to +6 -9.5 to -12	-	1	1-1/2
2020-B-01	+7 to +0.5 -13 to -18.5 -31 to -34	3-1/2	-	-
2002-EB-1	-12 to -17 -22 to -27	3-1/4	-	-
2002-EB-2	-	0	-	-
2002-EB-3	-10 to -16 -28 to -33	2-1/2	-	-

Based on our review of available maps and literature, and the results of our site evaluations, it is our opinion, when the site is subjected to a Maximum Considered Earthquake (MCE) event, the likelihood of liquefaction occurring at the site is high.

5.2.2 Dynamic Densification Evaluations

We performed both CPT-based and SPT-based dynamic densification evaluations based on procedures developed by Tokimatsu and Seed (1987) and Robertson and Shao (2010). A geometric mean MCE peak ground acceleration (PGA_M) of 0.81g, a mean earthquake magnitude of 7.0, and the project design groundwater level at Elevation of +8 feet were used in our analyses. The potential dynamic densification settlements of the near-surface unsaturated sandy fills of about 8 to 13 feet in thickness at the site are estimated to be on the order of 1/4 to 1/2 inch after the MCE event. The detailed results of each boring and CPT location are presented in **Supplement E**. It is our opinion that the potential for soil dynamic densification to impact the site is low.

5.2.3 Lateral Spreading

Lateral spreading occurs when soils liquefy during an earthquake event and the liquefied soils, along with the overlying soils, move laterally toward a free face or unconfined space, such as the west bank of the Lake Merritt Channel. Lateral spreading can result in significant horizontal ground displacements.

Our site lateral spreading evaluations generally followed methodology described in the EERI Monograph 12 (MNO-12, Idriss and Boulanger, 2008) to estimate the maximum shear strain of each liquefiable soil layer and calculate the Lateral Displacement Index (LDI) (Zhang et al., 2004) at each CPT and boring location. The detailed results are included in **Supplement D**.

In addition, empirical correlations developed by Youd et al. (2002) were also used to identify the potential soil layers that are prone to trigger ground lateral spreading and to provide estimates for possible ground lateral displacement. According to Youd et al. (2002), saturated cohesionless soil sediments with SPT $N_{1,60}$ -value equal or more than 15 are considered as not likely to have significant displacement during earthquakes smaller than magnitude 8. Our calculated LDIs and order of ground lateral displacements (from soil layers having $N_{1,60}$ -value less than 15) at the site CPT and boring locations are summarized in the table below. It should be noted these values should be considered as an index due to the limitations of the current engineering knowledge and analysis methodology. The Table 5.2 lateral displacement values are for Mw 7.0 earthquake.

Table 5.2: CPT- and SPT-Based LDI and Lateral Displacement Analysis Results

Location	Liquefiable Soil Elevation (ft)	Calculated Lateral Displacement Index - LDI (inches)	Potential Lateral Spreading Triggering Soil Elevation (ft)	Estimated Ground Lateral Displacement (inches)
2019-CPT-01	+8 to +1.5 -5 to -7.5	42	-	0
2019-CPT-02	+7 to -2.5 -26.5 to -31	30 to 33	+7 to -2.5	12 to 24
2019-CPT-03	+7 to +3.5 +2 to -14 -37.5 to -39	56 to 59	+7 to -8	18 to 36
2020-CPT-04	+8 to +6 -9 to -13	18	-	0
2020-CPT-05	+7 to +5 -12.5 to -14.5 -17 to -19 -24 to -29	22 to 24	+7 to -2	12 to 24
2020-CPT-06	+8 to +4.5 -0.5 to -3 -38 to -40 -43 to -45.5	25 to 27	+8 to -5	12 to 30
2020-CPT-07	+8 to +7 -33 to -35 -38 to -40.5	10	+8 to -5	12 to 24
2020-CPT-08	+3.5 to 2 -12.5 to -16 -27 to -31	22	-	0
2002-CPT-2	+7 to +6 -9.5 to -12	12	-	0
2020-B-01	+7 to +0.5 -13 to -18.5 -31 to -34	23	+7 to +3.5	6 to 18
2002-EB-1	-12 to -17 -22 to -27	30	-	0
2002-EB-2	-	0	-	0
2002-EB-3	-10 to -16 -28 to -33	23	-	0

Our results generally indicate the loose to medium dense sand layers encountered by CPTs and borings in the area adjacent to the Lake Merritt Channel at Elevations between +8 and -5 feet have a high potential to trigger ground surface lateral spreading during soil liquefaction from an

MCE event. The other onsite liquefiable sand layers are considered as having low potential to trigger ground lateral spreading due to their presence in isolated thin pockets and/or being located at deeper depths in relation to the bottom of the Lake Merritt Channel. Our estimated lateral extent of potential ground lateral spreading/slope instability is shown on **Plate 3**.

5.3 Slope Stability Analysis

The project proposed building is located about 130 to 160 feet away from the edge of the west bank of the channel. Our evaluations are only meant to assess the global stability of the proposed development and the potential lateral extents of ground failures caused by the possible lateral spreading of the channel bank during an MCE event (if it occurs). Detailed stability evaluation of the existing channel west bank is beyond our scope of work, since soil stratigraphy below the bank and channel were extrapolated from data developed for the project area.

The global site slope stability was evaluated using a two-dimensional, limit equilibrium computer program, SLOPE/W (GeoStudio 2016, Ver. 8.16.1.13452), and Spencer analysis method. The recommended analysis procedures by South California Earthquake Center (SCEC, 2002) were generally followed. The representative Cross-Sections A-A', D-D' and E-E' (**Plates 7, 10 and 11**) were used in our analyses to evaluate the following four (4) design loading cases:

- Case 1: Long Term (Static)
- Case 2: Seismic Event Yield Acceleration (Pseudo-static)
- Case 3: Seismic Event $k = 0.15g$ (Pseudo-static); Fixed Slip Surface at Edge of Building
- Case 4: Post-Liquefaction (Static)

Factors of safety against slope stability failures were calculated for the Cases 1, 3, and 4. Pseudo-static yield acceleration (k_y to achieve a factor of safety equals 1.0) was calculated for Case 2.

5.3.1 Subsurface Soil Engineering Properties

Soil engineering properties were developed based on the field exploration and laboratory testing results by Fugro and others, and typical engineering correlations. The table below summarizes the soil properties used in our analyses.

Table 5.3: Soil Engineering Properties Used in Site Slope Stability Analyses

Material	Unit Weight (pcf)	Material Shear Strength	
		Cohesion c' (psf)	Friction Angle ϕ' (degree)
Sandy Fill	120	0	35
Young Bay Mud with Sand Lenses	90	0.35 x Effective Overburden Stress (psf)	0
Interbedded Clays and Sands	130	0	40
Highly Liquefiable Sands	110	0	33
Post-Liquefaction Sands (Residual Strength)	110	100 + 20 x Depth (ft)	-

5.3.2 Slope Stability Analysis Results and Conclusions

The results of our slope stability analyses are presented in the table below. Our interpreted cross-section stratigraphic profiles, soil engineering properties used in the analyses, and the detailed results of the analyses are presented on the computer program printouts in the attached **Supplement F**.

Table 5.4: Slope Stability Analysis Results

Cross-Section	Case 1 Long Term	Case 2 Seismic Event Yield Acceleration	Case 3 Seismic Event $k = 0.15g$; Fixed Slip Surface at Edge of Building	Case 4 Post-Liquefaction
	Factor of Safety	k_y	Factor of Safety	Factor of Safety
A-A'	2.8	0.12	0.9	2.6
D-D'	2.2	0.12	0.9	2.0
E-E'	1.7	0.11	0.9	1.5

The results of our slope stability analyses generally indicate that the factors of safety against slope failures for the Case 1 (Long Term, Static) are 2.8, 2.2, and 1.7, respectively, for Sections A-A', D-D' and E-E', which exceed the generally accepted minimum allowable value of 1.5 for long term conditions.

For the Case 2 (Seismic Event Yield Acceleration, Pseudo-static), the yield accelerations (k_y) are determined to be 0.12g, 0.12g, and 0.11g, respectively, for Sections A-A', D-D', and E-E'. Using the Bray (1998) procedure as recommended by the SCEC publication (2002), we calculated slope displacements on the order of about 15 to 24 inches (38 to 61 centimeters) may occur during an MCE event (with a maximum horizontal acceleration of 0.81g from a mode magnitude 7.5

causative earthquake located at 6.8 kilometers from the site). These calculated displacements exceed the threshold of 6 inches (15 cm) defined by the SCEC publication (2002), which likely distinguishes conditions in which small to moderate displacements are likely from conditions in which large displacements are likely. However, as indicated on the result printouts in **Supplement F**, the most critical slip surfaces along these cross-sections do not daylight within the proposed building location.

In addition, by fixing the slip surface daylight location at the edge of the proposed building location, factors of safety against slope failures for the Case 3 (Seismic Event $k = 0.15g$, Pseudo-Static) are all 0.9 for Sections A-A', D-D' and E-E', which also fail to meet the commonly accepted minimum value of 1.15 for seismic performance (Seed, 1979)³⁴. It should also be noted, due to the low undrained shear strength of Young Bay Mud used in the Case 2 and Case 3 analyses (pseudo-static), the calculated low factors of safety and the estimated large and deep slip surfaces (35 to 45 feet deep below the top of channel bank) may not fully represent the seismic global slope stability at the proposed building location (which is about 130 to 160 feet away from the edge of the channel bank). Seismic slope stability of site is most likely governed by the extent of possible ground lateral spreading during major liquefaction events.

In Case 4 (Post-Liquefaction, Static), post-liquefaction residual shear strength was used for the highly liquefiable sands. The factors of safety against slope failures are 2.6, 2.0, and 1.5, respectively, for Sections A-A', D-D' and E-E', which exceed the generally accepted minimum value of 1.3 for short term conditions after major liquefaction events.

Due to the high degree of uncertainties on site subsurface conditions, seismic characteristics of the triggering earthquake, and analysis methodology, the results of our seismic slope stability and lateral spreading analyses should be considered as an index of site performance during major earthquake events. It is our opinion that the potential for slope instability during an MCE event and/or after major liquefaction event to impact the proposed building location is low to moderate. However, extensive slope failures may occur for the areas immediately adjacent to the Lake Merritt Channel if soil liquefaction and ground lateral spreading do occur at the site region during major earthquake events. Our estimated lateral extent of potential ground lateral spreading/slope instability is shown on **Plate 3**.

5.4 Compressible Soils

The site is blanketed by historical sandy or clayey fills that extend to depths of about 8 to 25 feet (Elevation of about +8 feet to -5 feet). Most of these fills appear to be derived from the historical filling of the natural Lake Merritt outlet channel between 1860s and 1940s, and the later development of the Laney College campus in 1960s. These fills are heterogenous and locally

³⁴ Seed, 1979. *Considerations in the Earthquake-Resistant Design of Earth and Rockfill Dams*, Geotechnique, V. 29 (3), p. 215-263.

contain various amounts of concrete, brick, and wood debris. These historical fills were most likely not compacted to the current acceptable geotechnical engineering standards and are potentially compressible. In addition, we estimated minor cut and fill grading of up to about 2 to 3 feet had been performed at the site during the portable classroom development in 2007 or 2008. The actual details of the previous grading are unknown.

Below the surficial fill layer, Young Bay Mud was encountered to about 30 feet deep (Elevation of about -10 feet) at the northwest side of the proposed building location and about 50 feet deep (Elevation of about -30 feet) at the southeast side of the proposed building location. This 15- to 35-foot-thick layer of slightly over-consolidated to normally consolidated Young Bay Mud is very soft to soft, has a high moisture content and a low shear strength, and is highly compressible. Under additional new loads, such as weights of the new fills and structures, the Young Bay Mud will consolidate while the induced excess pore water pressures are dissipating, which may cause detrimental total and differential settlements to the imposing structures and improvements.

We estimate the primary consolidation settlement due to the historical fills placed prior to 1960s at the site should have been completed. Additional settlements from the recent fill placement during the portable classroom development in 2007 or 2008 may be still ongoing. We recommend any available previous grading and construction records be forwarded to us for further review.

No significant raising of the existing site grade is anticipated for the project. If new fills will be placed to raise the existing grade, we anticipate that additional settlement will occur in the future. Our analyses indicate that for every foot of new fills that will be placed, it would induce an additional ultimate settlement of about 2 to 3 inches over the next 10 to 30 years. This additional settlement will also likely affect the integrity of the existing and/or new utility lines. In addition, this settlement will also cause downdrag forces to the pile-supported structure.

5.5 Other Geologic Hazards

Below we briefly review other geologic hazards identified by the CGS (2019) Note 48 as exceptional geologic hazards or adverse site conditions that do not occur statewide. This section addresses expansive soils, corrosive soils, volcanic eruptions, flooding and dam inundation, tsunamis and seiche, naturally occurring asbestos, and hydrocompaction.

5.5.1 Expansive Soils

The near-surface soils encountered at the site were predominately man-made fills that consist of silty sands and lean clays. The expansion potential of the near-surface soils at this site is considered low to moderate. The potential expansive soil hazard can be further reduced provided our recommendations in the report are followed.

5.5.2 Corrosive Soils

Corrosivity tests, that include redox, pH, chlorides, sulfates, and resistivity were performed by CERCO Analytical, Inc. on two representative onsite near-surface soil samples (from Boring 2019-CPT-01 at about 2-1/2 feet and 2019-CPT-03 at about 4 feet). The test results and a brief evaluation report prepared by CERCO regarding the onsite soil corrosivity are also included in **Supplement B**. According to the evaluation report, the onsite near-surface soils should be considered as “moderately” and “slightly” corrosive based on resistivity and redox potentials measurements, respectively.

5.5.3 Volcanic Eruption

The hazards of volcanic eruption include impact and inundation by lava flows, volcanic mudflows, or pyroclastic flows, and the effects of airborne volcanic ash and gases. No active volcanoes occur in the San Francisco Bay area. The nearest active volcano is the Clear Lake Volcanic Field, located about 90 miles north of the site. Volcanic flows would not extend far enough to affect the site. Airfall ash, which is known to travel great distances, would likely travel eastward based on prevailing winds. Potential hazards associated with volcanic activity in the site region are estimated to be very low (Miller, 1989).

5.5.4 Flooding and Dam Inundation

In this section we provide a brief discussion of flooding and dam inundation hazard based on a review of readily available information. A detailed risk evaluation of flooding and inundation at the site was not performed because the initial screening evaluation did not identify any significant flooding or inundation hazards.

According to the FEMA (2018) flood insurance rate map for Oakland, the project building area is located outside a 100-year flood zone. The site is adjacent to the Lake Merritt Channel, which serves as the outlet for Lake Merritt and whose level is controlled by tide level in the Oakland Inner Harbor and the level of Lake Merritt, which is partially tidal. Tide gates at the 7th Street bridge regulate the water flows into and out of Lake Merritt. The elevation of the site is 18 to 21 ft (NAVD88) and the highest astronomical tide (HAT) in the Oakland Inner Harbor is about 8 feet (NAVD88) (<https://tidesandcurrents.noaa.gov/datums.html?id=9414764>), at least 10 feet lower than the site. Runoff into Lake Merritt from heavy storms could raise the water level in the tidal channel if lake waters were released through the tide gates, but this is not likely to exceed the HAT.

The City of Oakland notes that there are 13 active dams, reservoirs, and clearwells that, in case of failure, would cause flooding in Oakland. These facilities include:

- Central, Claremont, Dingee, Dunsmuir, Estates and 39th Avenue reservoirs, the dams at Lake Chabot and at Upper San Leandro reservoir, and the Upper San Leandro filtration plant no. 1 and no. 2 clearwells (owned by the East Bay Municipal Utility District, EBMUD);
- Lake Temescal dam (owned by the East Bay Regional Park District);
- Lower Edwards and Upper Edwards reservoirs (owned by the Mountain View Cemetery Association); and
- Lower and Upper Edwards reservoirs, owned by the Mountain View Cemetery Association.

However, according to Figure 6.1 of the City of Oakland General Plan Safety Element (2004), the site is not located within any of the dam failure inundation areas of any of these above facilities. Based on this information, the potential for flooding or inundation of the project site by dam failure is judged to be very low.

5.5.5 Tsunami and Seiche

During a major earthquake, strong waves such as tsunamis or seiches may be generated in large bodies of water and may cause damage to structures at or near the shoreline. Tsunamis are large waves generated by displacement of the seafloor by earthquakes, coastal or submarine landslides, or volcanoes. Damaging tsunamis are a potential hazard along the California coast. Most historical California tsunamis were associated with distant earthquakes (such as those in Alaska or Pacific Ocean), not with local earthquakes. However, they may occur, especially along the far northern coast of California where seafloor displacement is associated with major subduction zone earthquakes. Devastating tsunamis have not occurred in historic times in the San Francisco Bay Area.

The existing surface elevations at the project building area are about +18 feet to +21 feet (NAVD 88) and the site is located about 1/4 mile from the Oakland Inner Harbor, bounded by the Alameda Island and the Oakland bay shore. According to the Tsunami Inundation Map for Emergency Planning of the Oakland West Quadrangle (CGS, 2009), the project building area is located adjacent to but outside the mapped boundary of an identified potential tsunami inundation area. It appears the mapped boundary lies approximately at Elevation of +15 feet. In our opinion, the potential inundation hazard by a tsunami at the project building area is low.

A seiche is a wave that occurs in an enclosed basin as a result of displacement in the basin bottom, large landslides into the basin, or periodic oscillation or sloshing of the water in the basin. According to City of Oakland General Plan Safety Element (2004), the nearby by Lake Merritt, with depths greater than 2 to 3 feet only near its center, is likely too shallow to be able to generate devastating seiches. In our opinion the potential for damage due to a seiche is negligible.

5.5.6 Supplement Naturally Occurring Asbestos (NOA)

Inhalation of asbestos fibers may cause cancer. Most commonly, asbestos occurrences are associated with serpentinite and partially serpentinized ultramafic rocks.

Asbestos occurs naturally in certain geologic settings in California. Exposure and disturbance of rock and soil that contains asbestos can result in the release of fibers to the air and consequent exposure to the public. Asbestos most commonly occurs in ultramafic rock that has undergone partial or complete alteration to serpentine rock (proper rock name serpentinite) and often contains chrysotile asbestos. In addition, tremolite, another form of asbestos, can be found associated with ultramafic rock, particularly near faults. Sources of asbestos emissions include:

- Unpaved roads or driveways surfaced with ultramafic rock,
- Construction activities in ultramafic rock deposits or soils, or
- Rock quarrying activities where ultramafic rock is present.

The bedrock underlying the site is estimated to be on the order of 500 feet below the surface. In addition, no serpentinite gravels were reportedly encountered in the previous borings at the site, and no serpentinite outcrops or serpentine derived soils are identified in the hills that drain into Lake Merritt. Therefore, we consider the possibility of NOA at the site to be very low.

5.5.7 Hydrocompaction

Hydrocompaction; also referred to as hydro-collapse, is a process of settlement and resulting volume change that occurs in, low density, fine sand with minor amounts of silt and clay. Near-surface soils above groundwater encountered at the site predominately consist of medium dense silty sands and gravels or medium stiff clays; therefore, the potential for hydrocompaction or hydrocollapse is very low.

6. Discussion and Conclusions

It is our opinion that the project is feasible from a geotechnical and engineering geologic standpoint, provided that the conclusions and recommendations presented in this report are incorporated into the project design and specifications. The principal geotechnical considerations are discussed in the following sections.

6.1 Seismic and Geologic Hazards

The site is in a seismically active region of California. Significant earthquakes in the San Francisco Bay Area have been associated with movements within the fault zones. Earthquakes occurring along faults in the area have the potential to produce strong ground shaking at the site. Structures within the San Francisco Bay Area will experience similar shaking effects during a moderate to strong earthquake. Details discussions regarding the site geologic hazards are presented in **Section 5.0**.

Based on the results of our review and evaluation, geologic hazards at the project site consist of the potential for strong ground shaking, liquefaction, lateral spreading, landsliding, compressible fills and soils, corrosive soils, and expansive soils. Detailed measures to mitigate these geologic hazards are incorporated in our recommendations presented in **Section 7.0**.

However, the potential for surface fault offset, dynamic densification, seismically induced waves, flooding, dam inundation, hydrocompaction, NOA, and volcanic eruption at the project building area appear to be low to negligible.

6.2 Liquefaction, Lateral Spreading, and Slope Instability

As described previously, the results of our site liquefaction evaluations generally indicate the saturated, loose to medium dense sand layers of various thicknesses located both above and within the Young Bay Mud layer have a high potential for liquefying when they are subjected to an MCE earthquake event. The majority of these sand layers were encountered by borings and CPTs at the site within depths of about 30 to 40 feet (above Elevation of about -15 feet). We calculated that the MCE induced liquefaction in these sand layers would result in residual volumetric strains varying from about 1 to 4 percent and total ground surface settlements (without reduction associated with the depth of occurrence) ranging from as little as 1 inch to up to about 6-1/2 inches.

Our lateral spreading analysis results generally indicate the loose to medium dense sand layers encountered by CPTs and borings in the area adjacent to the Lake Merritt Channel at Elevations between +8 and -5 feet have a high potential to trigger ground surface lateral spreading during soil liquefaction from an MCE event. The other onsite liquefiable sand layers are considered as

having low potential to trigger ground lateral spreading due to their presence in isolated thin pockets and/or being located in deeper depths in relation to the bottom of the Lake Merritt Channel.

In addition, it is our opinion the potential for slope instability during an MCE event and/or after major liquefaction event to impact the proposed building location is low to moderate. However, extensive slope failures may occur for the areas immediately adjacent to the Lake Merritt Channel if soil liquefaction and lateral spreading do occur at the site region during major earthquakes.

We recommend the proposed new building be supported on a deep foundation system that provides proper bearing support during the potential soil liquefaction events. The deep foundation should be designed to resist downdrag loads that would be imposed upon the foundations due to soil liquefaction.

In addition, the southeast side of the proposed new building foundation should also include a permanent shoring system, or a ground improvement technique should be used to mitigate the detrimental impacts from the potential lateral spreading and slope instability from the areas immediately adjacent to the Lake Merritt Channel. Our estimated lateral extent of potential ground lateral spreading/slope instability is shown on **Plate 3**.

Based on the proposed building layout, we recommend the permanent shoring system along the southeast side of the proposed building (estimated lateral spreading/slope instability lateral extent) be designed to retain a 12-foot-high column of soils, assuming the loss of adjacent ground support due to slope failure. The small portion of the shoring system located further east of the area of estimated lateral spreading/slope instability should be designed to retain an 18-foot high column of soils. Our recommended lateral pressures for the shoring system designs are shown on **Plates 14** and **15**. Recommendations and specifications for ground improvement technique are presented in **Supplement I and J**.

The site and any new improvements not supported on deep foundations may experience total areal ground surface settlements on the order of about 1 to 4 inches with locally up to about 6-1/2 inches of settlement. In the area immediately adjacent to the channel bank, the ground settlements may be larger than the above estimates if lateral spreading occurs. Underground pipelines (gas lines, sanitary sewers, water services, etc.) should be properly designed to accommodate for the settlement caused by the liquefaction of the underlying supporting soils. Consideration should be given to using flexible pipe connections to mitigate potential damage from the estimated potential liquefaction-induced settlement of 4 inches at locations where the pipes are connected to pile-supported structures.

It should be noted that after a major liquefaction event, phenomena such as sand boils, ground cracking, and differential movement of overlying improvements such as roadways and utilities may be observed and may require repair.

Alternatively, soil liquefaction ground improvement options that involve densification, drainage, reinforcement, mixing, or replacement of the liquefiable soils can be used to mitigate the site liquefaction, lateral spreading, and slope instability potentials. If needed, we can provide additional recommendations during project design, once the building and development layouts are finalized.

6.3 Compressible Soils

As described previously, the site is blanketed by sandy or clayey fills that extended to depths of about 8 to 25 feet (Elevation of about +8 feet to -5 feet). Below the surficial fill layer, Young Bay Mud was encountered to about 30 feet deep (Elevation of about -10 feet) at the northwest side of the proposed building location and about 50 feet deep (Elevation of about -30 feet) at the southeast side of the proposed building location. This 15- to 35-foot layer of slightly over-consolidated to normally consolidated Young Bay Mud is very soft to soft, has high moisture content and low shear strength, and is highly compressible under new additional loads. Besides the areas of the recent fills placed during the portable classroom development in 2007 or 2008, we estimated the site primary consolidation settlement due to the historical fills placed prior to 1960s should have been completed.

In our 2020 report, we recommend the proposed new building be supported on a deep foundation system that extends to a depth of at least 70 feet (or to a pile tip Elevation of -50 feet) to transfer bearing loads to the sand and clay layers below the Young Bay Mud layer. Either precast pre-stressed concrete driven piles or drilled piles, such as Case-in-Drilled-Hole (CIDH) piers and auger cast piles, can be used at the site. We note that 70- to 110-foot long, 14-inch square, precast, pre-stressed concrete driven piles were used to support the existing Art Building (built in 2005) that is also located adjacent to the Lake Merritt Channel and is about 500 feet northeast of the proposed Library Learning Resource Center site. Furthermore, the new Building Efficiency for a Sustainable Tomorrow (BEST) Center built in 2016 also is reportedly supported by 95- to 105-foot long, 14-inch square, precast, pre-stressed concrete driven piles.

The design team has decided to use a DMM ground improvement technique in combination with a shallow foundation for the LLRC building. The details of the design and specifications are presented in **Supplement I and J**.

In addition, to reduce the soil consolidation-induced downdrag forces on the pile foundations, we recommend the proposed project site grading activities, construction of the new surface improvements (such as exterior flatwork), and backfill for deeply buried pipelines (if any) be designed so “zero net load” will be imposed on the underlying Young Bay Mud. A “zero net

load” condition can be achieved by over-excavating the fills (and possibly a portion of the Young Bay Mud if necessary) and backfilling the excavation with lightweight fill materials. Lightweight fills or concrete materials should also be used to backfill deep pipe trenches. The weight combination of new fills, at-grade new improvements, and new lightweight fills and/or concrete materials should not exceed the weight of the soils removed.

Our recommended unit weights of the fills and Young Bay Mud to be used in the “zero net load” analyses are shown in the table below. The site grade prior to the portable classroom development in 2007 or 2008 should be used in the analyses as the base line. We also recommend a groundwater level at Elevation of +8 feet be used in the analysis.

Table 6.1: Recommend Fill and Young Bay Mud Unit Weight

Soil Unit	Elevation	Unit Weight (pcf)
Existing Fill and Soil Above Groundwater	Above +8 Feet	110
Young Bay Mud Below Groundwater	Below +8 Feet	30

Alternatively, lightweight concrete materials such as Elastizell and Geofom can be used as lightweight fills. We note that with the use of these lightweight materials below the ground water level would likely require dewatering of the excavation until sufficient weight from fills and/or structure loads are imposed to prevent potential uplift water pressures from lifting the lightweight fill materials.

6.4 Deep Mixing Method (DMM)

The design team decided to use shallow foundation and ground improvement technique in lieu of deep foundation and retaining wall system to create a more competent bearing layer for the shallow foundation and reduce the ground displacements due to lateral spreading. DMM ground improvement is one of the many techniques that is an in-situ soil treatment in which native soils or fills are mixed and blended with cement or other binders and water. The final mixed soil-binder product has enhanced engineering properties such as increased strength, lower permeability, and reduced compressibility. Two types of DMMs are used in the United States: wet mixing and dry mixing. Wet mixing involves injecting binders in slurry (wet) form to blend with the soil. Primarily single-auger, multi-auger, or cutter-based mixing processes are used with cement-based slurries to create isolated elements, continuous walls or blocks for large-scale foundation improvement, earth retaining systems, hydraulic barriers, and contaminant/fixation systems. Dry mixing uses binders in powder (dry) form that react with the water already present in the soil. Primarily single-auger dry mixing processes are used with lime and lime-cement mixtures to create isolated columns, panels, or blocks for soil stabilization as well as reinforcement of cohesive soils.

Soils best suited to DMM include cohesive soils with high moisture contents and loose, saturated, fine granular soils. DMM has also been used successfully in a wide range of less cohesive soils and fills, but it is typically not feasible in very dense or stiff materials or in ground with obstructions such as cobbles or boulders. The treated soil properties obtained by DMM reflect the characteristics of the native soil, binder characteristics, construction variables, operational parameters, curing time, and loading conditions. The generic term DMM is inclusive of other terms such as deep soil mixing (DSM) and cement deep soil mixing (CDSM). A detailed design and recommendations are presented in DMM Design Recommendations, **Supplement I and J**.

6.5 Preliminary Corrosion Evaluation

Corrosivity tests that include redox, pH, chlorides, sulfates, and resistivity were performed by CERCO Analytical, Inc. in Concord, California, on two representative onsite near-surface soil samples (from Boring 2019-CPT-01 at about 2-1/2 feet and 2019-CPT-03 at about 4 feet). The test results and a brief evaluation report prepared by CERCO regarding the onsite soil corrosivity are also included in **Supplement B**. We recommend these test results and the report be forwarded to the project underground contractors, pipeline designers, and foundation designers and contractors, so that they can design and install corrosion protection measures for buried concrete structures and ferrous metal. We also recommend additional testing be performed if the test results in **Supplement B** are deemed insufficient by the designers of the corrosion protection.

6.6 Construction Considerations

Excavations will be required to construct building foundations and elevator pit (if any), install utilities, and to remove locally weak or unsuitable soils. All excavations that will be deeper than 5 feet and will be entered by workers should be shored or sloped for safety in accordance with Occupational Safety and Health Administration (OSHA) standards.

If earthwork is performed during the dry season, moisture conditioning will be required to raise the onsite soil moisture contents to the engineered fill placement and compaction recommendation presented in this report. If earthwork is performed during or shortly after wet weather conditions, the moisture content of the soils could be appreciably above optimum. Consequently, subgrade preparation and fill placement may be difficult. Additional recommendations for wet weather construction can be provided at the time of construction, if required.

7. Recommendations

7.1 Seismic Design

The proposed new building should be designed to resist the lateral forces generated by earthquake shaking in accordance with Chapter 16 of the 2019 California Building Code (CBC). This section presents seismic design criteria according to 2019 CBC, which has adopted the seismic hazard assessment procedures provided by ASCE 7-16, Minimum Design Loads for Buildings and Other Structures. Per Section 11.6 of ASCE 7-16, structures of Risk Category I, II, and III (defined in ASCE 7-16 Table 1.5-1) should be designed according to Seismic Design Category "D".

Our liquefaction triggering hazard assessment indicated that the soils at the site are potentially liquefiable. Therefore, according to ASCE 7-16, the site is classified as Site Class F, and site response analyses, as defined in Section 21.1 of ASCE7-16, are required to calculate the design ground motions at the ground surface. Additionally, due to the large ground motion amplitudes expected at the site, ASCE 7-16 also requires the performance of a site-specific seismic hazard assessment according to Section 21.2 of ASCE 7-16. Detailed discussions of these site-specific ground motion analyses are included in **Supplement G**.

Table 7.1 tabulates the spectral ordinates of the recommended site-specific MCE_R and design response spectra per ASCE 7-16 for the ground surface. The corresponding design acceleration parameters S_{MS} , S_{M1} , S_{DS} , S_{D1} , S_S , and S_1 are tabulated in **Table 7.2**. The MCE_R and design response spectra per ASCE 7-16 at the base of the Young Bay Mud layer is provided in **Supplement G**.

Table 7.1: MCE_R and Design Response Spectra per ASCE 7-16 at the Ground Surface, 5% Damping

Period (sec)	Horizontal Spectral Acceleration (g)	
	Site-Specific MCE _R	Design Response Spectrum
0.01 (PGA)	0.584	0.389

7.2 Earthwork

7.2.1 Site Clearing and Preparation

The site should be cleared of all obstructions, including any existing structures and their entire foundation systems, concrete slabs-on grade, existing utilities and pipelines and their associated backfill, designated trees and their associated entire root systems, landscaping, and debris. Concrete/asphalt concrete, baserock, and trench backfill materials can be reused as new fills provided debris is removed and concrete/asphalt concrete are broken up to meet the engineered fill size requirements presented in this report.

Holes resulting from the removal of underground obstructions extending below the proposed finish grade should be cleared and backfilled with engineered fills and compacted to the requirements presented in this report. We recommend backfilling operations for any excavations to remove underground obstructions be performed under observations and testing of the project Geotechnical Engineer. After clearing, areas containing heavy surface vegetation should be stripped to an appropriate depth to remove these materials. We estimate the stripping depth to be about 6 inches. The amount of actual stripping should be determined in the field at the time of construction. Stripped materials should be removed from the site or stockpiled for later use in landscaping, if desired.

7.2.2 Subgrade Preparation

Following the site clearing and preparation, soil subgrades in areas to receive engineered fill, slabs-on-grade, or pavements be scarified to a depth of at least 12 inches, moisture conditioned to approximately 3 percent above optimum water content and compacted to the requirements for engineered fills. Locally weak fills and soils, if encountered, should also be excavated and replaced, or otherwise stabilized as recommended by the project Geotechnical Engineer at the time of earthwork operations.

The prepared subgrade surface should be firm, unyielding, and kept moist during construction. The subgrades should be protected from damage caused by weather and construction traffic. If the subgrades are left exposed to weather for extended periods of time or are disturbed by construction traffic, the project Geotechnical Engineer should be consulted on the need for subgrade moisture reconditioning and/or scarifying and recompacting to eliminate shrinkage cracks and disturbances.

7.2.3 Engineered Fill Materials

Any new fills placed at the site should consist of engineered fills that meet the requirements presented in this report, except for landscaping materials which are placed on level ground. All engineered fills should have an organic content of less than 3 percent by volume and should not

contain rocks or lumps larger than 4 inches in greatest dimension with not more than 15 percent larger than 2.5 inches.

Onsite soils (except for Young Bay Mud) and fills can be used as new fills. Imported fills not used as non-expansive fills should be predominantly granular, have a liquid limit less than 40 percent, and have a plasticity index not exceeding 20. Imported, non-expansive fills should consist of sub-angular to angular particles, have a plasticity index not exceeding 12, and have a significant fine content. All imported fills should not contain environmental contaminants or debris and should be non-corrosive.

7.2.4 Fill Placement and Compaction

Within the upper 5 feet of the finished ground surface, we recommend engineered fills be compacted to at least 90 percent relative compaction, as determined by ASTM D1557. Engineered fills below a depth of 5 feet should be compacted to at least 95 percent relative compaction. The upper 6 inches of subgrade soils beneath pavements should be compacted to at least 95 percent relative compaction. Fill material should be spread and compacted in lifts not exceeding approximately 8 inches in uncompacted thickness.

We recommend engineered fills be moisture conditioned to approximately 3 percent above optimum water content. To achieve satisfactory compaction of fill materials, it may be necessary to adjust the water content at the time of earthwork operations. This may require that water be added to soils that are too dry, or that aeration be performed in any soils that are too wet. To achieve satisfactory compaction of onsite excavated soils from near or below the existing groundwater level will require drying at the time of construction.

7.2.5 Trench Backfill and Pipe Bedding

To prevent imposing additional load to the underlying soils and to reduce potential settlement along deeply buried pipelines, trench backfill materials should be properly selected so that the unit weight of backfill materials is less or equivalent to the unit weight of the removed onsite soil materials (zero net load). Considerations should be given to increasing the hydraulic gradient of gravity flow pipes to account for potential soil differential consolidation settlements below the pipes and also using flexible connections for all pipes.

Pipeline trenches should be backfilled with engineered fills placed in lifts of approximately 8 inches or less in uncompacted thickness. Thicker lifts can be used provided the method of compaction is approved by the project Geotechnical Engineer and the required minimum degree of compaction is achieved. Backfill should be placed by mechanical means only; jetting is not permitted. Onsite soils, and onsite and imported fills when used for trench backfill should be compacted to at least 90 percent relative compaction. Imported sands and aggregate bases when used for trench backfill should be compacted to at least 95 percent relative compaction and sufficient water is added during backfilling operations to prevent the soil from "bulking"

during compaction. The upper 3 feet of trench backfill in foundation, slab, and pavement areas should be entirely compacted to at least 95 percent relative compaction.

Sand or gravel backfilled trench laterals that extend from irrigated landscaped areas, such as lawns or planting strips, toward pavements, exterior slabs, and building foundations, should be plugged with onsite or imported clayey soils, low strength concrete, or sand-cement slurry mixture below the edges of pavements and exterior slabs, and under perimeters of the foundations. The plugs for the trench laterals should be at least 24 inches thick, extend at least 24 inches beyond the trench walls, and extend from the bottom of the trench to the top of the sand or gravel backfills.

Bedding material should consist of Caltrans Class 2 Aggregate Base or Aggregate Base Course (ABC) meeting the requirements of Section 26 of Caltrans Standard Specifications. All bedding material shall have 3/4-inch maximum aggregate size and be free from organic or vegetable matter, lumps, or balls of silt/clay, or any other deleterious matter. ABC material shall conform to the following gradations when tested in accordance with ASTM C136 or California Test 202.

Table 7.3: Aggregate Base Course Gradation Requirements

Sieve Size (Square Openings)	Percentage by Weight Passing Sieves
1 inch Screen	100
3/4 inch Screen	90 to 100
No. 4 Sieve	35 to 60
No. 30 Sieve	10 to 30
No. 200 Sieve	2 to 9

In addition to the above requirements, all material used shall conform to the following quality requirements:

- Resistance (R-Value) with the minimum test results of 78;
- Sand Equivalent with the minimum test result of 22; and
- Durability Index with the minimum test result of 35.

7.2.6 Exterior Flatwork

We recommend exterior slabs, such as sidewalks and patios, be placed directly on the properly prepared subgrades in accordance with the recommendations presented in this report.

Eliminating aggregate base, gravel, or crushed rock base beneath exterior slabs will reduce the potential for landscape irrigation water to seep through the granular materials and cause the underlying soil subgrades to saturate or pipe. Prior to placing concrete, subgrade soils should be

moisture conditioned to increase their moisture content to approximately 3 percent above laboratory optimum moisture (ASTM D-1557).

The expansive clayey soils and fills at the site could be subjected to volume changes during fluctuations in moisture content. As a result of these volume changes, some vertical movement of exterior slabs should be anticipated. This movement could result in damage to the exterior slabs and might require periodic maintenance or replacement. Adequate clearance should be provided between the exterior slabs and building elements that overhang these slabs, such as doors that open outward. We recommend reinforcing exterior slabs with steel bars in lieu of wire mesh. To reduce potential crack formation, considerations should be given to installing of #4 bars spaced at approximately 18 inches on center in both directions. Both score joints and expansion joints can be used to control cracking and allow for expansion and contraction of the concrete slabs.

We recommend appropriate flexible, relatively impermeable fillers be used at all expansion and cold joints. The installation of dowels at all expansion and cold joints will reduce differential slab movements; if used, the dowels should be at least 30 inches long and should be spaced at a maximum lateral spacing of 18 inches. Although exterior slabs that are adequately reinforced will still crack, trip hazards requiring replacement of the slabs will be reduced.

It should be noted, movements or failures of the exterior slabs should be anticipated after major liquefaction events. Repair of the exterior slabs, as well as site regrading, may be needed after the events.

7.2.7 Surface Drainage and Landscaping

We recommend exaggerated positive surface gradients that take into account potential differential ground settlements be provided adjacent to structures and for pavements to direct surface water toward suitable discharge facilities. Roof downspouts and landscaping drainage inlets should be connected to solid pipes that discharge into appropriate facilities. Ponding of surface water must not be allowed adjacent to structure foundations and exterior slabs, adjacent to pavements, at the top or adjacent to retaining walls.

To reduce moisture changes in the soils below and adjacent to structure foundations and exterior slabs, landscaping and irrigation systems should be designed and installed in a uniform and systematic manner as equally as possible on all sides of the foundations and adjacent to exterior slabs. If landscaping plans include trees, they should be planted a minimum distance of one-half the anticipated mature height of the trees from improvements to reduce the adverse effects from the tree roots. We recommend that drought resistant plants and low flow/drip irrigation watering systems be used. All irrigation systems should be regularly maintained and inspected for leakage. Over-watering must be avoided.

For bio-retention swales and basins (if planned), where they are located within 10 feet of infrastructure improvements (such as structure foundations, exterior flatwork, and pavements), we recommend they be lined with a relatively impermeable membrane to reduce water seepage and the potential for damage to other infrastructure improvements (such as foundations, exterior slabs, and pavements). The membrane can consist of a layer of STEGO Wrap 15-mil or equivalent installing below and along the sides of these facilities to direct the collected water into subdrain pipes. The membrane should be lapped and sealed in accordance with the manufacturer's requirements, including sealing joints where pipes penetrate the membrane.

The bio-treatment soil mix materials within swales and basins should be considered as having no lateral load resistant. We recommend the sidewall slopes of the swales and basins not to exceed 2:1 (horizontal to vertical) to reduce potential vertical and lateral movements of surrounding ground surface. In addition, we recommend either improvements (foundations, exterior slabs, and pavements) be setback beyond an imaginary 1:1 (horizontal to vertical) plane projected upward from the bottom edges of the swales and basins or the affected areas of the improvements be supported by deepening foundations or edges. Alternatively, properly designed below-grade enclosure structures can be used to build the swales and basins and to retain surrounding ground and improvements.

7.2.8 Construction During Wet Weather Conditions

If construction proceeds during or shortly after wet weather conditions, the moisture content of the onsite soils could be appreciably above optimum. Consequently, subgrade preparation, placement of onsite soil as structural fill might not be possible. A geotechnical engineer can provide alternative wet weather construction recommendations in the field at the time of construction, if appropriate.

7.3 Building Foundation System

The proposed new building foundation should be designed to provide proper bearing supports during the potential soil liquefaction events. Two foundation system are proposed: 1) deep foundation in combination with a permanent shoring system on the southeast side of the proposed new building foundation and 2) shallow foundation in combination with DMM ground improvement technique to mitigate the detrimental impacts from the potential lateral spreading and slope instability from the areas immediately adjacent to the Lake Merritt Channel. Our estimated lateral extent of potential ground lateral spreading/slope instability is shown on **Plate 3**.

Based on the proposed building layout, we recommend the permanent shoring system along the southeast side of the proposed building (estimated lateral spreading/slope instability lateral extent) be designed to retain a 12-foot-high column of soils, assuming the loss of adjacent ground support due to slope failure. The small portion of the shoring system located to further

east of the estimated lateral spreading/slope instability lateral extent should be designed to retain an 18-foot high column of soils. Our recommended lateral pressures for the shoring system designs are shown on **Plates 14** and **15**.

We recommend the proposed new building be supported on a deep foundation system that extends to a depth of at least 70 feet (or to a pile tip Elevation of -50 feet) to transfer bearing loads to the sand and clay layers below the Young Bay Mud layer. Either precast pre-stressed concrete driven piles or drilled piles, such as Case-in-Drilled-Hole (CIDH) piers and auger cast piles, can be used at the site. The deep foundation should also be used to support any exterior elements that are considered essential parts of the building. Structural slabs should be designed to span between pile foundations. Detailed descriptions of the ground improvement technique are presented in DMM Design and Recommendations, **Supplement I and J**.

The deep foundation should be designed to resist downdrag loads that would be imposed upon the foundations due to soil liquefaction. Consideration should also be given to using flexible pipe connections to mitigate potential damage from the estimated potential liquefaction-induced settlement of 4 inches at locations where the pipes are connected to pile-supported structures.

Structures not supported on deep foundations may experience total areal ground surface settlements on the order of about 1 to 4 inches with locally up to about 6-1/2 inches of settlement. In the area immediately adjacent to the channel bank, the ground settlements may be larger than the above estimates if lateral spreading occurs.

7.3.1 Pile Axial Load Capacity

The new building can be supported by a deep foundation system that develops its load carrying capacity from soil friction/adhesion within the competent sand and clay layers below the Young Bay Mud. Either precast pre-stressed concrete driven piles or drilled piles, such as Case-in-Drilled-Hole (CIDH) piers and auger cast piles, can be used at the site

Piles should be at least 14 inches in square or diameter, extend to a depth of at least 70 feet (or to a pile tip Elevation of -50 feet), and have a center-to-center spacing of at least 3 times the pile dimension. The actual design lengths of the piles should also be determined using an ultimate skin friction of 1,500 psf (pounds per square feet) for the pile section located below the bottom of the Young Bay Mud layer. As indicated on **Plates 7** through **11**, the bottom of the Young Bay Mud layer is located at about 30 feet deep (Elevation of about -10 feet) at the northwest side of the proposed building location and about 50 feet deep (Elevation of about -30 feet) at the southeast side of the proposed building location. The pile section within and above the Young Bay Mud layer should be neglected in design for axial loading. The allowable axial capacity should be calculated by dividing the ultimate axial capacity by the factors of safety provided in

the table below or the project structural design over strength factor (if applicable). Eighty percent (80 percent) of the skin friction value can be used to resist uplift.

Table 7.4: Recommended Factors of Safety for Axial Loading of Pile Foundation

Load Condition	Factor of Safety
Dead Load	3
Dead plus Live Loads	2
Total Loads (including wind or seismic)	1.5

The piles should also be designed to resist downdrag loads that would be imposed upon the foundations due to potential liquefaction of the isolated sand layers above Elevation of about - 15 feet. We recommend an average negative skin friction of 650 psf be included along the upper 35 feet of the pile shaft to account for the potential liquefaction-induced downdrag forces from about 15 feet of fills, and 20 feet of Young Bay Mud with liquefied sand lenses. This value should be subtracted from the ultimate pile axial capacity.

A viscous bituminous coating can be applied on the upper 35 feet of pile shaft to reduce the downdrag loads. A fifty percent (50 percent) reduction is applicable to the above downdrag value when bituminous coating is used.

Static total and differential settlements of the pile supported structure are estimated to be insignificant (i.e., less than 0.5 inch) and within tolerable limits for the proposed structure. Seismic settlement of the pile is estimated to be less than 1 inch assuming the pile is designed to resist the downdrag force only using pile skin friction.

Regardless of the calculated pile lengths to meet axial capacity demands, a minimum of 35 feet of pile embedment is also needed to provide pile "fixity" to resist lateral loading based on the LPILE analysis results.

7.3.2 Pile Lateral Load Capacity

We evaluated pile lateral load capacities using the computer program LPILE (Ensoft, Ver. 2017.11.01) to model subsurface soils as a series of discrete springs with nonlinear behavior. Our analyses assumed a 70-foot long, 14-inch square elastic pile with a design concrete strength of 5,000 pounds per square inch (psi). The estimated flexural rigidity (EI) of the pile was reduced by fifty percent (50 percent) to account for an assumed twenty percent (20 percent) of pile section concrete crack in the direction of lateral loading. Pile axial loads were not included in our analyses.

Four (4) different soil profiles (1, 2, 3A & 3B) along the Cross-Section A-A' (**Plate 7**) were established in our analysis models based on the idealized subsurface soil conditions at the site. The locations of these profiles are shown on **Plate G-1** for reference, included in **Supplement G**.

Both Profiles 1 and 2 have the same soil stratigraphy, besides the thickness of the Young Bay Mud layer. An additional saturated highly liquefiable sand layer was also included in Profiles 3A and 3B between the surficial fill layer and the underlying Young Bay Mud layer. In Profile 3B, this sand layer was assumed to be liquefied during earthquake events. A design groundwater table at an elevation of +8 feet were used for all profiles. The detailed soil stratigraphy and engineering properties used in our analyses are in the tables below.

Table 7.5: Soil Engineering Properties for Profile 1

Depth Below Ground Surface	Soil Layer	Model Used	Effective Unit Weight (pcf)	Material Properties

Both free and fixed pile head conditions were examined in our analyses. Our estimated lateral loads for 1/4-inch, 1/2-inch, and 1 inch of lateral displacements at pile heads for each pile head condition and loading case (1 through 6) are presented in the tables for each soil profile. The calculated pile head deflection, bending moment, and shear force versus embedment depth are

presented in **Supplement H**. It should be noted that no factor of safety was applied to the estimated loads or deflections.

Table 7.9: Estimated 70' Long 14" Square Pile Lateral Load Capacities – Profile 1

Where competent subgrade soils exist, a soil passive resistance equal to an equivalent fluid weighing 350 pcf (pounds per cubic foot), which acts against the vertical face of the pile cap and grade beam (assumes a deflection of approximately 1/2 inch), can also be used in conjunction with the above estimated pile shaft lateral load capacities. A higher soil passive resistance equal to an equivalent fluid weighing 450 pcf can be used for the portion of the surficial fills that is properly over-excavated and re-compacted as engineered fills. The upper 12 inches of soils should be neglected in passive resistance design unless they are confined by a pavement or slab. This value can be used without reduction if the pile shaft lateral load capacity is also based on a compatible 1/2 inch pile head displacement. Any portion of the pile cap, grade beam and shaft located above an imaginary 1.5:1 (horizontal to vertical) plane projected upward from the bottom edge of the adjacent utility trenches should be ignored in the passive resistance design.

For closely spaced piles, the shear planes in the soil overlap and the lateral resistance for a pile within the group is less than that of a single pile. We note that the leading piles are generally less impacted by group effects and tend to draw higher loads. To account for the reduction of soil resistance because of group effects, we recommend multiplying the lateral loads by the reduction factors provided in the table below. Reduction factors, or p-multipliers, are a function of center-to-center spacing where D is the pile diameter. P-multipliers should be applied to trailing piles in the direction of loading.

As an example, a 1 by 6 pile row with a center-to-center spacing of 6 diameters and loaded in the direction parallel to the pile row would use a p-multiplier of 1.0 for the lead pile and 0.7 for all trailing piles. The same group loaded perpendicular to the pile row would use a p-multiplier of 1.0 for all piles. Linear interpolation may be used for other pile spacing.

Table 7.13: Reduction Factors for Pier Lateral Load Capacity

Center-to-Center Spacing	p-Multiplier
8D	1.0
6D	0.7
4D	0.4
3D	0.3

7.3.3 Pile Construction

We recommend that the installation or excavation of all piles be performed under the direct observation of the project Geotechnical Engineer to confirm that the piles are founded in suitable materials and constructed in accordance with the recommendations presented herein. All piles should be installed or constructed vertically to their design tip elevations at the specified locations to develop adequate vertical pile capacities.

The pile driving hammer and the methods of handling, picking, and setting the piles should be properly selected by the contractor and reviewed by both the project Structural Engineer and Geotechnical Engineer. It is possible for a very large or very small hammer to cause damage to the pile it is driving. The pile driving criteria should be established by the Contractor in conjunction with the project Geotechnical Engineer by performing a wave equation analysis (WEAP) after selections of type and size of pile and pile hammer have been finalized, and prior to pile installation.

In addition, we recommend an indicator pile program be performed for the project, which consists at least 5 indicator piles and Pile Dynamic Analyzer (PDA) tests. The indicator piles should be performed in close proximity to the exploratory borings and CPTs to determine the lengths for production piles and driving resistance of the piles, as well as to verify the pile

capacities and the anticipated soil profile across the site. The indicator piles should be at least 10 feet longer than the anticipated design length of the production piles. The indicator pile program should be conducted using the same equipment and same installation methods that will be used for installing the production piles. Due to the potential for encountering hard driving within dense sands below the Young Bay Mud layer, we recommend that the moment resisting reinforcement in the indicator piles be deepened 10 to 20 feet in anticipation of possible pile cutoffs.

The project Geotechnical Engineer should observe the driving of all indicator and production piles and in no case should driving be terminated without the approval of the project Geotechnical Engineer. The project Geotechnical Engineer should evaluate the allowable capacity of any piles driven shorter than their anticipated lengths.

We recommend predrilling through the existing fill layer be performed at driven pile locations to avoid obstructions and potential damage to the piles. The pre-drilled holes should have a diameter less than the 3/4 the diagonal width of the piles.

7.3.4 Deep Mixing Method (DMM) Ground Improvement

Several alternatives were considered for mitigating the lateral spread hazard at the planned building site, including installation of a retaining wall and the deep mixing method (DMM) beneath the building footprint. Considering the high seismic demand, presence of shallow liquefiable soils and soft Young Bay Mud, proximity to the Lake Merritt Channel, and constraints from the PG&E easement on the north side of the planned building, it is our experience and opinion that continuous grids of deep mixed shear walls are the most suitable, robust, and cost-effective technique to mitigate the lateral spread hazard at the planned building site. The grids of deep mixed shear walls will provide support for shallow foundation systems for seismic loading and transfer bearing loads deeper to the medium dense to very dense sands and stiff to hard clays, reducing total and differential building settlements. In addition, we recommend using structural slabs to span between DMM deep mixed shear walls, assuming that the untreated soils within the grid walls may still develop post-liquefaction reconsolidation settlements below slabs. The deep mixed shear walls will also affect the composite ground response to horizontal ground motions. This section presents a brief overview of the deep mixing method (DMM), our design approach, DMM design properties, and results of our evaluation process, including results of seismic stability analyses. Seismic design parameters incorporating the composite response of the deep mixed zone are presented in **Supplement I and J**, herein.

7.3.5 Building Ground Interior Slab

The interior ground slab should consist structural slabs that are designed to span between pile foundations. The slab should be underlain by an at least 12 inches of properly compacted engineered fills that extend at least 3 feet beyond the foundation footprints.

If migration of water vapor through interior slab is undesirable, we recommend a vapor retarder and an underlying 4-inch layer of $\frac{3}{4}$ -inch, clean, crushed, uniformly graded gravel/drain rock be placed between the bottom of the slab and the recommended engineered fill layer. The gravel/drain rock layer can be considered as part of the non-expansive engineered fill layer. We recommend the vapor retarder consist of a single layer of Stego Wrap Vapor Barrier 15 mil or equivalent provided the equivalent satisfies the following criteria: a permeance less than 0.01 perms as guided by ACI 302.2R, Class A strength as determined by ASTM E1745, and a thickness of at least 15 mils. Installation of the vapor retarder, including protrusions where pipes or conduit penetrate the membrane, should conform to ASTM E1643 and the manufacturer's requirements. Care must be taken to protect the membrane from tears and punctures during construction. We do not recommend placing sand or gravel over the membrane. The subgrade below the slab should be properly prepared, firm, and non-yielding. All foundation excavations should be kept moist and free of loose soils and standing water prior to concrete placement.

Concrete slabs retain moisture and often take many months to dry; construction water added during the concrete pour further increases the curing time. If the slabs are not allowed to completely cure prior to constructing the super-structure, the concrete slabs will expel water vapor and the vapor will be trapped under impermeable flooring. A proper water/cement ratio should be determined by the foundation designers for the slabs to reduce vapor transmitting if need. We recommend the foundation designer determine if corrosion protection is needed for the foundation concrete and reinforcing steel. The corrosivity test results of onsite soil samples and a brief evaluation report by others are included in **Supplement B**; the foundation designer should determine if additional testing is needed. In addition, the foundation designers should provide recommendations to reduce the potential for differential concrete curing if necessary.

7.4 Retaining Walls

Retaining walls can be supported on spread footing or pile foundations. Fill placed behind walls should conform to the engineered fill materials, and fill placement and compaction recommendations. If heavy compaction equipment is used behind the walls, the walls should be appropriately designed to withstand loads exerted by the heavy equipment and/or temporarily braced.

For retaining walls not to be supported on piles, a "zero net load" approach should be used for the wall design and construction to reduce the soil consolidation settlement below the walls. Detailed descriptions of the approach are provided in **Section 6.3**. It should be noted that walls located within the area of potential ground lateral spreading/slope instability (east of the dashed line) may potentially experience large vertical and lateral movements during major earthquake events.

7.4.1 Lateral Loads

Any walls that retain soils should be designed to resist both lateral earth pressures and any additional lateral loads caused by roadway surcharging, earthquake loading, and hydrostatic pressure if the walls are located below groundwater table. Considerations should be given to applying waterproofing to backside of the wall to reduce water/vapor transmission and efflorescence forming on the front wall face.

We recommend that any undrained unrestrained walls are free to deflect or rotate be designed to resist an equivalent fluid pressure of 85 pounds per cubic foot (pcf). Undrained restrained walls should be designed to resist an equivalent fluid pressure of 100 pcf. This assumes walls with level backfills. Walls with inclined backfill should be designed for an additional equivalent fluid pressure of 1 pound per cubic foot for every 2 degrees of slope inclination. Walls subjected to surcharge loads should be designed for an additional uniform lateral pressure equal to $1/3$ the anticipated surcharge load for unrestrained walls, and $1/2$ the anticipated surcharge load for restrained walls.

If back-drainage is provided behind the walls, we recommend that drained unrestrained walls be designed to resist an equivalent fluid pressure of 50 pounds per cubic foot (pcf). Drained restrained walls should be designed to resist an equivalent fluid pressure of 75 pcf. These recommended drained lateral pressures assume walls are fully-back drained to prevent the build-up of hydrostatic pressures. This can be accomplished by using $1/2$ to $3/4$ inch crushed, uniformly graded gravel entirely wrapped in filter fabric, such as Mirafi 140N or equal (an overlap of at least 12 inches should be provided at all fabric joints). The gravel and fabric should be at least 8 inches wide and extend from the base of the wall to within 12 inches of the finished grade at the top (Caltrans Class 2 permeable material (Section 68) may be used in lieu of gravel and filter fabric). A 4-inch diameter, perforated pipe should be installed at the base and centered within the gravel. The perforated pipe should be connected to a solid collector pipe that transmits the water directly to suitable discharge facilities. If weep holes are used in the wall, the perforated pipe within the gravel is not necessary provided the weep holes are kept free of animals and debris, are located no higher than approximately 6 inches from the lowest adjacent grade and are able to function properly. As an alternative to using gravel, pre-fabricated drainage panels (such as AWD SITEDRAIN Sheet 94 for walls or equal) may be used behind the walls in conjunction with perforated pipe (connected to solid collector pipe), weep holes, or strip drains (such as SITEDRAIN Strip 6000 or equal).

For walls that are higher than 6 feet, we recommend the walls also be designed to resist a uniform lateral pressure of $38H$ pcf for both unrestrained and restrained wall conditions based on the ground acceleration from a design basis earthquake (Seed and Whitman, 1970; Atik and Sitar, 2007), where H is the height of the retaining portion of the walls. This seismic induced earth pressure is in addition to the pressures noted above. Due to the transient nature of the

seismic loading, a factor of safety of at least 1.1 can be used in the design of the walls when they resist seismic lateral loads.

7.4.2 Wall Footing Foundation

Retaining walls can be supported by conventional spreading footings that are designed for “zero net load” and bear on competent onsite fills. Over-excavation and re-compaction of any weak fills below the footings may be required due to the heterogenous nature of the onsite existing fills. The bottom of the footings should be at least 12 inches wide and founded at least 24 inches below lowest adjacent finished grade. Deeper embedment will be required for footings that are located adjacent to or near top of slopes. Portion of the footings located within 10 feet (as measured laterally) of the slope face should be ignored in both vertical and passive resistance design.

Footings located adjacent to other footings or utility trenches should also bear below an imaginary 1.5:1 (horizontal to vertical) plane projected upward from the bottom edge of the adjacent footings or utility trenches. Alternatively, the foundation reinforcing could be increased to span the area defined above assuming no soil support is provided. Our recommended allowable spread footing bearing pressures are provided below. These allowable bearing pressures are net values; therefore, the weight of the footing can be neglected for design purposes.

Table 7.14: Allowable Wall Spread Footing Bearing Pressures

Load Condition	Allowable Bearing Pressure (psf)	Factor of Safety
Dead Load	“Zero Net Load”	-
Dead plus Live Loads	“Zero Net Load”	-
Total Loads (including Wind or Seismic)	3,000	1.5

Resistance to lateral loads can be provided by friction along the base of footings and by passive pressures acting on the sides of footings. An allowable friction coefficient of 0.3 times the dead load (a factor of safety of 1.5) may be used to evaluate the allowable frictional resistance along the bottom of footings. Where the footing is poured neat against competent subgrade soils, a passive pressure equal to an equivalent fluid pressure of 350 pounds per cubic foot (pcf) can be used for lateral load resistance against the sides of footings perpendicular to the direction of loading. The upper 12 inches of soils should be ignored, unless they are confined by pavement or slab. This passive resistance should be considered as an ultimate value (a factor of safety of 1.0) and assumes a deflection of approximately 0.5 inch to fully mobilize the passive resistance.

7.5 Additional Geotechnical Services

Fugro should review geotechnical aspects of the plans and specifications to check for conformance with the intent of our recommendations. We recommend that Fugro be also retained to provide geotechnical services during earthwork operation and foundation installation to observe compliance with the design concepts, specifications, and recommendations presented in this report. Our presence will also allow us to modify design if unanticipated subsurface conditions are encountered.

8. Limitations

The opinions, conclusions, and recommendations presented in this report are based on our reviews of available geologic and geotechnical data, maps, reports, our site subsurface exploration and laboratory testing results, our engineering analysis results, and information provided by others. Our opinions, conclusions, and recommendations are solely professional opinions and were made in accordance with generally accepted local and current geotechnical engineering principles and practices. We make no warranty, either express or implied.

Site exploration and testing characterizes subsurface conditions only at the locations where the explorations or tests are performed and at the time when services were conducted; actual subsurface conditions between explorations or tests may be different than those described in this report. Variations of subsurface conditions from those analyzed or characterized in this report are not uncommon and may become evident during construction. In addition, changes in the condition of the site can occur over time as a result of either natural processes (such as earthquakes, flooding, or changes in ground water levels) or human activity (such as construction adjacent to the site, dumping of fill, or excavating). If changes to the site's surface or subsurface conditions occur since the performance of the field work described in this report, or if differing subsurface conditions are encountered, we should be contacted immediately to evaluate the differing conditions to assess if the opinions, conclusions, and recommendations provided in this report are still applicable or should be amended.

This report has been prepared for the exclusive use of Peralta Community College District and their consultants for specific application to the proposed Laney College Library Learning Resource Center in Oakland, California as described herein. If there are any changes in the nature, design or location of the project, as described in this report, or if any future additions are planned, the conclusions and recommendations contained in this report shall not be considered valid unless the project changes are reviewed by us, and the conclusions and recommendations presented in this report are modified or verified in writing.

Reliance on this report by others must be at their risk unless we are consulted on the use or limitations. We cannot be responsible for the impacts of any changes in geotechnical standards, practices, or regulations subsequent to performance of services without our further consultation. We can neither vouch for the accuracy of information supplied by others, nor accept consequences for use of segregated portions of this report without our prior consultation.

		OH ORGANIC CLAY	
HIGHLY ORGANIC SOILS	PT Peat or Highly Organic Soils		
Notes: Classification of soils on the boring logs is in general accordance with ASTM D2488, or D2487 if appropriate laboratory data are available. The geologic formation is noted in bold font at the top of interpreted interval on the boring logs.		OTHER MATERIAL SYMBOLS	
		Debris or Mixed Fill	
		Pavement with Aggregate Base	

SAMPLER TYPE

SPT (Driven) 1-3/8" ID 2" OD	Modified California (Driven) 2-3/8" ID 3" OD	Modified California (Driven) 1-7/8" ID 2-1/2" OD
Shelby Tube (Pushed) 2-7/8" ID 3" OD	Pitcher Barrel (Rotary-cut) 2-7/8" ID	Osterberg (Piston) 2-7/8" ID
101 Geobarrel (Rotary-cut) 2-7/8" ID	Rock Core (Rotary-cut) See log for size	Vibracore (Vibrated) See log for size
Push-core (Pushed) See log for size	Collected from Auger	Other See log for details

Note: Refer to text of report for additional details or other sampler types.

BLOW COUNT

Number of blows required to drive sampler each of three 6-in. intervals, as measured in the field (uncorrected). An SPT hammer (140 lb., falling 30-in.) was used unless otherwise noted on the boring log. For example:

Blow Count	Description
5 7 8	5, 7, and 8 blows for first, second, and third interval, respectively.
35 50/3"	35 blows for the first interval. 50 blows for the first 3 inches of the second interval. Lack of third value implies that driving was stopped 3 inches into the second interval.
WOH WOH 5	"WOH" indicates that the weight of the hammer was sufficient to advance the sampler over the first two intervals. 5 blows were required to advance the sampler over the third interval.

N-VALUE

The N-Value represents the blowcount for the last 12 inches of the sample drive if three 6-inch intervals were driven. N-value presented is independent of impact energy. If 50 hammer blows were insufficient to drive through either the second or the third interval, the total number of blows and total length driven are reported (excluding the first interval). "ref" (refusal) indicates that 50 blows were insufficient to drive through the first 6-inch interval.

Parenthesis indicate that an approximate correction has been applied for non-SPT drive samplers. For example, a factor of 0.63 is commonly used to adjust blow counts obtained using a 3-inch outside diameter modified California sampler to correspond to Standard Penetration Test.

UNDRAINED SHEAR STRENGTH

A value of undrained shear strength is reported. The value is followed by a letter code indicating the type of test that was performed, as follows:

- U - Unconfined Compression
- Q - Unconsolidated Undrained Triaxial
- T - Torvane
- P - Pocket Penetrometer
- M - Miniature Vane
- F - Field Vane
- R - R-value

OTHER TESTS

Field or laboratory tests without a dedicated column on the boring log are reported in the Other Tests column. A letter code is used to indicate the type of test. For certain tests, a value representing the test result is also provided. Typical letter codes are as follows. Additional codes may be used. Refer to the report text and the laboratory testing results for additional information.

- k - Permeability (cm/s)
- Consol - Consolidation
- Gs - Specific Gravity
- MA - Particle Size Analysis
- EI - Expansion Index
- OMV - Organic Vapor Meter

Corrosivity Analysis – ASTM Test Methods with Brief Evaluation

Dear Mr. DePaola:

Pursuant to your request, CERCO Analytical has analyzed the soil samples submitted on April 05, 2019. Based on the analytical results, this brief corrosivity evaluation is enclosed for your consideration.

Based upon the resistivity measurements, both samples are classified as “moderately corrosive”. All buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron should be properly protected against corrosion depending upon the critical nature of the structure. All buried metallic pressure piping such as ductile iron firewater pipelines should be protected against corrosion.

The chloride ion concentrations reflect none detected with a reporting limit of 15 mg/kg.

The sulfate ion concentrations are 16 & 22 mg/kg and are determined to be insufficient to damage reinforced concrete structures and cement mortar-coated steel at these locations.

The pH of the soils are 7.59 & 7.97, which does not present corrosion problems for buried iron, steel, mortar-coated steel and reinforced concrete structures.

The redox potentials are 270 & 280-mV. These samples are indicative of potentially “slightly corrosive” soils resulting from anaerobic soil conditions.

This corrosivity evaluation is based on general corrosion engineering standards and is non-specific in nature. For specific long-term corrosion control design recommendations or consultation, please call *JDH Corrosion Consultants, Inc.* at (925) 927-6630.

We appreciate the opportunity of working with you on this project. If you have any questions, or if you require further information, please do not hesitate to contact us.

Very truly yours,

CERCO ANALYTICAL, INC.

J. Darby Howard, Jr., P.E.
President

1430.001	February, 2002	

DRILL RIG	Mobile B-61, HSA	SURFACE ELEVATION	14.4 Feet	LOGGED BY	NS
DEPTH TO GROUND WATER	15 feet	BORING DIAMETER	8-inch	DATE DRILLED	2/26/02

DESCRIPTION AND CLASSIFICATION			DEPTH	SAMPLER	PENETRATION RESISTANCE (BLOWS/FT)	WATER CONTENT(%)	DRY DENSITY (PCF)	UNCONFINED COMPRESSIVE STRENGTH (KSF)	OTHER TESTS
DESCRIPTION AND REMARKS	CONSIST	SOIL TYPE	(FEET)						

SAND (SM/SC) , continued grades to blue-gray-brown, trace gravel at 60 feet grades to brown, clayey below 63 feet	Dense		65		61	22	105	2.3	% of Passing #200 Sieve = 43 PP = 4.0	
			70		67					PP = 4.5
			75		73					PP = 2.5

Bottom of Boring = 75 Feet

Notes:

- The stratification lines represent the approximate boundaries between material types and the transition may be gradual.
- For an explanation of penetration resistance values, see first page of Appendix A.
- A 140-lb safety hammer falling 30 inches was used to drive the sampler.
- Ground water was encountered originally at depth of about 17 feet, and at depth of about 15 feet two hours later.
- The borehole was backfilled with lean cement immediately upon completion of the drilling.
- PP = Pocket Penetrometer Reading (tsf).
- High value of blow count is due to localized encountering metal, brick, and/or concrete debris.
- Low shear strength was probably caused by severe sample disturbance.

NOTES ON FIELD INVESTIGATION

1. Borings were advanced with a 6-in. diameter continuous flight power auger and by wash boring.
2. The Engineering Geologist were M. Conant, R. Russell and C. Taylor
3. In-place samples of the soils were obtained with either drive samplers or Shelby tube samplers. The size of sampler used is indicated at the sample location on the logs of borings.
 - a) The 2-in. sampler measures 2-in. I.D. and 2½-in. O.D.. Thin brass liners are enclosed in the sampler. The sampler is driven 18-in. into the soil at the bottom of the holes with a 140 lb. hammer falling 30 in.
 - b) The 2½-in. sampler measures 2½-in. I.D. and 2¾-in. O.D. and also contains brass liners. This sampler is driven 24-in. into the soil with a 140 lb. hammer falling 30 in.
 - c) Shelby tube samplers are thin-walled brass tubes, measuring either 2.8 or 3.2 I.D., and are pushed into the soil by hydraulic mechanism. Loss of the sample is prevented by either a fixed piston in the Osterberg type sampler or by ball check valve in the open type sampler.
4. When the sampler was withdrawn from the test holes, the brass tubes containing the soils samples were removed, carefully sealed to preserve the natural moisture content, and returned to the laboratory for testing.
5. Classifications are based on the Unified Classification System and are made in the field by our Engineer or Geologist. Classifications of in-place samples are verified by an examination by the Staff Engineer.

G.1 Introduction

This appendix summarizes a site-specific seismic hazard assessment and site response analyses conducted to estimate the severity of ground motions that may affect the project site for specific design levels of hazard. The seismic hazard assessment was conducted using the seismic source model adopted by the United States Geological Survey (USGS) to develop the 2014 National Seismic Hazard Map Project (NSHMP) (Petersen et al., 2014), and the NGA West 2 Ground Motion Models (Bozorgnia et al., 2014).

A liquefaction triggering hazard assessment indicated that the soils at the site are potentially liquefiable. Therefore, according to ASCE 7-16, the site is classified as Site Class F, and site response analyses are required to calculate the design ground motions at the ground surface. These site response analyses were performed using the commercial finite-difference program FLAC (Itasca, 2016) and evaluated the effect of nonlinear dynamic response of the soft and liquefiable soils at the site on the surface ground motions. The design ground motion parameters were calculated following the site-specific ground motion procedures defined in Chapter 21 of ASCE 7-16 (ASCE, 2016; 2018) as required by the 2019 California Building Code (CBC) (CBC, 2019).

G.2 Subsurface Conditions for the Seismic Hazard Assessment

Subsurface conditions at the project site generally consist of approximately 10 feet (ft) of sandy fill overlaying approximately 20 to 30 ft of soft Young Bay Mud (YBM) overlaying denser sands and stiffer clays (e.g., see **Plates 7 and 9** of the main text). Liquefiable sand seams on the order of 5 ft in thickness exist within the YBM (these sands are referred to as YBM Sand herein). Bedrock at the project site is expected to exist at depths greater than approximately 500 ft (Rodgers and Figuers, 1991). Idealization of subsurface conditions for the seismic hazard assessment was based primarily on data from geotechnical borings (including standard penetration test [SPT] and laboratory test data) and cone penetration test (CPT) soundings performed at the project site. Locations of the project explorations and interpreted cross sections are shown on **Plate 3** of the main text.

Free-field site response analyses were performed for a one-dimensional soil column extending from the ground surface to the base of the YBM. The denser sands and stiffer clays underlying the YBM are considered competent (Site Class D), and consequently their effect on seismic wave propagation at the site is captured reasonably well by the ground motion models used in the seismic hazard assessment.

G.2.1 Shear Wave Velocity

The time-weighted average shear wave velocity (V_s) in the top 100 ft (30 meters [m]) (V_{s30}) is an important input parameter to include the local site conditions in the seismic hazard assessment.

Similarly, characterization of the small-strain stiffness, G (where $G = \rho V_s^2$ and ρ is density) is important for site response analysis. In-situ V_s measurements were conducted by Gregg Drilling and Testing for the seismic CPT-07 located between the building footprint and the Lake Merritt Channel (2020-CPT-07 on **Plate 3** of the main text; data presented in **Appendix A**). These measurements are shown on **Figure G.2-1** alongside V_s values calculated from empirical correlations between V_s and CPT data using the same CPT sounding. Two CPT-based shear wave velocity correlations are shown on **Figure G.2-1**; the Mayne and Rix (1995) correlation for clays is shown within the YBM and the Andrus et al. (2007) correlation is shown for all other strata. The correlations are consistent with the seismic measurements for this CPT sounding in the YBM and competent clays and sands underlying the YBM. Strata demarcations for CPT-07 consistent with the interpreted cross sections (e.g., **Plate 8** of the main text) are also shown on this figure. **Figure G.2-2** shows correlated V_s values for all project CPT soundings, where Mayne and Rix (1995) is shown for YBM and Andrus et al. (2007) is shown for all other strata. This range of data approximately represents the variability of V_s across the site. The relatively small range of correlated V_s values in YBM across all CPT soundings is similar to the range of measured values for CPT-07. Idealized shear wave velocities within the YBM and competent sands and clays underlying the YBM are shown on **Figure G.2-3**. Measured and correlated V_s values for CPT-07 are also shown on this figure. Extrapolation of shear wave velocities in the competent soils underlying the YBM was based on review of data from (1) local Fugro projects and (2) near the former Cypress Structure (Rogers and Figuers, 1991). A V_{s30} from the base of the YBM of approximately 860 ft/s (260 m/s), corresponding to Site Class D per ASCE 7-16, was computed using the idealization shown on **Figure G.2-3** and was used for the seismic hazard assessment to develop input ground motions for the site response analyses. V_{s30} from the ground surface was estimated to be approximately 560 ft/s (170 m/s), corresponding to Site Class E per ASCE 7-16; however, Site Class F was assigned because of the presence of potentially liquefiable YBM Sand seams. The Site Class F classification requires that a site response analysis in accordance with ASCE 7-16 Section 21.1 be performed.

G.2.2 Young Bay Mud Undrained Shear Strength

The undrained shear strength (s_u) of YBM was evaluated based on CPT and laboratory test data. YBM undrained shear strengths from (1) unconsolidated undrained (UU) triaxial compression tests, (2) unconfined compression (UC) tests, and (3) CPT measurements (i.e., $s_u = q_{t,net}/N_{kt}$ where $q_{t,net}$ is the net total cone resistance and the cone factor $N_{kt} = 20$) are shown on **Figure G.2-4**. The CPT data are shown as a hexagonally binned two-dimensional histogram (hexbin). The laboratory test data are biased low (i.e., they fall near the lower bound of the CPT data) likely because of sample disturbance effects. The idealized YBM undrained shear strength used for the site response analyses (i.e., for calibration of the modulus reduction and damping factor [MRDF] constitutive model as described in **Section G.6.1**) is also shown on **Figure G.2-4**.

Note that these are static strengths which were empirically adjusted for rate effects for the site response analyses as described in **Section G.6.1**.

G.2.3 Penetration Resistance for Sand-Like Soils (Fill and YBM Sand)

Penetration resistances in the fill and YBM Sand are summarized on **Figure G.2-5** which plots $(N_1)_{60cs}$ (i.e., equivalent clean sand blow counts corrected to 60% energy ratio and an effective overburden of one atmosphere) versus elevation. Hexbin profiles of correlated $(N_1)_{60cs}$ values from CPT data (per the procedures described by Boulanger and Idriss [2014]) are in good agreement with SPT measurements (shown with triangular markers on **Figure G.2-5**). Blow counts in the saturated YBM Sand are mostly between 9 and 16, whereas blow counts in the fill range from roughly 10 to greater than 30.

G.2.4 Idealized Profiles for One-Dimensional Site Response Analyses

Figure G.2-6 shows three idealized soil profiles used for the site response analyses. These profiles reasonably represent the expected stratigraphic variation beneath the building footprint (note that deeper YBM was encountered closer to the Lake Merritt Channel, outside of the building footprint, e.g., 2020-CPT-06 on **Plate 7**). The three idealized profiles are described below.

- **Profile P1** (deep YBM) consists of 10 ft of fill overlaying 31 ft of YBM.
- **Profile P2** (deep YBM with liquefiable sand) consists of 10 ft of fill overlaying 31 ft of YBM with a 5-foot-thick liquefiable YBM Sand layer within the YBM from depths of 25 to 30 ft.
- **Profile P3** (shallow YBM) consists 10 ft of fill overlaying 18 ft of YBM.

G.3 Probabilistic Seismic Hazard Analysis

A site-specific seismic hazard assessment was conducted for a V_{s30} of 860 ft/s (260 m/s) corresponding to the base of the YBM, to calculate the input design ground motions for the site response analyses.

G.3.1 Project Location

A Probabilistic Seismic Hazard Analysis (PSHA) was conducted for one representative location of the project site. The geographical coordinates of the location used for the seismic hazard analyses are tabulated in **Table G.1**.

Table G.1: Representative Project Location Coordinates used in the PSHA

Latitude	Longitude
37.7948°N	122.2624°W

G.3.2 Methodology

PSHA Framework

The methodology for a PSHA includes the following components:

1. Seismic Source Model. This includes defining the location, style, and rates of earthquake occurrence in the model area. The characterization includes developing values for the following seismic source parameters:
 - i. Source location and geometry. All major active faults and seismotectonic provinces are defined within the model area. This includes the geographical extent at the surface as well as the orientation and depth of the source zones.
 - ii. Source type (e.g., shallow crustal area source zones, fault sources, subduction zones, etc.) and style of faulting (e.g., normal, strike-slip, reverse, etc.).
 - iii. Magnitude potential (i.e., range of earthquake sizes possible on each source) and magnitude distribution (i.e., characterized using a magnitude probability density function).
 - iv. Earthquake magnitude recurrence, which is a characterization of the annual rate at which earthquakes of a specified magnitude or greater occur in each source.
2. Ground Motion Model. Characterization of ground motion attenuation characteristics of each source are based on the geologic and tectonic environment. These characteristics are described by a series of ground motion models, or GMM (also known as “attenuation relationships,” “attenuation models,” or “ground motion prediction equations”).
3. Probabilistic Seismic Hazard Analysis. A PSHA uses inputs from the seismic source model and GMMs selected for the specific environment, to estimate the ground motion hazard at the site. The hazard is expressed in terms of the annual frequency of exceeding a given spectral acceleration at the project site (i.e., annual hazard curves). This information also can be shown in the form of uniform hazard response spectra (UHRS), which correspond to spectral acceleration having the same probability of exceedance across all structural periods. The UHRS are typically used by different design codes to define the design response spectra.

PSHA Calculation

Computation of the seismic hazard involves the combination of uncertainties in earthquake size, location, frequency, and resulting ground motions. The estimated annual rate at which the ground motion, A , will exceed a particular value, a , is computed by (Cornell, 1968):

$$\lambda[A > a] = \sum_{i=1}^{N_{source}} N(M_{min}) \iint P[A > a | m, r] f_M(m) f_R(r) dm dr$$

Equation 1

where N_{source} is the total number of seismic sources; $N(M_{min})$ is the annual rate of earthquake with magnitude greater than or equal to M_{min} ; $P[A > a|m, r]$ is the probability of the ground motion, A , exceeding the threshold value, a , given the earthquake magnitude and distance from the seismic source; and $f_M(m)$ and $f_R(r)$ are probability density functions describing magnitude and distance.

The computation of this integral is carried out numerically. By assuming that earthquake occurrence can be modeled as a Poisson process, the probability of exceedance in a specified exposure period (typically corresponding to the useful life of a project) may be estimated as follows:

$$P[A > a, t] = 1 - e^{-[\lambda(a)t]}$$

Equation 2

where $P[A > a, t]$ is the conditional probability of the spectral acceleration (A) exceeding a specified acceleration (a) during a time interval (t) given that an earthquake will occur, and $\lambda(a)$ is the mean annual rate of exceedance of the specified acceleration level.

Seismic Source Model

The PSHA was conducted using the seismic source model adopted by the USGS to develop the 2014 NSHMP (Petersen et al., 2014) for California which corresponds to the Uniform California Earthquake Rupture Forecast, Version 3 (UCERF3). The details of this seismic source model can be found in Field et al. (2013).

Empirical Ground Motion Models

The attenuation of seismic waves from a seismic source were modeled using empirical ground motion models (GMM's). These empirical GMM's should model the type of rupture mechanism as well as the regional geology to properly estimate site-specific strong ground motion parameters. Four of the Next Generation Attenuation (NGA) West 2 GMM's (Bozorgnia et al., 2014) were used. These four NGA West 2 GMM are: Abrahamson et al. (2014), Boore et al. (2014), Campbell and Bozorgnia (2014), and Chiou and Youngs (2014). The four NGA West 2 GMM's were equally weighted, following the weighting scheme used in the development of the 2014 USGS NSHMP (Petersen et al., 2014).

Implementation

The PSHA was performed using the USGS computer code *nshmp-haz*, which has been used by the USGS to develop the US national seismic hazard maps.

G.3.3 Results from the PSHA

Figure G.3-1 shows the mean annual seismic hazard curves for selected spectral periods ranging from 0.01 to 10 seconds for a V_{s30} of 260 m/sec. A spectral period of 0.01 seconds is used to represent the peak ground acceleration (PGA). These hazard curves represent the total mean hazard from combining all seismic sources and ground motion models. This figure also indicates the annual frequency of exceedance corresponding to a return period of 2,475 years.

Table G.2 tabulates the mean magnitude, distance, and epsilon calculated from the seismic hazard deaggregation for PGA and S_a (spectral acceleration) at 1 second for a return period of 2,475 years. Epsilon is the number of standard deviations that the estimated ground motion amplitude deviates from the estimated median ground motion amplitude. Thus, an epsilon of 1 indicates that the probabilistic value of the ground motion corresponds to a median plus one-standard-deviation value.

G.4 Design Response Spectra at Base of YBM

According to ASCE 7-16, for Site Class D sites with S1 (mapped 5% damped spectral response acceleration parameter at a period of 1 second) greater than or equal to 0.2 g, the design response spectrum and design acceleration parameters should be developed following the site-specific ground motion procedures defined in Section 21.2 of ASCE 7-16. The S1 for the project site was calculated as 0.660 g using the USGS web service (<https://earthquake.usgs.gov/ws/designmaps/asce7-16.html>). Therefore, the design ground motions for the site should be calculated using the site-specific procedures from ASCE 7-16.

ASCE 7-16 defines a site-specific Risk-Targeted Maximum Considered Earthquake (MCE_R) as the lesser of probabilistic (MCE_R) and deterministic (MCE_R) ground motions. The probabilistic MCE_R ground motion is calculated as the ground motion in the direction of maximum horizontal

response that is expected to achieve 1 percent probability of collapse within a 50-year period. The deterministic MCE_R ground motion is defined as the 84th percentile ground motion in the direction of maximum horizontal response of the largest acceleration from deterministic seismic hazard analysis (DSHA) of the characteristic earthquakes on all known active faults within the project region. Additionally, ASCE 7-16 specifies a lower limit to the deterministic MCE_R ground motion. The site-specific MCE_R should not be less than 150 percent of the site-specific design response spectrum. The site-specific design response spectrum is calculated as $2/3$ of the site-specific MCE_R . The site-specific design response spectrum should be greater than or equal to 80 percent of the spectral acceleration as determined by using the general response spectrum of Section 11.4.6 of ASCE 7-16, using modified F_a and F_v values provided in Section 21.3 of ASCE 7-16.

The PSHA results described in the previous section were used to calculate the probabilistic MCE_R spectrum. As specified in ASCE 7-16, to obtain ground motions with a uniform 1 percent probability of collapse within a 50-year period, the UHRS for a return period of 2,475 was scaled by a risk coefficient, C_R . The C_R values were calculated using Method 1 described in Chapter 21 of ASCE 7-16. The mapped risk coefficients at spectral periods of 0.2 and 1.0 sec, C_{RS} and C_{R1} , respectively, were determined using the USGS web service (<https://earthquake.usgs.gov/ws/designmaps/asce7-16.html>). The value of these risk coefficients C_{RS} and C_{R1} are 0.921 and 0.906, respectively. The ground motions in the direction of maximum horizontal response were calculated by applying the scaling factors recommended in ASCE 7-16. **Figure G.4-1** shows the UHRS for a return period of 2,475 years along with the probabilistic MCE_R response spectrum.

The deterministic MCE_R spectrum was calculated by performing a DSHA in EZ-FRISK™ (Fugro, 2019) using the same seismic sources and GMM's used in the PSHA. The UCERF3 source model includes magnitude frequency distributions (MFD's) which relate frequency of occurrence to earthquake magnitude; however, these MFD's include multi-fault ruptures scenarios with large magnitudes but with low probability of occurrence. Therefore, following the current USGS approach to calculate deterministic ground motions from the UCERF3 source model, to estimate the characteristic magnitude for the seismic sources, we used the empirical relationships proposed by Wells and Coppersmith (1994) that relates rupture geometry to earthquake magnitude. The ground motions in the direction of maximum horizontal response were calculated by applying the scaling factors recommended in ASCE 7-16. **Figure G.4-1** illustrates the calculation of the deterministic MCE_R response spectrum. The deterministic MCE_R response spectrum was calculated as the maximum of the 84th DSHA response spectrum and the lower limit specified by ASCE 7-16 Supplement 1 calculated for a Site Class D.

Figure G.4-2 presents the development of the site-specific MCE_R and design response spectra for the base of the YBM. In this case, the deterministic MCE_R spectrum is lower than the probabilistic MCE_R spectrum for all spectral periods. The site-specific MCE_R spectrum is the

maximum of: 1) the minimum of the probabilistic and deterministic MCE_R , and 2) 150 percent of the design response spectrum. Following ASCE 7-16, the design response spectrum was calculated as the maximum of 2/3 of the site-specific MCE_R and the lower limit specified by ASCE 7-16 (80 percent of the general spectrum for Site Class D, using modified F_a and F_v values provided in Section 21.3 of ASCE 7-16). The transition period from constant velocity to constant displacement, T_L , required to calculate the lower limit, was estimated as 8 seconds using the USGS web service (<https://earthquake.usgs.gov/ws/designmaps/asce7-16.html>).

Table G.4 tabulates the spectral ordinates of the recommended site-specific MCE_R and design response spectra per ASCE 7-16 for the base of the YBM.

Table G.4: MCE_R and Design Response Spectra per ASCE 7-16 for a Vs30 of 260 m/sec (base of YBM), 5% Damping

G.5 Ground Motion Acceleration Time Histories for Input to Site Response Analyses

G.5.1 Selection of Seed Ground Motions

Following Section 21.1.1 of ASCE 7-16, five pairs of orthogonal recorded horizontal seed ground motion (GM's) acceleration time histories were selected and scaled to comply with the site-specific MCE_R response spectrum at the base of the YBM developed in the previous section.

During the selection of seed GM's, we considered the following criteria:

- The selected GM's were recorded from seismic events that are comparable with events that control the MCE_R scenario from the seismic deaggregation.
- The shape of the GM's acceleration response spectra.
- The lowest usable frequency of the selected GM's.
- Other criteria including strong motion duration, Arias Intensity, faulting mechanism, and shear wave velocity at the site where the GM's were recorded.

Table G.5 lists the properties of the selected seed GM's.

Table G.5: Selected Seed Ground Motions

No.	Record Sequence Number (RSN)	Earthquake Name	Recording Station	Moment Magnitude (Mw)	Faulting Mechanism	Vs30 of Recording Station (m/s)	Rupture/ Closest Distance (km)	Minimum Usable Frequency (Hz)	Average Scaling Factor
1	729	1987 Superstition Hills-02	Imperial Valley Wildlife Liquefaction Array	6.54	Strike slip	179	24	0.1	4.1
2	1545	199 Chi-Chi_ Taiwan	TCU120	7.62	Reverse Oblique	459	7.4	0.0375	4.1
3	6952	2010 Darfield_ New Zealand	Papanui High School	7	Strike slip	263	19	0.0625	4.0
4	806	1989 Loma Prieta	Sunnyvale - Colton Ave.	6.93	Reverse Oblique	268	24	0.1	4.4
5	1176	1999 Kocaeli_ Turkey	Yarimca	7.51	Strike slip	297	5	0.0875	3.3

G.5.2 Scaling of Seed Ground Motions

Figure G.5-1 shows a comparison between the response spectra of the two components (H1, H2) for each of the linearly scaled ground motions (thin colored lines), the mean response spectra of the five scaled motions (thick red line) and the target MCE_R at the base of the YBM (thick black line). On average, the mean of the scaled acceleration response spectra shows good agreement with the target response spectrum.

The scale factor for each of the seed ground motions was selected such that the average of their spectral accelerations within the period range from 0.05 seconds to 5 seconds matches, on average, the spectral accelerations of the target MCE_R response spectrum within the same period range. The average scaling factor for the response spectra of the two components of the seed ground motions is listed in **Table G.5** above.

G.6 One-Dimensional Site Response Analyses

According to ASCE 7-16, for sites classified as Site Class F, the design response spectrum and design acceleration parameters should be developed following the site-specific ground motion procedures defined in Chapter 21 of ASCE 716. Specifically, site response analyses shall be performed in accordance with ASCE 7-16 Section 21.1. The approach, analyses, and results for one-dimensional free-field site response analyses are presented herein.

G.6.1 Approach

One-Dimensional Site Response Modelling in FLAC

One-dimensional site response analyses were performed using the commercial finite difference program FLAC (Fast Analysis of Continua) (Itasca, 2016). One-dimensional site response was modeled with a single column of 2.5-foot square zones. Analyses were performed for the three idealized profiles shown on **Figure G.2-6**. The water table was modeled at the base of the fill for all profiles. Analyses were performed using the user defined constitutive models MRDF (modulus reduction and damping factor hysteretic model, Hashash et al., 2010) and PM4Sand (Boulanger and Ziotopoulou, 2017). MRDF was used to model the fill and YBM, and PM4Sand was used to model the liquefiable, saturated YBM Sand in profile P2. Analyses were performed for each of the 10 scaled ground motion time histories (5 ground motion records, 2 components) developed in the previous section.

For dynamic simulation, a quiet (absorbing) boundary was used at the base of the model and the lateral boundaries were attached (i.e., at a given elevation the left and right nodes displace together). A single elastic zone was included at the base of the model with properties representative of the competent soils underlying the YBM (i.e., V_{s30} of 860 ft/s). Outcrop ground motions were input at the base of the model (at the quiet boundary) as shear stress time histories. Shear stress time histories were computed from outcrop acceleration time histories by

integrating to obtain velocity and multiplying by twice the competent soil density times the competent soil V_s per the compliant base procedure proposed by Mejia and Dawson (2006).

Constitutive Calibration and Input Parameters

The bases for constitutive model calibration and input parameters are summarized in **Table G.6**. YBM shear wave velocity was modeled using the idealization shown on **Figure G.2-3**. Shear wave velocity in the fill and YBM Sand was modeled based on correlation to SPT blow count. Representative $(N_1)_{60cs}$ values of 17 and 12 were used to model the fill and YBM Sand, respectively. These $(N_1)_{60cs}$ values correspond to $V_{s1} = 586$ ft/s in the fill (i.e., V_s ranges from about 300 to 500 ft/s in the fill) and $V_{s1} = 544$ ft/s in the YBM Sand (i.e., V_s of about 550 ft/s in the YBM Sand).

Target empirical shear modulus reduction (G/G_{max}) and material damping relationships are summarized in **Table G.6**. In general, the degree to which the target relationships are represented by the calibrated models depends on the model (i.e., MRDF vs. PM4Sand) and the calibration procedure. For MRDF, fitting parameters can be selected to produce near exact matches with target shear modulus reduction and damping curves, however, such calibrations may underpredict or overpredict shear strength depending on the small-strain stiffness (G). For site response analyses, the relative importance of matching these behaviors (i.e., empirical G/G_{max} and shear strength) depends on the strain-level of interest and is problem dependent. Soft clays at the project site are expected to develop large shear strains for the MCE_R level of shaking, hence MRDF was calibrated to honor the idealized undrained shear strength profile shown on **Figure G.2-4**; a dynamic multiplier of 1.4 was applied to these idealized strengths to account for strain-rate effects. This was done following the procedure described by Hashash et al. (2010) where G/G_{max} values for shear strains greater than 0.1% are adjusted to achieve the desired shear strength. For PM4Sand primary input parameters were correlated to $(N_1)_{60cs}$ as described by Boulanger and Ziotopoulou (2017); all secondary input parameters used default values. Boulanger and Ziotopoulou (2017) demonstrate reasonable consistency with the EPRI (1993) modulus reduction and damping curves for a range of $(N_1)_{60cs}$ and effective overburden pressures.

Lastly, the PM4Sand contraction rate parameter was calibrated based on $(N_1)_{60cs}$ and the Idriss and Boulanger (2008) SPT-based liquefaction triggering correlation.

Table G.6: Constitutive Model Calibration Basis

Strata	Constitutive Model	Shear wave velocity, V_s	Basis for MRDF Strength	G/G_{max} and Damping Ratio Curve Source(s)
Fill	MRDF	$V_{s1} = 85[(N_1)_{60} + 2.5]^{0.25}$ m/s (Boulanger and Ziotopoulou, 2017)	Bolton (1986) strength-dilatancy relationship for plane strain ($\phi'_{cv} = 33^\circ$)	EPRI (1993)
YBM	MRDF	$V_s = 310$ ft/s at 10 ft depth Increasing at 5 ft/s/ft (Figure G.2-3)	Figure G.2-4 with 1.4 dynamic multiplier	Fugro (2007, 2020)
YBM Sand	PM4Sand	$V_{s1} = 85[(N_1)_{60} + 2.5]^{0.25}$ m/s (Boulanger and Ziotopoulou, 2017)	N/A	EPRI (1993)

Verification of Modelling Approach

To verify the FLAC modeling approach (i.e., the numerical platform, application of earthquake loading, MRDF constitutive model implementation, etc.), a subset of analyses was performed using both FLAC and DEEPSOIL (Hashash et al., 2017). Comparisons between FLAC and DEEPSOIL were made for profile P1 for two levels of shaking (the MCE_R and a smaller level of shaking with $PGA \approx 0.45$ g). Comparisons of results obtained from the two analysis platforms showed near identical surface response spectra, stress-strain responses, and profiles of maximum shear strain, PGA, and maximum shear stress. The FLAC modelling approach was adopted for all other analyses (including modelling of liquefiable YBM Sand in profile P2), as described in the preceding sections.

G.6.2 Results

Baseline Analyses

Results for one-dimensional site response analyses for profile P1, P2, and P3 are shown on **Figure G.6-1** and **Figure G.6-2**. Profiles of absolute maximum shear strain and PGA are shown on **Figure G.6-1**. The thin lines are for individual ground motions and the thick lines are mean responses per profile. Overall, large shear strains develop in the YBM at the MCE_R level of shaking. Surface response spectra and amplification ratios are shown on **Figure G.6-2**. The amplification ratios were calculated as the ratio of the response spectra at the surface to the input response spectrum. The thin lines show responses for each ground motion time history and the thick lines show mean responses per idealized profile. Overall, there is little variation in the mean surface spectra for the three profiles analyzed. The shorter period (higher frequency) mean responses exhibit significant deamplification, whereas periods greater than approximately three seconds exhibit amplified responses. Yielding in the YBM deamplifies higher frequencies and effectively base isolates the soil column, hence there is little difference in the surface

response spectra for the three idealized profiles. For smaller levels of shaking, clear differences in the response of the three profiles is expected.

Figure G.6-3 shows the idealized amplification ratios developed based on the average amplification ratios from the site response analyses. The idealized amplification ratios consider variability on the soil stratigraphy and variability on ground motion time histories. However, sensitivity analyses conducted showed similar amplification ratios by considering variability in soil properties (YBM shear wave velocity and undrained shear strength).

Parametric Analyses

Parametric analyses were performed for profile P1 to evaluate the effect of lower bound YBM shear wave velocities and a range of YBM undrained shear strength idealizations on the site response. Overall, these parameter variations had little effect on the surface spectrum (for the same reasons discussed above). An upper bound undrained shear strength profile caused the most significant change to the surface spectrum, slightly increasing the amplification for periods between about 1.5 to 4 seconds while decreasing the amplification for periods greater than approximately 4 seconds. Even with an upper bound undrained shear strength, large shear strains developed throughout the YBM (mean absolute maximum shear strains were on the order of 10 to 20 percent).

G.7 Design Response Spectra at the Ground Surface

Figure G.7-1 presents the development of the site-specific MCE_R and design response spectra for the ground surface. The MCE_R response spectrum from the site response analyses is calculated as the site-specific MCE_R at the base of the YBM (input to the site response analyses) multiplied by the idealized amplification ratios presented on **Figure G.6-3**. The site-specific MCE_R spectrum is the maximum of: 1) MCE_R response spectrum from the site response analyses, and 2) 150 percent of the design response spectrum. Following ASCE 7-16, the design response spectrum was calculated as the maximum of $2/3$ of the site-specific MCE_R and the lower limit specified by ASCE 7-16 (80 percent of the general spectrum for Site Class E, using modified F_a and F_v values provided in Section 21.3 of ASCE 7-16). The transition period from constant velocity to constant displacement, T_L , required to calculate the lower limit, was estimated as 8 seconds using the USGS web service (<https://earthquake.usgs.gov/ws/designmaps/asce7-16.html>).

Table G.7 tabulates the spectral ordinates of the recommended site-specific MCE_R and design response spectra per ASCE 7-16 for the ground surface. The corresponding design acceleration parameters S_{MS} , S_{M1} , S_{DS} , and S_{D1} are tabulated in **Table G.8**.

Table G.7: MCE_R and Design Response Spectra per ASCE 7-16 at the Ground Surface, 5% Damping

Period (sec)	Horizontal Spectral Acceleration (g)		
	Site-Specific MCE _R	80% General Response Spectrum	Design Response Spectrum

DMM Design and

Recommendations Report

I.1 Introduction

Liquefaction and seismic slope stability analyses performed during project geotechnical investigation and geologic hazards evaluation, indicated potential for significant lateral spreading (up to several feet) and liquefaction-induced settlements (generally 1 to 4 inches and up to about 6 inches closer to the Lake Merritt Channel). The loose to medium dense sand layers of various thicknesses located both above and within the Young Bay Mud layer have a high potential for liquefying when subjected to an MCE (Maximum Considered Earthquake) event. These sand layers were encountered within depths of about 30 to 40 feet (above elevation -15 feet). The seismic slope stability at the planned building location is affected by both liquefaction and the presence of relatively soft Young Bay Mud (YBM). For further description of the seismic slope stability and liquefaction hazards refer to the project geotechnical report (Fugro, 2020).

It has been decided that the foundation soil will be improved using Deep Mixing Method (DMM) columns and grids under the entire footprint of the Laney College Library & Learning Resource Center (LLRC) building, which will be supported by shallow foundations (e.g., footings, and structural slab, and grade beams). This Addendum presents our methodology for the DMM design, provide DMM specifications, and to provide geotechnical design parameters for the design of the LLRC structure and its foundation system.

I.2 Proposed Structure

The location of the LLRC building is shown on **Plate 1**. The proposed new structure will be constructed at approximately the existing grades without basements. The footprint of the LLRC building is approximately 23,750 square feet. This building will be supported by shallow spread footings with interior structural first floor slabs and grade beams.

I.3 Subsurface Conditions

The subsurface soils below the site generally consist of predominately medium dense sandy fills that extend to depths of about 8 to 25 feet (Elevations of about +8 feet to -5 feet). Clayey fills of about 2 to 4 feet thick were also encountered in some areas. These fills are heterogenous and locally contain various amounts of concrete, brick, and wood debris. Most of these fills appear to be derived from the historical filling of the natural Lake Merritt outlet channel between 1860s and 1940s, and the later development of the Laney College campus in 1960s. Most likely these fills were not compacted to current acceptable geotechnical engineering standards.

Below the surficial fill layer, very soft to soft, high moisture content, and low shear strength Young Bay Mud was encountered to a depth of about 30 feet (Elevation of about -10 feet) at the northwest side of the proposed building location and about 50 feet (Elevation of about -30 feet) at the southeast side of the proposed building location. Some thin loose to medium dense sand lenses about 2 to 6 feet thick were also encountered within the Young Bay Mud layer. About 15-

feet of loose to medium dense sands were also encountered between the surficial fill and the Young Bay Mud layers at the east edge of the building, extending towards the channel. These sands could be either historical fills placed in the natural Lake Merritt outlet channel or natural sand deposits that existed within the channel.

I.4 DMM Ground Improvement

I.4.1 Purpose

Several alternatives were considered for mitigating the lateral spread hazard at the planned building site, including installation of a retaining wall and the deep mixing method (DMM) beneath the building footprint. Considering the high seismic demand, presence of shallow liquefiable soils and soft Young Bay Mud, proximity to the Lake Merritt Channel, and constraints from the PG&E easement on the north side of the planned building, it is our experience and opinion that continuous grids of deep mixed shear walls are the most suitable, robust, and cost-effective technique to mitigate the lateral spread hazard at the planned building site. The grids of deep mixed shear walls will provide support for shallow foundation systems for seismic loading and transfer bearing loads deeper to the medium dense to very dense sands and stiff to hard clays, reducing total and differential building settlements. In addition, we recommend using structural slabs to span between DMM deep mixed shear walls, assuming that the untreated soils within the grid walls may still develop post-liquefaction reconsolidation settlements below slabs. The deep mixed shear walls will also affect the composite ground response to horizontal ground motions. This section presents a brief overview of the deep mixing method (DMM), our design approach, DMM design properties, and results of our evaluation process, including results of seismic stability analyses. Seismic design parameters incorporating the composite response of the deep mixed zone are presented in **Section I.5**, herein.

I.4.2 Description of the Deep Mixing Method

The deep mixing method (DMM) is a soil improvement technique used to treat soils in place without excavation or dewatering. A rig that is typically equipped with multi-shaft mixing augers (containing auger flights and mixing paddles) is used to inject a cementitious grout and blend it with the in-situ soils. When the design depth is reached, the augers are withdrawn while mixing on the way to the surface, leaving in-place a stabilized soil mass that is stronger, less permeable, and has improved engineering properties. A multi-shaft mixing rig creates interconnected soil mixed elements formed by partially overlapping columns. The elements can be arranged to form walls, grids, and blocks of deep mixed soil-cement. There are various diameters of multi-shaft mixing augers and they typically range from 3 to 5 feet.

While there are other methods of creating deep mixed grids, such as by Cutter Soil Mixing (CSM) or Trench Cutting and Remixing (TRD), we believe multi-shaft auger systems will be most efficient for creating the deep mixed grids, and there are several contractors locally who have

such systems. We do not recommend using single shaft soil mixing equipment for creating deep mixed shear walls and grids because, in our experience, uniform mixing is more difficult to control when using single shaft soil mixing equipment.

The body of literature (case histories, numerical simulations, and physical model tests) on the effectiveness of DMM grids for mitigating liquefaction effects demonstrates that grid configurations are more effective than columns, with benefits including reduced ground settlements and lateral spread displacements, reduced earthquake-induced shear stress and strain within untreated soils bounded by the grid walls, containment of liquefied soils within the grid walls if liquefaction occurs, and reduced migration of excess pore pressure between unimproved and improved zones (Namikawa et al., 2007; Siddharthan & Porbaha, 2008; Nguyen et al., 2013; Yamashita et al., 2015; Tsukuni & Uchida, 2015 and 2017; Boulanger et al, 2018; Boulanger & Shao, 2021). The effectiveness of DMM grids to mitigate liquefaction-induced displacements depends on a variety of factors, including the treatment geometry and area replacement ratio (A_r) and deep mixed ground strength and stiffness. The area replacement ratio is defined as the ratio of the surface area of treated soil-cement to the total surface area within a given treatment zone. As area replacement ratio increases, the composite shear strength of the deep mixed zone increases, and earthquake-induced shear stresses decrease.

I.4.3 Design Approach

Design of the DMM ground improvement generally follows the approach described by the FHWA guidelines (Bruce et al., 2013) and involves the following steps:

1. Establish trial geometry (area replacement ratio, column diameter, and shear wall spacing) and deep mixed ground properties,
2. Evaluate global slope stability (static, seismic, and post-seismic),
3. Evaluate other potential external modes of failure of the deep mixed zone (overturning and bearing)
4. Evaluate internal stability of the deep mixed zone (racking failure, crushing of deep mixed shear walls at the outside toe),
5. Evaluate static and seismic settlements,
6. Repeat steps 1-5 until performance is satisfactory,
7. Evaluate deep mixed column bearing capacity for support of structural loads, and
8. Refine layout and add additional deep mixed columns to reduce floor free span distance, where appropriate, to reduce floor slab costs.

The following sections describe the evaluation process for the key steps (1 through 5) listed above.

I.4.4 DMM Design Properties

DMM design properties and geometries were initially selected based on rule of thumb and review of relevant case histories and published design guidelines and technical papers on the subject. Following the design approach presented above, DMM properties and geometries were iteratively adjusted to achieve acceptable performance. The final DMM properties used for design are summarized in the **Table I.4.1**.

Table I.4.1: DMM Design Properties

Parameter	Design Value
Unconfined Compressive Strength ($q_{dm,spec}$)	125 psi
Shear Strength (s_{dm})	74 psi (curing time = 365 days) (40% of unconfined compressive strength)
Young's Modulus (secant modulus at 50% mobilized strength; E_{50})	37,500 psi (300 times unconfined compressive strength)
Shear Modulus Ratio ($G_r = G_{dm}/G_{soil}$)	5-20
*dm = deep mixed	

I.4.4.1 Area Replacement Ratio

An area replacement ratio (A_r) of 50 percent was selected for design to limit lateral spread displacement to an acceptable magnitude. The basis for tolerable lateral spread displacement and our evaluation of seismic slope displacement are presented in the following section. An area replacement ratio of 50 percent with conventional DMM strengths will also provide adequate support for all footings and moment frame grade beams. In addition, case histories indicate good performance against soil liquefaction hazards with A_r greater than approximately 20 percent.

For example, the 14-story International Hotel in Kobe Japan used an A_r of about 20 percent. During the Kobe earthquake, this structure performed very well despite having the ground surrounding the building liquefy, laterally spread several meters, and settle significantly. DMM grids of about 34 feet deep and with an A_r of about 30 percent were reportedly used for several two-story new school buildings at Jordan High School in Long Beach, California (completed in 2017) to reduce liquefaction-induced settlements and support the buildings on shallow foundation systems. A design 28-days DMM unconfined compressive strength of 150 psi was used at the Jordan High School project.

The West Dowling Road Overcrossing in Anchorage Alaska was built in 2014 with deep mixed shear walls and columns supporting the approach abutment footings in part to mitigate earthquake-induced lateral deformations within shallow soft peat and liquefiable silt layers (Boulanger & Shao, 2021). The deep mixed walls and columns were spaced to produce area

replacement ratios of approximately 90 percent beneath the footings (shear walls with overlapping columns) and 50 percent in the area surrounding the footings (shear walls only). The bridge performed well in the 2018 Anchorage earthquake ($M = 7.1$ and PGA at the overcrossing estimated to be 0.35 to 0.45) with deformations kept to acceptable levels.

We have used the deep mixing ground improvement method and our latest experience was the Agnews Campus project located in San Jose, California. The project included sixteen one- to three-story building on an approximately 55-acre site. For that project, estimated liquefaction-induced ground surface settlements exceeded the project settlement design criteria for buildings and structures that were supported on shallow foundations without ground improvement. DMM grids of about 40 feet deep with an A_r of 40% and unconfined compressive strength of 250 psi was used for the ground DMM design.

Based on available literature, case histories, and the analyses presented in the following sections, we judge that a minimum A_r of 40 to 50 percent is reasonable for support of the planned Laney College LLRC building. The design calculations presented in the following sections are based on $A_r = 50\%$.

I.4.5 Global Slope Stability Analyses

I.4.5.1 Seismic Slope Displacement

The methodology and results of seismic slope displacement evaluations for the DMM ground improvement are presented in this section. Based on results of the stability analysis and variable Young Bay Mud (YBM) thickness encountered at the site, we performed 10 additional CPTs on November 17, 18, and 22, 2022 to better define the bottom elevation of the YBM layer. The new cross sections are shown on **Plates 2a through 2f**, herein. The updated cross sections together with results of stability analysis were used to develop the DMM depths and the zonation shown on **Plate 1**.

I.4.5.1.1 Methodology

Simplified Seismic Slope Displacement Procedures

Seismic slope displacement was evaluated for an idealized section representative of cross section A-A' [**Plate 1**; the interpretive cross section is presented in the LLRC Geotechnical Report (Fugro, 2020)] using the simplified procedures developed by Bray and Macedo (2019) and Rathje and Antonakos (2011). In general, these procedures are based on regression of Newmark sliding block type analyses performed for a wide range of slope conditions (i.e., slope height, soil stiffness, and yield acceleration) and substantial databases of ground motions. The two models used herein differ with respect to:

1. Their representation of the dynamic response of the sliding block,

2. The ground motion databases available at the time of their development, and
3. Their parameterization of the ground motion for regression (for building their predictive models).

The Bray and Macedo (2019) procedure is based on fully coupled stick-slip sliding block analyses and the NGA-West2 ground motion database (>6,000 ground motion recordings were used to develop their predictive model). Their coupled model simultaneously captures the nonlinear dynamic response of the sliding mass and its effect on sliding episodes. The Rathje and Antonakos (2011) procedure is based on decoupled analyses, where calculations for the dynamic response of the sliding block and plastic slip (i.e., sliding) are performed independently. Their predictive model is based on an earlier version of the NGA strong ground motion database (>2,000 ground motion recordings were used to develop their predictive model). Coupled analyses are more rigorous and considered superior, although any sliding block type analysis represents potential slope deformations with a very simplistic failure mechanism, and results should be interpreted as an index of slope performance. While both models use earthquake magnitude as a proxy for shaking duration, they employ different parameterization of the seismic demand. The Bray and Macedo (2019) model uses the spectral acceleration (at the base of the sliding mass) at a degraded period equal to 1.3 times the initial period of the sliding mass to represent the seismic demand. The Rathje and Antonakos (2011) model used herein uses the PGA at the base of the sliding mass to represent the seismic demand. Both models require the initial fundamental period of the potential sliding mass (T_s) and the slope's yield coefficient (k_y).

The initial fundamental period of the potential sliding mass (T_s) was estimated based on the approximate height of the potential sliding mass observed in the pseudostatic limit equilibrium analyses, the range of in-situ shear wave velocities previously idealized for site response analysis (Supplement G of LLRC Geotech Report), shear modulus ratios ($G_r = G_{dm} / G_{soil}$) ranging from 5 to 20, an area replacement ratio of 50 percent, and the model for shear wave velocity ratio for periodic grid inclusions proposed by Nguyen et al. (2013). The resulting estimates of T_s ranged from approximately 0.17 to 0.28 seconds.

Seismic slope displacements were estimated for a design-level ground motion based on the geometric mean and without risk coefficients (e.g., $PGA_M / 1.5$) [CGS Note 48 (CGS, 2019)]. Acceleration response spectra for the MCE_R [tabulated in Table G.4 of the LLRC Geotech Report (Fugro, 2020)], MCE_G , and the design-level ground motion used for seismic slope displacement analyses are shown in **Plate 3** for $V_{s30} = 260$ m/s (i.e., at the base of the YBM). The range of spectral accelerations used for the Bray and Macedo (2019) seismic slope displacement model (corresponding to the estimated range of degraded period of the sliding mass) is annotated on this plate. An earthquake magnitude of 7.6 was used in these analyses based on the maximum considered earthquake associated with the Hayward Fault.

Displacements were estimated using the Bray and Macedo (2019) procedure for both ordinary ground motions and near-fault pulse ground motions. The results presented in the following section were weighted by the expected proportion of pulse motions, which was estimated to be approximately 0.4 based on the Hayden et al. (2014) model. A peak ground velocity (PGV) of 105 cm/s was used for the pulse ground motion predictive model based on the correlation developed by Watson-Lamprey and Abrahamson (2006), which was found to be in good agreement with the 1,000-year PGV computed using the beta web API for the 2018 USGS national seismic hazard maps.

Pseudostatic Slope Stability Analyses and Estimation of Yield Coefficient

The yield coefficient (i.e., the horizontal seismic coefficient that results in a pseudostatic factor of safety of unity) was evaluated by pseudostatic limit equilibrium analyses performed with the commercial software program SLOPE/W (GeoStudio 2019 version 10.0.0.18569; GEOSLOPE, 2019) and the idealized stratigraphy presented in **Table I.4.2**. Circular and non-circular slip surfaces were evaluated using the Morgenstern-Price limit equilibrium method (which satisfies equilibrium of both forces and moments). The design of the DMM ground improvement was iteratively adjusted until pseudostatic stability analyses produced yield coefficient values corresponding to tolerable seismic displacements.

The deep mixing treatment zone was represented with composite properties assuming no shear resistance from native soil between the deep mixed grids. The shear strength of the deep mixed ground was computed as $s_{dm} = \frac{1}{2}(f_r \times f_c \times q_{dm,spec})$ where $q_{dm,spec}$ is the specified unconfined compressive strength of the deep mixed ground ($q_{dm,spec} = 125$ psi), f_c is a factor accounting for curing time ($f_c = 1.48$ for the 365 day curing time assumed for seismic load cases), and f_r is a factor accounting for differences between unconfined peak and confined large-strain strengths taken as 0.8 (Bruce et al., 2013). The composite shear strength of the treatment zone was then estimated as $s_{dm,grid} = f_v \times A_r \times s_{dm} \approx 5,000$ psf where f_v is a factor that accounts for the greater variability that typically exists in the strength of deep mixed ground compared to the variability that exists in the strength of clay deposits [f_v was estimated to be 0.95 per the FHWA guidelines (Bruce et al., 2013)], A_r is the area replacement ratio ($A_r = 0.5$), and s_{dm} is the shear strength of the deep mixed ground defined above.

The Young Bay Mud (YBM) was modelled with an undrained shear strength ratio of 0.22 to approximate cyclic softening behaviours. This softened strength ratio was based on an average peak, static strength ratio of 0.28 and an undrained shear strength reduction factor of 0.8 (i.e., $0.8 \times 0.28 = 0.22$) based on the cyclic strength (i.e., cyclic resistance ratio, CRR) for $M=7.5$ suggested by Idriss and Boulanger (2008) for plastic silts and clays, and Fugro's past experience characterizing and modelling YBM.

The liquefiable sands were modelled with residual strength of liquefied soil estimated using the Kramer and Wang (2015) model which depends on energy and effective overburden corrected SPT blow count, $(N_1)_{60}$ and in-situ vertical effective stress. Baseline analyses were performed for $(N_1)_{60} = 15$. Sensitivity analyses were also performed for $(N_1)_{60} = 10$.

Table I.4.2: Soil Properties Used in Pseudostatic Slope Stability Analyses

Material	Unit Weight (pcf)	Material Shear Strength	
		Cohesion c' (psf)	Friction Angle ϕ' (degree)
Sandy Fill	120	0	35
Young Bay Mud with Sand Lenses	90	0.22 x Effective Overburden Stress (psf)	0
Interbedded Clays and Sands	130	0	40
Highly Liquefiable Sands	110	Kramer and Wang (2015) $(N_1)_{60}=15$	0
DMM Composite	120	5,000	0

I.4.5.1.2 Results

Results of the pseudostatic slope stability analyses and simplified seismic slope displacement estimates are presented herein. **Plates 4a through 4c** show factors of safety and corresponding slip surfaces from pseudostatic stability analyses with a horizontal seismic coefficient (k_h) of 0.35 for block, circular, and optimized circular slip surfaces. The block slip surface (passing through the DMM grid) and the optimized circular slip surface (passing beneath the grid) both have factors of safety of approximately 1.0 (i.e., $k_y = 0.35$). The circular slip surface (not optimized) exhibits a factor of safety of 1.1 for $k_h = 0.35$ (i.e., $k_y < 0.35$). The deep mixed zone is deeper on the east side of the building (Zones A2 and B in **Plate 1**) extending approximately 55 feet deep (Elev. -35 feet; 12 to 22 feet below YBM). This deeper section is approximately 55 feet wide in the slope stability model. Based on the results of the stability analyses the deeper portion of the DMM is extended further back along the north side of the building so that there is at least a 55-foot-wide deep buttress for slip surfaces oblique to the building orientation (e.g., Cross Section F-F', **Plate 2f**). Additionally, based on the additional CPTs performed in November 2022 the DMM depth was extended in Zone A2 to ensure bearing into the competent sands and clays beneath the YBM. A smaller maximum center-to-center grid spacing is specified for Zone B (**Plate 4**). The deep mixed zone on the western side of the building is shorter (Zone A1 in **Plate 1**), keyed 3-5 feet into the competent sands and clay under the YBM, generally extending to a depth of about 33 feet below ground surface (Elev. -15 feet). Sensitivity analyses with residual strength of liquefied soils based on Kramer and Wang (2015) for $(N_1)_{60} = 10$ had a small effect on the results because only small fractions of the slip surfaces were affected.

The range of estimated seismic displacements for the DMM ground improvement is shown in **Plate 5**. The range is based on: (1) the range of k_y values computed for circular and non-circular slip surfaces and several parameter sensitivity analyses, (2) reasonable ranges of average shear wave velocity of the potential sliding mass, and (3) both the Bray and Macedo (2019) and Rathje and Antonakos (2011) predictive models. Estimated median seismic displacements range from negligible to approximately 13 cm, with the Bray and Macedo (2019) model producing larger displacement estimates for all cases. The $T_s = 0.17$ and 0.21 seconds analysis cases likely better represent the deep mixed zone in these analyses ($Gr \approx 20$ and 10 , respectively). The $T_s = 0.28$ seconds case was included as a reasonable sensitivity analysis where the degraded period of the sliding mass corresponds to the peak spectral acceleration (i.e., $Sa(1.3T_s) = 1.2$ g). The differences between the two predictive models are partly attributed to differences in how they model the dynamic response of the sliding mass, with the Bray and Macedo (2019) coupled model considered superior. The approximate performance of the existing slope (i.e., without DMM ground improvement) is also annotated on **Plate 5** for reference. Large seismic displacements were estimated for the existing slope for $k_y \approx 0.1$, which corresponds to a range of performance where displacement estimates are very sensitive to small changes in yield acceleration. Conversely, the DMM ground improvement performance falls on a much flatter part of the displacement vs. k_y curves.

Two seismic displacement thresholds are indicated on **Plate 5**. The 15-cm (6-inch) threshold is commonly accepted for screening-level evaluations of earthquake-induced landslide hazard (e.g., SP-117A, 2008). The 15-cm threshold likely distinguishes small to moderate displacements from larger displacements (Blake et al., 2002), and sliding block displacement estimates less than approximately 15 centimetres are unlikely to correspond to serious landslide movement or damage (SP-117A, 2007). The 10-cm (4-inch) threshold corresponds to the ASCE 7-16 upper limit for lateral spreading horizontal ground displacement for shallow foundations for buildings in Risk Category IV (Table 12.13-2 of ASCE 7-16). Therefore, we designed the DMM ground improvement to limit average lateral spread displacement to approximately 10 cm. This corresponds to a yield acceleration of approximately 0.35 (**Plate 4**) which was computed for the best estimate pseudostatic stability analyses previously presented on **Plates 4a and 4c**.

I.4.5.1.3 Conclusions

Seismic slope displacement estimates based on two methods and incorporating uncertainty in the initial fundamental period of the sliding mass were on average less than 10 cm and are considered tolerable given the ASCE 7-16 upper limit for lateral spreading horizontal ground displacement for shallow foundations (10 cm for buildings in Risk Category IV). Therefore, the design of the DMM ground improvement presented herein is judged to be acceptable with respect to global seismic stability.

The deeper treatment zone modelled on the east side of the building in the two-dimensional pseudostatic stability analyses will need to also wrap around the north side of the building to limit lateral displacement for slip surfaces oblique to the building's principal orientation and to protect the north side of the building against potential soil loss. This configuration is shown in plan on **Plate 1** and provides a similar width of deeper treatment (to what was modelled for Section A-A') for potential slip surfaces on cross sections oblique to the building orientation. The deeper ground improvement extends along the north side of the LLRC building to the eastern limit of the Building E.

The final depth of the DMM grid should be determined based on the results and interpretation of additional CPTs that we recommend be performed prior to construction. The DMM depths presented in this section (and used for the stability analyses) are minimum depths that may need to be exceeded based on interpretation of the additional CPTs.

I.4.5.2 Post-Seismic Global Stability

Post-seismic stability analyses demonstrated factors of safety greater than five. Post-seismic global stability was evaluated using the same properties shown in **Table I.4.2**, except the YBM was modelled with an undrained shear strength ratio of 0.17 (i.e., a strength reduction factor of 0.6 to represent cyclically softened strength for a static loading rate). Analyses were performed for both the original slope geometry and for a case where the channel side soils (east of the building) are assumed to have displaced towards the channel more than the building, exposing a free face of deep mixed ground approximately 20 feet tall. In both cases the DMM ground improvement is acceptable from a post-seismic global stability perspective.

I.4.6 Additional Stability Checks

Additional stability checks were performed following FHWA guidelines (Bruce et al., 2013) and including seismic loads. Overall, the design of the DMM ground improvement was controlled by global seismic slope displacements given the favourable aspect ratio and relatively high area replacement ratio needed. External stability was checked for combined overturning and bearing. Internal stability was checked for crushing of the deep mixed shear walls at the outside toe, racking failure (shearing on vertical planes in the deep mixed shear walls), and extrusion of soil between the deep mixed shear walls.

To simplify these checks, we conservatively modelled the shallower treatment zone on the west end of the building and the deeper treatment zone on the east end of the building as separate blocks of soil-cement. Seismic activate earth pressures were estimated using the same limit-equilibrium models used for the pseudostatic analyses and with $k_h = 0.35$ (following the GLE approach described by Anderson et al., 2008). A horizontal inertial load of the deep mixed ground was also included as the weight of the deep mixed ground (W) times the horizontal seismic coefficient (k_h). Additionally, no passive resistance from the channel side of the deep mixed

ground was conservatively assumed. Factors of safety for all additional stability checks were more than 1.3 [the minimum value for static load cases recommended by Bruce et al. (2013)].

I.4.7 DMM Treatment Zone Settlements

Post-liquefaction reconsolidation settlement within the building footprint was estimated to range between approximately 1 and 4 inches based on the local borings and CPTs. Note that the largest settlement (approximately 6 inches) was estimated for CPT-03 which was performed to the southeast of the building. The potential for the DMM to reduce cyclic shear stresses and limit post-liquefaction reconsolidation settlement was evaluated for shear modulus ratios ($G_r = G_{dm} / G_{soil}$) ranging from 5 to 20 and the design area replacement ratio of 50%. The shear stress reduction factor ($R_d = CSR_i / CSR_u$, where CSR_i and CSR_u are cyclic stress ratio for the improved and unimproved cases, respectively) was estimated using the relationship proposed by Nguyen et al. (2013) for periodic grid arrangement of shear walls. CPT-based post-liquefaction reconsolidation settlement analyses for R_d values ranging from 0.5 ($A_r = 50\%$ and $G_r = 5$) to 0.17 ($A_r = 50\%$ and $G_r = 20$) resulted in negligible ($R_d = 0.5$) to substantial ($R_d = 0.17$) reduction in estimated settlements. A R_d value of 0.3 ($A_r = 50\%$ and $G_r = 10$) provides a reasonable estimate of the settlement hazard that accounts for reduced seismic shear stresses in the native soil and resulted in reconsolidation settlements within the building footprint on the order of 1 to 2 inches for the MCE.

We judge that by using DMM to mitigate liquefaction effects, post-liquefaction reconsolidation settlements of 1 to 2 inches can develop between DMM grids beneath the floor slabs. Therefore, we recommend using structural slabs to span between deep mixed shear walls.

In addition, we estimate static settlement of buildings and structures supported on the deep mixed ground will depend on footing layout and service load and will be less than about 3/4 inch.

Underground pipelines (gas lines, sanitary sewers, water services, etc.) should be properly designed considering differential settlements of about 4 inches associated with post-liquefaction reconsolidation between DMM supported structure and unimproved areas adjacent to the building. Additional consideration should be given to the impacts of differential seismic slope movements (lateral and vertical) between the improved and unimproved areas.

I.5 Seismic Design Parameters

Due to the ground improvement, the combination of the DMM grids and the existing soil will create a stiffer composite medium which has a higher shear wave velocity compared to the native soft YBM and sandy fill material. We estimate that the shear wave velocity of the top 100 feet of soil (V_{s30}) will increase to 270 m/s due to the ground improvement. The corresponding composite average shear wave velocity profile was estimated based on the idealized shear wave

velocity profiles previously developed for site response analyses [Supplement G of LLRC Geotech Report (Fugro, 2023)] and considering shear modulus ratios, G_r , ranging from 5 to 30 (based on deep mixed soil-cement E_{50} values between 300 and 600 times the specified unconfined compressive strength, as recommended by Boulanger and Shao, 2021). Overall, for the resulting range of estimated V_{s30} values the short period spectral accelerations (that control short period spectral acceleration parameters, S_{DS} and S_{MS}) increase with increasing V_{s30} . Given that the estimated building period is 0.45 seconds, we selected a representative V_{s30} based on a reasonably conservative average G_r value of 20, which for $A_r = 50\%$ corresponds with a ratio of $V_{s,av} / V_s$ of approximately 2.5 per the relationship developed by Nguyen et al. (2013) for periodic grid inclusions (where $V_{s,av}$ is the average shear wave velocity in the treatment zone and V_s is the soil's shear wave velocity) The idealized V_s profiles previously developed for site response produce V_{s30} values of approximately 270 m/s when multiplied by 2.5 over the thickness of fill and YBM.

A site-specific Probabilistic Seismic Hazard Analysis (PSHA) was performed for the new V_{s30} to estimate the severity of ground motions that may affect the project site for specific design levels of hazard. The design ground motion parameters were calculated following the site-specific ground motion procedures defined in Chapter 21 of ASCE 7-16 (ASCE, 2016) as required by the California Building Code (CBC) (CBSC, 2019).

Table I.5.1 tabulates the spectral ordinates of the recommended site-specific MCER and design response spectra per ASCE 7-16. The corresponding design acceleration parameters S_{MS} , S_{M1} , S_{DS} , and S_{D1} are tabulated in **Table I.5.2**.

Table I.5.1: MCE_R and Design Response Spectra per ASCE 7-16 for a V_{s30} of 270 m/sec, 5% Damping

Period (sec)	UHRs for Return Period of 2,475 Years	Horizontal Spectral Acceleration (g)						Design Response Spectrum

S_{M1}	2.28
S_{DS}	1.30
S_{D1}	1.52
T_L	8 seconds

Plate 6 shows the mean annual seismic hazard curves for selected spectral periods ranging from 0.01 to 10 seconds for V_{s30} of 270 m/s. A spectral period of 0.01 seconds is used to represent the peak ground acceleration (PGA). These hazard curves represent the total mean hazard from combining all seismic sources and ground motion models. These figures also indicate the annual frequency of exceedance corresponding to a return period of 2,475 years. **Plate 7** presents the 5 percent-damped mean horizontal UHRS (Uniform Hazard Response Spectrum) for a return period of 2,475 years and the representative V_{s30} value of 270 m/sec. The UHRS for a return period of 2,475 years along with probabilistic response MCE_R response spectrum are illustrated in **Plate 8**.

Plate 9 presents the development of the site-specific MCE_R and design response spectra for the site. In this case, the deterministic MCE_R spectrum is lower than the probabilistic MCE_R spectrum for all spectral periods. The site-specific MCE_R spectrum is the maximum of: 1) the minimum of the probabilistic and deterministic MCE_R , and 2) 150 percent of the design response spectrum. Following ASCE 7-16, the recommended design response spectrum for the site was calculated as the maximum of 2/3 of the site-specific MCE_R and the lower limit specified by ASCE 7-16 (80 percent of the general spectrum for Site Class D, using modified F_a and F_v values provided in Section 21.3 of ASCE 7-16). The transition period from constant velocity to constant displacement, T_L , required to calculate the lower limit, was estimated as 8 seconds using the USGS web service (<https://earthquake.usgs.gov/ws/designmaps/asce7-16.html>).

I.6 Foundation System

I.6.1 Spread Footing

We anticipate an area replacement ratio (A_r) of at least 50% will be used in the DMM design. The DMM columns can be constructed in various diameters and selection of the diameter and depth of these columns is project specific. Typically, the overlap of adjacent DMM columns is about 30% of the column diameter. The A_r may vary based on number of DMM columns under the foundation. To achieve the full allowable bearing pressure, DMM should extend laterally beyond

footing bases such that the area replacement ratio under the footing is 100%. Otherwise, the bearing capacity should be multiplied by the actual A_r under the foundation.

The axial capacity of the DMM grids is the minimum of the structural capacity and geotechnical capacity of the grids. For the designed DMM grids, the structural capacity is expected to control. Using a design DMM unconfined compressive strength of 125 psi, and following the FHWA design guidelines (Bruce et al., 2013), the ultimate structural capacity of the DMM columns ($A_r=100\%$) is estimated to be 21,300 pounds per square feet (psf) for long term and seismic loads and 14,400 psf for short term construction loads (after 28 days). According to CBC Section 1605A.1.1, the factor of safety for soil bearing shall not be less than the overstrength factor. Factors of safety for allowable stress design are show in **Table I.6.1** below. For example, if the overstrength factor is 2.5, the factors of safety for Dead Load, Dead plus Live Load, and Total Load cases are 3, 2.5, and 2.5, respectively.

Table I.6.1: Factors of Safety for Axial Loading of Foundations (Allowable Stress Design)

Load Condition	Factor of Safety
Dead Load	maximum (3, overstrength factor)
Dead plus Live Loads	maximum (2, overstrength factor)
Total Loads (including wind or seismic)	maximum (1.5, overstrength factor)

Provided bearing capacities are for shallow foundations supported on DMM with 100% area replacement ratio (A_r). It should be noted that considering the relatively high bearing capacity of the DMM, the A_r under the footing may be decreased depending on the design loads. The allowable bearing pressure is a net value; therefore, the weight of the footing can be neglected for design purposes. For footings supported on DMM with A_r less than 100%, the bearing capacity should be reduced by multiplying by A_r .

Footings should be at least 12 inches wide, and bottom of footings should be founded at least 24 inches below the lowest adjacent finished grade. Estimated static settlement of building supported on the deep mixed ground depends on footing layout and service loads, but should be less than about $\frac{3}{4}$ inch.

Resistance to lateral loads may be provided by friction along the base of foundations and by passive pressures acting on the sides of foundations. An allowable friction coefficient of 0.35 may be multiplied by the dead load to evaluate the allowable frictional resistance along the bottom of foundations. Where the footing is poured neat against subgrade soils, an ultimate passive pressure equal to an equivalent fluid pressure of 500 pounds per cubic foot (pcf) can be used for lateral load resistance against the sides of footings perpendicular to the direction of loading. If the footing is poured against forming, the ultimate passive resistance will be reduced by 30%. The upper 12 inches of soils should be ignored unless they are confined by pavement or slab.

The passive resistance value can be linearly interpolated between at-rest pressure (equivalent to a fluid pressure of 50 pcf) at zero deflection and the ultimate at a deflection of $0.025 \cdot D$, where D is the depth of the footing. The passive pressures against the footings and grade beams along the eastern and northern edge of the treatment Zone B should be ignored in foundation design due to potential for seismic soil displacements adjacent to the building in these areas.

I.6.2 Structural Mat Slab

When used, the structural mat slabs foundations should be supported on properly prepared subgrade that is proof rolled to provide a smooth, unyielding surface for slab support. Where the slab will be located at surface grade, we recommend at least 12 inches of imported, predominantly granular, "non-expansive" engineered fills that meet the requirements presented in the **Section 7.2** of the LLRC Geotechnical Report (Fugro, 2023) be provided below the slab. For slabs that support vehicular loads, the "non-expansive" engineered fill layer should consist of Caltrans Class 2 aggregate base.

For the portion of the slab that are supported on compacted soil, we recommend a modulus of subgrade reaction (k_1 , 1 foot by 1 foot) of 125 pounds per square inch per inch (psi/in) be used for the design of the structural mat slab foundation for the static condition. This value can be modified to k as $125/B$ psi/in, where B is the equivalent foundation width measured in feet. However, for the seismic condition, the slabs should be able to span between the DMM grids due to liquefaction-induced settlements (i.e., subgrade modulus = 0.0).

For the portion of the slab that are supported on 100% area replacement ratio DMM, we recommend a modulus of subgrade reaction (k_1 , 1 foot by 1 foot) of 4,000 psi/in be used for the design of the structural mat slab foundation. This value can be modified to k as $4,000/B$ psi/in, where B is the equivalent foundation width measured in feet. Recommended values of modulus of subgrade reaction for various footing aspect ratios are provided in **Table I.6.2** below. For other aspect ratios, values of modulus of subgrade reaction can be linearly interpolated. Note that if the area replacement ratio is less than 100%, **rigid footing** bearing capacities provided above and **modulus of subgrade reaction** in table below shall be **reduced by multiplying by the area replacement ratio**.

Table I.6.2: Values of Modulus of Subgrade Reaction for Various Rigid Footing Aspect Ratios

Footing Aspect Ratio Length (L) : Width (B)	Modulus of Subgrade Reaction k (psi/inch)
1	4,000/B
1.5	3,300/B
2	2,900/B
3	2,500/B
4	2,300/B
5	2,100/B
10	1,800/B
15	1,700/B

Note: B, equivalent footing width measured in feet

I.7 Conclusions and Recommendations

We recommend that approximately 30- to 55-foot deep DMM ground improvement be used to support shallow foundations of the proposed LLRC building to mitigate seismic hazards. We conclude that the LLRC building supported on DMM that are designed using the recommendations provided below will meet the project settlement criteria and allowable lateral spread displacement for shallow foundations per ASCE 7-16. We estimate total settlements less than ¾ inch (differential settlements up ½ inch over 30 feet or between adjacent structural columns) for DMM supported foundations and less than approximately 4 inches of average lateral spread displacement for the design-level ground motion.

A summary of our key recommendations for DMM follows:

- Ultimate DMM compressive capacities of 21,300 psf and 14,400 psf can be used for design of footings and slabs supported on DMM with 100% A_r for long term/seismic and short-term construction loads (after 28 days), respectively. For footings supported on DMM with A_r less than 100%, the bearing capacity should be reduced by multiplying by A_r .
- The allowable axial capacity should be calculated by dividing the ultimate axial capacities by the factors of safety provided in **Table I.6.1**.
- Lateral resistance of footing bases and slabs supported on DMM can be calculated using an allowable frictional coefficient of 0.35.
- The DMM should be constructed using multi-shaft mixing equipment to create columns that are a minimum of 3 feet and a maximum of 6 feet in diameter.
- The overlapping between any two adjacent DMM columns should be at least 30 percent of the column diameter.

- The bottom of DMM columns should be extended to below elevation -15 feet for Zone A1 and -35 feet for Zones A2 and B.
- The design unconfined compressive strength ($q_{dm,spec}$) is 125 psi .
- The mixed-in-place soil cement grids and blocks should cover a minimum Area Replacement Ratio (A_r) of 50 percent for a specified unconfined compressive strength ($q_{dm,spec}$) of 125 psi.
- Center-to-center spacing of DMM grids should not exceed 4.0d Zones A1 and A2 and 3.2d for Zone B, for min $A_r = 50\%$ ($q_{dm,spec} = 125$ psi), where d is the diameter of the DMM columns.
- DMM within the building footprint should be arranged in an uninterrupted grid that follows the building column lines and underlies all footings and moment frame grade beams.
- The DMM should underlie the entire building footprint and extend laterally to include any attached structures which are deemed to be essential parts of the buildings.
- To achieve the full allowable bearing pressure, DMM should extend laterally beyond footing bases such that the area replacement ratio under the footing is 100%. Otherwise, the bearing capacity should be multiplied by the actual A_r under the foundation.
- Elevator shafts should also be supported by DMM grids.
- Ground floor slabs should be designed to structurally span between DMM walls. Vapor barrier recommendations for floor slabs are provided in Section 7.3.4 of the LLRC Geotechnical Report (Fugro, 2023).
- The top of the DMM elements should extend to the base of the ground floor slab section, the bottom of footings, and the bottom of moment frame grade beams. The bottom of DMM elements should extend at least to the minimum depth shown on **Plate 1**.
- The average unconfined compressive strength of the DMM core specimens should be at least 125 psi at 28 days for a minimum A_r of 50% as determined by ASTM D2166. Ninety percent (90%) of all unconfined compressive strength tests on core samples should exceed the specified unconfined compressive strength.
- Lumps of unimproved soils should not amount to more than 15 percent of the total volume of any core run from continuous full-depth core sample and all of the unrecovered core length should be assumed to be unimproved soil.
- Any individual or aggregation of lumps of unimproved soil should not be larger than 12 inches in greatest dimension.
- Detailed DMM acceptance criteria are provided in performance specifications in **Supplement J, Construction Specifications for Deep Mixing**.
- Before construction, a detailed utility locating report should be provided to the design team.
- The DMM Contractor should control and process all spoils created during the DMM construction and should coordinate with the project grading contractor for the spoils to be reused as fills at the project site. The DMM spoils can be used below all interior slabs-on-grade or structural mat slabs as non-expansive engineered fills provided, they meet the requirements provided in our Geotechnical Report (Fugro, March 31, 2023).

- Design parameters per ASCE 7-16 at the ground surface are tabulated in **Table I.7.1** below:

Table I.7.1: Design Parameters per ASCE 7-16 at the Ground Surface, 5% Damping

Parameter	Value
S_{MS}	1.95
S_{M1}	2.28
S_{DS}	1.30
S_{D1}	1.52
T_L	8 seconds

- DMM modulus of subgrade reaction (k_1 , 1 foot by 1 foot) of 4,000 psi/in can be used for the structural design for portions of the slab that are supported by $A_r = 100\%$ DMM. The modulus of subgrade reaction for compacted soil between DMM grid is 125 psi/in which should be ignored when designing for seismic condition. These values can be modified to $k_{aa} = k_1/B$ psi/in, where B is the equivalent foundation width measured in feet. DMM modulus of subgrade reaction (k) for footings with various aspect ratios are provided in Table 6.1.
- Design requirements for foundations in liquefiable sites specified in **Section 12.13.9** of **ASCE 7-16** should be used for when designing the structural members and foundation system.
- We judge that by using DMM to mitigate liquefaction effects, post-liquefaction reconsolidation settlements of up to 2 inches can develop between DMM grids beneath the floor slabs. Therefore, we recommend using structural slabs to span between deep mixed shear walls.
- We recommend DMM ground improvement be installed by a qualified specialty contractor with demonstrated experience in this type of ground improvement. Construction of uniformly mixed, high strength DMM columns requires proper equipment, trained and experienced personnel, the proper mix design for the soils encountered, careful attention to the construction procedures, continuous monitoring of the installation parameters, and sufficient quality control testing. The DMM contractor should develop construction procedures, mix design, and quality control required to achieve the desired results and meet the project design and specified acceptance criteria. Additional details regarding contractor's responsibility are included in the DMM specifications.
- Fugro should also be retained to provide geotechnical services during DMM contractor selection, construction document and drawing submittal review, and DMM implementation and testing, to observe compliance with the design concepts, specifications, and recommendations presented in this addendum and the project Geotechnical Report (Fugro, , March 31, 2023). Our presence will also allow us to modify design if unanticipated subsurface conditions are encountered.

Appendix C

Construction Specification for Deep Mixing

Deep Mixing Method (DMM)

A.1 Part 1 – General

A.1.1 Scope

1. The Deep Mixing Method (DMM) Contractor shall furnish all plant, equipment, labor, and materials required to construct and perform Quality Control of the DMM in accordance with the DMM Design Plans and Specifications.
2. The purpose of DMM ground improvement is to reduce seismically induced slope displacements and settlements to acceptable levels and to provide vertical and lateral support for shallow foundation systems for the Laney College Library & Learning Resource Center (LLRC) building for both static and seismic loadings. The DMM ground improvement consists of continuous underground overlapping deep mixed (DM) columns forming a series of DM walls that are arranged in a grid pattern to form a series of DM walls and blocks. The dimensions and layout of DM grids and blocks are shown on the DMM Design Plans and are described in **Section A.3.2** of this Specification.
3. This specification has been developed as a combination of performance and method specifications. The intent is that the DMM Contractor will select the means and methods for satisfying the acceptance criteria. The DMM Contractor will then demonstrate that the means and methods will satisfy the acceptance criteria using one or more test sections. Once the test section indicates satisfactory results, as determined by the Geotechnical Engineer, the DMM Contractor will follow the means and methods used to satisfy the acceptance criteria for all of the production DMM construction. If the DMM Contractor desires to change the means and methods during the course of production DMM, the changes need to first be approved by the Geotechnical Engineer and CGS. The Geotechnical Engineer may require additional test sections prior to approval of changes in means and methods.
4. The DMM Contractor shall be responsible for performing Quality Control (QC) during DMM construction, which includes QC documentation preparation and submittal, and sample collection, storage, and transportation. Sample testing shall be performed by a DSA approved testing laboratory hired by the Owner to verify that the acceptance criteria are satisfied. The Geotechnical Engineer shall make the determination as to whether the acceptance criteria have been met.
5. Upon completion of DMM installation, an as-built submittal package shall be prepared by the DMM Contractor and the Geotechnical Engineer to document that the installed DMM meets the project performance requirements. The as-built submittal package shall be submitted to CGS for approval. The submittal shall include test section results, daily quality control reports, DMM core and lab test results, as-built DMM record drawings, and any other information needed to document the work.

A.1.2 References

1. American Concrete Institute (ACI)
2. American Society of Testing and Materials (ASTM)
3. American Petroleum Institute (API)

A.1.3 Definitions

1. Area Replacement Ratio (Ar): A ratio of the surface area of soil-cement to the total surface area of ground to be improved within a given Treatment Zone. The total area of each Treatment Zone is measured to the outer tangent lines of the DMM columns along the entire Treatment Zone perimeter.
2. DMM: In situ ground treatment in which soil is blended with cementitious and/or other binder materials to improve strength, permeability, and/or compressibility characteristics (synonym terms include DSM, deep mixing, CDSM, and soil cement mixing).
 - a. The DMM grids and blocks are formed by an arrangement of at least two soil mixing shafts with overlapping augers and blades (paddles), guided by a lead mounted on a crawler base machine.
 - b. The mixing shafts shall be driven by a power source sufficient to provide torque for the wide range of expected drilling conditions, indicated by the available boring and CPT logs and other test data included in the Geotechnical Investigation Report (GIR) and planned future CPT logs prior to construction.
 - c. As the mixing shafts are advanced into the soil, grout is pumped through the hollow stem of the shafts and injected into the soil at the shaft tips. Auger flights and mixing blades on the shafts blend the soil with grout in a pugmill fashion. When the design depth is reached, the mixing shafts are withdrawn while the mixing process is continued.
 - d. The mixing shafts are positioned so as to overlap one another to form continuously mixed overlapping columns. After withdrawal, two (or more) overlapping soil-cement columns remain in the ground.
 - e. The process is then repeated to form grids and blocks of overlapping DMM columns.
3. DMM Design Addendum (DA): DMM Design Addendum No. 1 prepared by Fugro USA Land, Inc. dated June 10, 2022, and subsequent addenda.
4. DMM Elements: DMM columns will be used to create DMM grids and DMM blocks of treated soil referred to as ground improvement. A DMM grid will consist of interconnected DMM walls formed by partially overlapping columns arranged in a grid pattern with a replacement ratio less than 100 percent. A DMM block used to support a building footing will consist of interconnected DMM walls formed by overlapping columns arranged in a parallel pattern with a replacement ratio of 100 percent or less as shown in project plans and drawings. For this project, individual DMM Element refers to the grouping of columns installed simultaneously during single penetration of the DMM rig.
5. DMM Contractor: The firm performing the DMM construction.

6. DMM Layout Plan: The alternate DMM construction layouts designed by the DMM Contractor, which satisfy the requirements of this Specification. The DMM Layout Plans shall be reviewed and approved by the Geotechnical Engineer and Structural Engineer.
7. Cement Dosage: The amount of cement (in terms of dry weight) used to treat a given initial volume of in-situ soil.
8. Cone Penetrometer Test (CPT): A geotechnical exploration tool, as defined in ASTM D 5778.
9. Core Run: The total length reported by the driller as the actual depth penetrated by coring, including both recovered and unrecovered lengths.
10. Geotechnical Investigation Report (GIR): Geotechnical Investigation Report prepared by Fugro USA Land, Inc. dated February 28, 2020, and subsequent addenda. Note the DMM Design Addendum No. 1 (DA) supersedes the GIR.
11. Geotechnical Engineer: The geotechnical engineer of record responsible for the DMM design, who is hired by the Owner.
12. Ground Improvement Area: The plan area contained within a single perimeter shown on the DMM Design Plans that surrounds:
 - a. - All planned soil-cement grids/blocks.
 - b. - Unmixed soil within the grids.
13. Grout: A stable colloidal mixture of water, Portland cement, and admixtures. The purpose of the grout is to assist in loosening the soils for penetration and optimum mixing, and upon setting, to strengthen the in-situ soil.
14. Grout-Soil Ratio: A volumetric ratio of grout to in-situ soil to be mixed.
15. Owner: Peralta Community College District and its representatives.
16. Structural Engineer: The structural engineer of record responsible for designs of structure foundations supported by DMM, who is hired by the Owner.
17. Testing Laboratory: The testing laboratory of record performing construction material testing, which is hired by the Owner and approved by the Geotechnical Engineer. The Testing Laboratory shall be selected from the DSA approved laboratory list.
 - a. Treatment Zone: A spatial zone of soil targeted for ground improvement. The vertical and lateral (horizontal) extents of the Treatment Zones are defined on the DMM Design Plans.

A.1.4 Submittals

1. Evidence of conformance to the referenced standards and requirements shall be submitted by the DMM Contractor to the Geotechnical Engineer for the following, but not limited to, in accordance with the requirements in this Specification.
 - a. Cement: Certificate of compliance for each truck load delivery.
 - b. Admixtures: If used, certificate of compliance for each load or lot of material delivered.
 - c. Preliminary Mix Design: Proposed mix designs including all materials and quantities and documentation of calibration of the grout mixing plant.

- d. Proposed Test Section Program, Sampling Plan, and Laboratory Testing Program, conforming to the requirements described in this Section.
- e. Construction Schedule: Submit a detailed schedule that identifies start dates and duration of each major task in the work. The schedule shall at a minimum include information regarding equipment mobilization, equipment setup, soil-cement mixing test section, production installation, and verification testing.
- f. Site Work Plan: Submit a site plan showing staging area for all on-site equipment, including anticipated sections of the streets which may require blocking of parking spaces or traffic clearances.
- g. DMM Layout Plans: Submit 1"=20' scale drawings showing proposed layout of DMM Elements (including test section(s) and production DMM), including column diameters, column overlap, grid sizes, tip elevations, top elevations, coordinates of the corners, foundations, and proposed column and element numbering scheme prior to site mobilization in hard copy and electronic format using the project coordinate system at least 14 calendar days prior to beginning DMM construction. The DMM Contractor must obtain the Geotechnical Engineer's approval of the proposed column layout prior to beginning DMM construction.
- h. Equipment and Procedures: Submit a detailed description of the equipment and procedures to be used during all DMM work including, but not limited to, construction of DMM test section(s), production DMM work, and collecting samples for laboratory confirmation testing. Procedures shall include methods for locating the DMM Elements in the field and confirming that the columns are plumb. In addition, while it is recognized that the specific responses to field difficulties are dependent on several factors, the DMM Contractor shall submit their anticipated responses to the following possible situations that could occur during construction and testing of the DMM columns including poor core sample recovery or inability to retrieve core samples, and failing production test results (e.g., repair and/or treatment of failed area and modification to approved procedures or mix design).
- i. The DMM Contractor shall also submit the anticipated cement dosages (proportions) to achieve the acceptance criteria outlined under acceptance criteria in **Section A.3.15** of this Specification.
- j. Quality Control Program, as outlined in the Execution Section of this Specification.
- k. Daily Quality Control Reports: Prior to construction, submit a proposed Daily Quality Control Report format for approval by the Geotechnical Engineer. Submit the Daily Quality Control Report at the end of the next working day. The report should be in conformance with quality control in **Section A.3.14** of this Specification.
- l. DMM Test Results: Submit all QC test results as outlined in quality control in **Section A.3.14** of this Specification.

- m. Calibrations: Submit all metering equipment calibration test results including mixing systems, delivery systems, alignment systems, and mixing tool rotational and vertical speed.
 - n. Record Drawing: Submit record drawings prepared by the DMM Contractor indicating the as-built location and elevations of the DMM Elements in terms of project coordinates and vertical datum. The record drawings shall also indicate the above structure foundation designs and locations.
2. Upon completion of DMM installation, the as-built submittal by the DMM Contractor to the Geotechnical Engineer, Structural Engineer, and CGS shall include test section results, daily quality control reports, DMM core and lab test results, DMM record drawings, and any other information needed to document the work.

A.2 Part 2 – Products, Materials, and Equipment

A.2.1 Materials

1. Grout: The material added to the blended in situ soils shall be a water-based Portland cement grout. The purposes of the grout are to assist in loosening the soils for penetration and optimum mixing, and upon setting, to strengthen the in-situ soils. The grout shall be premixed in a mixing plant which combines dry materials and water in predetermined proportions.
2. Cement used in preparing the grout shall conform to ASTM C150 “Standard Specification for Portland Cement Type II”. The cement shall be adequately protected from moisture and contamination while in transit to and in storage at the job site. Reclaimed cement or cement containing lumps or deleterious matter shall not be used.
3. Water: Fresh water, free of deleterious substances that adversely affect the strength and mixing properties of the grout, shall be used to manufacture grout.
4. Admixtures: Admixtures are ingredients in the grout other than Portland cement, and water. Admixtures of softening agents, dispersions, pozzolans, retarders or plugging or bridging agents may be added to the water or the grout to permit efficient use of materials and proper workability of the grout. However, no admixtures shall be used except as approved by the Geotechnical Engineer.

A.2.2 Equipment

The DMM equipment shall meet the following requirements:

1. The mixing tools shall have mixing augers and blades (paddles) configured in such a manner so that they are capable of thoroughly blending the in-situ soils and grout.
 - a. Multi-shaft mixing equipment (machines with at least two soil mixing shafts with overlapping augers and blades) shall be used.

- i. The mixing augers and blades shall be minimum 3 feet and maximum of 6 feet in diameter.
 - ii. Allowable wear to mixing augers and blades will be limited such that equipment produces a column no less than the design diameter listed on the DMM Layout Plans.
 - iii. The overlapping between any two adjacent DMM columns shall be at least 30 percent of the column diameter.
 - b. The power source for driving the mixing shafts shall:
 - i. be sufficient to provide torque for the wide range of expected drilling conditions, indicated by available boring and CPT logs and other test data included in the Geotechnical Investigation Report (GIR) and DMM Design Addendum (DA).
 - ii. be sufficient to maintain the required revolutions per minute (RPM) and penetration rate from a stopped position at the maximum depth required.
2. The DMM rig shall be equipped with electronic sensors built into the leads to determine vertical alignment in two directions: fore-aft and left-right.
 - a. The sensors shall be calibrated at the beginning of the project and the calibration data shall be provided to the Geotechnical Engineer. The calibration shall be repeated at intervals not to exceed three months per rig.
 - b. The output from the sensors shall be routed to a console that is visible to the operator and the Geotechnical Engineer during penetration and reported. The console shall be capable of indicating the alignment angle in each plane.
3. The DMM equipment shall be adequately marked to allow the Geotechnical Engineer to confirm the penetration depth to within 6 inches during construction.
4. The grout shall be premixed in an on-site mixing plant, using a batch process, which combines dry materials and water in predetermined proportions. The mixing plant shall consist of a grout mixer, grout agitator, grout pump, batching scales, and a computer control unit.
 - a. Dry materials shall be stored in silos. The dry materials shall be transported to the project site and blown into the on-site storage tanks using a pneumatic system.
 - b. The air evacuated from the storage tanks during the loading process shall be filtered before being discharged to the atmosphere.
 - c. Automatic batch scales shall be used to accurately determine mix proportions for water and cement during grout preparation.
 - d. The dry admixtures, if used for mixing with water and cement, can be delivered to the mixing plant by calibrated auger. However, the DMM Contractor shall demonstrate that the calibrated auger can deliver the quantity of dry admixture with accuracy equivalent to that measured and delivered by weight.

- e. Calibration of mixing components shall be done at the beginning of the project and repeated at intervals not to exceed three months thereafter and after each move of the batch plant.
5. Positive displacement pumps shall be used to transfer the grout from the mixing plant to the mixing tool head. The grout shall be delivered to each slurry-injecting tool head by an individual positive displacement pump.
6. The DMM rig shall be equipped with sensors to continuously monitor and record the mixing tool penetration/withdrawal speed, mixing tool rotation speed, and injection rate.
 - a. The output from these sensors shall be visible to the Operator and Geotechnical Engineer during penetration and withdrawal.
 - b. The DMM Contractor may propose alternative display/monitoring systems; however, the systems shall first be reviewed and approved by the Geotechnical Engineer prior to use.
 - c. Calibration of this equipment shall be performed at the beginning of the project and the calibration data shall be provided to the Geotechnical Engineer. The calibration shall be repeated at intervals not to exceed three months.

A.2.3 Products

1. DMM: The in-place grout mix together with the soils shall meet all of the acceptance criteria specified in **Section A.3.15** of this Specification, determined according to the quality control, sampling, and testing methods specified in **Section A.3.14** of this Specification.

A.3 Part 3 – Execution

A.3.1 Observation of Work

1. The work covered by these specifications shall be performed under the observation of the Geotechnical Engineer, who shall be retained and paid by the Owner. The Geotechnical Engineer will be present at the site during the conduct of work to observe the work, and to perform field and laboratory tests, as deemed necessary by the Owner. The DMM Contractor shall cooperate with the Geotechnical Engineer in performing the observations and tests. At the completion of their work, the Geotechnical Engineer shall submit a report to the Owner, including a tabulation of all tests performed. The Geotechnical Engineer's costs for observing the construction, testing, and the repair of unsatisfactory work performed by the DMM Contractor shall be billed to the Owner. The Owner shall pay them and then shall deduct the amount from monies due to the DMM Contractor.
2. This work falls under the jurisdiction of the California Division of State Architect (DSA) who will review submittals and may observe portions of the work.

A.3.2 General

1. The soil-mixing shall be constructed by the DMM Contractor to the lines, grades, and cross sections indicated on the DMM Design Plans example layouts or an alternate layout approved by the Geotechnical Engineer, Structural Engineer, and CGS. Revisions to the approved layouts shall be submitted to Geotechnical Engineer of Record (GEOR) for review and approval. DMM ground improvement within a single structure shall be arranged in an uninterrupted grid that follows the structure column lines and underlies all footings and moment frame grade beams, tie beams, and shear walls as shown on the DMM Design Plans.
2. As shown on the DMM Design Plans, the DMM shall underlie the entire structure footprints and extend laterally to include any attached structures which are deemed to be essential parts of the structures.
3. Grading after the site demolition may be required to provide suitable level ground for constructing the DMM. The DMM contractor is responsible for coordinating with the site grading operation to define the Drill-Through Zone.
4. The minimum Area Replacement Ratio (A_r) for DMM grids and blocks and the maximum spacing for DMM grids depends on the specified unconfined compressive strength ($q_{dm,spec}$) as shown in **Table A.1**. Additional DMM Elements may be added within the untreated area to meet or reduce the slab free span distance as instructed by the Geotechnical and Structural Engineer.

Table A.1: Minimum DMM A_r and Maximum DMM Grid Spacing

Specified Unconfined Compression Strength, $q_{dm,spec}$ (psi)	Minimum A_r (%)	Zone B Maximum DMM Center-to- Center Grid Spacing ¹	Zones A1 and A2 Maximum DMM Center-to-Center Grid Spacing ¹
125	50	3.2d	4.0d

¹d = DMM column diameter

5. DMM elements shall extend to at least the elevations indicated on the DMM Design Plans based on the penetration of the shortest mixing shafts.
6. The top of the DMM shall extend to the base of the ground floor slab section, the bottom of footings, the bottom of moment frame grade beams, and the bottom of elevator pits, as indicated in the DMM Design Plans.
7. Any proposed plan and Area Replacement Ratio by the DMM contractor should be approved by the Geotechnical Engineer and CGS.
8. Elevator pits shall be supported entirely by DMM.

9. The DMM columns shall be essentially vertical columns as stated in this Specification, with a minimum diameter of 3 feet and a maximum diameter of 6 feet and shall extend from the top to the bottom of the Treatment Zone indicated on the DMM Design Plans.
10. The overlapping between any two adjacent columns at ground surface shall be a minimum of 30 percent of column diameter.
11. The completed DMM shall be a homogeneous mixture of grout and the in-situ soils. Mixing is to be controlled by shaft rotational speed, drilling speed, and grout injection rate.
12. Monitoring of construction parameters and confirmation testing will be used to verify that the acceptance criteria have been satisfied.
 - a. The DMM Contractor shall establish consistent procedures to be employed during DMM construction to ensure a relatively uniform product is created.
 - b. These procedures are to be defined in the equipment and procedures submittal as defined in **Section A.1.4** of this Specification and subsequently modified, if necessary, based on the results of the pre-production testing or quality control testing.
13. The DMM Contractor may request that the established grout mix/grout-soil ratio design, equipment, installation procedure, or test methods be modified. However, the Geotechnical Engineer may require additional testing, at no additional cost to the Owner, to verify that acceptable results can be achieved.
 - a. The DMM Contractor shall not employ modified grout mix/grout-soil ratio design, equipment, installation procedures, or sampling or testing methods until approved by the Geotechnical Engineer in writing.
 - b. The Geotechnical Engineer, at his sole discretion, may reject any modification proposed by the DMM Contractor.

A.3.3 Construction Site Survey

The location of both active and abandoned buried utilities at the site can have significant impact on the design and construction of deep mixing works. Careful consideration of the presence and location of all utilities is required.

1. Prior to bidding, the contractor should review the available subsurface information and visit the site to assess the site geometry, equipment access conditions, location of existing structures, and above-ground utilities and facilities.
2. The contractor should field locate and verify the locations of all utilities prior to starting work. The contractor should maintain uninterrupted service for those utilities designated to remain in service throughout the work. The contractor should notify the engineer of any utility locations different from those shown in the plans that may require relocation of deep mixed elements or structure design modification. Subject to owner's geotechnical engineer's approval, the contractor should be compensated for additional costs of element relocation and/or structure design modifications resulting from utility locations different from those shown in the plans.

A.3.4 Site Access for Soil Samples

1. After award of the Contract, the DMM Contractor will have the option of accessing the jobsite to collect additional soil samples for use in mix designs with the following requirements:
 - a. Prior to commencing with field work, the DMM Contractor shall obtain all necessary permits for sampling activities, including drilling permits from Alameda County Public Work Agency, if applicable.
 - b. The DMM Contractor shall submit to the Geotechnical Engineer a sampling plan indicating in detail the sampling activities proposed, and the proposed methods for backfilling boreholes or excavations and restoring the site.
 - c. Cement grout backfill for boreholes per Alameda County Public Work Agency is required.
 - d. The soil sampling and testing will be performed by DMM Contractor. The costs of additional soil sampling and testing (if performed) are to be included in the project DMM construction costs.

A.3.5 Test Sections

1. The DMM Contractor shall construct a minimum of one test section on site to demonstrate that the proposed mix design, equipment, and procedures will meet the specified requirements. The location(s) of the test section(s) shall be determined by the DMM Contractor with the approval of the Geotechnical Engineer.
2. Additional test sections may be performed at the DMM Contractor's option to optimize the mix design and procedures.
3. Each test section must extend at least to the deepest DMM design depth as indicated by the DMM Design Plans.
4. The costs of the test section(s) are to be included in the project DMM construction costs.
5. Each test section shall consist of at least two full strokes of the DMM equipment. For example, if the DMM rig uses three augers, then the test section shall consist of 2 strokes times 3 columns equal 6 columns.
6. Test sections shall not be located directly below proposed footings, moment frame grade beams, and elevator pits. However, the test sections may be constructed in place of other production DMM columns, provided it is later demonstrated that the test sections meet all acceptance criteria. If the test sections are found to fail the acceptance criteria, the DMM Contractor shall make necessary repairs or replace the DMM Elements to the written satisfaction of the Geotechnical Engineer and CGS.
7. During the time interval between construction of the test section(s) and the completion of laboratory test results, the DMM Contractor may proceed with production DMM installation at their own risk. Any production DMM found to fail the acceptance criteria must be

repaired at the DMM Contractor's expense, to the written satisfaction of the Geotechnical Engineer and CGS.

8. A minimum of two (2) full-depth cores shall be obtained from each test section, according to the procedures detailed in this Specification.
9. Laboratory tests, as specified in this Specification, shall be performed on a minimum of ten samples per full-depth core or a minimum of one sample per core run, whichever is greater, from each test section, as selected by the Geotechnical Engineer. Additional cores may be performed to retrieve enough test samples.

A.3.6 Horizontal Alignment

1. The DMM Contractor shall accurately stake the location of DMM Elements using a surveyor before beginning installation. The main survey control for a given area shall be established by a California licensed surveyor; layout of individual DMM Elements does not require a licensed surveyor. Horizontal alignment of DMM columns shall conform to the geometric tolerances in the acceptance criteria of this Specification.
2. The DMM Contractor shall provide an adequate method to allow the Geotechnical Engineer to verify the as-built location of the DMM during construction.
3. Movement of the crawler base machine shall provide the preliminary alignment of the augers and the final alignment shall be adjusted by hydraulic manipulation of the leads.
4. One stroke of the machine shall construct a DMM Element consisting of at least two overlapping columns.
5. The DMM shall be advanced stepwise by overlapping the adjacent columns of the previous strokes.
6. Following DMM construction, the DMM Contractor shall submit as-built drawings indicating the location of the DMM elements in terms of project coordinates and elevation datum.
7. The DMM contractor should provide a construction plan at least two (2) weeks prior to the start of construction that includes the plan showing the numbering and location of the DMM columns, tip elevations or depths, and cut-off (top) elevations. The daily work plan should be provided to the Geotechnical Engineer at the beginning of workday and work progress should be checked and confirmed by the Geotechnical Engineer during and at the end of each day. The DMM contractor should provide a summary progress report to the Geotechnical Engineer at the end of each workday.
8. The location of known obstructions or utilities at or near the treatment area should be marked on the project drawings and on the ground before construction begins. Existing obstructions within the treatment zone area should be removed prior to construction. It is not anticipated that drilling obstructions will be encountered within the Treatment Zone during DMM construction unless further site investigation reveals otherwise.
 - a. If an obstruction preventing drilling advancement is encountered, the DMM Contractor shall investigate the location and extent of the obstruction using methods approved by

- the Geotechnical Engineer. The DMM Contractor shall propose remedial measures to clear the obstruction for approval by the Geotechnical Engineer.
- b. While the investigation for an obstruction is underway, the DMM Contractor shall continue to install columns in areas away from the obstruction location. No stand-by delay will be allowed for equipment and operations during the investigation of an obstruction.
 - c. The DMM Contractor will be compensated for removal or clearing of obstructions as a Changed Condition, paid in accordance with the General Conditions.
 - d. The DMM Contractor will not be compensated for removal or clearing of obstructions without prior approval by the Geotechnical Engineer and the Owner.
9. The DMM Contractor will not be compensated for DMM Elements that are located outside of the tolerances specified in the acceptance criteria.

A.3.7 Vertical Alignment

1. The equipment operator shall control vertical alignment of the auger stroke. Verticality shall be monitored with respect to two orthogonal horizontal axes. Vertical alignment of DMM columns shall conform to the geometric tolerances in the acceptance criteria of this Specification.

A.3.8 DMM Depth

1. DMM depths shall extend to the line and grades shown on the DMM Design Plans.
2. The total depth of penetration shall be measured either by observing the length of the mixing shaft inserted below a reference point on the mast, or by subtraction of the exposed length of shaft above the reference point from the total shaft length.
 - a. For each stroke, the elevation of the reference point on the mast must be established within one inch using measurements from a surveyed control point.
 - b. The final depth and bottom elevation of the stroke shall be noted and recorded on the Daily Quality Control Report by the DMM Contractor. The equipment shall be adequately marked to allow the Geotechnical Engineer to confirm the penetration depth during construction.
3. If rigs with varying mixing shaft lengths are used, the shortest shafts shall extend to the minimum DMM depths indicated on the DMM Design Plans.

A.3.9 Grout Preparation

1. Dry material shall be stored in silos and fed to mixers for agitation and shearing. In order to accurately control the mixing ratio of grout, the addition of water and cement shall be determined by weight using the automatic batch scales in the mixing plant.
 - a. The admixtures, if used, for mixing with water and cement, can be delivered to the mixing plant by calibrated auger. However, the DMM Contractor shall prove that the

calibrated auger can deliver the quantity of dry admixture with accuracy equivalent to that measured and delivered by weight.

2. A minimum mixing time of one minute and a maximum holding time of four hours will be enforced for the grout.
 - a. The grout hold time shall be calculated from the beginning of the initial mixing.
3. The specific gravity of the grout shall be determined during the design mix program for double checking grout proportions.
 - a. The specific gravity of the grout shall be checked by the DMM Contractor at least twice per shift per rig using the methods outlined in ASTM D4380.
 - b. The specific gravity of the grout measured in the field should not deviate by more than 3 percent of the calculated specific gravity for the design cement ratio.
 - c. If the specific gravity is lower than that required by the design mix, the DMM Contractor shall add additional cement and remix and retest the grout at no cost or schedule impact to the Owner.
 - d. The specific gravity measurements shall be indicated on the Daily Quality Control Report.

A.3.10 Soil-Grout Mixing

1. Installation of each column shall be continuous without interruption.
 - a. If an interruption of more than one hour occurs, the column shall be remixed (while injecting grout at the design grout ratio) for the entire height of the element at no additional cost to the Owner.
 - b. If an interruption of more than ten minutes occurs, the DMM Contractor shall inject a volume of grout equal to that required for three feet of auger penetration, while maintaining constant auger elevation. Once the specified volume of grout has been injected, auger penetration may continue.
2. The completed CSDM shall be a uniform mixture of cement grout and the in-situ soils.
 - a. Soil and grout shall be mixed together in place by the specially designed overlapping augers or blades on the mixing shafts.
 - b. The grout shall be pumped through the mixing shafts and injected from the tip of the shafts. The shafts shall break up the soil and blend it with cement grout.
 - c. The mixing action of the shafts shall blend, circulate, and knead the soil over the length of the column while mixing it in place with the grout.

A.3.11 Shaft Rotational Speed and Penetration/Withdrawal Rate

1. The mixing shaft rotational speed (measured in RPMs) and penetration/withdrawal rates shall be established before beginning work. It may be adjusted with the approval of the Geotechnical Engineer to achieve adequate mixing.

2. The contractor shall obtain the suitable shaft rotational speed during the installation of test section. The rotational speeds and penetration/ withdrawal rates shall be recorded on the Daily Quality Control Report.
3. The established rotational speeds and penetration/withdrawal rates shall be used during the work. If these parameters are varied more than ten (10) percent from those determined during the test section(s), the Geotechnical Engineer may require additional testing, at no additional cost to the Owner, to verify that the acceptance criteria are met.
4. The DMM Contractor may request that the established mixing parameters be modified during the production DMM installation. To verify acceptable results for the modified parameters, the Geotechnical Engineer may require additional testing at no additional cost to the Owner.

A.3.12 Grout Injection Rate

1. The grout injection rate per no more than three vertical feet of column shall be in accordance with the requirements of the design mix.
 - a. The required mix design and grout-soil ratio shall be determined during the test section(s).
 - b. The grout injection rate shall be constantly monitored and controlled.
 - c. The DMM Contractor shall record the volume of grout injected continuously for each column on the Daily Quality Control Report.
2. If the volume of grout injected per three vertical feet of column is less than the amount required to meet the grout-soil ratio established during the test section, the DMM columns shall be remixed and additional grout injected (at the design grout-soil ratio) to a depth at least 3 feet below the deficient zone or until design depth is met, at no additional cost to the Owner.
3. The DMM Contractor may request that the established grout-soil ratio be modified during the production DMM installation.
 - a. To verify acceptable results for the modified grout-soil ratio, the Geotechnical Engineer may require additional testing or a new test section at no additional cost to the Owner.

A.3.13 Control of Spoils

1. The DMM Contractor shall control and process all spoils created during the DMM construction.
 - a. Prior to stockpiling materials greater than 10 feet in height, stockpile locations and heights shall be submitted for review and approval to Geotechnical Engineer. The DMM Contractor shall consider the locations of and avoid damage to existing utilities, structures, and other improvements, as well as recently constructed DMM Elements when stockpiling material. Lesser stockpile heights may be necessary in some areas.

- b. The spoils shall be processed until they have cured to a sufficient level to allow them to be stockpiled such that they will not reform a cemented mass in the stockpile. The DMM Contractor shall dispose of spoils in accordance with all local laws, codes, and ordinances in a manner acceptable to the Owner or coordinate with the project grading contractor for the spoils be reused as fills at the project site.

A.3.14 Quality Control Program

1. The DMM Quality Control Program shall be the responsibility of the DMM Contractor and shall include, as a minimum, the following components:
 - a. An approved pre-construction test program on soils obtained from the project site, to establish appropriate design parameters such as cement dosage and water content.
 - b. Field monitoring by the DMM Contractor of construction parameters during DMM construction.
 - c. Sample collection including full depth continuous coring, sample storage, and sample transportation to the Testing Laboratory.
 - d. Reporting of the field monitoring and sampling performed by the DMM Contractor.
 - e. Reporting of the core strength testing performed by the Testing Laboratory.
2. Prior to site mobilization, the DMM Contractor shall submit a detailed work plan for the Quality Control Program for review and approval by the Geotechnical Engineer. The work plan shall include, as a minimum:
 - a. A description of all installation, monitoring, sampling, and testing procedures to be implemented. The proposed auger penetration and withdrawal rates shall be proposed by the DMM Contractor at this time.
 - b. Descriptions of all sampling equipment.
 - c. A list of parameters to be monitored.
 - d. Tolerances for the parameters monitored.
 - e. Names of any subcontractors.
3. The DMM Contractor shall provide all the personnel and equipment necessary to implement the Quality Control Program. Contractor to provide the number of years/projects, project descriptions, and reference list for all cases below:
 - a. The DMM Contractor must have at least 7 (seven) years of previous successful experience with at least 5 (five) DMM projects for soil conditions and project scope similar to that of the project being bid.
 - b. The DMM contractor must have a registered California Professional Engineer (PE) who have had at least 5 (five) years of experience with at least 3 (three) DMM projects.
 - c. The DMM Contractor must have assign a project manager who have had at least 5 (five) years of experience on at least 3 (three) DMM projects.
 - d. The DMM Contractor must have assign a project engineer/ supervisor who have had at least 3 (three) years of experience with at least 2 (two) DMM projects.

- e. The DMM Contractor must assign a full-time project superintendent with at-least 3 (three) DMM projects with at least 150,000 cubic yard of total treatment volume in DMM construction.
 - f. The DMM equipment operator must have at least three years of experience with the equipment and DMM construction.
 - g. Written requests for substitution of these key personnel must be submitted prior to personnel changes. Documentation must be submitted to the owner that demonstrates that the substitute meets the requirements listed. Substitution may not be made until written approval is provided by the owner.
4. The Geotechnical Engineer will continuously observe the DMM construction. The Geotechnical Engineer will review DMM Contractor submittals to check that the Quality Control Program is being properly implemented.
 5. The established quality control procedures shall be maintained throughout the production DMM installation to ensure consistency in the installation and to verify that the work complies with all requirements indicated in the DMM Design Plans and Specifications, unless modifications to the procedures are approved in writing by the Geotechnical Engineer.
 6. DMM Contractor shall perform sample collection, storage, and transportation.
 - a. DMM Contractor shall collect one full-depth continuous coring should be made for every 3% of the total DMM elements or for every 900 square feet of treated ground, whichever produces the greater number of cores at locations specified by the Geotechnical Engineer.
 - i. The coring rig shall be a triple-barrel rig approved by the Geotechnical Engineer and capable of achieving the required recovery. The ability to achieve the recovery criteria is solely the Contractor's responsibility.
 - ii. Full-depth samples obtained by the DMM Contractor shall have a diameter of at least 3 inches.
 - iii. The continuous core sample shall extend from the top through the bottom of the Treatment Zone, and to at least 5 feet below the Treatment Zone to sample the foundation soil directly below the Treatment Zone.
 - iv. Unless otherwise directed by the Geotechnical Engineer, the full-depth samples shall be obtained along an essentially vertical alignment located one-fourth of a column diameter from the column center and not within column overlaps.
 - v. The DMM Contractor shall perform all full-depth sampling in the presence of the Geotechnical Engineer.
 - vi. Full-depth core samples shall be retrieved using triple tube continuous coring techniques after the soil-grout mixture has hardened sufficiently.
 - vii. Each core run shall be a minimum 4 feet in length.

- viii. Following logging, the engineer will select at least five specimens from each full-depth continuous core for strength testing. Each test specimen should have a length-to-diameter ratio of 2 or greater.
 - ix. A minimum recovery of 85 percent for each 4-foot core run shall be achieved for cores from within the Treatment Zones. During coring, the elevation of the bottom of the holes shall be measured after each core run in order that the core recovery for each run can be calculated.
 - x. The DMM Contractor shall determine the time interval between column installation and coring except that the interval shall be no longer than required to conduct 28-day strength testing.
 - xi. The DMM contractor should photograph each core run and submit to the Geotechnical Engineer for test sample selection.
 - xii. Upon retrieval, the core runs shall be provided to the Geotechnical Engineer for logging, uniformity inspection, and test specimen selection.
 - xiii. Following logging and test specimen selection by the Geotechnical Engineer, the entire full-depth core, including the designated test specimens, shall be immediately sealed in plastic wrap to prevent drying and transported to the laboratory by the DMM Contractor. Alternatively, the DMM Contractor may transport only the selected test specimens to the laboratory and store the remaining core on-site in a humidity and temperature-controlled storage facility as described in this Specification.
 - xiv. All core holes shall be filled with cement grout that will obtain a 28-day strength equal to or greater than the strength of the DMM. However, the Contractor shall not grout the core holes until after acceptable core recover and uniformity has been confirmed by the Geotechnical Engineer.
 - xv. The DMM Contractor shall notify the Geotechnical Engineer at least one business day (24 hours) in advance of beginning core sampling operations.
- b. In addition to coring, the DMM Contractor should obtain wet grab samples from the DMM elements at the presence of Geotechnical engineer.
- i. 3 (three) wet samples from each mixed design used in each test section as directed by the geotechnical engineer.
 - ii. One wet sample (i.e., one selected depth at one location) should be retrieved every 2 (two) production days or for every 2,500 cubic yards of treated soil, whichever produces the higher sampling frequency.
 - iii. The contractor proposes locations for wet sampling as outlined in the QC program, considering input from the geotechnical engineer based on subsurface conditions, DMM layout, review of the QC results, and observation of the soil mixing operation.
 - iv. The contractor should report all attempts, successful and unsuccessful, to obtain wet samples. Some deep mixed material may not be able to be sampled readily

- because either the mixture is too stiff or the material may not flow back into the void left after the sampler is extracted, possibly leaving a damaged element.
- v. The sampling tool is inserted into the DMM column to a designated depth, filled with treated soil, and lifted to the ground surface. The treated soil material is then poured into a container, screened for oversized lumps (gravel versus unmixed soil), and placed in 3-inch (76-mm)- diameter, 6-inch (152 mm)- long molds. Eight test specimens should be prepared from each wet sample.
 - vi. The wet treated material should be placed into the mold in three to five layers. After the placement of each layer, the specimens must be tapped or vibrated to remove trapped air bubbles. The specimens should be sealed to prevent moisture from entering or leaving the specimens, and the sealed specimens should be stored in a humid environment in accordance ASTM C192.
 - vii. For field validation testing, unconfined compressive strength testing may be performed on specimens at 3, 7, 28, and 56 or more days. For full production work, unconfined compressive strength testing may be performed at 3, 7 and 28 days.
 - viii. The DMM contractor should deliver the samples for testing to a local lab as directed by the geotechnical engineer.
 - ix. If wet samples produce results that are consistently acceptable, the frequency of wet sampling can be reduced as the project progresses.
 - x. The engineer may request additional test specimens for QA testing.
- c. Untested portions of the full-depth samples shall be retained at the laboratory until completion and acceptance of all DMM, for possible inspection and confirmation testing by the Geotechnical Engineer.
7. The DMM Contractor shall be responsible for handling of test specimens, including storing of untested specimens and transporting test specimens to the Testing Laboratory.
 - a. The laboratory testing shall be performed by the DSA accepted Testing Laboratory hired by the Owner and approved by the Geotechnical Engineer.
 - b. The samples shall be stored in a moist room as specified in ASTM C 192 until the test date.
 - c. Testing for 28-day unconfined compressive strength shall be conducted in accordance with ASTM D2166.
 8. In addition to confirmation tests performed by the Testing Laboratory, additional tests may be requested by the Geotechnical Engineer on samples collected by the DMM Contractor. Both the Testing Laboratory's testing and the Geotechnical Engineer's requested additional testing (if performed) shall demonstrate that the acceptance criteria are met prior to acceptance of the work.
 9. Daily Quality Control Report
 - a. The DMM Contractor shall submit Daily Quality Control Reports to the Geotechnical Engineer at the end of the next working day. The Daily Quality Control Report shall

document the progress of the DMM construction, present the results of the QC parameter monitoring, present the results of the strength testing, and clearly indicate if the columns have met the acceptance criteria. The DMM Contractor shall make all Daily Quality Control Reports available to the Geotechnical Engineer

- b. The Daily Quality Control Report shall include as a minimum the results of the following QC parameter monitoring for each column:
 - i. Rig number,
 - ii. Type of mixing tool,
 - iii. Date and time (start and finish) of column construction,
 - iv. Column number and reference drawing number,
 - v. Column diameter,
 - vi. Column top and bottom elevations,
 - vii. Grout mix design designation,
 - viii. Slurry specific gravity measurements (refer to Section A3.9 for number of tests and tolerance), and
 - ix. Description of obstructions, interruptions, or other difficulties during installation and how they were resolved.
- c. The Daily Quality Control Reports shall also include the following parameters recorded automatically for each column continuously and submitted in the form of either tables or figures (as agreed to by the Geotechnical Engineer):
 - i. Elevation in feet vs. real time,
 - ii. Shaft rotation speed in RPMs vs. depth,
 - iii. Penetration and withdrawal rates in feet per minute vs. depth,
 - iv. Grout injection rate in gpm vs. depth, and
 - v. The average quantity of grout in gallons per foot injected per 3-foot (or less) vertical increment of column vs. depth.

A.3.15 Acceptance Criteria

1. The Geotechnical Engineer and CGS shall make the sole determination as to whether the acceptance criteria have been satisfied. The in-place grout-soil mixture comprising the DMM Elements shall meet the following acceptance criteria:
 - a. The DMM within the Treatment Zone shall be installed within the following geometric tolerances:
 - i. The horizontal alignment of the DMM blocks shall be within 4 inches of the location shown on the approved DMM Layout Plans.
 - ii. The vertical inclination of the DMM columns shall be no more than 1: 100 (horizontal to vertical).

- iii. Overlap between any two adjacent columns shall be a minimum of 30 percent of column diameter for the entire depth, as calculated based on depth of column embedment and measured auger lateral and longitudinal inclination.
 - iv. The tops of the columns shall be at or higher than the elevations indicated on the DMM Design Plans.
 - v. The bottoms of the columns shall extend to or lower than the levels indicated on the DMM Design Plans.
- b. Two alternative specified unconfined compressive strengths are provided with corresponding minimum A_r and maximum grid spacing in **Table A.1**. The DMM Contractor shall select one of these options for the entire project.
 - c. The unconfined compressive strength shall be determined by ASTM D2166 at 28 days on samples taken by coring of the constructed DMM.
 - d. 80 percent of all unconfined compressive strength testing on core samples determined by ASTM D2166 from each tested deep mixed element shall equal or exceeds the specified strength. If a strength specimen falls below the specified strengths due to an obviously unrepresentative lump of unmixed soil in the specimen, the Geotechnical Engineer has the option to select another specimen from the same core run and allow the Testing Laboratory to test the replacement specimen and substitute the strength from the replacement specimen for the strength from the unrepresentative specimen that failed to satisfy the strength requirement. Only one such retest will be allowed per core run.
 - e. 90 percent of all the test results on core samples across the site should equal or exceed the specified strength.
 - f. To prevent a weak layer at one elevation in the DMM foundation system, strengths below the specified strength are not permitted within 10 feet of the same elevation in more than 2 nearby cored elements.
 - g. Uniformity of mixing within the target zone shall be evaluated by the Geotechnical Engineer based on the full-depth samples recovered by the DMM Contractor from the columns.
 - i. Lumps of unimproved soils shall not amount to more than 15 percent of the total volume of any core run from a continuous full-depth core sample. For evaluating the volume of unimproved lumps of soil, all of the unrecovered core length shall be assumed to be unimproved soil.
 - ii. Any individual or aggregation of lumps of unimproved soil shall not be larger than 12 inches in greatest dimension.
 - iii. Continuous core recovery shall be at least 85 percent over any full-length core.
2. If the acceptance criteria specified in this Specification are not achieved for production DMM, the failed section of DMM shall be rejected.

- a. Unless otherwise determined by the Geotechnical Engineer, the failed section of DMM shall be considered to include all DMM columns constructed during all rig shifts that occurred between the times of construction when passing tests were achieved.
- b. The DMM Contractor may conduct additional sampling and testing to better define the limits of the failed area at no additional cost to the Owner.
- c. The DMM Contractor shall submit a proposed plan for remixing or repair of failed sections for review and approval by the Geotechnical Engineer and CGS.
- d. If the treated soil that failed to meet the uniformity criteria is concentrated in a narrow elevation range forming weak planes or zones, the contractor could propose redrilling and remixing to 3 feet below and above the deficient zone. IF redrilling and remixing cannot be done efficiently, the contractor must replace the elements to the full depth. If the treated zone in the narrow elevation meets the uniformity criteria but fails to meet the strength criteria, the contractor could propose to redrill and remix the deficient zone or to assign a lower strength level to the deficient zone and install additional elements to compensate for the strength deficiency.
- e. If the treated soil that failed to pass cannot be isolated in a specific zone, the contractor must provide remedial measures for all elements constructed during all rig shifts that occurred between passing elements.
- f. Remedial measures are subject to coring and application of the specification acceptance criteria.
